VOL. IV.

BENEDICT TO CADIZ.

• Haddon, Printer, Castle Street, London.

THE
LONDON ENCYCLOPÆDIA,
OR
UNIVERSAL DICTIONARY
OF
SCIENCE, ART, LITERATURE, AND PRACTICAL MECHANICS,

COMPRISING A
POPULAR VIEW OF THE PRESENT STATE OF KNOWLEDGE.

ILLUSTRATED BY
NUMEROUS ENGRAVINGS, A GENERAL ATLAS,
AND APPROPRIATE DIAGRAMs.

Sic oportet ad libram, presertim miscellanei generis, legendum accedere lectorem, ut solet ad convivium conviva civilis. Convivator annititur omnibus satisfacere; et tamen si quid apponitur, quod hujus aut illius palato non respondeat, et hic et ille urbane dissimulant, et alia fercula probant, ne quid contristent convivatorem.
Erasmus.

A reader should sit down to a book, especially of the miscellaneous kind, as a well-behaved visitor does to a banquet. The master of the feast exerts himself to satisfy his guests; but if, after all his care and pains, something should appear on the table that does not suit this or that person's taste, they politely pass it over without notice, and commend other dishes, that they may not distress a kind host.
Translation.

BY THE ORIGINAL EDITOR OF THE ENCYCLOPÆDIA METROPOLITANA,
ASSISTED BY EMINENT PROFESSIONAL AND OTHER GENTLEMEN.

IN TWENTY-TWO VOLUMES.

VOL. IV.

DSW

BELT', *n. s.* Sax. belt, Lat. *baltheus*. A girdle; a cincture in which a sword or some weapon, is commonly hung.

Full many ladies often had assay'd,
About their middles that fair belt to knit.

Spenser.

He cannot buckle his distemper'd cause
Within the belt of rule. *Shakspeare.*

Ajax slew himself with the sword given him by Hector, and Hector was dragged about the walls of Troy by the belt given him by Ajax. *South.*

Then snatch'd the shining belt, with gold inlaid;
The belt Eurytion's artful hands had made. *Dryden.*

BELT, **BALTHEUS**, a kind of military girdle, commonly of leather, wherewith the sword or other weapons are sustained. Belts are known among the ancient and middle-age writers by divers names, as ζωνη, ζωνα, zona, cingulum, remiculum, rinca or ringa, and baldrellus. The belt was an essential piece of the ancient armour; insomuch that we sometimes find it used to denote the whole armour. In later ages, the belt was given to a person when he was raised to knighthood; whence it has also been used as a badge or mark of the knightly order.

BELT, a disease in sheep, is cured by cutting their tails off, and laying the sore bare; then easting mould on it, and applying tar and goose-grease.

BELT, **BELTIS**, in ecclesiastical writers of the middle age, signifies a string of beads.

BELT, in surgery, signifies a bandage; thus quicksilver belts are used for the itch; belts for keeping the belly tight, and discharging the water in the operation of tapping, &c.

BELTS, **FASCIAE**, in astronomy, two zones or girdles surrounding the body of the planet Jupiter. See **ASTRONOMY**.

BELT, **THE GREAT AND LITTLE**, two straits of Denmark, connecting the Baltic with the Cattegat. The former runs between the island of Zealand and that of Funen, at the entrance of the Baltic. In 1658 it was so completely frozen over, that Charles Gustavus, king of Sweden, marched across it with a design to take Copenhagen. It varies in depth from five to twenty fathoms, and its greatest width is about twenty miles. The neighbouring shores afford several good and convenient harbours. The chief danger in the navigation arises from the sand banks, and the number of small islands. The passage-boats cross in summer from Nyborg in Funen to Corsoer in Zealand, a distance of fifteen miles, in the course of three or four hours. In the middle of the passage is the small island of Sprogø. Vessels passing this strait pay a toll at Nyborg, where a guard ship is stationed. At Fredericia, where the tolls are levied, it does not

exceed a mile in width, so that the entrance from the Cattegat is completely commanded. In other parts of the strait the water expands in width to an extent of eight or ten miles. The route from Jutland to Copenhagen, by way of Fredericia, though circuitous, is preferred on account of the regularity and security of the conveyance. The shores of the Little Belt are seldom steep or rugged, but contain several sand-banks; and the current from the Baltic to the Cattegat is of considerable strength. The depth varies from four fathoms to twenty-seven. The passage of both Belts is attended with considerable risk for large vessels, which on that account generally pass through the Sound; the Great Belt, however, was much frequented by British ships during the stoppage of the Sound, from 1807 to 1814, in consequence of our hostilities with Denmark.

The Lesser lies to the west of the Great Belt, between the island of Funen and the coast of Jutland. It is not three miles in average breadth, and very crooked.

BELTAN, or **BELTEIN**, a superstitious custom of the Highlands of Scotland. 'It is,' says Mr. Pennant, in his Tour, 'a kind of rural sacrifice performed by the herdsmen of every village on the first of May. They cut a square trench in the ground, leaving a turf in the middle: on that they make a fire of wood, on which they dress a large caudle of eggs, butter, oatmeal, and milk; and bring, besides the ingredients of the caudle, plenty of beer and whisky; for each of the company must contribute something. The rites begin with spilling some of the caudle on the ground, by way of libation: on that, every one takes a cake of oatmeal, upon which are raised nine square knobs, each dedicated to some particular being, the supposed preserver of their flocks and herds, or to some particular animal, the real destroyer of them: each person then turns his face to the fire, breaks off a knob, and flinging it over his shoulder, says, This I give to thee, preserve thou my horses; this to thee, preserve thou my sheep; and so on. After that they use the same ceremony to the noxious animals: This I give to thee, O fox! spare thou my lambs: this to thee, O hooded crow! this to thee, O eagle! When the ceremony is over, they dine on the caudle; and after the feast is finished, what is left is hid by two persons deputed for that purpose; but on the next Sunday they re-assemble and finish the reliques of the first entertainment.' Dr. James Robertson, minister of Callander, gives a very different, and seemingly more credible account of this festival, in Sir John Sinclair's Stat. Acc. Vol. xi. 620. 'Upon the first day of May,' says the Dr., 'which is called

Beltan, or Baltein day, all the boys in a township or hamlet, meet in the moors. They cut a table in the green sod, of a round figure, by casting a trench in the ground, of such circumference as to hold the whole company.' After dressing the caudle as above-mentioned—'They knead a cake of oatmeal, which is toasted at the embers against a stone. After the custard is eaten up, they divide the cake into so many portions, as similar as possible to one another in size and shape, as there are persons in the company. They daub one of these portions all over with charcoal, until it be perfectly black. They put all the bits of the cake into a bonnet. Every one, blindfold, draws out a portion. He who holds the bonnet, is entitled to the last bit. Whoever draws the black bit, is the devoted person who is to be sacrificed to Baal, whose favor they mean to implore, in rendering the year productive of the sustenance of man and beast. There is little doubt of those inhuman sacrifices having been once offered in this country, as well as in the east, although they now pass from the act of sacrificing, and only compel the devoted person to leap three times through the flames; with which the ceremonies of this festival are closed.' The Dr. in a note traces the origin of this and other superstitions from our ancient Druidism. 'Baltein signifies the fire of Baal. Baal, or Ball, is the only word in Gaelic for a globe. This festival was probably in honor of the sun, whose return, in his apparent annual course, they celebrated, on account of his having such a visible influence, by his genial warmth, on the productions of the earth. That the Caledonians paid a superstitious respect to the sun, as was the practice among many other nations, is evident, not only by the sacrifice at Baltein, but upon many other occasions. When a Highlander goes to bathe, or to drink waters out of a consecrated fountain, he must always approach by going round the place, from east to west on the south side, in imitation of the apparent diurnal motion of the sun. When the dead are laid in the earth, the grave is approached by going round in the same manner. The bride is conducted to her future spouse, in the presence of the minister, and the glass goes round a company, in the course of the sun. This is called, in Gaelic, going round the right, or the lucky way. The opposite course is the wrong, or the unlucky way.'

BELTESHAZZAR, the name given to the prophet Daniel, by Nebuchadnezzar's chief eunuch.

BELTURBET, a market town of Ireland, in the county of Cavan, situated on the river Erne, eight miles from Cavan, and sixty from Dublin. Before the union, it sent two members to the Irish parliament. All articles offered for sale in the market pay toll in kind. They principally consist of oatmeal, potatoes, and yarn. Brewing and distilling are also carried on here. It appears to have been once a military station; there being some ancient fortifications still visible.

BELTZ, or BELZO, a province of Red Russia in Poland, bounded by Leopold on the south, by Chelm on the north, Little Poland on the east, and Volhynia on the west.

BELTZ, or BELZO, a town of Poland, and capital of the province, seated on the confines of Upper Volhynia, among marshes, thirty-five miles north of Lemberg.

BELVEDERE, a town of European Turkey, on the west coast of the Morea, and standing on the site of the ancient Elis. It is poorly built, but receives the name of Belvedere from its fine situation. It is the capital of a province which comprises the Messenia and Elis of the ancients, and is one of the most beautiful and fertile in Greece. The town is thirty-six miles south of Patras, and sixty-five west of Corinth. Long. 21° 30' E., lat. 37° 59' N.

BELVEDER, in the Italian architecture, &c. denotes either a pavilion on the top of a building, or an artificial eminence in a garden; the word literally signifying a fine prospect.

BELVIDERE, in botany. See CHENOPODIUM.

BELVIS, a small town of Spain, in Estremadura, with a castle, seated between two mountains.

BELUGA, in zoology, a name of the delphinus albicans; this fish occasionally containing a morbid concretion called the beluga stone. Its figure is globular or oval; it is of a yellowish white color, smooth polished surface, and between the size of a pigeon's and goose's egg. It is ponderous, and requires a strong blow to break it. When scraped and sprinkled on hot iron it emits a faint urinous smell, and calcines into a light insipid grayish earth. The Asiatics of the Volga give it in doses of from ten grains to a dram, in calculous disorders; and they believe also that it facilitates childbirth.

BELULCUM, a chirurgial instrument for extracting darts, arrows, &c. from wounds.

BELUNUM, in ancient geography, a town of Rhatia, above Feltria, in the territory of the Veneti; now called Belluno.

BELUR, a general name given to the Alpine region which divides the southern part of ancient Scythia, or Great Bucharica, from Little Bucharica. It lies in about the 37th degree of north latitude, and the 71st of east longitude.

BELUR TAGH, a range of mountains in central Asia, which runs nearly north and south, about the 71st degree of east longitude. The term, in the Mongul language, implies 'the dark or cloudy mountains.' They belong to a part of the ancient Imaus, and are perpetually covered with snow.

BELUS, in ancient geography, a small river of Galilee, at the distance of two stadia from Ptolemais, running from the foot of Mount Carmel out of the lake Cendevia. Near this place, according to Josephus, was a round hollow or valley, where was a kind of sand fit for making glass; which, though exported in great quantities, was found to be inexhaustible. Strabo says, the whole of the coast from Tyre to Ptolemais has a sand fit for making glass; but that the sand of the rivulet Belus and its neighbourhood is a better sort; and here, according to Pliny, the making of glass was first discovered.

BELUS. See BEL.

BELUSSA, a market town of Hungary, in the county of Trentschin, near which are warm sulphur springs.

BELWETHER, *n. s.* From bell and wether. A sheep which leads the flock with a bell on his neck.

The fox will serve my sheep to gather,
And drive to follow after their *belwether*.

Spenser.

To offer to get your living by the copulation of cattle ; to be a bawd to a *belwether*. *Shakspeare.*

The flock of sheep and *belwether* thinking to break into another's pasture, and being to pass over another bridge, jostled till both fell into the ditch. *Hovel.*

BELZONI (John Baptist), a modern traveller, celebrated for his discoveries in Egyptian antiquities. He was, according to his own preface to his *Travels*, born at Padua, of a Roman family, and his original destination was to a monastic life. The disturbed state of his country, however, in consequence of the French invasion in 1800, induced him to seek an asylum in England, whither he repaired in 1803. Here he married, and continued to reside nine years. Being considerably more than six feet high, robust and well proportioned, he at one time exhibited feats of strength at Astley's amphitheatre ; but subsequently devoted himself to the grand object of exploring the north-eastern shores of Africa. Taking Mrs. Belzoni with him he left England in 1815, and passed by Portugal and Spain to Malta and Egypt, where he was much encouraged and assisted in his researches by Mr. Salt, the British consul. He returned to England in 1820, to lay the results before the public, and published a *Narrative of the Operations and recent Discoveries within the Pyramids, Temples, Tombs, and Excavations, in Egypt and Nubia ; and of a Journey to the coast of the Red Sea, in search of the ancient Berenice ; and another to the Oasis of Jupiter Ammon*, 4to ; together with forty-four illustrative plates in folio. In 1821 Mr. Belzoni exhibited, at the Egyptian Hall in Piccadilly, a model of the tomb which he had explored near Thebes ; fac-similes of the paintings on the walls of one or two of the sepulchral apartments, with other Egyptian curiosities. This exhibition attracted much public attention, and probably proved very profitable ; but in Paris the following season it did not meet with equal success. Our traveller afterwards undertook an expedition of discovery to the central parts of Africa, and reached the mouth of Benue river on the coast of Guinea, in the autumn of 1823. On the night of the 24th of November he set off for Gato with a gentleman of some influence with the king of Benue. But having reached Benue he was seized with a disease which speedily terminated in death, and was interred at Gato ; the following monumental inscription being placed over his grave :

Here lie the remains of

J. B. BELZONI ;

Who was attacked with dysentery at Benue,

(On his way to Houssa and Timbuctoo,)

On the 26th of November, and died at this place,

December 3, 1823.

BEMA, *βημα*, denotes a step or pace. The bema made a kind of itinerary measure among

the Greeks, the length of which was equivalent to one cubit and two-thirds, or to ten palms. Whence also the term *βηματιζειν*, *bematizein*, to measure a road.

BEMA, in ecclesiastical writers, denotes 1. The altar and sanctuary in the ancient churches. In this sense it means the third or innermost part of the church, answering to our chancel. 2. The bishop's chair or throne, in the sanctuary, was called bema from the steps by which it was ascended. 3. The reader's desk. This in the Greek church was called *βημα γροτων*, in the Latin church ambo.

BEMA was particularly used by the Manichees for their altar, which was in a different place from that of the Catholics. Bema was also a denomination given by this sect to the anniversary of the day on which Manes was killed, which with them was a solemn feast and day of rejoicing. One of the chief ceremonies of the feast consisted in setting out and adorning their bema or altar with great magnificence.

BE'MAD. Be and mad. See **MAD**.

BE'MARTYR. Be and martyr. See **MARTYR**.

BE'MASK. Be and mask. See **MASK**.

BE'MAUL. Be and maul. See **MAUL**.

BE'MAZE. Be and maze. See **MAZE**.

EMBER, a chain of mountains in Asia, which divide India from Tartary.

BEMBO (Flavio), a native of Amalfi, in Naples, the inventor of that most useful instrument in navigation, the mariner's compass, flourished about the beginning of the fourteenth century.

BEMBO (Peter), a noble Venetian, secretary to Leo X. and afterwards cardinal, was one of the best writers of the sixteenth century. He was a good poet, both in Italian and Latin ; but he is justly censured for the looseness and immodesty of some of his poems. He published also *A History of Venice ; Letters ; and a book in praise of the Duke and Duchess of Urbino*. He died in 1547, aged seventy-two.

BE'METE. Be and mete. See **METE**.

BEMETRE, in ornithology, a name by which the Portuguese in the Brasils call a greenish black bird of the starling kind, common there, and more generally known by its Brazilian name, *pitanguacu*.

BEMILUCIUS, in mythology, a surname of Jupiter, represented young and beardless.

BE'MINGLE. Be and mingle. See **MINGLE**.

BE'MIRE. Be and mire. See **MIRE**.

BEMIST. Be and mist. See **MIST**.

BEMOAN, } Be and moan. See **MOAN**.

BEMOANING, }

BEMOCK. Be and mock. See **MOCK**.

BEMOIL. Be and oil. See **MOIL**.

BEMONSTER. Be and monster. See **MONSTER**.

BEMOURN. Bi or be and mourn. Goth. *mauran* ; Ang.-Sax. *murnan*, to mourn, to grieve for, to lament.

BEMUFFLED. Be and muffle ; muffle the diminutive of muffle. See **MUFF**.

BEMUSE. Be and muse. See **MUSE**.

BEN, in botany, the oily acorn, or ben-nut ; a whitish nut, the size of a small filbert and of a roundish triangular shape, including a kernel of

the same figure, covered with a white skin. It is the fruit of the hyperanthera moringa, a native of the East Indies. These nuts, on expression, yield one-fourth of their weight of a yellow insipid oil, which does not grow rancid with long keeping. It is impregnated with the odor of roses, jessamine, and other flowers, by stratifying them with cotton dipped in the oil, and repeating the process with fresh flowers, until the oil becomes sufficiently odorous; after which, it is squeezed out from the cotton in a press. In this manner the celebrated *huile antique de la rose*, or otto of roses, is prepared.

BEN-ABOUD, or **BENAVOUD**, the Table hill, a mountain of Scotland, between the shires of Aberdeen and Inverness. It is about three miles long, and nearly flat at the top, presenting a huge barren mass of rock, rising to the height of 3940 feet above the level of the sea. A few topazes and beryls are sometimes found there.

BEN LEDI, a mountain in the county of Perth, in Scotland, rising 3009 feet above the level of the sea; on the summit is a small lake.

BEN-LOMOND, a mountain in the county of Stirling, in Scotland. It rises conically from Lochlomond, above the level of which it towers 3240 feet, and above that of the sea 3262. It is chiefly composed of granite and masses of quartz. It is entirely the property of the duke of Montrose.

BEN MACDUIE, a mountain on the western confines of the county of Aberdeen, in Scotland, the second highest in Britain: It is 4300 feet in height.

BEN NEVIS, a mountain in the county of Dumbarton, in Scotland, rising 4370 feet above the level of the sea. It is the highest in Britain. It is chiefly composed of porphyry and red granite, and it contains a vein of lead ore richly impregnated with silver.

BENA, or **BENE**, a town of Piedmont, in the district of Mondovi, on the road from Finale to Turin, from which it is about twenty-eight miles distant. It is a fortified place, defended by a castle; and contains nearly 5000 inhabitants. It was taken by the French in April, 1796.

BENACO, a department of the late Italian republic, so named from the Benacus, comprehending part of the *ci-devant* Venetian territory of Verona, and the whole of the late territory of Sado, on the lake of Garda. It is now a part of the Lombardo-Venetian kingdom. It was eighty Italian miles long and fifteen broad, and being partly level, partly mountainous, exhibits one of the most charming spots in Italy. It abounds in corn, wine, oil, silk, fruits, lemons, oranges, iron, lead, copper, marble, granite, &c. It contains forty-two parishes, 150 villages, one large, and several small towns; and sent nine deputies to the two councils of the republic. Its population in October, 1797, was 150,895. Desenzano was the capital.

BENÆ LAPIS, in the natural history of the ancients, the name given by the earliest writers to that fossil body, afterwards called *thracius lapis*.

BENAIAM, בְּנֵי, i. e. the Lord's building, the son of Jehoidah, one of David's heroes, and captain of his guards. Having adhered to Solo-

mon's interest, in opposition to Adonijah, he was appointed general instead of Joab. He appears also to have been appointed public executioner, an office, it would seem, not held dishonorable in those days; we find him ordered to put to death Joab and Adonijah. His personal prowess, in killing the lion, the Egyptian, and the two Moabish champions, is recorded in 2 Sam. xxiii. 20.

BENARES. See **BANARES**.

BENAVENTO, or **BENAVENTE**, a town of Spain, in Leon, with the title of duchy. It is seated on the river Ezla, forty miles south of Leon, and has a strong castle; but though it contains nine parishes, an abbey, two convents, three hospitals, and other public establishments, the population does not exceed 3000. The churches are old, but well built, and the palace of the dukes is a noble and very ancient structure. Not far from the town is a famous monastery of Hieronymites. It is twenty miles north of Zamora.

BENAVIDIO (Marc), a lawyer, born at Padua in 1489, and died in 1582. His principal works are, 1. *Dialogus de Concilio*, 4to. Venet. 1541. 2. *Epitome Illustrium Jurisconsultorum*, 8vo. Patav. 1553; printed afterwards in Richard's *Lives of Lawyers*, Patav. 1665; and in Hoffman's edition of *Pancirollus*, 4to. Leips. 1721. 3. *Illustrium Jurisconsultorum Imagines*, fol. Rom. 1566; Venet. 1657. 4. *Observationes Legales*, 8vo. Venet. 1745. 5. *Polymathiæ Libri Duodecim*. Venet. 1558. &c.

BENBECULA, Beau-vealla, Gael., a small island on the west coast of Scotland, belonging to the parish of South Uist, from which it is separated by a narrow channel, nearly dry at low water. It is a low island, about nine miles in length, and nearly the same in breadth. The soil is sandy, and unproductive. Great quantities of sea-weed are thrown annually upon the coast, from which the inhabitants make kelp. There are the remains of a large Danish tower upon it, said to contain the ashes of the daughter of a Danish chief. It is situated between the islands of North and South Uist. Long. 8° 10' W., lat. 57° 26' N.

BENBOW (John), an English admiral, born about 1650. He was brought up to the sea, in the merchant service, and in 1680 commanded a ship in the Mediterranean trade, with which he beat off a Saltee rover. His gallantry being reported to Charles II. of Spain, he invited the captain to court, and gave him a letter of recommendation to king James, from whom he received a commission in the navy. He was afterwards sent to the West Indies by king William, where he relieved the British colonies; and when he returned home he was greatly honored, though the house of commons severely censured those who had sent out the squadron. He was despatched a second time to that quarter; and, not long after his arrival, fell in with the French admiral, Du Casse, near St. Martha, on the Spanish coast. A skirmishing action commenced, and continued three or four days; but on the last, the other ships having fallen a-stern, left the admiral alone engaged with the French. In this situation, though a chain-shot had shat-

tered his leg, he would not be removed from the quarter deck, but continued fighting till the morning, when the French sheered off. The admiral made signal for his ships to follow, but his orders were not attended to; and he was thus obliged to return to Jamaica, where he caused the officers who had behaved so basely to be tried by a court-martial, and the most culpable suffered as they deserved. The heroic tar did not long survive this disappointment: it aggravated the effects of his wound, and he died on the 4th Nov. 1702.

BENCH, *v. & n.* } Sax. *benc*; Fr. *banc*; a
BENCHER. } mound, heap, any eminent
or rising place. See BANK. Any thing elevated
as a seat. Grown to mean a seat of justice, where
judges sit. It is also used to designate the per-
sons seated on a bench for the purpose of admin-
istering justice.

Those gentlemen of the inns of court are called
benchers, who have been readers; they being admitted
to plead within the bar are also called inner barristers.
The *benchers* being the seniors of the house,
are intrusted with its government and direction, and
out of them is a treasurer yearly chosen.

Blount. Chamber.

And in a little herber that I have,
That *benched* was on turves fresh igrave,
I bad men shouliden me my couche make.

Chaucer.

The seats and *benches* shone of ivory,
An hundred nymphs sat side by side about.

Spenser.

His cupbearer, whom I from meaner form
Have *benched*, and rear'd to worship. *Shakspeare.*
To pluck down justice from your awful bench;
To trip the course of law. *Id.*

Cyriac, whose grandsire on the royal bench
Of British Themis, with no mean applause,
Pronounced, and in his volumes taught our laws,
Which others at their bar so often wrench.

Milton.

All Rome is pleased when Statius will rehearse,
And longing crowds expect the promised verse;
His lofty numbers with so great a gust
They hear, and swallow with such eager lust:
But while the common suffrage crowned his cause,
And broke the *benches* with their loud applause,
His muse had starved, had not a piece unread,
And by a player bought, supplied her bread.

Dryden.

Fools to popular praise aspire
Of public speeches, which worse fools admire;
While from both *benches*, with redoubled sounds,
The' applause of lords and commoners abounds.

Id.

'Twas *benched* with turf, and goodly to be seen,
The thick young grass arose in fresher green.

I was taking a walk in the gardens of Lincoln's
Inn; a favour that is indulged me by several
benchers, who are grown old with me. *Tatler.*

BENCH, or BANC, in law. See BANK.

BENCH, AMICABLE. See AMICABLE BENCHES.

BENCH, FREE, signifies that estate in copy-
hold lands which the wife, being espoused a vir-
gin, has, after the decease of her husband, for
her dower, according to the custom of the manor.
As to this free bench, manors have various cus-
toms; and in those of East and West Enbourne,
in the county of Berks, and other parts of
England, there is a custom alluded to in the

Spectator, 614, 623, that when a copyhold
tenant dies, the widow shall have her free bench
in all the deceased husband's lands, whilst she
lives single and chaste; but if she is guilty of
incontinency, she shall forfeit her estate; never-
theless, upon her coming into the court of the
manor, riding on a black ram, and having his
tail in her hand, and at the same time repeating
a form of words prescribed, the steward is obliged,
by the custom of the manor, to re-admit her to
her free bench.

BENCH, KING'S, a court in which the king was
formerly accustomed to sit in person, on which
account it was moved with the king's household.
This was originally the only court in Westmin-
ster-hall, and from this it is thought, that the
courts of common pleas and exchequer were de-
rived. As the king in person is still presumed
in law to sit in this court, though only repre-
sented by his judges, it is said to have supreme
authority; and the proceedings in it are sup-
posed to be *coram nobis*, that is, before the king.
This court consists of a lord chief justice and
three other justices or judges, who are invested
with a sovereign jurisdiction over all matters
whether of a criminal or public nature. All
crimes against the public good, though they do
not injure any particular person, are under the
cognizance of this court; and no private subject
can suffer any unlawful violence or injury against
his person, liberty, or possessions, but a proper
remedy is afforded him here; not only for satisfac-
tion of damages sustained, but for the punishment
of the offender; and wherever this court meets with
an offence contrary to the first principles of jus-
tice, it may punish it. It frequently proceeds
on indictments found before other courts, and
removed by *certiorari* into this. Persons ille-
gally committed to prison, though by the king
and council, or either of the houses of parliament,
may be bailed in it; and in some cases even
upon legal commitments. Writs of *mandamus*
are issued by this court, for the restoring of
officers in corporations, &c. unjustly turned out,
and freemen wrongfully disfranchised. The
court of King's Bench is now divided into a
crown and plea side; the one determining crimi-
nal, and the other civil causes. On the crown
side, or crown office, it takes cognizance of all
criminal causes, from high treason down to the
most trivial misdemeanour or breach of the peace.
Into this court also indictments from all inferior
courts may be removed by writ of *certiorari*;
and tried either at bar, or at *nisi prius*, by a jury
of the county out of which the indictment is
brought. The judges of this court are the su-
preme coroners of the kingdom; and the court
itself is the principal court of criminal jurisdic-
tion known to the laws of England. For which
reason, by the coming of the court of King's
Bench into any county (as it was removed to
Oxford on account of the sickness in 1665), all
former commissions of oyer and terminer, and
general gaol-delivery, are at once absorbed and
determined *ipso facto*. Into the court of King's
Bench has reverted all that was good and salu-
tary of the star-chamber. On the plea side, this
court determines all personal actions commenced
by bill or writ; as actions of debt, upon the

case, detinue, trover, ejectment, trespass, waste, &c. against any person in the custody of the marshal of the court, as every person sued here is supposed to be by law.

BENCOOLEN, **BENCAULU**, or **FORT MARLBOROUGH**. The chief establishment of the East India Company, on the Island of Sumatra, on the south-west coast. Lat. $3^{\circ} 50' S.$, long. $102^{\circ} 3' E.$

The lands for this settlement were taken possession of, by treaty with the natives, so far back as 1685; and in 1698 this settlement had already cost the company £200,000. It was at this time very unhealthy. The foundations of Fort Marlborough were laid in 1714; but, in 1719, the settlers were expelled by the natives who, however, being more alarmed at the Dutch in the absence of the English, soon permitted the latter to resettle.

In 1760 the French, under Comte d'Estaing, destroyed the English settlements here. But they were quickly re-established; and three years after Fort Marlborough, which had hitherto been a subordinate of Fort George, or Madras, was formed into an independent presidency. The establishment, however, exceeding the revenue £90,000 per annum, and the settlement having become of little importance as a commercial establishment, since pepper could be more advantageously supplied from Prince of Wales' Island and Malabar; in August, 1801, the directors ordered it to be reduced to a residency, under the government of Bengal. One cargo of pepper of the value of £15,000 is all that is now sent annually from Bencoolen; and in 1810 the woollen goods exported in return, were valued only at £4276. In fact provisions and refreshments of all sorts are scarce and expensive here, and the trade is insignificant. The imports are opium, piece goods, and grain; and the chief exports pepper, other spices, and bullion.

BEN-COWSE, a fortified town of southern Algiers. The walls are of mud, and it is defended by a small garrison, with three or four pieces of cannon. In its vicinity are to be seen the remains of a considerable city, consisting of broken pillars, walls, and cisterns; here too, the inhabitants show the tombs of what they call the seven sleepers, whom they suppose to have been Mussulmans, and to have taken their final sleep here. It is about sixty-three miles south-west of Constantia.

BEND, *v. & n.* } Sax. *bendan*; Fr. *bander*;
BENDER, } as Skinner thinks from Lat.
BENT. } *pandure*. To make crooked;
 to crook; to inflect, or incline in a particular direction.

The rainbow compasseth the heavens with a glorious circle, and the hands of the Most High hath *bended* it. *Eccles.*

It never yet was *bent*, ne *bent* it now
 Albe the stroke so strong and puissant were,
 That seemed a marble pillour it could bow.

Spenser.

They *bend* their bows, they whirl their slings around:
 Heaps of spent arrows fall, and strew the ground:
 And helms, and shields, and rattling arms resound.

Dryden.

To that sweet region was our voyage *bent*,
 When winds, and every warring element,
 Disturb'd our course. *Id.*

Oetavius and Mark Antony
 Came down upon us with a mighty power,
Bending their expedition toward Philippi. *Shakspeare.*

Why dost thou *bend* thy eyes upon the earth,
 And start so often, when thou sitt'st alone? *Id.*

He is within, with two right reverend fathers,
 Divinely *bent* to meditation. *Id.*

I'm settled, and *bend* up
 Each corporeal agent to this terrible feat. *Id.*
 Your gracious eyes upon this labour *bend*.

Fairfax.
 Then, with a rushing sound, the' assembly *bend*
 Diverse their steps; the rival rout ascend
 The royal dome. *Pope.*

Men will not *bend* their wits to examine, whether
 things, wherewith they haue been accustomed, be
 good or evil. *Hooker.*

When he fell into the gout, he was no longer able
 to *bend* his mind or thoughts to any publick business. *Temple.*

As a fowler was *bending* his net, a blackbird asked
 him what he was doing? *L'Estrange.*
 To incline.

But when to mischief mortals *bend* their will,
 How soon they find fit instruments of ill! *Pope.*
 To **BEND THE BROW**. To knit the brow; to frown.

Some have been seen to bite their pen, scratch
 their head, *bend their brows*, bite their lips, beat the
 board, and tear their paper. *Camden.*

BEND, in heraldry, an honorable ordinary formed by diagonal lines drawn from the dexter, or right corner at top, to the sinister base, or left corner at bottom, which is supposed to represent a shoulder belt or scarf, and to show the wearer to be valiant in war. The content of the bend when charged is the third part of the field, but uncharged it contains only the fifth. The bend taken absolutely signifies the dexter-bend, as in fig. 1. Otherwise it is called a bend sinister, as in fig. 2. Bends are composed of either plain or crooked lines; engrailed, wavy, crenelle, flory, &c. as in fig. 4. the bend crenelle.

Fig. 1.

Fig. 2.

Fig. 3.

Fig. 4.

The bend has four different diminutives; namely, the bendlet, the garter, the cottice, and the ribbon. In-bend is when a charge is borne sloping from the dexter chief to the sinister base,

after the manner of a bend, as in fig. 3. a wyvern volant in-bend.

BEND EMIR, or **BUND EMEER**, called the Cyrus by ancient geographers, a river of Persia, which flows through the plain of Mendesht, and on entering the districts of Kurjan is divided into numerous artificial channels, for the purpose of irrigation. The portion which is not expended in this way, is received by the lake Baktegan.

BENDER, a town of Bessarabia, in European Turkey, seated on the river Dnieister, memorable for being the retreat of Charles XII. after he was defeated by the Russians at the battle of Pultowa, in 1709. In 1770 the Russians, under Panin, took Bender by storm, put the greater number of the inhabitants to the sword, and reduced the town to ashes. It was given back, however, at the peace of Kaynardgi. Prior to this siege, Bender contained 30,000 inhabitants, of whom one-half were soldiers. The Russians got possession of it a second time, on the 15th November, 1789, almost without firing a shot; and, although it was restored at the peace of Jassy, they again made themselves masters of it in the last war, and retained it at the peace of 1812. 100 miles east of Jassy, and 100 west of Oczakov. Long. 29° 36' E., lat. 46° 50' 32" N.

BENDIDIA, in antiquity, *Βενδιδα*, festivals, not unlike the Bacchanalia, celebrated by the Athenians in honor of Diana.

BENDING, in a general sense, the reducing a straight body into a curve, or giving it a crooked form. The bending of timber boards, &c. is effected by means of heat, whereby their fibres are so relaxed that you may bend them into any figure.

BENDING, in the sea-language, the tying two ropes or cables together: thus they say, bend the cable, that is, make it fast to the ring of the anchor; bend the sail, make it fast to the yard.

BENDLETS, in heraldry, one of the diminutives of the bend, which is in size half the breadth of the bend. Bendlets are sometimes borne in an unusual manner, called *enhanced*, i. e. lifted up to a place in which they are not usually borne, as three bendlets, *gules*.

BENDS, in a ship, the same with what is called wails or wales: the outmost timbers of a ship's side, on which men set their feet in climbing up. They are reckoned from the water, and are called first, second, or third bend. They are the chief strength of a ship's sides; and have the beams, knees, and foot-hooks bolted to them.

BENDY, in heraldry, or bendwise; an epithet for a thing that is divided four, six, or more parts drawn sloping like a bend, as in the annexed figure, bendy wavy. The general custom of England is to make an even number; but in other countries this is not regarded.

BENEAPED. A ship is said to be beneaped, when the water does not flow high enough to

bring her off the ground, over a bar, or out of a dock.

BENE'ATH. Sax. *beneoð*; Dut. *beneden*. The imperative of to be, compounded with neath, according to Mr. Tooke. Below, lower. Sometimes used in the Bible for the place of future punishment.

And he seide to hem, ye ben of *byneth*, I am of above: ye ben of this world, I am not of this world.

Wiclif. Jon. cap. viii.

Our country sinks *beneath* the yoke;
It weeps, it bleeds, and each new day a gash
Is added to her wounds. *Shakspeare.*

I destroyed the Amorite before them; I destroyed his fruits from above, and his roots from *beneath*.

Amos.

Any thing that is in heaven above, or that is in the earth *beneath*. *Exodus.*

Their woolly fleeces, as the rites required,
He laid *beneath* him, and to rest retired. *Dryden.*

And oft on rocks their tender wings they tear,
And sink *beneath* the burdens which they bear. *Id.*

Ages to come might Ormond's picture know;
And palms for thee *beneath* his laurels grow.

Prior.

We have reason to be persuaded, that there are far more species of creatures above us, than there are *beneath*. *Locke.*

He will do nothing that is *beneath* his high station, nor omit doing any thing which becomes it.

Atterbury.

Beneath his feet pale Envy bites her chain,
And snaky Discord whets her sting in vein.

Beaumont.

Thy reliques, Rowe, to this fair urn we trust
And sacred, place by Dryden's awful dust:
Beneath a rude and nameless stone he lies,
To which thy tomb shall guide enquiring eyes.

Pope. Epitaph on Mr. Rowe.

BENEDEK, a market town of Transylvania, in the county of Lower Weissenburg, not far from the borders of Hungary, with Hungarian and Walachian inhabitants, and a Protestant church.

BENEDETTO, (St.) or **BENDITTO**, a considerable town of Italy, in the Mantuan, seated on the Po; famous before the revolution for the richest and finest convent in all Italy. The celebrated countess Mathilda died and was buried in it.

BENEDICT, } Lat. *benedicere*, *benedic'tion*, } *dictum*. Having mild and
BENEDICTIONARY. } salubrious qualities. An old physical term. It is now applied to wishing well or imploring benefits; also for thanks.

It is not a small thing won in physick, if you can make rhubarb, and other medicines that are *benedict*, as strong purges as those that are not without some malignity. *Bacon.*

A sovereign shame so bows him; his unkindness,
That stript her from his *benediction*, turn'd her
To foreign casualties, gave her dear rights
To his dog-hearted daughters. *Shakspeare.*

From him will raise
A mighty nation; and upon him shower
My *benediction* so, that in his seed,
All nations shall be blest. *Milton.*

Could he less expect
Than glory and *benediction*, that is, thanks? *Id.*

Prosperity is the blessing of the Old Testament; adversity is the blessing of the new; which carrieth the greater *benediction*, and the clearer revelation of God's favour. *Bacon.*

Ridley observes, there is not the least mention of any saint whose name corresponds with this, either in the Roman Calendar, the service in Usum Sarum, or in the *benedictionary* of Bishop Athelwold.

Gammer Gurton's Needle, act iv. sc. 1. Note.

Such ingenious and industrious persons are delighted in searching out natural rarities; reflecting upon the Creator of them his due praises and *benedictions*. *Ray.*

BENEDICITE, among ecclesiastical writers, an appellation given to the song of the three children in the fiery furnace, on account of its beginning with the word *benedicite*. The use of this song in christian worship is very ancient, it appearing to have been sung in all the churches, as early as St. Chrysostom's time.

BENEDICT, abbot of Peterborough, was educated at Oxford, became a monk in the monastery of Christ Church in Canterbury, and some time after was chosen prior. Though he had been a great admirer of Becket, and wrote a life of him, he was so much esteemed by Henry II. that by the influence of that prince he was elected abbot of Peterborough, A. D. 1177. He assisted at the coronation of Richard I. A. D. 1189; and was advanced to be keeper of the great seal A. D. 1191. But he did not long enjoy this high dignity, as he died A. D. 1193. He also wrote a History of Henry II. and Richard I. from A. D. 1170, to A. D. 1192: which has been much and justly esteemed by our greatest antiquaries, as containing one of the best accounts of the transactions of those times. A beautiful edition of this work was published at Oxford, in two volumes, by Mr. Hearne, A. D. 1735.

BENEDICT (St.) the founder of the order of the Benedictine monks, was born in Italy about A. D. 480. He was sent to Rome when very young, and there received the first part of his education. At fourteen he was removed from thence to Subiaco, about forty miles distant. Here he lived a most ascetic life, and shut himself up in a cavern, where nobody knew any thing of him except St. Romanus, who, we are told, used to descend to him by a rope, and to supply him with provisions. Being afterwards discovered by the monks of a neighbouring monastery, they chose him their abbot. Their manners, however, not agreeing with his, he returned to his solitude; whither many persons followed him, and put themselves under his direction, so that in a short time he built twelve monasteries. In 528, or 529, he retired to mount Cassino, where idolatry was still prevalent, there being a temple of Apollo erected on it. He instructed the people in the adjacent country, and having converted them, broke the image of Apollo, and built two chapels on the mountain. Here he founded a monastery, and instituted the order of his name, which in time became so famous. Here too he composed his *Regula Monachorum*, which Gregory the Great mentions as the most sensible and best written piece of that kind ever published. The time of his death is uncertain,

but is placed between 540 and 550. He was looked upon as the Elisha of his time; and is reported to have wrought a great number of miracles, which are recorded in the second book of the dialogues of St. Gregory.

BENEDICT XIII. (Vincenzo Maria Orsini), was the eldest son of the duke of Gravina, a nobleman of Naples. In 1672 he was raised by family influence to the dignity of cardinal, but it was with difficulty that he could be made to accept of the pontificate. With a view to reform his court he held a provincial synod in the Lateran in 1725, but was defeated by the Jesuits. He also is said to have expressed a wish for the diffusion of scriptural knowledge, and encouraged the distribution of the Bible in modern languages. Another great object with him was, if possible, to unite the four religious communities of Christendom, and he proposed, that four councils should be held in different places, consisting of representatives of the Romish, Greek, Lutheran, and Calvinistic churches. This scheme failed; but the purity of his intention seems undeniable. Benedict lived with the utmost frugality, and has been called more a monk than a pope. His great fault was his implicit confidence in cardinal Coscia, to whom he left the entire management of his government, and who much abused it. He died February 1731, in the sixth year of his pontificate. His works were published in 1728, in three volumes folio, under the title of *Opere di Benedetto XIII.*

BENEDICT XIV. (Pope), Prosper Lambertini of Bologna, was also celebrated for his learning and moderation, which gained him the esteem of all sensible Protestants. He was the patron of learned men and celebrated artists; and an elaborate writer on theological subjects. His works make twelve vols. in folio. He died in 1758.

BENEDICTINS, in church history, an order of monks, who profess to follow the rules of St. Benedict. The Benedictins, being those only that are properly called monks, wear a loose black gown, with large wide sleeves, and a capuche, or cowl, on their heads, ending in a point behind. In the canon law, they are styled black friars, from the color of their habit. The time when this order came into England is well known; for to it the English are said to owe their conversion from idolatry. In 596 Pope Gregory sent hither Augustin, prior of the monastery of St. Andrew at Rome, with several other Benedictine monks. St. Augustin became archbishop of Canterbury; and the Benedictins founded several monasteries in England, as also the metropolitan church of Canterbury, and all the cathedrals that were afterwards erected. Pope John XXII. who died in 1354, after an exact enquiry, found that since the first rise of the order, there had been of it twenty-four popes, near 200 cardinals, 7000 archbishops, 15,000 bishops, 15,000 abbots of renown, above 4000 saints, and upwards of 37,000 monasteries. There have been likewise of this order twenty emperors and ten empresses, forty-seven kings, and above fifty queens, twenty sons of emperors, and forty-eight sons of kings; about 100 princesses, daughters of kings and emperors; besides dukes, marquesses, earls, countesses, &c.

innumerable. The order has produced a vast number of eminent authors and other learned men. Their Rabanus set up the school of Germany. Their Alcuin founded the university of Paris. Their Dionysius Exiguus perfected the ecclesiastical computation. Their Guido invented the scale of music; and their Sylvester the organ. They boast to have produced Anselmus, Ildephonsus, Venerable Bede, &c. There are nuns likewise who follow the order of St. Benedict; among whom those who call themselves mitigated, eat flesh three times a week, on Sundays, Tuesdays, and Thursdays: the others observe the rule of St. Benedict in its rigor, and eat no flesh unless they are sick.

BENEDICTION, in the modern Romish church, is used, in a more particular manner, to denote the sign of the cross made by a bishop, or prelate, as conferring some grace on the people. The custom of receiving benediction by bowing the head before the bishops, is very ancient; and was so universal that emperors themselves did not decline it. Under the name benediction the Hebrews also frequently understand the presents which friends make one to another, in all probability because they are generally attended with blessing, and compliments, both from those who give and those who receive them.

BENEDICTION is also used for an ecclesiastical ceremony, whereby a thing is rendered sacred or venerable. In this sense benediction differs from consecration, as in the latter unction is applied, which is not in the former; thus, the chalice is consecrated, and the pix blessed; as the former, not the latter, is anointed; though, in common usage, these two words are applied promiscuously. The spirit of superstition has introduced into the Romish church benedictions for almost every thing. We read of forms of benedictions for wax candles, for boughs, for ashes, for church vessels, and ornaments; for flags or ensigns, arms, first-fruits, houses, ships, pascal eggs, cilicium, or the hair cloth of penitents, church-yards, &c. In general, these benedictions are performed by aspersions of holy water, signs of the cross, and prayer suitable to the nature of the ceremony. The forms of these benedictions are found in the Roman pontifical, in the Roman missal, in the book of ecclesiastical ceremonies printed in pope Leo X's time, and in the rituals and ceremonies of the different churches, which are found collected in father Martene's work on the Rites and Discipline of the Church.

BENEDICTION, BEATIC, benedictio beatica; is the viaticum given to dying persons. The pope too begins all his bulls with this form: Salutem et apostolicum benedictionem.

BENEDICTION, NUPtIAL, the external ceremony performed by the priest in the office of matrimony. This is also called sacerdotal and matrimonial benediction, by the Greeks *ιερολογία* and *εορτηλεια*. The nuptial benediction is not essential to, but the confirmation of, a marriage in the civil law.

BENEDICTIONALIS LIBER, an ancient church book, containing the forms of the divers sorts of benedictions given by bishops, priests, &c.

BENEFACTION, } Lat. *benefacio*. The
BENEFACtor, } act of conferring a bene-
BENEFACtress. } fit, or the benefit con-
ferred: which is the more usual sense.

Then swell with pride, and must be titled gods,
Great benefactors of mankind, deliverers,
Worshipped with temple, priest, and sacrifice.

Milton.

From that preface he took his hint, though he had
the baseness not to acknowledge his benefactor.

Dryden.

I cannot but look upon the writer as my benefactor,
if he conveys to me an improvement of my under-
standing.

Addison.

Whoever makes ill returns to his benefactor, must
needs be a common enemy to mankind.

Swift.

One part of the benefactions, was the expression of
a generous and grateful mind.

Atterbury.

BENEFICE,

BENEFICED,

BENEFICENCE,

BENEFIT,

BENEFICELESS,

BENEFICIAL, *n. & adj.*

BENEFICIALLY,

BENEFICIALNESS,

BENEFICIARY,

BENEFICENCY.

Beneficence. Lat.
*benefacio, benefici-
ens, beneficentia, be-
nefice, beneficium*. In
feudal times benefice
was applied to the
gratuitous donations
of estates; to things
given for the benefit
of the church. Be-
neficence is benevolence,
good will, kind wishes
in operation and endeavour.

And of the priest eftsnoons 'gan to enquire,
How to a benefice he might aspire.

Spenser.

Much to himself he thought, but little spoke,

And, undeprived, his benefice forsook.

Dryden.

The duke of Parma was tempted by no less promise,
than to be made a feudatory, or *beneficiary*
king of England, under the seignory in chief of the
pope.

Bacon.

The usual rate between the *beneficed* man and the
religious person, was one moiety of the benefice.

Ayliffe.

A benefice is either said to be a benefice with the
cure of souls, or otherwise. In the first case, if it
be annexed to another benefice, the *beneficiary* is
obliged to serve the parish church in his own proper
person.

Id.

You could not extend your *beneficence* to so many
persons; yet you have lost as few days as Aurelius.

Dryden.

Love and charity extends our *beneficence* to the
miseries of our brethren.

Rogers.

Such a creature could not have his origination from
any less than the most wise and *beneficent* Being, the
great God.

Hale.

But Phœbus, thou, to man *beneficent*,

Delight'st in building cities.

Prior.

Not any thing is made to be *beneficial* to him, but
all things for him, to shew beneficence and grace in
them.

Hooker.

This supposition grants the opinion to conduce to
order in the world, consequently to be very *beneficial*
to mankind.

Tillotson.

The war, which would have been most *beneficial*
to us, and destructive to the enemy, was neglected.

Swift.

Are the present revolutions in circular orbs more
beneficial than the other would be?

Bentley.

BENEFICE, in authors of the middle age, is
used for a fee, sometimes denominated more
peculiarly *beneficium militare*. In this sense,
benefice was an estate in land, at first granted
for life only; so called, because held *ex inero*

beneficio of the donor; and the tenants were bound to swear fealty to the lord, and to serve him in the wars. In after-times, as these tenures became perpetual and hereditary, they left their name of beneficia to the livings of the clergy; and retained to themselves the name of feuds.

BENEFICE, in an ecclesiastical sense, is a church endowed with a revenue for the performance of divine service; or the revenue itself assigned to an ecclesiastical person, by way of stipend, for the service he is to do that church. All church preferments, except bishoprics, are called benefices; and all benefices are, by the canonists, sometimes styled dignities: but we now ordinarily distinguish between benefice and dignity; applying dignity to bishoprics, deaneries, archdeaconries, and prebendaries; and benefice to patronages, vicarages, and donatives. Benefices are divided by the canonists into simple and sacerdotal. In the first there is no obligation but to read prayers, sing, &c.; such are canonries, chaplainships, chantries, &c.: the second are charged with the cure of souls, or the direction and guidance of consciences; such as vicarages, rectories, &c. The Romanists again distinguish benefices into regular and secular.

BENEFICE IN COMMENDAM is that, the direction and management of which, upon a vacancy, is given or recommended to an ecclesiastic, for a certain time, till he may be conveniently provided for.

BENEFICES, REGULAR, or titular, in the Romish church, are those held by a religious, or a regular who has made profession of some religious order; such are abbeyes, priories, conventuals, &c.; or rather, a regular benefice is that which cannot be conferred on any but a religious, either by its foundation, by the institution of some superior, or by prescription; for prescription, forty years possession by a religious makes the benefice regular.

BENEFICES, SECULAR, are only such as are to be given to secular priests, i. e. to such as live in the world, and are not engaged in any monastic order. All benefices are reputed secular, till the contrary is made to appear. They are called secular benefices, because held by seculars; of which kind are almost all cures.

BENEFICES, VACATING. The canonists divide three manners of vacating a benefice, viz. 1. De jure, when the person enjoying it is guilty of certain crimes expressed in those laws, as heresy, simony, &c. 2. De facto, as well as de jure, by the natural death or the resignation of the incumbent; which resignation may be either express, or tacit, as when he engages in a state, &c., inconsistent with it, as, among the Romanists, by marrying, entering into a religious order, or the like. 3. By the sentence of a judge, by way of punishment for certain crimes, as concubinage, perjury, &c.

BENEFICIARIUM, in Roman antiquity, denoted, 1. Soldiers who attended the chief officers of the army, being exempted from other duty. 2. Soldiers discharged from the military service or duty, and provided with beneficia to subsist on. These were probably the same with the former, and both might be comprised in the

same definition. They were old experienced soldiers, who having served out their legal time, or received a discharge as a particular mark of honor, were invited again to the service, where they were held in great esteem, exempted from all military drudgery, and appointed to guard the standard, &c. These, when thus recalled to service, were also denominated *evocati*; before their recal, *emeriti*. 3. Soldiers raised to a higher rank by the favor of the tribunes or other magistrates. *Beneficiarius* frequently occurs in the Roman inscriptions found in Britain, where *consulis* is always joined with it; but besides *beneficiarius consulis*, we find in Gruter *beneficiarius tribuni*, *pratorii*, *legati*, *præfecti*, *proconsulis*, &c.

BENEFICIARY, *beneficiarius*, is particularly used for a beneficed person, or one who receives and enjoys one or more benefices. A beneficiary is not the proprietor of the revenues of his church; he has only the administration of them, though unaccountable for the same to any but God.

BENEFICIARY is also used, in middle age writers, for a feudatory or vassal. The denomination was also given to the clerks or officers who kept the accounts of the benefice, and made the writings necessary thereto.

BENEFICIO PRIMO ECCLESIASTICO HABENDO, a writ directed to the lord chancellor, &c. by the king, to bestow the benefice that shall first fall, in the king's gift, on this, or that man.

BENEFICIUM, in military matters, among the Romans, denoted a promotion to a higher rank by the favor of some person in authority.

BENEFIELD (Sebastian), an eminent divine of the seventeenth century, born in 1559, at Prestonbury in Gloucestershire, and educated at Oxford. In 1608 he took the degree of D. D. and five years after was chosen Margaret professor in that university. He had been presented several years before to the rectory of Meysey-Hampton, in Gloucestershire. He published commentaries on the first, second, and third chapters of Amos; a considerable number of sermons, and some Latin treatises. He died in 1630.

BEN'EFIT, *v. n.* See **BENEFICENCE**. A kindness; a favor conferred; an act of love.

Bless the Lord, O my soul, and forget not all his *benefits*. *Psalms.*

The creature abateth his strength for the *benefit* of such as put their trust in thee? *Wisdom.*

When noble *benefits* shall prove
Not well disposed, the mind grown once corrupt,
They turn to vicious forms. *Shakspeare.*

What course I mean to hold,
Shall nothing *benefit* your knowledge. *Id.*

Offer'd life
Neglect not, and the *benefit* embrace
By faith, not void of works. *Milton.*

To tell you, therefore, what I have *benefited* herein,
among old renowned authors, I shall spare. *Id.*

He was so far from *benefiting* trade, that he did it a great injury, and brought Rome in danger of a famine. *Arbutnot.*

BEN'EMPT, *adj.* See **NEMPT**. Named; marked out: an obsolete word.

Much greater gifts for guerdon thou shalt gain,
Than kid or cosset, which I thee *benempt*;
Then up, I say. *Spenser.*

BENENAIM, **BENENATH**, **BENENASCH**, or **BENENAT**, in astronomy, the outermost star of the second magnitude, in the tail of *ursa major*. It is also called *alioth*.

BENEPLACITO, in music-books, signifies, if you please; or if you will.

BENERTH, a feudal service formerly rendered by the tenant to his lord, with his plough and cart.

BENESOEUF, a town of Egypt, seated on the western shore of the Nile, and remarkable for its hemp and flax.

To **BE'NET**, *v. a.*, from net; to ensnare; to surround as with toils.

Being thus *benetted* round with villains,

Ere I could mark the prologue, to my bane

They had begun the play. *Shakspeare.*

BENEVENTO, a duchy of Italy, in the kingdom of Naples, with an archbishop's see; it is situated near the confluence of the rivers Sabato and Calore, in a fertile valley called the strait of Benevento. It was once a more considerable territory, but now consists only of the city of Benevento, and a small surrounding district of about eleven square miles; comprising that city and seven villages and hamlets, with a population of about 24,000 individuals. It is a fertile tract, producing excellent wine and fruit, besides feeding numbers of cattle, and yielding some corn; it has also many excellent springs. This district was first erected into a duchy by the Lombards in 571. The successor of its first prince, Zotto, conquered a great part of the country, which now constitutes the kingdom of Naples: after this it passed into the hands of the Saracens and Normans. The modern duchy of Benevento, however, long maintained its independence, and was, in the eleventh century, granted to the Holy See by the emperor Henry II. in exchange for some jurisdictions he possessed at Bamberg. From that time it may be said to have remained in possession of the church; for though there has scarcely been a sovereign of Naples who has not seized it in the course of his reign, it has always returned to the original possessor. Buonaparte availed himself of the disputes between the Neapolitan and Papal powers, to seize upon this duchy, which he conferred on his minister Talleyrand, whom he created duke of Benevento. The Beneventine duchy acknowledged this new master for about ten years; when its annual revenue was about 14,000 ducats, or £2300.

BENEVENTO, the capital of the above duchy, is situated on a steep declivity, at the point of a hill, between two narrow valleys; the one watered by the Sabato, and the other by the Calore, which unite into one stream below the town. This city in general is well built; but several of the most populous streets are narrow, and some of them so steep as to be impassable for carriages. It contains about 18,000 inhabitants. Few places except Rome can boast of more antiquities. Its origin seems to be hid in obscurity; but there is no doubt that it was one of the principal towns of the Samnites. See **BENEVENTUM**.

The arch of Trajan, now called the *Porta Aurea*, forms one of the entrances to the city.

This arch, though it appears to great disadvantage from the walls and houses that enclose it on both sides, is in tolerable preservation, and one of the most magnificent remains of Roman grandeur. The architecture and sculpture are both singularly beautiful. This elegant monument was erected A.D. 114, about the commencement of the Parthian war, and after the submission of Decebalus had entitled Trajan to the surname of *Dacicus*. The order is Composite, the materials white marble, the height sixty palms, length thirty-seven and a half, and depth twenty-four. It consists of a single arch, the span of which is twenty palms, the height thirty-five. On each side of it, two fluted columns, upon a joint pedestal, support an entablature and an attic. The intercolumniations and frieze are covered with basso-relievos, representing the battles and triumph of the Dacian war. In the attic is the inscription. As the sixth year of Trajan's consulate, marked on this arch, is also to be seen on all the military columns he erected along his new road to Brundisium, it is probable that the arch was built to commemorate so beneficial an undertaking. The whole upper division, representing the apotheosis of the emperor, nearly approaches to the perfection of the finest Grecian bas reliefs. Benevento also possesses the remains of several other excellent pieces of sculpture, and those of a Roman amphitheatre. Scarce a wall is built of any thing but altars, tombs, columns, and remains of Roman architecture. The cathedral is a Saracenic edifice, dedicated to the Virgin Mary. It was built in the sixth century, enlarged in the eleventh, and altered considerably in the thirteenth, when archbishop Roger adorned it with a new front. To obtain a sufficient quantity of marble for this purpose, he spared neither sarcophagus, altar, nor inscription; but fixed them promiscuously and irregularly in the walls of his barbarous structure. Three doors (a type of the trinity, according to the rules established by the mystical Vitruvii of those ages), open into this façade. That in the centre is of bronze, embossed with the life of Christ, and the effigies of the Beneventine Metropolitan, with all his suffragan bishops. Near one of the town gates an ancient monastery presents a good specimen of the style which prevailed during the early period of the lower Greek empire. The castle is said to have been built in the year 1323. This town has often suffered greatly by earthquakes. In 1688 it was almost destroyed by one; and the archbishop, afterwards pope Benedict XIII., was dug alive out of the ruins, having been preserved by an incurved beam that fell over him. On his promotion to the papal chair he rebuilt the city. It was afterwards greatly damaged by another earthquake in 1703. It has given birth to three popes.

BENEVENTUM, a town of the Samnites, formerly called *Maleventum* from the unwholesomeness of the wind, and under that appellation mentioned by Livy; but after a Roman colony was led thither, A.U.C. 485, it came to have the name of Beneventum, as a more auspicious title. It is mentioned by Horace as an ancient city, said to have been built by Diomedes, before,

the Trojan war. Near it, on the Appian way, stood the city of Caudium, at the narrow pass near which (the Furca Caudinæ) the Samnites obliged two Roman armies to pass under the yoke, in the year of the city 433. About fifty years afterwards, Pyrrhus was defeated in the same neighbourhood by the Consul Curius Dentatus. Here also the brutal Charles of Anjou, king of Naples, triumphed over his rival Manfred in 1266.

BENEVOLENCE, } *Benevolentia*, Latin,
BENEVOLENT, } from *bene* and *volens*,
BENEVOLENTLY, } well-willing; friendly;
BENEVOLOUS. } kind; gracious; fa-
vorable; benevolence; a good-will.

Grasp the whole worlds of reason, life, and sense,
In one close system of *benevolence*. *Pope*.

Thou good old man, *benevolent* as wise. *Id.*

Nature all

Is blooming and *benevolent* like thee. *Thomson.*

A *benevolent* inclination is implanted into the very frame and temper of our church's constitution.

Fuller. Moderation of the Church of England, p. 509.

It is the *benevolent* passions only, which can exert themselves without any regard or attention to propriety, and yet retain something about them that is engaging. *Smith. Moral Sentiments.*

BENEVOLENTIA REGIS HABENDO, a form in ancient fines, to purchase the king's favor, in order to be restored to estate, title or place.

BENFELD, or BENFIELD, a town of France, in the department of the Lower Rhine, the cidevant Alsace, seated on the Ille, fifteen miles south-west of Strasburg. Its fortifications were demolished in consequence of the treaty of Westphalia.

B E N G A L.

BENGAL, a large province of Hindostan, lying between the twenty-first and twenty-seventh degrees of north latitude. It is bounded on the north by Nepaul and Bootan; on the south by the bay of Bengal; on the east by the Burmese territories; and on the west by Bahar. Its length may be estimated at 350 miles, and its average breadth at 300. The northern frontier is guarded by a broad belt of low land, covered by impenetrable woods; beyond this rise the bold mountains of Hindostan. On the south, it is protected by the forests and shallows of the coast, the outlets of the Ganges, and the difficult access to its only port; while on the west, where alone an enemy is to be apprehended, the natural frontier is strong, and the contiguous region sterile and thinly inhabited. The river Ganges flows along Bengal in a south-easterly direction, separating the whole country into two territorial divisions, of which, in case of invasion, the eastern tract would present an asylum to the inhabitants.

Abul Fazel in 1582 describes the province as follows:—"The soubah of Bengal is situated in the second climate. From Chittagong to Kurhee is 400 coss difference of longitude; and from the northern range of mountains to the southern extremity of Sircar Madarun (Birbhoom) comprehends 200 coss of latitude. When Orissa was added to Bengal, the additional length was computed to be forty-three coss, and the breadth twenty coss. Bengal was originally called Beng. The soubah of Bengal consists of twenty-four sircars, and 787 mahals. The revenue is 1,49,61,482 sicca rupees; and the zemindars, who are mostly koits, furnish 23,330 cavalry, 801,158 infantry, 170 elephants, 4260 cannon, and 4400 boats."

At the period when the institutes of Acber were compiled, the government of Bengal extended to Cuttack, and along the Mahanuddy River, Orissa not being then formed into a distinct soubah, as appears from the arrangement of the twenty-four sircars immediately following, of which the last five are in Orissa.

1. Oudumbher, or Tandch; 2. Jennctabad;

3. Futtehabad; 4. Mahmoodabad; 5. Khalife-tabad; 6. Bokla; 7. Purmeah; 8. Taugepoor; 9. Ghoraghaut; 10. Pinjerah; 11. Barbuckabad; 12. Bzoooha; 13. Soonargong; 14. Silhet; 15. Chatgong; 16. Shereefabad; 17. Solimabad; 18. Satgong; 19. Madarun; 20. Jellasilr; 21. Buddruck; 22. Cuttak; 23. Kullangdunpaut; 24. Raje Mahindra.'

Anterior to the cessions made by the Nabob of Oude, in 1801, the regions immediately governed by the Calcutta presidency, comprehended the entire soubahs of Bengal and Bahar, part of the soubahs of Allahabad, Orissa, and Berar, and some tracts of country which had maintained their independence during the most flourishing period of the Mogul empire, consisting of part of the Morung, Cooch Bahar, and other districts, which have become tributary since the English became possessors of Bengal.

The greater part of the country forms one vast alluvial plain, descending imperceptibly to the sea, and annually covered by the inundations of the Ganges. Beng, the ancient name of this level region, is supposed to have been the origin of the present name of the province, while the higher lands, above the limit of the inundation, were called Varendra, or Barendra. Châti-gâng, or Chittagong, Silhet, and Bêrb'hûm, are the only parts of the province which can be called mountainous, and they scarcely deserve the name.

The rivers, besides those gigantic streams, the Ganges, the Brahma-putra, and Megna, are the Rûp-narâin, Dâmôdâ, Têstâ, Cûram, Corotoyâ, Mânas, Côsî, and Cónki. The J'hils, called lakes, are rather morasses, or inundated valleys, than lakes; but are generally navigable for boats in the wet seasons. To check as much as possible the force of the inundation, embankments are indispensable, and the sum allowed by government for their maintenance, amounted in 1815 to 247,457 rupees, or £30,932. 2s. 6d. sterling.

The periodical winds prevalent in the Bay of Bengal, extend their influence over the entire level, until diverted by chains of mountains.

These that prevail over that part of the country facing the head of the bay, are north and south; the former of which blows during the cold season, the latter during the hot. The period of their change, however, seems earlier on the eastern side of the Delta, than on the western; and, in this respect, corresponds with a difference observed in the periodical winds on the respective shores of the bay. In Bahar and Assam, the most common winds are east and west, also corresponding with the changes of seasons. In the month of April, and in the south-east quarter rather earlier, there are frequent storms of thunder and lightning, attended by heavy squalls from the north-west, which happen at the close of the day; and during this period great caution is necessary in navigating the large rivers. In the beginning of June, the periodical rains commence, and commonly last till the middle of September, when they are succeeded by an excessive heat, which, however, gradually diminishes as the year advances. If the rains break up early in September, the heat becomes almost intolerable, and is attended with a great sickness and mortality, especially among Europeans.

Although, properly speaking, there are but three seasons in the year, viz. the cold, hot, and rainy, the inhabitants commonly assign six, each continuing two months. The spring and dry seasons occupy four months, during which the heat progressively increases, till it becomes almost insupportable, even to the natives; the sun's beams are too powerful for the eyes at noon-day, and the large stars, as Venus and Jupiter, shine with surprising lustre. Mild showers in the east districts, and the thunder-storms called north-westerns in the middle, nevertheless, cool and refresh the atmosphere, and the scorched inhabitants are at length relieved by the rainy season, during the first two months of which the rains are heavy and almost unremitting; an interval of many successive days is rare. In the two subsequent months, the intervals are more frequent, and of longer duration, and the climate becomes more sultry. The rivers, and especially the Ganges, which begins to rise before the commencement of the rainy season, in the third month reach their greatest height, and the Delta becomes overflowed. A striking scene now presents itself: large sheets of water, with ears of rice floating on the surface, stupendous mounds and dykes, at intervals checking the progress of the inundation, and navigation over fields submerged to a considerable depth, and peasants embarked on rafts, with their families and cattle, repairing to market, or to the higher grounds, present an association of objects, which are novel and interesting in the highest degree to a stranger.

At the approach of winter the rivers decrease, the showers cease to fall, and the inundation drains off; after which, as the cold season comes on, fogs and heavy dews produce an almost continued dampness, which, combined with the effects of a tropical sun, is injurious to the health of Europeans, and annually carries off great numbers of our fellow-countrymen. Frost and extreme cold are experienced in the higher latitudes, and even in the flat country ice is obtained

by the simple process of assisting evaporation in porous vessels, although the atmosphere is much warmer than the freezing temperature.

The original soil of Bengal appears to be clay mixed with a considerable portion of silicious sand, fertilised by various salts, together with decayed vegetable and animal substances. These form a compost highly productive, which, combined with moisture, and the heat of the climate, accounts for a luxuriance and rapidity of vegetation almost unparalleled. In the flat country sand alone forms the general basis of the succeeding strata of superincumbent earth and a period of thirty years is scarcely sufficient for covering it with soil sufficient to reward the labors of the husbandman. Beneath the annual inundations however fertilisation is extremely rapid, owing to the rich deposits, and the dissolution of the clay.

The assemblage of peasants in their villages, their small farms, and their want of enclosures, present an insurmountable barrier to all great improvements in husbandry; but in a country subject to the incursions of pirates and banditti, called Dacoits, together with the ferocious ravages of tigers, and other wild beasts, solitary dwellings would be insecure.

In Bengal and Bahar, not more than one-third of the land is tilled, exclusive of lays and fallows; being little more than one acre of cultivated land to every inhabitant. Labor is, nevertheless, extremely cheap; in some districts not more than a penny or two-pence per day for a man; but fuel, herbs, and fruit cost nothing; the wife spins and weaves cotton, to clothe herself and husband; and the children run about naked. Near the sea, rice, further up wheat and barley, in the middle districts the mulberry, and in the northern and western divisions the poppy, are primary objects of cultivation. Rice is the species of grain most extensively cultivated, and is almost infinitely varied, from the periods and situations in which it is grown. The best is that gathered in at the beginning of the winter. The wild plant sows itself about that time, and vegetates with early moisture at the approach of the rains, during the continuance of which it ripens, and drops its seed as before. Wheat and barley are sown at the commencement of the cold season, and reaped in the spring. A great variety of pulse is sown or reaped in the winter. Maize is cultivated mostly in the western districts, where the soil is poor, and the surface hilly. Mustard, linseed, sesamum, and palma Christi, are extensively cultivated for the sake of the oils extracted from them, which, as well as that expressed from the cocoa-nut, have a vast consumption. Tobacco, cotton, indigo, together with the mulberry and poppy, require land peculiarly appropriated to them; and of indigo, newly cleaned ground produces the largest crops. The Bengalese plough is peculiarly defective: the share, having neither width nor depth to stir a new soil, can only scratch the surface of what has often been turned before. This deficiency the natives endeavour to supply by ploughing the land several times over; a second ploughing crosses the first, and a third is sometimes given diagonally to the preceding. These, frequently repeated, and followed by a branch of a tree, or some other substitute

for a harrow, pulverise the soil, and sweeten it for the reception of the seed. The field, after it has been sown, must be watched for several days, to defend it from the depredations of numerous flocks of birds by day, and of large bats by night; the same care is also necessary with fields of maize and millet, when the harvest approaches maturity, particularly in regions that are much infested with wild boars, elephants, buffaloes, and deer. For this purpose a bamboo stage is erected, similar to those used in Arabia, and represented in Niebuhr's plates. On these watchmen are placed, to scare away the rapacious intruders. Every harvest in Bengal is reaped by the sickle, the scythe being unknown. The practice of stacking corn, to be preserved for seed, is unusual; the corn is trodden out by cattle, after which it is winnowed by the wind, and stored in jars of unbaked earth, or in baskets made of large twigs, which are deposited in circular huts, raised one or two feet above the surface of the ground. The rotation of crops, which engrosses so much attention among the enlightened cultivators of Europe, is not understood in India, and a course of husbandry, extending beyond the year, was never dreamed of by a Bengalee farmer. The tanks, or reservoirs, and embankments, for the management of forced rice by irrigation, are in so miserable a state of decay, as to become public nuisances, by the pestilential vapors which they exhale. Manure is never employed, except in the growth of mulberry, tobacco, poppy, sugar, and some other articles. The land, though permitted a lay, never lies fallow. In short, a worse system of management can scarcely be imagined than that employed by the natives of Bengal.

Small commons, interspersed among the arable lands, and downs or forests in the hilly districts, furnish the cattle with provender. Grass is cut for them when in the stall, and their dung collected for fuel. The Indian, by means of almost unparalleled perseverance, obtains the object of his toil, notwithstanding the apparent inadequacy of the wretched implements he employs; and, as the want of capital prevents the subdivision of labor, he turns his hand from one branch of his trade to another, with an adroitness which is observed by Europeans with surprise. Every manufacturer, artist and laborer, working on his own account, conducts the whole process of his art himself, from the formation of his tools to the sale of his produce in the market. Wages are extremely low, and, as the usual hire of a plough is less than sixpence per day, ten ploughs may be employed for about thirty shillings per week. Rice is cleaned by persons who undertake that work on condition of returning five-eighths of the weight freed from the husk, and receiving the overplus for their labor. Five quarters per acre are accounted a large crop, and a return of fifteen for one on the seed. Although the laborers are commonly hired servants, in some districts slaves are employed, but they are humanely treated. A strong evidence of the improvement of agriculture in this province is afforded by the fact, that from 1790 to 1800, notwithstanding an increased export of grain, together with a very extensive growth of sugar, indigo, and other articles, rice

became more abundant and lower in price than had been known since Bengal was ceded to the English; nor has any thing like a famine been experienced since 1770.

The orchard in this province is what chiefly attaches the peasant to his native soil, owing to the superstitious veneration which he retains for the trees planted by his ancestors. Orchards of mangoes (*mangifera Indica*) adorn the plain in every part of Bengal; the palmira, or wild date (*elate sylvestris*) abounds in Bahar; the cocoanut thrives in those parts of the province within and near the tropic, and the date tree (*phœnix dactylifera*) over the whole region. Plantations of areca are found in the central parts of the province; the bassia thrives in the hilly districts, and on the poorest soils; its inflated corols are esculent and nutritious, yielding by distillation an intoxicating spirit; and from its seeds is expressed a grateful oil, which, in the mountainous districts, is used instead of butter. Numerous clumps of flourishing bamboos diversify the whole face of the country. So rapid is the growth of this plant, that it completes its greatest height within a single year; and in the year succeeding the wood acquires all that hardness and elasticity for which it is so highly valued. A single acre of bamboos yields more wood than ten of any other tree. Potatoes have been introduced by Europeans, and are said to be little inferior to any in our own country, although the watery insipidity of tropical plants is a circumstance commonly complained of by Europeans.

The staple productions of Bengal are sugar, tobacco, silk, cotton, indigo, and opium. The sugar-cane, the name of which was scarcely known to the ancient inhabitants of Europe, grew luxuriantly in every part of Bengal, and its adjacent territories, especially in the districts of Benares, Bahar, Birbhoon, Rungpoor, Midnapoor and Burdwan. This plant was introduced from India to Arabia, and thence to Europe and Africa. From Benares to Rungpoor, and from the borders of Assam to Cuttack, oilcake is frequently applied to it instead of manure; and so great is its fertility in Bengal, that there seems to be no other bounds to the possible production of sugar than the limits of the demand. The internal consumption is vast, and the manufacture so cheap, that raw sugar may be purchased in the Calcutta market under 18s. 6d. per maund, of about eighty pounds weight.

Tobacco was unknown in India, as well as to Europe, before the discovery of America. According to a proclamation made by Jehangire, and mentioned in his memoirs, it appears that it was introduced by Europeans, either in his own reign, early in the seventeenth century, or during that of his father Acher, and was too congenial with the habits of the Asiatics not to come very soon into general use, especially as the practise of inhaling the smoke of hemp leaves, and other intoxicating drugs, was both ancient and universal. The cultivation of it prevails mostly in the northern districts, over every part of Hindostan, requires a good soil, and including every charge for duties and agency, may be procured in the market of Calcutta at the low price of eight shillings per maund.

Cotton is cultivated in every part of Bengal; and that grown in the eastern districts is of very superior quality, fit for the most delicate manufactures. Large quantities are likewise brought from the banks of the Jumna and the Deccan; but the best import is that brought by land from Nagpore to Mirzapore, in the province of Benares, and sold there for about £2. 5s. per cwt. although its average price in Nagpore is not more than two-pence half-penny per pound. The name of this article is derived from the Arabic *kutn*, pronounced *cootn*.

Europe was anciently supplied with silk through the medium of India; the original language of which has names both for the silk-worm and for the silk in a state of manufacture. Amongst the numerous tribes of Hindoos, derived from a mixture of the original tribes, are two separate classes, whose appropriate occupations were the feeding of silk-worms, and the spinning of silk. A peasant who feeds his own silk-worms, has full employment for his family. The rearing of them is, however, chiefly confined to the district of Burdwan, and the banks of the Bhagirathi and Great Ganges, from the fork of these rivers to the distance of one hundred miles down their streams. The Company's investment is made principally at Cossimbazar, Rungpore, Malda, Radnagore, Bauliah, Jungceypore and Comercolly. Much is also procured from wild silk-worms. Four crops of mulberry leaves are obtained from the same field in the course of a year, and many worms are fed on other plants besides the mulberry.

Indigo, which derives its name from India, has been cultivated there from the earliest period, and that country anciently supplied all Europe, till the produce of America engrossed the public attention, and drove the Asiatic manufacture out of the market. The perseverance of a few individuals has restored this branch of Bengalee commerce to its original channel, by no other means than the manufacture of a superior article; for, with respect to the culture, no material change has taken place in the practice of the natives. The total manufacture of indigo in Bengal, in 1807 and 1808, was not less than 120,000 factory maunds; and the aggregate sold at the East India Company's sales, in 1810, amounted to 5,253,489 lbs. and netted £1,942,328. In 1814 no fewer than 102,524 factory maunds (8,200,000 lbs.) were entered at the custom-house at Calcutta.

The consumption of animal food is insufficient to render the rearing of cattle an object of any considerable profit, although stock can be grazed at the very low rate of half a rupee, or even a quarter of a rupee (the former equal to 1s. 3d. the latter to 7½d. of our money), per annum. The tattoos, or native horses, are a thin, ill-shaped, miserable breed, unfit for labor; bullocks alone are used in the plough and team. The sheep are a dark, gray-colored, thin, diminutive breed; but when fattened make excellent mutton. Some of them have four horns, two on each side of the head. Pariah dogs infest the streets throughout all the towns, jackals every thicket, and the approach of the enemy is announced by the howling of the numerous flocks of them which

then quit their retreats in the jungles. Apes and monkeys swarm in the woods, and, being sacred animals, are often fed by pious Hindoos. The brahminy, or sacred ox, rambles about the villages without molestation, and is both pampered and caressed by the people, who consider this a meritorious act of religion. Crows, kites, sparrows, and mayanas (*coracias Indica*), familiarly hop about the habitations of the Bengalese; and storks, from their erect stately gait called adjutants by the European soldiers, are almost as common as the toads, snakes, lizards, and insects, on which they feed.

Fish is extremely plentiful, of which a great diversity of kinds is found in the Ganges and its branches. They often become the food of the poorest natives, and the smallest kind are equally acceptable in a curry, the standing dish in every Hindoo family, which, with a pilau nearly comprehends their whole art of cookery. The bickly, or cockup fish, are extremely rich; but the highest flavored fish in Bengal, and perhaps in the whole world, is the *polynemus paradisea*, or mango fish, so called from its appearing in the rivers during the mango season. Mullet are found in all the rivers, and are killed with small shot, as they swim against the stream. The turtles are indifferent, but the small oysters from the coast of Chittagong are excellent. Alligators and porpoises abound in all the rivers of Bengal.

The natives of Bengal are handsome and lively, of highly polished manners, possessing a soft expression of countenance, and mildness of character. Though thin, they are small and well shaped, of an olive tint, black hair and eyes, oval face and aquiline noses. The clothing of the poor consists of little else than a rag round their waists. The rich, when abroad, have dresses much like the Mahomedans; but within doors resume their old national costume, consisting of different pieces of cloth twisted round the body, with one end tucked into the folds. Upon the head nothing is worn. The women rub red lead on their foreheads, blacken their teeth with a preparation of vitriol and iron filings; and are peculiarly fond of trinkets. Rings of shell lac round the arms, and bracelets of mother-of-pearl are favorite ornaments; as are also trinkets generally; and proud is the woman who hears herself described as walking like a duck or an elephant, having teeth as black and red as the seeds of the pomegranate; a nose like a parrot's beak; hands and feet as wide spreading as the water-lily; lips as red as the fruit of the *tálacúcha*, and a chin as plump as a mango. Widows of a pure caste, however handsome, are stripped of their ornaments, condemned to sleep on the ground, exposed to damp, vermin, and other inconveniences, and to act as menial servants to the young, who are decked out in the finery of which their elders have been deprived. This, in all probability, is one reason why so many prefer the funeral pile, with the expectation of bliss in another world.

The natives of the mountains beyond Bengal, along the northern boundary, indicate, by their features, a Tartar origin. The inhabitants of the eastern hills and plains adjacent, are obviously of peculiar derivation, whilst the elevated tract

included in the western part of Bengal, is peopled by several races of mountaineers, the probable aborigines of the country. Distinguished in character, language, manners, features, and religion, from the Hindoo nation, the race descended from this stock people the vast mountains which bulge from the centre of India; and some tribes of them have not yet emerged from the savage state. In the mixed population of the middle districts, the Mohammedans and Hindoos claim the pre-eminence. Among the former may be discriminated the Moghul, the Afghan, and their immediate descendants from the naturalised Mussulmen; and among the latter the peculiar traits of a Bengalese from those of the Hindostany. The native Bengalese have been thought pusillanimous; and the descendants of foreign settlers are fond of tracing their origin to the countries of their ancestors. No native, however, has any motive to distinguish himself in the army, as he cannot rise higher than a soubahdar, a rank inferior to an ensign.

Slavery, in its severest sense, is unknown in Bengal. Domestic slavery is, indeed, allowed by law, but the slaves are rather treated as hereditary servants. The marriage of slaves is never impeded, and many children are born in that condition; but it is thought disreputable to sell them, and an act of piety to grant their manumission. Parents themselves usually meet the demands of the market, by disposing of the children which poverty and misfortune have rendered them unable to support. The prices given even in that case for infants is extremely small, except either when the purchaser is a Brahmin of some religious order, who wants a disciple to assist him in begging, or when he is the master of a troop of dancing girls and prostitutes, who wishes to replenish his stock. Slaves in Bengal are, in all cases, placed under the protection of the law.

Of the population of Bengal various estimates have been given at different times; none of which, however, are thought equal to the real amount. In 1789 Sir William Jones estimated the inhabitants of Bengal and Bahar at 24,000,000. Mr. Coleman, in 1793, made them 27,000,000. Another estimate, formed in 1790, carries the population of Bengal, Bahar, and Benares, to 32,787,500. Under the direction of the marquis Wellesley, in 1801, was taken a more accurate survey than any of the preceding; the result of which has never been communicated to the public in any authentic form. The average upon the whole, in well-peopled districts, is about 200 to every square mile, and the total population of the three provinces already named more than 30,000,000. The population of Bengal, under the British government, has undergone a progressive increase, surpassing that of England, although it has met with some severe checks: as in 1770, when one-fifth of the inhabitants perished by famine; in 1784, when the same calamity prevailed; in 1787, when great numbers in the eastern provinces perished by inundation; and in 1788, when there was a partial scarcity.

Small villages line the banks of the rivers as thickly as in the most populous parts of China, and are surprisingly numerous. The cheerful,

bustling multitudes of men, women, children, poultry, and cattle, all mixed and crowded together, which continually meet the traveller's eye, as he sails or is towed along from place to place, show a sense of security, and an appearance of happiness, which will in vain be sought for beyond the demarcation of the Company's territories. Even pirates and banditti have been effectually checked, and will no doubt in a few years be entirely extirpated.

In point of national character, the native Bengalese are artful, fraudulent, indolent, and thriftless. Flattering pictures have, indeed, been given of their morals by some writers who were evidently misled by partial and erroneous views, whilst the Protestant missionaries, on the other hand, have given a delineation exactly the reverse. To obtain information from a source, the purity of which cannot be controverted, we must have recourse to the records of the courts, and the reports of the magistracy; which furnish precisely the species of evidence that is required. From these we learn that robbery, even when accompanied by great atrocities, neither occasions remorse in the offenders, nor detestation in the public; that a general want of moral principle is notorious, in both Mahomedans and Hindoos, the lower classes of the former having adopted the idolatrous usages of the latter; that the bloody execrable worship of Cālī sanctifies the most atrocious barbarity; that perjury is scarcely considered a crime; and that the depraved character of the Hindoo mythology, combined with the Mahomedan doctrine of fatality, exerts a powerful and deleterious influence upon the sentiments and habits of the people. The abolition of mutilation and pecuniary commutation for murder, acquittal in default of proof of a malicious intention to assassinate, with other regulations established in our Indian tribunals, have in some measure diminished the mass of crime, and rectified the leading defects of the Mahomedan law; and at some future period may have the effect to purge out the old leaven, and produce a more extended reformation in the depraved manners of the people.

Considerable pains are now taken with the rising generation. The native children are early taught the elements of their language. About the age of five they are sent to the village school-master, who assembles them under the shade of a spreading tree, and, on a plan similar to the one adopted in our National Schools, teaches them to read and write in six months. They are next occupied for a year in learning to write with a reed and ink on the leaves of the palmira (elate sylvestris), and acquiring the rudiments of arithmetic, together with a knowledge of the common tables of weights and measures. Writing on paper, and summing, commonly finish their education. The arithmetic necessary for agricultural and commercial pursuits is taught separately, and mensuration and book-keeping are learned practically in some shop or warehouse, where the youth is placed upon his leaving school. The Hindoos anciently wrote with iron styles, instead of reeds, upon the narrow leaves of the palmira. Their books consist of separate leaves, which are filed on iron pins, and guarded at the top and bottom

with a flat strip of wood. The whole is tied with a string, and wrapped up in a cloth. One rupee is paid for every 32,000 letters; so that the Mahābhārat would cost sixty rupees (about £8); the Rāmāyan 24 (£3); and the Śrī B'hāgavat 18 (£2. 10s.). Divinity, astrology, and law, are almost the only sciences now studied, and learning has been long on the decline. The natives are, nevertheless, quick and inquisitive, and would probably be much improved by their intercourse with Europeans, but for that supreme contempt for other nations, generated by the notion of their being designated Hindoos.

The Bengalese, generally, are abstemious in their diet. In the morning, and at noon, the common repast amongst the upper classes is parched or parboiled rice, seasoned with sour milk, tamarinds, or molasses; amongst the poor, a little water with some salt, or acid fruit. Milk is always dressed in some way before it is used; butter is boiled, and by that means converted into g'hi, which keeps well, and may be used a year after it has been prepared. Their sweet-meats are fried in oil or butter, and the principal meal is made in the evening. Spirituous liquors are very seldom used for the purpose of intoxication, but preparations of hemp and opium are found very powerful substitutes.

The Mahomedans are computed at one tenth of the population, and abound mostly in the eastern districts. Of the four great Hindoo classes, the Brahmin, Khetri, and Vaisya, amount to a fifth part of the total population. Commerce and agriculture are universally permitted to all classes; and, under the general denomination of servants to the other three divisions, Sudras seem to be allowed to prosecute any manufacture. The Brahmins of this country are looked up to throughout the whole of Hindostan, and are said to have descended from five families introduced from Canó, or *Cānya cubja*, some centuries previous to the Mahomedan conquest. The first in rank are the Cúlinas. Of the Sudras, the Vaidyas, or medical tribe, rank first; next the Cāyasthas, or Cāits, the writers and accountants; besides which there are nine other tribes of uncontaminated Sudras, from whom a Brahmin may condescend to receive a cup of water. It may be observed that none but Brahmins and Sudras are of genuine Bengalese origin, and in the latter tribe are included, not only the true Sudras, but also the several castes whose origin is ascribed to the promiscuous intercourse of the four classes. The purity of caste is maintained by a sort of clubs, or lodges, called dōls, which are again subdivided into smaller societies. In practice, however, little attention is paid to the limitation of caste; so that even Brahmins daily exercise the menial profession of Sudras. The occupation appropriated to each tribe is merely entitled to a preference, the gates of almost all professions being opened indiscriminately. Animal food, also, is by no means universally proscribed among the Hindoos; and the *Agora Punt'h*, a privileged order of mendicants, have even been suspected of anthropophagy.

A rigid observance of all the frivolous and laborious ceremonies prescribed by their religion is thought amongst the genuine Hindoos to be

their truest glory; but truth and honesty are so little in request among them as never to be looked for, and scarcely to be desired. 'A man of integrity,' says a late publication, 'is a wonderful phenomenon; and one conscientious in his whole conduct may be safely pronounced to be an unknown character.' Their dead ought, strictly, to be burnt; but those who cannot afford to raise a funeral pile, stick a whisp of straw into the mouth of the corpse, and then throw it into the nearest river. To the rivers also they carry their expiring relatives when all hope is over, and leave them to die without assistance, or to be carried off by sharks and tigers. The self-immolation of widows has lately been so far checked by the police as to prevent the exercise of any compulsory means.

The hateful distinction of caste in Bengal annihilates every feeling of humanity towards the inferior classes, who, being considered as persons accursed by the gods, have no kindness to expect from those who are the favorites of heaven. Even common fowls are thought by the Hindoos impure. Ducks and pigeons are lawful, geese are kept as pets and rarely sold; but turkeys, with almost all other fowls, are to be met with only amongst the Mahomedans and Portuguese. Dogs and cats are merely tolerated; to kill a dog in order to relieve him from a lingering death would be a crime, and to feed him is no virtue. These animals wander about in a wretched half-starved condition, and even children show no disposition to render them any kindness.

The mechanical arts among the Bengalese are not in a state of great perfection. Their music is harsh and unharmonious; their dancing lifeless and ungraceful. Hymns or love songs, in honor of Crishna the Indian Apollo, and his favorite Rád'hā, sung by the boatmen while rowing on the rivers, are almost the only airs that have any thing of melody. The different trades are professedly confined to different castes, and some of them held in great contempt. Tailor's work is almost the exclusive employment of Mussulmans. The barbers, who pare nails, pick ears, and shave heads, are a pure caste, and are therefore well paid. A woman who cuts her hair is thought to commit a great breach of delicacy, and none but immodest ones ever smoke. The Bengalese artificers are not only clumsy, but indolent; and their metallic manufactures have none of that finish which distinguishes the blades of Damascus, and the filigree of Tunis. Paper was introduced by the Mahomedans, by whom it is usually made.

Amongst the most prominent manufactures of the Bengalese are to be enumerated plain muslins, distinguished by various names, according to the fineness and closeness of the texture; as well as striped, flowered, or chequered. Muslins, denominated from their patterns, are made chiefly in the province of Dacca, to which the manufacture of the thinnest sort of fine muslins is almost exclusively confined. Other kinds, more closely woven, are fabricated on the western side of the Delta of the Ganges; while a coarser sort, characterised by a more rigid texture, together with turbans, handkerchiefs, &c. of a similar quality, is not limited to any particular district. Inferior

muslins both plain and flowered, are obtained from the northern parts of Benares. Calicoes, as they are manufactured in Bengal, include various kinds of cloth, to which no English names have been fixed, and which throughout the whole of Europe, are known chiefly by the Indian denomination *cosies* (*klasabs*), are manufactured in that part of Bengal north of the Ganges, from Maulda to Berhazie, between the Mahanuddy and Tsamutty rivers. Similar articles are made near Faunda, in the dominions of the nabob of Oude. Baftas are made on the western frontier of Benares, in the neighbourhoods of Allahabad and Luckipore, the province of Bahar and other districts. Gurraes are the manufacture of Birbhoom; gezis and gezinas are woven in most districts, but chiefly in the Doab of the Ganges and Jumna, together with other kinds of cloth, the names of which are less familiar to the English reader. Sanaes are the chief fabric of Orissa and the district of Midnapoor, whilst some are imported from the territories immediately contiguous. On the northern frontier of Bengal Proper, sackcloth is manufactured from packthread, and serves as clothing to the mountaineers. Blankets are of universal manufacture, and canvass, made from cotton, is woven chiefly in the neighbourhood of Patna and Chittagong. In the centre of the Doab, a coarse cotton cloth, dyed red with cheap materials, are made for home consumption, whilst other sorts, dyed of various colors, especially blue, is prepared for inland commerce and for exportation. Both fine and coarse calicoes receive a topical dyeing, with permanent and fugitive colors, as well for common use as foreign commerce. Benares, the cities of Patna and Calcutta, with their immediate vicinities, are the principal seats of the manufacture of chintzes. The art, long since invented, appears to have been indigenous to India, and is brought to great perfection. Dimities of various kinds, and damask linen, are made at Tandah, Patna, Dacca, and other places. In the neighbourhood of Moorshedabad is the chief seat of the manufacture of wove silk and taffeta, both plain and flowered. Tissues, brocades, and ornamented gauzes, are manufactured at Benares, although plain gauzes are woven in the western and southern regions of Bengal. The manufacture of mixed goods, composed of silk and cotton, thrives mostly at Maulda and Boglipoor.

The rum distilled in Bengal proves little inferior to that of Jamaica, leather has been made there with considerable success; and the natives have also arrived at considerable perfection in the fabrication of saddles, harness, military accoutrements, boots, shoes, &c. and at Calcutta is manufactured an excellent species of canvass, which has, in some places, superseded the use of that imported from Europe.

The commerce of Bengal is extensive, consisting for the most part in piece goods, silk, salt-petre, opium and indigo. A considerable quantity of filature silk is exported to the western parts of India: a large proportion of it is sold at Mirzapoor, and passes thence to the Mahratta dominions, and the central parts of Hindostan. Tisser, or wild silk, is procured in abundance from the adjacent territories, where the worms are found in several species of trees

common in the forests of Assam, Silhet, and the Deccan. The color and lustre of this silk is far inferior to that of the domesticated insect, and the cones, although large, are but sparingly covered. Its cheapness, however, is a considerable recommendation: the aggregate production of it might be increased by encouragement; and large quantities, exported to Europe, might be used in the fabrication of coarse silks, or mixed with wool and cotton, might form, as it does now in India, a beautiful and acceptable manufacture.

Various drugs used in dyeing are exported to England; as galls, turmeric, safflower, or carthamus, myrobalans, roots of morinda, which dye a beautiful color on cotton, and blossoms of the nyctanthes, very useful for giving a permanent color to silks.

The number of articles brought from Bengal at present might easily be augmented; and should freight ever be reduced so low as it might be afforded, corn might be exported to Europe. Rice, barley, and wheat may be shipped in Calcutta for nearly the same price, viz. two rupees and a half per bag, containing two maunds, or from 3s. 4d. to 3s. 6d. per cwt. and rum might be exported at the low price of from 1s. 6d. to 1s. 9d. per gallon. Liquorice and ginger might be exported to any extent. Anotto (*bixa orellana*), coffee, cocoa, cochineal, and even tea, would succeed in this and the adjoining provinces, which comprehend every variety of tropical climate. Madder also grows wild on the neighbouring mountains. Gum Arabic, and many other species of gums and resins, both for manufacture and medicine, numerous varieties of drugs and vegetable oils, tinctal, from the high table-land of Thibet, together with sal ammoniac, and alkalies both mineral and vegetable, might be procured in great quantities at a small expense, though seldom imported by British merchants.

Besides the above articles, which are to a certain extent restricted to Bengal and its immediate territories, India furnishes aloes, asafetida, camphor, cassia lignea, cassia huds, benzoin, cardamums, cowries, arrangoes, cinnabar, chinacree, nutmegs, cloves, cinnamon, mace, elephants' teeth, numerous gums, pepper, mother-of-pearl, quicksilver and rhubarb from China, senna, saffron, sago, scammony, anise, coriander and cummin seeds, hemp and flax, which, with all their varieties and substitutes, abound here to greater extent than in any other part of the world. The true hemp is little used by the natives, except for the oil expressed from the seed, for medicine, and for an intoxicating ingredient often mixed with the tobacco of the hookah. The European goods sent out to India are too well understood to require enumeration. The trade between Bengal and the different coasts of the Indian ocean is very considerable. The exports to Madras on the coast of Coromandel are grain, sugar, pulse, salt-petre, molasses, ginger, clarified butter, long pepper, oil, wrought and unwrought silks, muslins, spirits, and provisions. The imports are chiefly salt, red wood, long cloth, *izáris* (striped calicoes for trowsers), and chintzes, with a balance either in specie or government bills. To China, the next great mart for Calcutta commodities, besides the exports named above, are

sent opium, gunpowder, iron, fire-arms, &c. and tutenague, sugar-candy, tea, alum, dammer, porcelain, lacquered ware, and a vast variety of manufactured articles are imported in return. The trade to Bombay consists of the first-named articles, with the addition of sacking and hempen ropes: amongst the returns may be reckoned teak-timber (tectona), ivory, and lac. To the gulfs of Arabia and Persia, Bengal sends her staple commodities; to Ava and the Birman empire, in addition, fire-arms, stores, naval and military, with a great variety of European goods. From the eastern islands and the Malay coast, she imports pepper, wax, dammer, brimstone, tin, gold-dust, spices, betel-nut, benzoin, specie, &c. From Manilla, besides specie, indigo of a very superior quality, sugar, sapan wood &c. From the Malabar coast, sandal wood, coir rope, pepper, cardamums, cargoes of cotton, wool, &c. From Pegu, teak timber, elephants' teeth, lac, and various other articles.

For inland commerce the province of Bengal possesses many important advantages, being watered by the Ganges from its western boundary to the sea, and intersected in every direction by navigable streams, which fall into that river. There is no division totally destitute of navigation during the rains, and scarcely any part, in the driest seasons, situated more than twenty miles from a navigable river. Rivulets, lakes, and water courses, communicating with great rivers, frequently conduct boats to the peasant's door. The vessels used in this inland navigation are various, adapted to the several streams they are intended to traverse. Flat clinker-built vessels are used in the rapid and shallow streams of the western districts; bulky and lofty-sided barks are commonly employed in the wide and stormy navigation of the lower Ganges. Low, deep, vessels are commonly used in the east, and are best adapted to a sea full of creeks and inlets. In one navigation, wherein vessels descend with the stream and return with the track rope, their construction recognises neither the sail nor the oar. In another, wherein boats in the same voyage are assisted by the stream of one creek, and opposed by the current of the next, as in the Sunderbunds, and under banks impracticable for the track rope, the oar is the principal dependence; a winding course in narrow passages affording few opportunities for the exhibition of the sail. Often grounding in the shallows, vessels would not be safe if constructed with a keel, for which reason, all vessels built in this province want this necessary appendage for quick sailing. The expense of building a Bengalese vessel is comparatively trifling. A circular board lashed to a bamboo forms the oar; a triangular frame sufficiently ballasted, serves for an anchor; a few bamboos bound together form the mast; a cane of the same species becomes a yard to the sail, which itself is generally a piece of coarse sacking, manufactured from the fibrous stem of the rushy *croalaria*, or hemp *hibiscus*; resin from the trees of the woods serve to pay the seams; and a thatch of straw, with mats, shelters the merchandise, and answers the purpose of a deck. Of these vessels, equipped and navigated with equal frugality, the number employed on the rivers of

Bengal and Bahar is so great as to furnish employment to no fewer than 300,000 men.

For land carriage there are not the same facilities, the highways in general not being in a condition to admit of distant journeys in wheel carriages. Formerly the communication was better assisted; a magnificent road, carried from the banks of the Goggrah or Dewah, to the Brahmapootra, formed a safe conveyance through countries subject to inundation, for a distance of 400 miles. Of this road few remains are at present visible, and the beaten path in general directs the traveller. Liability to inundation, and want of good materials, must always impose great difficulty and expense in the construction of carriage roads, whilst the poverty of the agricultural population would not admit of the establishment of tolls. To expedite military movements, the Bengal government have completed an excellent road from Calcutta to Benares, which, so far as it goes, has greatly contributed to the general convenience.

Notwithstanding the superior advantages of water carriage, the cultivator derives little advantage from it; and is for the most part obliged to adopt the other mode. His crops are commonly disposed of as soon as they are reaped, on which occasion he commonly becomes a prey to opulent speculators, who, after they have made a monopoly, fix the prices, and compel the peasant on the return of sowing time to pay exorbitantly for his seed, and very often take mortgages of his estates.

The trade carried on by the East India Company is regulated in the first instance by the Board of Trade, consisting of two members, and a nominal president, a member of the supreme council. Subordinate to this board are commercial agents, stationed in different places, and assisted by the civil powers and native officers.

Häts, or open markets, held on fixed days, in an open plain, and marked by a flag, were anciently the only places at which commercial transactions took place. Shop-keeping, which is still by no means universal, appears to have been introduced by the Mahomedans. Bazaars are an assemblage of shops, collected in one building or area, for the greater convenience of the inhabitants; and ganjs, or banders, are grain markets, or ports, in the canals and branches of rivers, inhabited by merchants or retail traders, under the protection of the nearest police officer.

The currency consists of cauries or cowries, and rupees; the former of which is used only for small change, gold being seldom seen out of Calcutta. The potdars, or money changers, have no shop, but sit in the open market with heaps of cowries piled up before them. In the morning they give cowries in exchange for silver, at the rate of 5,760 for a rupee; but in the evening will not receive them again at a lower rate than 5,920 for a rupee; thus, by a profit of 3 per cent. upon good mint money, imposing upon the ignorance and improvidence of the people. A still greater harvest is reaped by these harpies, in consequence of the fluctuating exchange on clipped or debased coin. Advances are also made to servants, who are paid in monthly wages, and

who thus lose from 65 to 70 per cent. in the course of the year.

The revenue of Bengal is derived chiefly from assessments on the land, made in consequence of the system established by the Moguls, by which the conqueror is considered as the proprietor of the soil; and, in all probability, the zemindars, or land owners, were nothing more than agents appointed to collect the revenue. Grants were also made in favor of the rajas, who had before enjoyed an independent authority. These, whether considered as tributary chiefs, or as feudatories, were looked upon by the Mussulman lawyers as officers of the sultan, and were considered as holding their lands in virtue of their office, and therefore as liable to suspension or removal at the sultan's pleasure. The ryot, or cultivator, is described as a tenant paying rent, and his superior as landholder; but, strictly speaking, his rent was originally a contribution to the state, and the zemindar, standing between him and government, received that levy on behalf of the crown. In the rule for dividing the crop, whether by custom or by special engagement, the proportions were the following, viz. half to the landlord, and half to the tenant; one-third to the landlord, and two-thirds to the tenant; two-fifths to the landlord, and three-fifths to the tenant.

The standard for the regulation of the rates has been lost; but it appears from observations made on the Bengal revenues by the late James Grant, Esq., that the assessment was limited never to exceed the proportion of one-fourth part of the gross produce of the soil. In early times the demands of the Hindoo sovereigns were more moderate, five-fifteenths being the smallest proportion ever assessed by the Mahomedans, and three-fifteenths more than were ever exacted by the Hindoos. The Mahabharat states, that the prince was to levy a fiftieth of the produce of the mines, and a tenth of corn. Menu and other legislators authorise the sovereign to exact an eighth, a tenth, or a twelfth part of grain, according to circumstances; and a sixth of the clear annual produce of trees. It is not clear whether any thing like hereditary authority was ever considered as vested in the zemindars, even under the Hindoo princes, although it is certain that the same lands descended from the father to the son, for many generations. At present, however, from motives of expediency, they are declared the proprietors of the soil, and the assessment on their estates has been irrevocably fixed, according to a valuation made during the administration of lord Cornwallis. Besides this assessment or jama, levied on the zemindars, there is an excise, or *ab-cari* (a duty on spirits), rates or *sayir*, levied on personal property; the customs imposed as import duties, tolls at the entrance of towns, on canals, &c. together with stamp duties, and a tax on the pilgrims to Budd'há Gayá, Jagannath in Orissah, Prayag at the conflux of the Ganges, and Jammunah, near Allah-abád.

A poll tax, called *jaziyah* was imposed by the khalif Omar, on all persons not of the Mahomedan faith; the Mussulman conquerors of Hindostan imposed it on the natives as infidels. It was,

nevertheless, abolished by the emperor Auber, and although, at a subsequent period, Aurengzebe attempted to revive it, he failed in the attempt.

Free lands are appropriated to the use of brahmins, bards, encomiasts, ascetics, priests, and mendicants, or as a provision for several public officers. The greater part of them were originally granted in small portions of waste ground.

The class of needy land proprietors is numerous, and the greatest landholders are poor. Responsible to government for a tax, originally calculated at ten-elevenths of the expected rents of their estates, they have no probable surplus above their expenditure; so that any unexpected calamity may involve a zemindar in difficulties, from which by no economy of his own can he possibly be retrieved.

The civil and military governments of the Bengal presidency are vested in the supreme council, consisting of the governor-general, and three counsellors; the former appointed by the king, at his pleasure, the latter by the court of directors, from the civil servants of twelve years standing. For the administration of justice throughout the dominions subject to this presidency, there is one supreme court at Calcutta, six courts of appeal and circuit, attached to six different divisions, and forty inferior courts, or rather magistrates, stationed in the following districts or cities:—

Agra,	Jessore,
Allahabad,	Jionpoor
Alyghur,	Meerat,
Backergunge,	Midnapoor,
Bareilly,	Mymunsingh in
Bahar,	Cuttack,
Benares,	Moorsheadabad,
Birbhoom,	Moradabad,
Boghlipoor or Mong-	Mirzapoor,
hir,	Mudda,
Burdwan,	Purneah,
Balasore,	Ranjeshy,
Bundelcund,	Ramghur,
Cawnpoor,	Runcpoor
Chittagong,	Sarun,
Dinagepoor,	Saharunpoor,
Dacca Jelaipoor,	Shahabad,
Etawah,	Silhet,
Farruckabad,	Tiperah,
Goracpoor,	Tirhoot,
Hooghly,	Twenty-four pergun-
Juggernaut,	nahs.

The courts of circuit consist of three judges, with an assistant, and native officers, both Mahomedan and Hindoo, who make their circuits at stated periods. Criminal causes are tried by the Mahomedan law, but so modified as to approach nearly to our own, and when the sentence is capital, or imprisonment is awarded beyond a defined period, the punishment is not executed till it receives the confirmation of the Nizamut Adawlet, or supreme criminal court at Calcutta. In country districts, the officer who in his criminal capacity has the appellation of magistrate, is also the civil judge of the city or district in which he resides. He tries all civil suits within

his jurisdiction, and has for his auxiliaries a registrar, one or more of the junior civil servants, together with native lawyers. An appeal, however, lies in almost all cases to the provincial court, within the jurisdiction of which they reside. To try petty suits, the district magistrate is empowered to appoint native commissioners, with an appeal lying to himself. Each district or *zilah*, is subdivided into portions of about twenty miles square, in each of which a *darogha*, or head police officer, is stationed, with a body of armed followers under his authority, for the apprehension of criminals, or, receiving authority from the magistrate. The average size of a district in this presidency is about 6000 square miles. The ultimate court of civil appeal is the *Sudder Dewanny Adawlet*, in the city of Calcutta, to which all causes involving personal property beyond 5000 rupees value are referrible; and, if the property contested amount to £5000 sterling, an appeal lies from the sentence of this court to the king in council.

Under the Mahomedan and Hindoo governors, suitors pleaded their own causes, who, being ignorant of the subtle usages of law, were frequently duped by the policy of their superiors. In 1793 regular native advocates, educated at the Mahomedan and Hindoo colleges at Calcutta and Benares, were appointed to plead in these courts, for regular fees; who, being equally acquainted with the laws, rules, and practice of the court, impose an effectual check on the negligence or misconduct of the judge and his assistants. Provisions have also been made against the corruption of those on whom the administration of justice depends, and if any individual of the Company's servants is convicted of having received a present from either of the parties who may bring a cause before him, his offence is deemed a misdemeanour in law. Written pleadings in the native languages have been introduced for the sake of precision; written evidence is sometimes admitted, when the witnesses are women, to whose appearance in public the Asiatics have a great dislike; and great indulgence is granted to the scruples of the caste. Suits between native and British subjects, or between the latter alone, are determined before the supreme court of judicature, with an appeal to the king in council. A chief justice, with two puisne judges nominated by the crown, constitute this court. It is held at Calcutta, and a jury of British residents exclusively decides the cause in criminal actions; the court alone in civil ones. Fourteen attorneys and six barristers are attached to this court. The Mahomedan law, as to the substance of it, still continues the foundation of criminal jurisprudence; but both Mahomedans and Hindoos, for the most part, enjoy the benefit of their respective usages.

Private war and assassination, which the weakness of former governments had fostered, are now no longer frequent; incursions from banditti are still more uncommon, and theft, housebreaking, &c. have received an effectual check by the vigilance of the watchmen and police. A crime of the most frequent occurrence in this country, though almost unknown elsewhere, is the murder of children; neighbours, friends, and relatives,

are often the perpetrators of these horrid deeds, in order to obtain the trinkets with which the child is decorated. Much attention has been paid of late to the state of the jails, and the health of the prisoners. The superintendents of the police, appointed in 1812, visit each district in rotation, and make a report accordingly to the governor-general in council.

The laws of inheritance, among both Mahomedans and Hindoos, divide the testator's property equally among all his heirs: which, besides opening a door to endless litigations, presents an effectual barrier to the improvement of landed property, and prevents the proprietor from acquiring that stability and consideration which would render him useful to his family and the state. This want of the privilege of primogeniture, together with other causes, has now thrown the wealth of the country into the hands of merchants and traders, resident in the great towns, who feel the superior security which they enjoy under the British government. The general poverty of the landholders is the effect of improvidence, extravagance, and dissipation, arising from their almost universal insensibility to any but immediate consequences; as also from their committing the management of their estates to unprincipled and rapacious agents. The female zemindars are generally under the direction of brahmins, who exercise an authority over the consciences of their patrons, and exert a considerable influence over their public conduct. To this concealed authority the agent submits, and conciliates it at the expense both of the zemindar and the state.

All the commercial, financial, political, and judicial offices, with a very few exceptions, are filled by the civil servants of the Company; and all vacancies are supplied by annual recruits of young men, to the number of about thirty, sent out from England, at the age of eighteen, under the name of writers. These youths, after having completed three years residence in the country, are eligible to an office of £500 per annum value; after six to one of £1500; after nine to one of £3000; and after twelve to one of £4000 and upwards. The number of civil servants in the year 1811 was as follows:—in Bengal 391; under the Madras presidency 206; under that of Bombay 74; forming a total of no fewer than 671. The whole expense for the same year, including European uncovenanted assistants, amounted to £1,045,400 sterling.

Commercial residents, for purchasing the investments of the Company, are stationed at Bareilly, Bauliah, Commercolly, Cossimbazar, Dacca, Etawah, Golagore, Goracpoor, Hurrial, Hurripaul, Jungeepoor, Keerpooy, Luckipoor, and Chittagong, Midnapoor, Maulda, Patna, Rungpoor, Radnagore, Soonamooky, Santipoor. The collectors of the government customs are at Dacca, Cawnpoor, Calcutta, Benares, Patna, Moorsheadabad, Hooghly, Furruckabad. The diplomatic residents are at Delhi, Lucknow, Hyderabad, Nagpoor, Mysore, Poonah, and with Dowlet Row Sindia, who seldom stays long in one place.

The number of native troops in the three presidencies, called *sepoys* (*sipahis*), or soldiers

amount to 123,000, of whom 9000 are cavalry, equally divided between Madras and Bengal. The non-commissioned officers are natives, and those who have commissions, to the number of nearly 3000, are Europeans. Each presidency is also furnished with one regiment of Europeans, besides artillery and engineers; the total number of whom, with their officers, who rise by seniority, exceeds 4000. About 22,000 of the king's troops, also, are usually stationed in India, at the entire expense and disposal of the Company; both armies being under the same commander-in-chief. The total expense in 1811 was £1,154,695 sterling. The annual appointment of cadets for the three presidencies may be averaged, annually, at 120 for the military, and ten for the marine service. The number of officers in the Company's service, on the Bengal establishment, amounted, in 1811, to 1571; occasioning an expense of £872,088 per annum. The number of resident Europeans in the Bengal presidency, out of the service, was computed, in 1810, at 2000.

The towns of Bengal are divided into different quarters, each of which is allotted to a different trade or nation. The Portuguese occupy one, the Mussulmans a second, the Hindoos a third; although this division, latterly, is but little observed. The houses, which are generally nothing more than huts with sloping roofs, resembling an inverted boat, are called *bancalâ*; whence the English bungalow, synonymous in India with the 'cottage.' The houses of the rich are merely a collection of huts within the same enclosure. Walls of mud, reed-hurdles, or split bamboos, a floor raised one or two feet from the ground, and occasionally a platform of bamboos at one end within, as a sleeping room and a place of retreat in times of inundation, constitute the whole of these habitations. The door, in general, is the only opening for the admission of light and air, few of their best constructed edifices having any thing like windows; and, instead of different apartments in the same house, separate huts are commonly constructed. In towns the houses are frequently of brick, and flat roofed, two stories high, consisting of a body and two wings enclosed by a high wall. In the upper story resides the family god, and the inhabitants in the apartments below. On each side of the court are verandas or open galleries, for the convenience of spectators on holidays, when religious ceremonies are performed. The apartments have scarcely any article of furniture except a loose mat, a few dishes for *pân* or betel-nut (piper betle), some utensils of brass, and a *hukkâh* or spiral tobacco-pipe. An empty house, or shed, is the only accommodation which can be procured by the traveller; and to obtain this is frequently a work of considerable difficulty. As the religion of the Brahmîns prescribes works of benevolence not for the good of men but for the gratification of the gods, any reward for public utility seldom enters into the mind of a devout Hindoo; who plants a grove, digs a tank, &c. regardless whether the trees afford a covering for tigers, or whether the tank be a public nuisance.

The districts into which Bengal is at present subdivided are Backergunge, Babloom, Burd-

wan, Chittagong, Hooghly, Jessore, Mymun-singh, Moorshedabad, Nuddea, Purneah, Raughshy, Rungpoor, Silhet, Tipperah, the twenty-four pergunnahs, and Midnapoor, although this last belongs properly to Orissa. Calcutta is the capital, for which see CALCUTTA.

Before we proceed to the description of the above-mentioned districts, we will give an account of the maritime frontier called the Sunderbunds, Sunder-bans, (*sundara-vansa*, the beautiful wood), which is a woody tract of country stretching 130 miles along the Bay of Bengal, intersected by an intricate maze of streams and creeks, having eight magnificent openings which may be regarded as outlets of the Ganges. The shelving sides of all these streams clearly evince the alluvial origin of the low lands of Bengal. Two of the passages that intersect this beautiful region are navigable, viz. the southern or Sunderbund, the northern or Balliaghaut. The former of these, which is the widest and deepest, falls into the Hooghly river sixty-five miles below Calcutta. Its course is through a thick forest, affording an asylum to ferocious animals, in which, during the day, not a sound is heard except the call of birds and the chattering of monkeys. Alligators are often seen sleeping on its banks, and enormous tigers spring upon the traveller who ventures to intrude upon their solitary retreat. This widely extended wilderness is, with some trifling exceptions, the property of government, and may hereafter be a source of revenue. A survey was made of it in 1812—13, by captain Morrison of the Bengal engineers; and in 1814 a commissioner was appointed to examine the validity of all claims to lands in it, as also to assess those lands that had been brought into a state of cultivation. The salt of this region is esteemed holy, being manufactured from the mud of the Ganges.

Saugor island, Sager island, (*Gangâ-sâgara*, i. e. the confluence of the Ganges and the ocean,) about twenty miles in length and five in breadth, is so intersected by creeks that its precise limits are difficult to define. It lies west of the channel creek, and the anchorage near it, being more open to the fresh sea breezes than Calpee or Diamond harbour, affords a better and more healthy situation for shipping. The island, from its situation at the very mouth of the Ganges, is thought by the Hindoos a place of peculiar sanctity; and, at the full moons of January and November, is rendered still more sacred by the sacrifice of human victims. Many of these are voluntary, consisting of aged persons weary of life, and infants devoted by their parents; who, in gratitude for their having been blest with five children, throw the fifth into the river. Some are, nevertheless, involuntary, and in one case a child, twelve years of age was forced by his parents a second time into the waves. The *Sâstras*, indeed, do not prescribe such sacrifices; but the vow, in compliance with which they are made, is thought inviolable. The island is inhabited by a few *Gosains*, (*Gôswamu*, religious mendicants) who levy contributions as the disciples of Capila, a sage, supposed to have lived 2000 years before the vulgar era. There are sufficient ruins upon the island to show that it was once numerously inhabited. In order to render this

spot subservient to the interests of government, the whole has been leased to a company, who are to hold the land rent free for thirty years, and afterwards at the annual assessment of four *ánas* per big *hat* (about one shilling and ninepence per acre), for ever. The undertakers have subscribed 250,000 rupees (£31,250 of our money), and one fifth of the land was cleared before the commencement of April 1819.

Edmonstone's island, near the former, and almost equally remarkable, exhibits a striking instance of the manner in which the whole Delta of the Ganges has been formed. It lies in lat. $21^{\circ} 35' N.$, and long. $88^{\circ} 20' E.$ upon the very spot where the Sagor shoal appeared in former maps. It was nothing more than a sand-bank in 1813, not having emerged above the waves; but in 1818 formed itself into a distinct island east and west; two miles in length by half a mile in breadth; and, from the decreasing depth of the channel between it and Sagor, it is highly probable that before any very considerable lapse of time the two islands will be united. At the period before alluded to, vegetation had already commenced in the central and most elevated parts of the surface. *Salsolas* and *Ipomæa pes capræ* had given it a verdant coloring; and, by daily binding the drifting sand, were contributing to form the basis of a fertile soil.

1. The district of Backergunge: it was formed about the year 1800, from the southern quarter of the Dacca Jelalpoore district. A part of this division called Boklah, in the time of Acber, now Ismaelpoor, extends chiefly along the western bank of the Puddah, or Great Ganges, nearly to its mouth at the island of Rabnabad, which forms the south-east angle of the Bengal Delta; the west of Hidgelee being the other. In 1584 the whole of this region was overwhelmed by an inundation; and from the succeeding ravages of the Mughls, aided by the Portuguese, who inhabited Chittagong, it continues to the present time in a state of great depopulation. From its vicinity to the Sunderbunds it is intersected by numerous rivers, and mantled by a covering of jungle. It is also infested with enormous tigers and alligators, together with numerous gangs of dacoits or robbers. The remains of several Portuguese colonies, planted two centuries ago, still exist, and exhibit a melancholy proof of the extreme degradation to which it is possible for Europeans to descend. They are a meagre, imbecile, puny race, blacker than the natives, and held in universal contempt.

Backergunge, the capital of the above district and residence of the judge and magistrate, is situated 120 miles from Calcutta in lat. $22^{\circ} 42' N.$, and long. $89^{\circ} 20' E.$

Ravan-ábád and Dak'hin-sháh-báz-púr are islands, of which the latter, at the junction of the Megna with the sea, is about thirty miles long and thirteen broad. It contains excellent salt-works, but is almost inundated during the rainy season. The navigation of the neighbouring channels is rendered dangerous by the bore, or overwhelming rush of the tide.

2. Birboom, or Bérb'húm (Virabtrumi, the Land of Heroes), is bounded on the north by Monghir and Rajemal, on the south by Burdwan and Pachete, on the east by Rajeschy, and on

the west by Monghir and Pachete. In the Ayin Acbari it is called the Serár of Madarún, and in 1784 its superficial extent comprehended 3858 square miles. The greater part is rocky, woody, and uncultivated; but is now rising in prosperity and importance. Coals and excellent iron ore are found in the hills; but the iron-works established in 1814, at the Moa and Húgli river, have not succeeded. The chief navigable river is the Adjí, and the chief towns Surool, Sooro, and Nagore. The roads and bridges are kept in good repair, and the latter are formed of the *palmeira* (elate *sylvestris*). Birboom is the largest Mahomedan zemindary in Bengal, and in the time of Shér Sháh, the Afghan, was conferred on Assud Ullah, father of Budder ul Zemaun, of the Afghan or Patan tribe, the better to enable him to protect the western frontiers from the incursions of the barbarous Hindoos of Jehareund. This grant anciently resembled the ancient military fiefs of Europe, but was resumed, in 1763, by Cossim Ali Khan. In Baidyanauth, or Desghur, is a celebrated temple, containing an illustrious lingam, or phallus, round which the pilgrims make many circuits, washing it with libations of holy water, in order to procure favorable dreams. So celebrated is this place of pious resort, that, notwithstanding the great danger there is of being murdered on the road, no fewer than 6000 devout persons from Bahar alone are said to visit it annually. The population of Birboom, as taken by marquis Wellesley, in 1801, amounted to 700,000 persons.

3. Burdwan (in Sauscrit Vardhaman, productive), is bounded on the north by Birboom and Rajeschy, on the south by Midnapoor and Hooghly, on the east by the Hooghly river, on the west by Midnapoor and Pachete; and is situated between the twenty-second and twenty-fourth degrees of north latitude. It came into our possession in 1760, and may be considered the most fertile territory in India. Environed as it is by the jungles of Midnapoor, in Orissa, of Pachete and Birboom, it appears like a garden surrounded by a wilderness. This district, in 1784, contained, according to major Rennel's measurement, 5174 square miles, although the original zemindary did not exceed 3280. Subsequently to 1722 it was conferred on Keerut Chund, the first known primogenitor of the present family, and, in 1790, the existing rajah paid to government a yearly rent of £400,000 sterling. The chief towns are Burdwan, Bissunpoor, and Keerpay; the principal rivers the Hooghly and Dummoodah. Villages are numerous, and most of them have schools, but there are no colleges for teaching the Mahomedan or Hindoo law. The population is supposed to be about 2,000,000, of whom one-sixteenth are Mahomedans. The remains of several forts are visible, supposed to have been originally constructed as a defence against the Mahrattas. Cutwa, in lat. $23^{\circ} 37' N.$, and long. $88^{\circ} 10' E.$, is celebrated as the place near which took place the well-known engagement between our troops and those of Cossim Ali in 1763.

The only rajahs possessing rank are those of Burdwan and Bissunpoor, both of whom now maintain so few followers in their service, that

when they appear abroad for purposes of state or ceremony, they are obliged to hire a retinue, although before the establishment of the present system, the number of persons called zemindary pykes, employed for police and other purposes, was upwards of 21,000.

4. Chittagong (Chaturgrama, or as some Gaóng Orgam), lies at the south-eastern extremity of the province, between the twenty-first and twenty-third degrees of latitude, and is bounded on the north by Tipperah district, south by Aracan, east by the Birman empire, and west by the sea; its entire superficies comprehending an extent of territory 120 miles in length, by 25 its average breadth. This district contains about 2987 square miles of unproductive hills and plains; arable land nearly in the proportion of two to one, and was divided formerly into four large and 140 small pergunnahs, partitioned among 1400 landholders. The original grant of this district, like the former, resembled a military fief, and was superseded by a division into distinct zemindaries, when the protection of the frontier ceased to require a military establishment. The principal river cannot admit ships of any size, and, at a considerable distance beyond the limits of the harbour, there are bars in the mouths of all streams which flow into the sea between that river and the boundary of Aracan. The southern part of this district, towards the Nauf river, which forms the line of separation between the British and Birman territories, is mountainous, and had been considered as almost incapable of cultivation till 1814, when enquiries, occasioned by the great emigrations from the neighbouring countries, evinced that between the ranges of hills are numerous plains and valleys, susceptible of improvement, as those of Chacária, Ramú, and Gargániá, the last of which is estimated at ten miles each way. A large number of emigrating Mughls have settled on the borders of the British territory; some under the character of husbandmen, others as pedlars or mechanics. The natural features of the interior are mountains, and beds of torrents, which roll forward to the sea. Both the inland waters and those of the ocean are continually encroaching on the labors of the cultivator. Its frequent change of level, maritime position, and lofty altitude, confer upon this region peculiar advantages, and render it highly proper for the production of coffee, pepper, spices, and many other valuable productions of Asia.

Islamabad (the Abode of the True Faith), the present capital of this district, is extremely well situated for maritime commerce, ship-building, &c. The Company have likewise an extensive establishment on the coast for the manufacture of salt. A considerable profit is derived from the elephants taken in the forests by the natives, who engage to provide a certain number annually. The sea air and bathing on this coast are considered extremely beneficial, for which reason it is much resorted to by Europeans.

About twenty miles north of Islamabad, is a remarkable hot well, named Sectacond, the surface of which, as it emits inflammable air, is capable of being ignited by the application of fire. This, like all other natural phenomena, is

esteemed sacred among the Hindoos, as is also another hot spring in the vicinity of Monghir.

Chittagong, it is probable, belonged originally to the extensive and independent kingdom of Tipperah; but, being a frontier province, where the two religions of Brahma and Buddha met, it was the subject of endless litigation, and was sometimes governed by the sectaries of one doctrine, and sometimes by those of the other. It is supposed to have been subdued in the beginning of the sixteenth century, by the Afghan sovereigns of Bengal, but afterwards, during the wars of the Moguls and Afghans, reverting to the Buddhists, fell into the possession of the rajah of Aracan. In the beginning of the seventeenth century it was visited by the Portuguese, who, co-operating with the rajah, greatly depopulated the south-eastern quarters of Bengal. In 1638, during the reign of the emperor Shah Jehan, Makat Ray, one of the Mugg chiefs, who held Chittagong for the rajah of Aracan, having incurred his master's displeasure, sought the protection of the Mogul sovereign, which led to the acquisition of this province by the Mogul government. In 1666 Shayistah Khan, the soubahdar of Bengal, having equipped a powerful fleet at Dacca, despatched it down the Megna, under the command of Onaid Khan, who, having previously conquered the island of Sundeeep, proceeded against this province and laid siege to the capital, which, though strongly fortified, and containing, according to the Mogul's historians, 1223 pieces of cannon, was speedily taken, and its present name conferred on it.

This province at an early period attracted the notice of the East India Company, who, in 1686, proposed to remove their factory from Hooghly to this station, and establish by force a fortified residence. In 1760 it was ceded to that body by the nabob Jaffer Ali Khan. The population of this district, as taken in 1801, under the direction of the marquis Wellesley, amounted to 1,200,000 souls. The capital, in lat. 22° 22' N. and long. 91° 42' E., was a great emporium in the time of Achar.

Coxe's bazaar, at the mouth of the river Nauf, occupying an elevated open site at the termination of a range of lofty cliffs, is clear of wood, and has excellent water. In 1816 it was honored by the erection of a custom-house on the Aracan frontier.

Sun-deep, or Sun-dip (the Island of the Moon), is at the mouth of the Megna, a broad stream formed by the united waters of the Ganges and Bráhmáputra. Its soil is alluvial, and its superficial extent about sixteen miles by eight. It was possessed in the beginning of the seventeenth century by Portuguese pirates, under Sebastian Gonzales; which individual, after reigning a few years, was expelled by the rajah of Aracan, who, in 1666, was also expelled by the fleet of Shayistah Khan, when the country became subject to the Mogul. Salt seems at present to be the article of manufacture.

The hilly tracts of this district are chiefly inhabited by the Chumíás and the Cúkies, or Lunetás. The Chumíás, a migratory people, seldom remaining more than two years in one place, occupy the lower range of hills to the north and east, and are subject to the Bengal government.

The Cúkies, in appearance resembling the Tartars, inhabit the more distant and elevated ranges. They are hunters and warriors, divided into many independent tribes; are much given to theft, and live mostly on animal food. The Hindoo distinctions of caste are not known.

5. Hooghly district, situated principally between the twenty-second and twenty-third degrees of latitude, and extending along both sides of the river of the same name, is bounded on the north by Burdwan and Kishenagur, south by the sea, on the east by Jessore and the Sunderbunds, and on the west by Midnapoor. The land is low, flat, and fertile, and the part bordering upon the sea, overgrown with jungle, is extremely unhealthy; its inland navigation is excellent, the surface being intersected on all sides with rivers and their branches. Three-fourths of this division remain in a state of nature, and are the abode of tigers, alligators, with numerous other species of vermin and reptiles.

The town of Hooghly, situated on the west of the river of that name, in lat. $22^{\circ} 54' N.$ and long. $88^{\circ} 28' E.$, was formerly the Bunder, or great sea-port of this part of India, and the place where the Mogul's duties were collected. The French, Portuguese, and Danes, had factories here, and were subsequently permitted to possess each a town, comprehended however, within ten miles extent along the river. Abul Fazel, in 1582, describes it as follows: 'There are two emporiums, about a mile distant from each other, one called Statgong, the other Hooghly, and its dependencies, both of which are in the possession of the Europeans.' The name of Hooghly is not mentioned in Faria de Souza's History of Bengal, where it is named Golin.

In 1625 the Dutch, and in 1640 the English, were permitted to build factories here, but the trade was exposed to continual exactions. The first serious quarrel between the Moguls and Europeans happened at Hooghly, in 1632, when it belonged to the Portuguese. The Moguls with a strong army besieged it for three months, during which period the Portuguese made many offers of submission. All terms were, however, rejected by the besiegers, who having sprung a mine, carried the place by assault, and commenced a most dreadful slaughter of the Portuguese. For the latter there seemed no escape; many who attempted to reach their boats were drowned, and those few who gained their ships in safety were immediately attacked on all sides. The captain of the largest vessel, having on board no fewer than 2000 men, women, and children, with all their wealth, rather than fall into the hands of the Mahomedans, blew up his ship, and many others followed the example; till, of sixty-four large vessels, fifty-seven grabs, and 200 sloops anchored opposite the town, only one grab and two sloops remained. In 1686 the English were involved in hostilities by the imprudence of three of their soldiers, who quarrelled with some of the nabob's peons. The action that followed was the first ever fought by the English in Bengal, and ended in the defeat of the nabob's troops. A disadvantageous peace was nevertheless shortly made, and the English, thinking themselves insecure in Hooghly, which

was an open town, removed to Chatá-nati, or Calcutta. Hijieli, or Hijala, west of the river, in lat. $21^{\circ} 50' N.$ and long. $88^{\circ} 10' E.$, consists of salt and redeemed marsh land, close to the mouth of the river. It was formerly the capital of a fanjdári, or military station, in the súbah or province of Orisah, but in the reign of Sháh Jehán was annexed to Bengal.

Culpee, in lat. $22^{\circ} 6' N.$, and long. $88^{\circ} 25' E.$, situated on a creek near the east bank of the river, is surrounded by wood, and very unhealthy. Kedgere, or Kijari, in lat. $20^{\circ} 55' N.$ and long. $88^{\circ} 16' E.$, lies at the mouth of the river, where it is nine miles in width. Ships of war generally anchor here, the air being much more salubrious than Diamond Harbour, where the Company's ships unload, and take in the greater part of their homeward cargoes. Statgong (the seven villages), was anciently a place of considerable note, though now sunk in comparative insignificance. It is situated on a creek, a little to the north-west of Hooghly, and in the middle of the sixteenth century small vessels were not able to approach. Fulta, in lat. $22^{\circ} 19' N.$, and long. $88^{\circ} 20' E.$, on the east bank of the river, is a village near which ships find safe anchorage, and are protected from the swell.

Barrackpoor, about sixteen miles above Calcutta, has a park with a small menagerie, and is the station where the native corps, amounting to 4000 men, are in cantonment. An institution is established here for the instruction of cadets in the artillery and engineer corps; and, in the cold season, horse races are practised, under the patronage of the military.

Chander-nagar (in Sanscrit, Chandra-nagara), is a French settlement, advantageously situated west of the river Hooghly, and contained, in 1814, 41,377 inhabitants.

Chinsurah, Chinchura, better known by the name of Hoogli, being situated near the suburbs of that anciently renowned city, is the principal Dutch factory in this part of India, and was established in 1656. The Dutch have no other possessions there, except their fort; the territory round it depending on the government of the country. One inconvenience attending this settlement is a sand-bank, that prevents ships from coming up nearer to it than Tulta, about twenty miles below Calcutta; occasioning of course an additional expense to the government. A school established in this place by Mr. May, for the instruction of native children, had on its list, in 1814, upwards of 1080 scholars. Reading, writing, and arithmetic, are taught to all; and English, as a reward to the most deserving.

The Portuguese formerly made Bandel, which is eighty leagues from the mouth of the Ganges, and a quarter of a league above the Hooghly, the principal seat of their commerce. Their flag is still displayed, and there are a few unhappy wretches remaining there, who have forgotten their country after having been forgotten by it. This factory has no other employment than that of supplying the Moors and the Dutch with mistresses.

Serampore, a Danish settlement, is situated on the west side of the Hooghly river, about twelve miles above Calcutta. It extends about a

mile along the river, but is very narrow, and has no fortifications. It is the head quarters of the Baptist missionaries.

6. Jessore (Jasar, the Bridge), situated between the 22nd and 24th degrees of north latitude, is bounded north by the Ganges, south by the sea, east by Kishenagur, and west by Dacca, Backergunge, and Jelalpoor. The southern part of this district, in the Sunderbunds, formed by alluvion, and the successive changes of the channels of the Ganges, is extremely fertile, though at the same time low, flat, and unhealthy. Its productions are numerous and valuable, of which indigo is the most important. A great proportion of the southern tract is covered with jungle, and inhabited by pirates and salt makers. The zemindary of Jessore was originally named Yusefpoor, in the revenue books, and early in the eighteenth century was conferred by Jafier Khan on Kishenram, a Khaist from Orissa. The chief towns are Jessore, or Moorly, Mahmudpoor, and Culna; and the population, as taken in 1801, amounted to 1,200,000, in the proportion of nine Mahomedans to seven Hindoos.

7. Mymun Singh, situated principally between the 24th and 25th degrees of north latitude, is bounded on the north by the Garrow Mountains and the district of Rungpoor, on the south by Dacca Jelalpoor, on the east by Silhet and Tipperah, and on the west by Rajsheshy and Dinagepoor. This district is of more recent formation than the adjacent ones, on which account it underwent no separate mensuration in 1784. It is low, flat, and fertile, and, since the perpetuation of the decennial settlement, is much improved. It is intersected by the great river Brahmapootra, into which flow innumerable tributary streams, and during the height of the rains the whole face of the country is nearly submerged. The chief town, Bygonbary, on the west side of the great river, in lat. $24^{\circ} 46'$ N., and long. 90° E., is the residence of the judge and collector, subordinate to the Dacca court of circuit; and the population, in 1801, amounted to 600,000, in equal proportions of Hindoos and Mahomedans. Siraj-ganj on the J' hináyi, near the confluence of that river and the Cónáyi, is perhaps, next to Calcutta, the greatest mart in the whole province, although not to be found in any map.

8. Moorsshedabad was formerly included in the Rajsheshy, but has lately passed among the moderns as a separate division. Its boundaries are very difficult to define, but it may generally be considered as having the Ganges and Jellingi rivers to the north and east, Nediya to the south, and Birboom to the west. In 1813 it was considered as the worst regulated of any part of the province; in consequence of which an assistant magistrate was appointed to reside within its capital. It is remarkable, that whereas this part of the province was formerly considered as particularly healthy, it is now extremely the reverse.

Moorsshedabad, the capital, seated on the most sacred branch of the Ganges, was originally called Muckhssoosabad till 1704, when Moorsshed Coolee Khan transferred to this place the seat of government, and conferred the present name. It stretches eight miles in length, cover-

ing both sides of the Bhagratty or Cossimbazar River, about 120 miles above Calcutta. The streets and buildings are bad, as is the case in most Indian towns; but the transit commerce is very great, and the river, with the exception of one interval in the year, is covered with boats of all sizes. From the month of October to May, when the river is nearly dry, much of the commerce is removed to B'hagwan Gola, a port on the parent stream of the Ganges. A canal between the two streams, formed in 1813, has been of great service; but the unhealthiness of the place, which, in 1814, almost exceeded belief, has caused the population visibly to decline. The Mootyjeel, or Pearl Lake, in this neighbourhood, is one of the windings of a former channel of the Cossimbazar River, and in the reign of Ali Verdy Khan, was dignified with a palace ornamented with columns of black marble from the ruins of Gour, the ancient capital of Bengal. A considerable part of the town is protected from inundation solely by the Bulabeg pushtah, or projecting embankment, which every year occasions great expense to the government. Gang robbery, or dacoity, is common; and the charges for the city police, in 1814, were estimated at the annual expense of 36,000 rupees, (£4500).

When the seat of government was removed from Dacca, by the Nabob Jafier Khan, Moorsshedabad became the metropolis, and continued so till the conquest of the province by the British, in 1757, when it was virtually superseded by Calcutta. It remained, however, from its central situation, the seat of the collector-general of the board of revenue till 1771. At present, besides being the residence of the native prince, Moorsshedabad is the head quarters of a court of circuit, including the following subordinate districts: viz. 1. Monghir, or Boglipoor; 2. Purneah; 3. Dinagepoor; 4. Rungpoor; 5. Rajsheshy; 6. Birboom; and 7. Moorsshedabad. The population, in 1801, was estimated at 1,020,572, in the proportion of one Mahomedan to three Hindoos.

9. Nuddea (Nara-dwipa, the new island), situated between the 22nd and 24th degrees of north latitude, is bounded on the north by Rajsheshy, on the south by Hooghly and the Sunderbunds, on the east by Jessore, and on the west by the Hooghly river. It was anciently called Oukerah, and more recently Kishenagur, from the zemindar who held it. Its soil is peculiarly fertile in all the dearer productions of Indian growth, but so light as to require a fallow for three successive years. Jasarush (from which a red dye is extracted), and pipal (piper longum), are grown here in great perfection. Cultivation has greatly increased since the decennial settlement. The inland navigation spreads itself through every part of the district; but the necessary embankments are difficult of formation, owing to the extreme lightness of the soil. In 1784, according to the mensuration taken by Major Rennell, this district comprehended 3115 square miles, and in 1801 contained a population of 764,000, in the proportion of two Mahomedans to seven Hindoos. The chief towns are Nuddea, Kishenagur, and Santipoor.

Nuddea, at the confluence of the Jellinghy and Cossimbazar rivers with the Hooghly, in lat. $23^{\circ} 25' N.$, and long. $88^{\circ} 24' E.$, was the capital of a Hindoo principality, previous to the Mogul conquest of Hindostan; but, on the invasion of Mahomet Bukhtyar Khiljee in 1204, was taken and entirely destroyed. It was afterwards distinguished as a school for Hindoo learning, and upon the decline of that Brahminical seminary, during Lord Minto's administration, a sum of 13,000 rupees (£1600), was assigned for its support.

Chogdah, east of the Hooghly river, thirty-four miles north of Calcutta, is celebrated as the place where the Hindoos used formerly to drown themselves in the holy stream: it is said they are now satisfied with the mere ceremony of immersion.

Palási, or Plassey, is the place near which Lord Clive, with an army of 3000 men, of whom 900 only were Europeans, completely routed the Nabob with no fewer than 50,000 troops, by which victory he acquired the possession of Bengal.

Agha-deep, Agá-dip, or Agra-dwipa, is a place of pilgrimage where the Hindoos resort, on account of the supposed image of Crishna, and brings a revenue to its proprietor of £300 per annum. It was seized by the late Rájá Nob Kishn (Nava Crishna), for a debt, but was recovered by a law suit.

10. Purneah (Purinya), situated about the 26th degree of north latitude, is bounded on the north by the Morung hills, in the Nepal territories, on the south by Monghir and Rajemall, on the east by Dinagepoor, and on the west by Tirhoot and Boglipoor. Abul Fazel, in 1582, describes it as follows: 'Sircar Poorneah, containing nine mahals; revenue, 6,408,793 dams. This Sircar furnishes 100 cavalry, and 5000 infantry.' This district, comprehending 5119 square miles, is a compact, well-watered flat, diversified with a few hillocks; in the north-eastern angle, in the region contiguous to the Mahanada, and near Manihari, not far from the Ganges, is a calcareous stone, the only rock in the whole district. The soil, though in some places light and sandy, is in general fertile, producing opium, fir-masts, and other valuable timber, together with the common productions of India. The northern part is covered with immense woods, and very thinly inhabited. Numerous shallow lakes and morasses are formed in deserted beds of rivers, and almost all the streams have changed their courses since the date of the Bengal atlas drawn up by Major Rennell; the high lands are, nevertheless, most productive. The rains do not last so long, neither are the heats so scorching, in this district, as they are further east and south, by which means the climate is rendered more healthy and salubrious. The prevailing winds are south during the rainy season, but north in the winter, and the frost exceedingly severe. Potatoes were introduced here by Mr. Smith, of Nat'h-púr, and had come into general use among the natives before 1810. The cattle of this district are excellent; butter made from buffaloes' milk is clarified, and exported under the name of G'hí. The Saul timber, with several other species, from the woods on the Mo-

run boundary, is floated in the rainy season down to Calcutta. The chief rivers are the Cossab, and Mahanada; the chief towns, Purneah, Tanjeeper, &c. The population, as taken in 1801, amounted to 1,450,000, in the proportion of seven Mahomedans to ten Hindoos.

During the Mahomedan government, this was a frontier military province, under the rule of a foudjar, subordinate to the soubaldar, or viceroy; possessing, nevertheless, a considerable share of independence. Of these provincial governors Syef Khan is the most remarkable, who ruled until his death in 1759, when he was succeeded by Soulet Jung; on whose death the government was usurped by Shouket Jung, or Khadim Hossein Khan. This rebellion was quelled in 1763, by Cossim Ali Khan, the nabob of Bengal. In 1765 Purneah devolved with the rest of the dówáni (stewardship) to Lord Clive.

Purneah, or Púrnyá, the capital of the above district, lies in lat. $25^{\circ} 45' N.$, and long. $88^{\circ} 23' E.$ 124 miles north-west by north from Moorshedabad. It is rather a crowd of villages than a town, and is of late extremely unhealthy. The best part of it is east of the Sáongri river, and consists of one wide street, opposite to which is Rám-bagh, a dry sandy plain, on which are erected the houses of the Europeans, courts of justice, &c. Nat'h-púr is situated in lat. $26^{\circ} 17' N.$, and long. $87^{\circ} 3' E.$, on the bank of the Cósí, in the wet season, but some miles distant after the water has retired.

11. Rajeshy (Rajshahi), situated principally between the twenty-fourth and twenty-fifth degrees of latitude, is bounded on the north by Dinagepoor and Mymensingh, on the south by Birboom and Kishenagur, on the east by Dacca, Jelaldoor, and Mymensing, and on the west by Monghir and Birboom. It is traversed by the Ganges, and its innumerable arms, by the overflowing of which, from July to November, it is almost entirely submerged. The tract, peculiarly liable to inundation, was anciently called Varandra. About Hariyal the country is woody and wild. The shallow lakes, or j'hils, are protected by a guard-boat, under the command of a jemádar, or corporal; but since the decennial settlement the improvement is considerable. Within the limits of this province are produced four-fifths of all the raw or manufactured silk used or exported from Hindostan. Numerous commercial towns and populous cities, are also contained in it, from which the manufactures are supplied.

The zemindary in 1784, according to Major Rennell's measurement, contained 12,909 square miles, and yielded a revenue of twenty-four lacs of rupees. The population, in 1801, amounted to 1,500,000, in the proportion of three Mahomedans to five Hindoos. The chief towns are Commercolly, Nathor, the residence of the judge and magistrate, Bália, &c.

Ráj-mahal (the King's palace), anciently called Acbar-nagar, and Cánc-jól, though belonging to Bengal, is now attached to Bahár. It lies on the south-west bank of the Ganges, and was formerly the seat of an important military government, established on the confines of the two

provinces, for the purposes of securing the passes, especially that of Telia-gâr-hi.

Tellia-gurry, or gully, in lat. $25^{\circ} 2' N.$, long. $87^{\circ} 43' E.$, was originally called Ag-mahal, and exchanged into Raj-mahal by Mân-sing'h, who, in the reign of Achar, made it the capital of Bengal. Sultân Shujââ, the brother of Aurang-zêb, made it the metropolis of Bengal and Bahar, for which its situation is extremely well adapted. The ruins of his magnificent palace, called Sangi-dâlan, are still visible, and the tomb of Mirair, the son of Jâfer Ah, is kept in good repair.

Sicly-gully, or Sâncrî-gâli (the narrow pass), one of the most celebrated defiles in Hindostan, is about eight miles north by west from Raj-mahal, and forms the boundary between Bengal and Bahar. It is not, as was supposed, the only pass by which the former of these provinces is accessible, since the Mahrattas, in 1742, invaded it from another quarter.

Oudanulla, a small town in lat. $24^{\circ} 56' N.$, and long. $87^{\circ} 52' E.$, although 300 miles distant from the sea, is the nearest place where any thing so coarse as gravel can be found in the bed of the Ganges. It is also distinguished by the extensive lines formed in 1764, by Kâsim Ali, and forced by major Adams. Few traces of them now remain.

12. Rungpoor (Rungapura), situated in the north-eastern extremity of the province, about the twentieth degree of latitude, is bounded on the north by the Bootan hills, on the south by the Mymensing, on the east by the Brahmapootra, and on the west by Dinagepoor. Separated from Cooch Bahar by the river Durlah, it is an extremely irregular district, the boundaries of which, being ill defended, are exposed to continual incursions from the neighbouring states. The river Câratoiyâ, which divides this district from Dinag-pûr, is continually shifting its course, as are most of the other streams by which it is traversed. To the north-east are several lakes, the largest of which lies five miles north of Juszig-hopa, and on the eastern side is a red soil, called Ranga-nati, covered with stately forests, overgrown with plants of an extraordinary size. East of the Brahmapootra and Chon-cosh, is a considerable extent of lilly country, surrounded on all sides by low lands. The heat is more moderate than in the western regions of the province; and the cocoa-nut, which has been supposed to require the proximity of the sea, flourishes at Gôâl-parah, 250 miles from the nearest coast. The face of the country is open, flat, and well-watered; the soil fertile. The chief rivers are the Teesta, Durlah, and Brahmapootra. The chief towns are Rungpoor, Mun-gulliant, and Guzgotta.

In this district the inhabitants, having no mills, dress their wheat like rice, and all the gear necessary for carrying on a small farm of one plough may be bought for seven shillings. Rhinoceroses, elephants, and black bears, are found in the forests. The frontiers, bordering on Mörung and Butâu, are inhabited by wandering tribes of mountaineers, called Kichacs, or Gidar-mars, who live by robbing and plundering. The natives, in general, are unhealthy, and numbers

die in their infancy. Prostitution is extremely common, and is carried on by a regularly organised society, which is the less surprising as the country forms a part of Camarûpa, the Paphian empire of the Hindoos. In 295 houses were found 460 women from twelve to twenty-five years of age, besides a number of others more advanced in years, who, together with several men and boys, the offspring of this abandoned community, acted in the capacity of servants. These women, though they affect the manners of the Hindoos, are of Mahommedan origin, and may be adduced, in the face of our modern infidels, as another proof of the superior morality of the Mahommedan code. The Mussulmans of this district, when in distress, frequently address their prayers to the saints and deities of their idolatrous neighbours.

Rangpoor, or Rungpoor, under the Mogul government, was a military station, on the frontier, towards the Moring and Cooch Bahar, and was first partially wrested from the rajah of the latter district in the reign of Shah Jehan, when it was formed into a circar. It was afterwards completely conquered by the generals of Aurungzebe in 1660-1, when it received the name of Fakerooondy; and, with the pergunnah of Koonddy, formed the modern district of Rungpoor, comprehending a territory of 2679 square miles, distributed into several zemindaries. Within the jurisdiction of this district may be included that of Ranganamatty, and the adjoining rajahship of Cooch Bahar, comprising in all the dimensions of its financial divisions 6610 square miles. In 1765 it fell, with the rest of the province, into the possession of the English, since which it has been progressively advancing in the scale of improvement. The ruins of Comotâpur, and the city of Prit'hî Raj, in the division of Sanyasi-gôta, show what the splendor of this country must have been when in the zenith of its glory. The air, it is said, is not extremely salubrious; and glandular swellings in the throat are frequent among the inhabitants.

Rungpoor, in lat. $25^{\circ} 43' N.$, long. $89^{\circ} 22' E.$, is rather an assemblage of four distinct villages than a town. It is frequently named as the capital of Assam, but is in reality only the military station to the real capital Gergonge. A considerable number of towns form a circle round the Rungpoor division, which is twelve miles in length by ten in breadth. There are few public buildings of brick, as temples, mosques, &c., and the Europeans reside at D'hap, near an excellent road, shaded with trees. West of Rungpoor is a bridge, built in the reign of Roodra Singh, by workmen from Bengal, which may be deemed the western gate of the military fortress. The protection on the south is an immense causeway, or line of fortification, extending from Namdaugh to the Dhekow.

Chilmarrý, or Chilmári, is a place of great resort, particularly on account of a neighbouring sand-bank, called Vârum chûr, a place of pilgrimage to the Hindoos. Near Ranga-mati, or Rungamutty, is the great forest of Pârhat Joyâr.

Gôalpara, (Gôâl-pâra), on the south side of the Brahmapootra, in lat. $26^{\circ} 8' N.$, and long. $90^{\circ} 33' E.$, is the principal mart for the people

of Assam, who come hither to barter coarse cloths, sticklac, tar, wax, and gold, for salt. There is a considerable fishery at the beautiful lakes called Toborong, north of Jugih'hopa, where 1400 maunds (112,000 pounds), are annually taken and dried; one-half of which quantity goes as tribute to the raja of Bijni. Near the village of Tocar is a very remarkable hill, formed of one vast mass of granite.

13. Silhet (Srihata, a rich market), situated between the twenty-fourth and twenty-fifth degrees of latitude; is bounded on the north and east by a lofty ridge of mountains, inhabited by several wild tribes; on the south by Tipperah and Mymensingh, and on the west by Mymensingh. The mountains which form the boundary of this district rise with peculiar abruptness from the plains on the western side, and are probably branches of the great chain of Himalaya, stretching in a south-easterly direction, through Chátigang and Aracan, to the Indian Ocean. The mountainous scenery of this district is very striking and delightful, when contrasted with the flat landscapes of Bengal. Conical hills, rising at intervals, form one broad basis, clothed to their summits with the charms of freshness and verdure; and lofty mountains, in the directions before described, rising like a wall to an extraordinary height, are objects which delightfully break and diversify the prospects in many parts of this interesting region: 350 miles from these mountains, to the east, lies the province of Yun-nan, in the Chinese empire; and the intervening space consists of wild and rugged land, at present imperfectly explored. In 1784 Silhet contained 2861 square miles, of which the revenue was only 233,924 rupees. It forms the most easterly part of the Company's possessions in Hindostan, and, in 1582, was described by Abul Fazel as follows: 'Sircar Silhet, containing eight mahals, revenue 6,681,621 dams. This sircar furnishes 1100 cavalry, 190 elephants, and 42,920 infantry. Sircar Silhet is very mountainous. It furnishes many eunuch slaves for the seraglio.' During the rains the greater proportion of the land is laid under water by the overflowing of the Soormah and other rivers. When the floods are at their greatest height there is more than ten feet of water, in the midst of which the elevated sites of villages appear like islands. After the waters have drained off, the land is in excellent condition for the cultivation of rice. Food is remarkably cheap, the average price of rice being four or five maunds per rupee. In 1801 grain in the husk sold for fifteen rupees the 100 maunds, or rather less than a quarter of a farthing per pound, and wages were proportionably low. Limes and oranges are cheap, and of superior quality; the latter are grown in plantations, which, from their extent, might be called forests, and are sold on the spot 1000 for a rupee. It is very remarkable that in all our territories in Hindostan, there are only three places where excellent oranges are produced; viz. Sát-gar'h, near Madras and Bangalore; Châud-pûr, near D'haca, where they are delicious; and Silhet where they are little inferior. The hills in these places abound in limestone, which is perhaps the reason why the

soil is so favorable to the growth of the orange. Chunam (i. e. Chunah Lime), wax, ivory, and other articles, are procured from the K'hasias (Cosseahs), natives of the hills eastward. Aguru, (fragrant Aloe-wood, the Agallochum of the ancients, or Excoecaria Agallocha), and wild silk, are also articles of commerce. From the cheapness of the necessaries of life there is little occasion for gold and silver coin; a more minute subdivision of value being required. The rents are paid in cowries, which have become the medium of commercial transactions generally. The chief towns are Silhet, the capital, Azmerigunge, Láúr, &c. The Soorma and Megna are the principal rivers, and the population of this district, in 1801, amounted to 492,495 inhabitants, in the proportion of two Mahommedans to three Hindoos. Slavery, and the sale of children by their parents, appear to have existed amongst the people from time immemorial.

Under the Mogul government, Silhet was formed into a foudjardary, or military station. Its actual dimensions, since the dismemberment of several pergunnahs, are computed at 2861 miles, and divided into 146 small pergunnahs, held by about the same number of zemindars.

14. Tipperah, situated principally between the 22nd and 24th degrees of north latitude, is bounded on the north by Silhet and Dacca, on the south by Chittagong and the sea, on the east by the hills and deep forests, which separate it from the Birman dominions, and on the west by the great river Megna, and the district of Dacca Jela'poor. It was described by Abul Fazel, in 1582, as follows: 'Bordering upon Bhatty is a very extensive country, subject to the chief of Tipperah, him they style Yeyah Manick. Whoever is possessed of the rajahship bears the title of Manick, and all the nobility are called Nar-rain. Their military force consists of 1000 elephants and 200,000 infantry, but they have few or no cavalry.' This district is also named Roshenabad, and forms the chief eastern boundary of the province. In 1784 it was estimated to comprehend 6618 square miles, since which period various lands have been added. Its eastern limits are not yet accurately defined, being extremely wild, clothed with extensive forests, and abounding with elephants, &c. The gayal (a species of ox), is also found in a wild state. The region about the Megna, from Daoud Caundy to Luckipoor, is rich and fertile. It is celebrated for the production of the betel-nut, which is held in so great estimation among the Birmans and Arracaners, that they come annually and buy it nearly all up for ready money, after which they form contracts for the succeeding year. The cotton goods of this district, baftaes and cossaes, are celebrated all over the world. The elephants are numerous, but inferior to those of Chittagong and Pegu. The height of this animal has been greatly exaggerated. In India that of females is commonly from seven to eight feet, and that of males from eight to ten, measured at the shoulder as horses are. The largest ever known with certainty, belonged to Asoph ud Dowlah, the nabob of Oude, of which animal the perpendicular height at the shoulder was ten feet six inches. One belonging to the

nabob of Dacca measured ten feet. The height required by the government, for elephants employed in their service, is nine feet.

Tipperah appears to have been the seat of an independent Hindoo principality, for many centuries after the Mahomedan conquest of the rest of Bengal; although its limits were probably at that period more contracted. The Mahomedan historians call it the country of Jagenagur. In 1279 it was invaded by Toghril, the Patan governor of Bengal, who plundered the inhabitants, and brought away 100 elephants. In 1343 it was invaded by Ilyas, the second independent sovereign of the province, who carried off a great quantity of plunder. For many succeeding years the state nevertheless preserved its independence, but was at last brought into subjection in 1733, when a nephew of the Tipperah rajah's fled to Dacca, and procured for his assistance an army of men under the command of Meer Hubble Oolah, who put him in possession of the government, on condition of paying a large annual tribute; so that the whole province became virtually a part of the Mogul empire (itself at that time on the eve of dissolution), and changed its ancient name for that of Roushnabad. It came into our possession, with the rest of Bengal, in 1765; and in 1801 was estimated to contain 750,000 population, in the proportion of three Mahomedans to four Hindoos.

15. Twenty-four pergunnahs, a small district, situated on the south side of Calcutta and east of the Hooghly River, comprehend a territory of 882 square miles, which, in 1757, became the zemindary of the Company, and jaghire of Lord Clive. In 1765 was obtained a ten years prolongation of the Jaghire to his Lordship, after the expiration of which it reverted to the Company. Within its boundaries are no fewer than 190 seminaries maintained by charity lands and voluntary contributions, in which Hindoo law, grammar and metaphysics, are subjects of education. There is also one madrassah, or college, for teaching the Mahomedan law. In 1813 this district was much infested with dacoits, or river pirates, though in an evident state of improvement. The jamá, or land tax, amounted in 1814 to 1,249,003 rupees (£156,125. 7s. 6d.), and the *ab-cari* or excise to 1,249,003 rupees (£11,834. 7s. 6d.) It was also observed, that the lands subject to the jamá were better cultivated than those that were exempted. The total population of the twenty-four pergunnahs, the town of Calcutta, which is sometimes included in them, and the adjacent territories within twenty miles, are estimated at nearly 3,000,000, in the proportion of three Hindoos to one Mahomedan. Budget, in lat. 22° 29' N. and long. 88° 20' E., is remarkable on account of its capture in 1756.

16. Midnapoor (Mednipur), properly belonging to Orissa, but long attached to Bengal, and now considered one of its districts, lies between the 22nd and 23rd degrees of latitude. It is bounded on the north by Rangur and Burdwan, on the south by the independent zemindary of Mohurbunge and Balasore, on the west by Singbloom, Mohurbunge and part of Rangur, and on the east by Burdwan, Hooghly and the sea. Its

area, in 1784, contained 6102 square miles, but has since received considerable additions, and is now estimated in round numbers at 7300 miles. In 1770 the greatest famine ever recorded in history visited this district, and swept away nearly half its inhabitants. In 1801 it was found to contain one million and a half of inhabitants, and, although the soil is rich and fertile, two thirds of the district are described as consisting of jungle, and swarming with noxious animals. The clearing of the land is said to be prevented by the same superstitious prejudices as prevail in Rámgarh. In this district there are several forts of mud and stone, now in ruins, from one of which named Bataw, were lately removed twenty un-serviceable pieces of artillery. The private houses of the zemindars, and other men of note, frequently consist of ruined forts. Celibacy is in this part of Bengal extremely uncommon; an unmarried Hindoo man of twenty-five, or an unmarried girl of fifteen, being scarcely to be found, and, although the women in general are prematurely debilitated, few marriages are unproductive. The facility of rearing children is extreme. As soon as a child is weaned it lives upon rice, like its parents, requires no care, goes naked for two or three years, and enjoys the best of health. Polygamy, prostitution, religious austerity, and the circumstance of young widows not marrying a second time, have nevertheless considerable influence upon the numerical population. The small pox also commits great ravages, owing to the unwillingness of the natives to practice inoculation.

The principal places of Midnapoor are the town of the same name, 70 miles west by south from Calcutta, Jellasure, Pipley, and Narraingur.

Of the existence of Bengal as a separate kingdom, there is no other evidence than its distinct language and peculiar written character. At the time of the war of Mahabharat, it consisted of three kingdoms, and afterwards formed part of the Maghada empire, from which it was dismembered before the Mahomedan invasion. The last Hindoo prince of this province, mentioned in history, was Lacshmanyah, who held his court at Nuddeah. During the reign of Cuttub ud Deen, the sovereign of Delhi, Mahomet Bukhtyar Khilijee was despatched to invade Bengal. This general captured the metropolis, expelled Lacshmanyah, and afterwards proceeded to Gour, where he established his capital, and reared his mosques on the ruins of Hindoo temples. The whole of this province is said to have been subdued in one year, and the death of the rajah at Juggernaut, where he retired immediately upon his defeat, gave little hope of a restoration. From this time Bengal was ruled by governors delegated by the sovereigns of Delhi, until 1340, when Fakher ud Deen, having assassinated his master, revolted, and after laying the foundation of an independent monarchy, was defeated and put to death. He was succeeded, in A. D. 1343, by Ilyas Khanje, from whom the succession continued till 1538, when Mahmood Shah was expelled by Shere Shah the Afghan, and Bengal once more became an appendage to the throne of Delhi. In 1576 it was conquered by the generals of the emperor Aebur, and four years

afterward formed into a soubah, or vice-royalty of the Mogul empire, by Rajah Tooder Mull. During the government of Azim Khan. A. D. 1534, the English obtained permission to trade with their ships to Bengal, in consequence of a firman from the Emperor Shah Jehan; but were restricted to the port of Pipley, where they established their factory. In 1642, during the reign of Sultan Shujah, the second son of Shah Jehan, and brother of Aurengzebe, Mr. Day, the agent who had so successfully established the settlement at Madras, proceeded on a voyage of experiment to Balasore, whence he sent the first regular despatch ever received by the court of directors from Bengal, recommending a factory at Balasore. In 1656 the factories of the Company were withdrawn, owing to the oppression and extortion which they experienced. In 1664 Shaista Khan succeeded to the throne, during whose government the French and Danes established themselves in the province. In 1680 Mr. Job Charnock was restored to his situation of chief at Cossimbazar, and in the year following, Bengal was constituted a distinct agency from fort St. George, or Madras. It was in 1686 that in consequence of a rupture with the Foujdar, or native military officer of Hooghly, as already described, that the agent and council retired to Calcutta. In 1689 Ibrahim Khan ascended to the supremacy, and in 1693, upon the death of Mr. Job Charnock, Mr. Eyre succeeded him, the seat of the Company's trade continuing at Chattanooga. Sir John Goldesborough was sent out as general commissary and superintendent of all the Company's possessions, but he also died in 1694, having confirmed Mr. Eyre as chief. In consequence of the rebellion of Soobha Singh, in 1696, the foreign settlers, viz. the Dutch at Chinsurah, the French at Chandenagore, and the English at Chattanooga, obtained permission to put their factories in a state of defence, the first instance of the kind ever tolerated within the limits of the Mogul dominions. In 1700 the reigning prince Azim Ushaun, grandson to Aurengzebe, permitted the Company's agents, in consideration of a valuable present, to purchase the three towns of Chattanooga, Govindpoor, and Calcutta, with the lands adjacent to their fortified factory, and Mr. Eyre the chief, having strengthened the fort, denominated it Fort William, in compliment to the King.

In 1706 the whole stock of the Company had been removed to Calcutta, where the garrison consisted of 129 soldiers, of whom sixty-six were Europeans, exclusive of the gunner and his crew. After the invasion of Hindostan by Ahmed Shah Abdalli in 1746, and the death of the emperor Mahomet Shah in the year following, the Mogul empire, with the exception of the region in the immediate vicinage of Delhi, may be considered at an end. In 1756 Seraje ud Dowlah, grandson to the late nabob, Ali Verdy Khan, showed a very hostile feeling towards the Europeans, he took possession of the three provinces in the month of April, and on the 20th of June captured Calcutta, on which occasion he shut the prisoners, to the number of 146, in a room 20 feet square, where they all perished, with the exception of twenty-three individuals. On the first

of January in the year following, Calcutta was retaken by Admiral Watson and Colonel Clive, and the tyrant defeated at Plassey, on the 20th of June. Crimes seldom go long unpunished, and this monster is said to have been assassinated in the July following by the son of his successor, in the twentieth year of his age, and the fifteenth month of his reign.

From this period may be dated the commencement of the British government in Bengal. The Dewanny, however, was not fully obtained till 1765, when lord Clive procured it from Shah Allua, on condition of paying him the annual sum of twenty-six lacks of rupees, and also securing him a territory in Upper Hindostan, both of which he forfeited, in 1771, by putting himself under the protection of the Mahrattas. The acquisition of the Dewanny, observes a native historian, 'was settled without hesitation or argument, as easily as the purchase of an ass, or any other animal, without envoys or reference either to the king of England, or the Company.' In 1767 lord Clive returned to his native country, and was succeeded by Mr. Verels and Mr. Cartier. A circumstance which occurred about this period, serves to show the state of the inhabitants. In August, 1770, a most alarming phenomenon appeared, of a large black cloud at a distance in the air, which sometimes obscured the sun, and seemed to extend a great way over and about Calcutta. The hotter the day proved, the lower this cloud seemed to descend, and for three days it occasioned great speculation. The brahmins pretended that this phenomenon, which was a cloud of insects, would make its appearance three times; and if ever they descended to the earth, the country would be destroyed by some untimely misfortune. They said, that about 150 years before, there had been such another bad time, when the earth was parched for want of water; and this cloud of insects made its appearance, though it came much lower the second time than it had done before. On the third day, the weather being very hot and cloudy, they descended so low that they could be plainly seen. They seemed to be about the size of a horse-stinger, with a long red body, large head and eyes, keeping close together like a swarm of bees, and, to appearance, flying quite on a line. None, however, were caught, the people being so much frightened by the prognostications of the brahmins. Whilst it rained, they continued in one position for near a quarter of an hour; then they rose five or six feet at once, and in a little time descended as much, until a strong north-west wind blew for two days successively. During its continuance they ascended and descended, but more precipitately than before; and next morning the air was quite clear. For some days before the cloud made its appearance, the toads, frogs, and insects, which, during the rains, make a continual noise through the night, disappeared, and were neither heard nor seen, except in the river.

The year 1772 was distinguished by a change in the administration, and Mr. Hastings was appointed governor. This gentleman was superseded thirteen years afterwards by Sir J. Macpherson, who held the administration till the arrival of Lord Cornwallis in 1787. During his lordship's

government, which lasted until August, 1793, the land revenue was permanently settled, a code of regulations enacted, the army and magistracy new-modelled, and various additional improvements laid down, in which his successor, Lord Teignmouth, perfectly acquiesced; and the marquis Wellesley, during a residence of some years, viz. from 26th of April, 1798, to the 20th of August, 1805, had the honor of completing them.

The Marquis Cornwallis, on his second mission, arrived at Calcutta in July 1805, and died at Ghazipoor, near Benares, on the 5th of the following October. His successor, Sir Geo. H. Barlow, conducted the administration till the arrival of Lord Minto, in July 1807, and on his lordship's return to Europe in 1813, the earl of Moira, who has recently been re-called, assumed the reins of government.

For further and more particular information on the various subjects connected with this article, we refer the reader to *Colbrooke, Stewart, Tennant, Grant, Asiatic Researches, Asiatic Journal, Asiatic Annual Register, Lambert, Bruce, Lord Teignmouth, Milburn, Ward's Religion of the Hindoos, Lord Valentia's Travels, &c. &c.*

BENGAL BAY OR, is a portion of the Indian Ocean, in figure resembling an equilateral triangle, similar to that formed by the continent of the Deccan, &c. south of India, and improperly called the peninsula. The western side extends from Bengal to Ceylon; the eastern from Bengal to Junkseyon, the remaining one across the bay from Ceylon to Junkseyon. Each angle may be estimated at 1120 miles in length, the whole being comprehended within the eighth and twentieth degrees of north latitude. The western coast of the bay is inhospitable for shipping, especially for ships of burden, there being no commodious harbour. On the contrary, the opposite coast affords many excellent harbours, as Aracan, Cheduba, Negrais, and Syriam, in Pegu, near Martaban; Tavoy River, King's Island, Junkseyon, Telebene, Pula Larla, and several others in the Mergui Archipelago. The winds in the bay are said to blow six months of the year from the north-east, and the other six from the south-west, which, though not strictly accurate, is sufficiently

so for common purposes. It is remarkable that in many parts of India, strong winds are observed upon the shore during March and April, blowing directly from the sea, while in the offing it is perfectly calm. Thus, in Bengal, about that period, are strong southerly winds, while in the bay calms prevail until May and June. The south-west monsoon does not commence on the Malabar coast till the opening of the rainy season, although in-shore is visited by strong westerly winds from about the vernal equinox. The tides and currents of the bay run with great velocity; and, as opposite currents frequently meet, a rippling is formed, extending in a straight line for several miles, with a sound resembling that of breakers. The numerous rivers that open on the coast carry into the bay such quantities of slime and mud, that the sea appears turbid at a great distance from the shore. The eastern and western coasts differ very materially. Coromandel has no soundings thirty miles from the shore; the east coast has soundings as far distant as two degrees. Coromandel opens the prospect of a comparatively clear country; the eastern side is covered with wood. Coromandel is extremely hot, from the winds blowing over arid sands; the eastern coast is always cool. On the former side of the bay, the mouths of the rivers are choked with sand; on the latter they are deep and muddy. Coromandel is often visited with destructive gales; the eastern coast has these but seldom.

The land bordering on the summit of this bay, from Point Godavery to Cape Negrais, is understood in the Hindoo Puranas by the term Calinga, and is divided into three parts: 1. Calinga Proper, which extends from Point Godavery to the western branch of the Ganges; the natives of which are called Calingi by Elian and Pliny. 2. Madhya, or Middle Calinga, in the Delta of the Ganges, which Pliny corruptly calls Medo Galinea. 3. Moga Calinga, extending from the eastern branch of the Ganges to Cape Negrais, in the country of the Mias or Muggs, called by Pliny Maccu Calingæ. This term Calinga, simply refers to a country abounding with creeks, and might be applied to the sea coast about the mouths of the Indus with equal propriety.

BENGAL QUINCE, in botany, the English name of the crataeva marmelos of Willdenow; and agle marmelos of Correa, and others.

BENGAL STRIPES. See GINGRAMS.

BENGO, a river of Angola in Western Africa, having a town of the same name at its mouth. It falls into the Atlantic, in lat. 8° 50'S.

BENGUELA, a province of Angola, bounded on the east by the river Rimba, on the north by the Coanza, and extending west quite to Cape Negro, where the Portuguese possess the only European settlements. Benguela was formerly governed by its own kings; but was entirely ruined by the incursions of the barbarous Gikas, so that its being conquered by the Portuguese, proved a happiness to the natives. The interior is little known, but the country is reputed very

unhealthy. It produces abundance of salt, and the mountains are said to abound in copper. Coral beads are at once the favorite ornament and the only money of this district. The chief town is Benguela de san Felipe, where the Portuguese have a fort, and the viceroy resides, north of the bay of Benguela, in long. 12° 50', lat. 12° 54'S. The harbour is reckoned commodious and safe.

BENHADAD I.; בְּנִי־הָדָד, Heb. i. e. a son of noise; the son of Tabrimon, king of Syria, who bribed by the king of Judah, broke his league with Baasha, king of Israel, and ravaged the northern parts of that kingdom. See 1 Kings xv. 18.

BENHADAD II. the son and successor of Benhadad I. was a still more terrible scourge to the Israelites. 1 Kings xx. and xxii. and 2 Kings v—viii.

BENHADAD III. the son of Hazael, king of Syria, was contemporary with Joash and Jeroboam, kings of Israel. 2 Kings xii—xiv.

BEN-HINNOM, or HINNOM, in ancient geography, a valley in the suburbs, and east of Jerusalem, either a part of, or conjoined with the valley of Kidron; infamous for sacrificing children to Moloch by fire. The place in the valley where the idol stood to which the sacrifice was made, was called Tophet (2 Kings xxiii. 10. Jer. vii. 31, 32, and xix. 2.) from the beating of drums or tabors, to drown the cries of the children; called also Geenon or the Valley of Ennon; whence some derive Gehenna, the place of future punishment.

BENI, a large navigable river of the province of Cuzco, in Peru. It has its rise in the Andes, and runs from east to west, until it enters the Ucayale, a branch of the Amazons. On its shores are many missionary settlements.

BENJAMIN, בְּנִימִן Heb. i. e. the son of the right hand, the youngest son of Jacob by Rachael, and parent of one of the tribes of Israel. Dr. Horne takes particular notice of the circumstances and place of his birth, as figurative of the birth of the Messiah.

BENJAMIN, of Tudela, a learned Jew of the twelfth century, born at Tudela in Navarre. He is supposed to have explored the countries to the north of the Euxine and Caspian as far as Chinese Tartary; where he collected considerable information respecting the Oriental tribes of the Jews. His narrative is curious, but romantic; and was first published at Constantinople in 1543, with a Latin translation by Arius Montanus. There are, also, English and French versions.

BENJAMIN, a gum. See BENZOIN.

BENIGHT. Be and night. See NIGHT. To darken; to surprise with the coming on of night; figuratively, to cloud with ignorance.

He that has light within his own clear breast
May sit i' th' centre and enjoy bright day;
But he that hides a dark soul, and foul thoughts,
Benighted walks under the mid-day sun;
Himself is his own dungeon. *Milton.*

Those bright stars that did adorn our hemisphere,
as those dark shades that did *benight* it, vanish. *Boyle.*

A storm begins, the raging waves run high,
The clouds look heavy, and *benight* the sky. *Garth.*

The miserable race of men, that live
Benighted half the year, benumb'd with frosts,
Under the polar Bear. *Philips.*

Being *benighted*, the sight of a candle, I saw a good way off, directed me to a young shepherd's house. *Sidney.*

Here some *benighted* angel, in his way,
Might ease his wings; and, seeing heaven appear
In its best work of mercy, think it there. *Dryden.*

But what so long in vain, and yet unknown
By poor mankind's *benighted* wit is sought,
Shall in this age to Britain first be shown. *Id.*

BENIGN, } French, *benigne, bénignité*;
BENIGNANT, } Ital. and Span. *benigno, benign-*
BENIGN, } *nita, benignidad.* Kindness of
BENIGNLY. } intention; gentle; courtesy;
actually good; generous and liberal; soothing;
emollient, in opposition to what is irritating
and malignant.

This is y enough, Grisilde min! quod he,
Be now no more agast, ne evil apaid;
I have thy faith and thy *benignitee*
(As wel as ever woman was), assaid,
In gret estat and pourelich arraied.

Chaucer. Cant. Tales.

This turn hath made amends! Thou hast fulfilled
Thy words, Creator bounteous and *benign*!
Giver of all things fair. *Milton.*

So shall the world go on,
To good malignant, to bad men *benign.* *Id.*

We owe more to Heaven, than to the sword,
The wish return'd of so *benign* a lord. *Waller.*

What Heaven bestows upon the earth, in kind in-
fluences and *benign* aspects, is paid it back in sacrifice
and adoration. *South.*

They who delight in the suffering of inferior crea-
tures, will not be very compassionate or *benign.* *Locke.*

Different are thy names,
As thy kind hand has founded many cities,
Or dealt *benign* thy various gifts to men. *Prior.*

It is true, that his mercy will forgive offenders, or
his *benignity* co-operate to their conversion. *Brown.*

Although he enjoys the good that is done him, he
is unconcerned to value the *benignity* of him that
does it. *South.*

These salts are of a *benign* mild nature in healthy
persons; but in others retain their original qualities,
which they discover in cachexies. *Arbuthnot.*

Bones receive a quicker agglutination in sanguine
than in choleric bodies, by reason of the *benignity* of
the serum, which sendeth out better matter for a
callus. *Wiseman.*

'Tis amazement more than love,
Which her radiant eyes do move;
If less splendour wait on thine,
Yet they so *benignly* shine,
I would turn my dazzled sight
To behold their milder light. *Waller.*

Oh, truly good, and truly great!
For glorious as he rose, *benignly* so he set. *Prior.*

BENIGNUS (St.), an Irish divine of the fifth
century, said to have been a disciple of St.
Patrick, and to have been his successor in the
see of Armagh. He died in 468. A work on the
Life and Miracles of St. Patrick, the Munster
Book of Reigns, and an Irish poem on the con-
version of his countrymen, are ascribed to him.

BENIHASSEN, a province of Morocco, on
the shores of the Atlantic. It abounds in corn,
and is said by Mr. Jackson to contain 300,000
inhabitants. Sallee is the chief town.

BENI-MEZZAB, a southern district of
Algiers, inhabited by a tribe of Arabs bearing
this name, who pay a mere nominal submission
to the Algerine state. The chief town is Gar-
deiah.

BENIN, an extensive kingdom on the coast of
Africa, whose boundaries are not precisely ascer-
tained, although the name seems to be generally
applied to that part of the coast extending from
the Rio Lagos to the Rio Formosa. It derives
its name from the river Bonny or Baní, which
flows from the north-west. It was first explored,
as Di Barros asserts, in 1486, by Alfonso de
Aveiro, in consequence of a request from the
king that missionaries might be sent to instruct
him in the Christian religion. The same author
mentions an embassy of the Portuguese, sent to
a great distance in the interior, for the purpose

of visiting a prince called Ogane, to whom the king of Benin was tributary. This major Rennell supposes to be the celebrated kingdom of Gana, established by the Arabians on the Niger. The entire coast presents a succession of estuaries, the origin of which has never been explored. These, dividing themselves into branches, intersect each other, and form a number of alluvial islands; and not unfrequently small floating islets, covered with shrubs and bushes, are brought down towards the sea. A recent traveller imagined from this aspect of the coast that the estuaries in question might form the embouchure of the great central river of Africa, the termination of which remains enveloped in mystery. At least the number of outlets appear to be the mouths of one large stream, forming a delta in the interior, like that of the Nile or the Ganges. The banks of these rivers, though fertile and agreeable, are extremely insalubrious, and particularly fatal to Europeans, so that the vessels which ascend them for the purpose of procuring slaves, commonly lose a great part of their crews before they return. This may be one reason why, notwithstanding the facilities of navigation, fewer attempts have been made to explore the interior from this part of the African coast than from almost any other.

There does not appear to have been any establishment on the coast before 1786, when the French erected a fort at the mouth of the Formosa, on the island of Borodo, ceded to them by the king of Wari. This was afterwards destroyed by our cruisers in 1793.

The land in general is low and woody; in some parts it has rivers and lakes, but in others there is a scarcity of water. The soil is every where alluvial, and highly productive, even where fresh water cannot be obtained, as is the case between Gato and Benin. It has a great number of wild beasts, particularly elephants, lions, tigers, leopards, baboons, monkeys, wild boars, deer, &c. The birds are partridges, of which some are blue and some green, turtles, wild ducks, woodcocks, &c. Indian corn and yams are the ordinary food of the natives, and serve in the room of bread; they have two sorts of beans, like horse-beans, but not near so good. Their fruits are cocoa-nuts, cormantine apples, bananas, wild figs, &c. Gold-dust is not found in this kingdom, which, together with the absence of other mineral productions, shows that the higher lands must be at a considerable distance. The negroes have several colors which might serve for painting, and a good sort of soap made with palm-oil and wood-ashes; palm-oil, salt, and acori or blue coral, are articles of trade; they have, also, a great deal of cotton, which not only serves for their own use, but is exported to distant places. A little above Arebo the country is extremely marshy and full of islands, overgrown with lofty trees; it is also incommoded with vast numbers of mosquitoes, which sting terribly, and render the skin full of pustules. There are three principal villages, to which the negroes come from the inland countries to traffic. One is called Boodaden, and consists of about fifty-five houses or huts, for they are made with reeds and covered with leaves. The

second, called Arebo, is much larger than the former, and pretty well stocked with inhabitants; the houses of this village have much more room, but are built after the same manner as the former. The third is named Agaton and was built upon a hill, and was almost ruined by the wars; but has been lately rebuilt by the negroes on account of its agreeable situation. Great Benin is the capital and residence of the king. The inhabitants are very exact in their trading, and will not recede from any of their old customs; this renders them so slow in their dealings, and backward to pay their debts, that even traders are sometimes obliged to sail before they receive satisfaction; but then they are paid when they return. Some of the merchants are appointed by the government, which demands a sort of custom, though very trifling. There are three sorts of officers under the king; the first are always near him, and none can address him but by their means: of the second sort, one takes care of the slaves, another of the cattle, another of the streets, another of war, and so on. Children go almost naked till they are fourteen, when they wrap a cotton cloth round their middles: the richer sort put on a sort of calico gowns, when they go abroad, with a kind of drawers; but within they are contented with their usual cloth: the women of the superior rank wear their cotton cloths like petticoats, and have a covering round their shoulders, but keep it open before. The rich inhabitants of Benin live upon beef, mutton, and poultry; their drink is water, and brandy when they can get it. The poorer sort live upon dried fish, bananas, and beans; their drink is water and palm-wine. Their chief handicrafts-men are, smiths, carpenters, and carriers: but they perform all their work in a very bungling manner. The men have as many wives as they can keep, whom they take without any ceremony, except giving a treat to their relations: when M. Palisot de Beauvois was in this country, one of the king's ministers had no fewer than 400. The wives of the lower sort may go where they please; but those of the rich are shut up. The husband, generally speaking, is jealous of his wives with respect to his own countrymen, but extremely indulgent to their connexion with Europeans, and not unfrequently offers them himself. In other cases when a woman is caught in adultery she is turned away, and the goods of the man are forfeited to the husband; but if the relations of the woman are rich, they prevail with him to overlook the fault by dint of presents. They use circumcision, which is performed seven days after the children are born, at which time the father makes a feast for the relations; they have also customs, relating to uncleanness, resembling those of the Jews. Thieves are punished by making the party amends, if they can, otherwise they are bastinadoed; but murder is always punished with death. When a person is only suspected of a crime, they have several ways of putting him to a trial, like the fire ordeal, or the bitter water of the Jews; but they are of such a nature, that the innocent may be as often condemned as the guilty. The religion of this country, like that of the rest of this coast, is a fetish (fertiço) worship, debased by

the grossest superstition. They believe in one almighty and invisible God; yet worship images as well in a human form as in those of inferior animals. They look upon these lesser deities as mediators between God and man; some of these idols are in the house, and some in cabins by themselves. Every fifth day is holy; on which the rich kill cows, sheep, and goats; and others, dogs, cats, and fowls, which they distribute among their poor neighbours.

The government of Benin is entirely absolute, and the king, like most of the negro princes, has a despotic power. He is venerated almost as a deity by his subjects, and is constantly attended by three grandees, through whose agency all affairs are transacted. He never appears in public except twice in the year, at the *yam*-feast and the *cowry*-feast, and then human sacrifices are offered up. On these occasions he is surrounded with his wives and a great number of officers, who walk out in procession, and begin the feast by sacrificial oblations. This done, he bestows victuals and wine among the multitude, which is imitated by his officers. On those whom the king wishes to confer peculiar honor, he bestows a string of coral, equivalent to one of our orders of knighthood; but it is death afterwards to lose this badge, or even to quit it for an instant. One traveller mentions a case in which this ornament had been stolen: and in consequence, the original possessor, the thief, and three persons who had known the crime without disclosing it, were put to death. At the decease of the king a great number of his attendants are buried alive along with him; and the descriptions given by the older navigators of the massacres made on these occasions are as horrid as similar scenes in *Ashantee* described by Mr. Bowditch. The obsequies are followed by a splendid festival celebrated with every species of intoxication and debauchery. It is, however, to be regretted that we have no authentic description of this country more recent than those of *Nyendael* and *Bosman*; the last of which was written more than a century ago.

Great Benin, the capital of the kingdom, and residence of their kings, is seated in the interior, on an open plain, and is enclosed by a wide ditch. Its extent, according to some travellers, is truly immense; it is said to be eighteen miles in circumference; to have one street three miles long, and many others of nearly equal dimensions. There are markets in the town twice a day, where the natives sell cows, cotton, elephants' teeth, European merchandises, and other valuable commodities; separate quarters being allotted for each distinct species of traffic. The women attend the markets, till the ground, and manage their domestic concerns. The king's palace consists of a great number of square enclosures, presenting an irregular and confused heap of buildings, made of boards and clay, including houses for the royal person, his women, and officers, besides stables, magazines, repositories, &c. The buildings are covered with shingles, and the nearest springs are a furlong distant, which must be a serious inconvenience in so hot a climate. The king's family is, however, smaller than those of the neighbouring monarchs, the number of his

wives seldom exceeding six hundred. In the midst of the royal enclosure is a wooden tower about seventy feet high, made like a chimney, and on the top is a brazen serpent, hanging with his head downwards: this is well made, and is the most curious thing in the town. There is a gallery of statues, but so wretchedly carved, that there is no knowing what they represent without being told: behind a curtain there are eleven brazen heads, with an elephant's tooth on each; these are the king's idols: his throne is made of ivory, on which he sits in a pavilion of Indian stuff. All the inhabitants of this town and country go under the denomination of the king's slaves; and some say, that none of them wear any habit till given them by the king; but this seems to be only a salvo to account for the great number of men and women that are daily seen naked in the streets; for if it be true, that the king of Benin can bring 100,000 fighting men into the field, his subjects must be very numerous; and it is scarcely probable he could bestow garments upon them all. The buildings of the town generally consist of huts, thatched with the leaves of the fan-palm (*latania*); and the town wall is composed of trunks of trees interwoven in the manner of a palisade. *Jabu*, west of the *Formosa*, is a place of considerable importance, and in rank, perhaps, next to the capital: blue and white cottons, manufactured here, are taken by the Portuguese for the use of their slaves in *Brasil*. *Wari*, an island at the mouth of the *Rio de Escavo* or *Dos Forcados* (slave's or hangman's river), formerly gave its name to an independent state. The Benin river in this kingdom has many arms, or sources; some of them so large that they deserve the name of rivers; it abounds with fish, which the inhabitants eat smoke-dried as well as fresh. The place of trade in this river is at *Arebo*, about 120 miles distant from its mouth; and to this place the ships may sail up. Those who take this voyage see the mouths of a great many rivers fall into the principal channel on the right and the left: but how far it ascends into the country is not known.

The natives are remarkably courteous and hospitable; they have the faults and the virtues of negroes; generally, they are benevolent and faithful; but irascible, vindictive, indolent, and thoughtless; the slaves of an inhuman and degrading superstition. The females are said to be lively and handsome, fond of ornament, and to use great art in dressing their hair. The attachment of these people to their country is beyond all bounds: how must this heighten the wretchedness of those who are carried off in slave ships! The number of these unhappy victims, from *Bani* alone, before the abolition, amounted to nearly 20,000 annually; and it is to be feared that the French and Portuguese have renewed the traffic to a great extent since the conclusion of the continental war.

This state, like many other negro kingdoms, has at times acquired an extensive influence over the petty principalities in the neighbourhood. At present, the islands of *Wari* (*Warce*, *Owheri*, *Owarre*, or *Awarri*), and *Bani* (*Bonny* on the east, and *Jabu* on the west), are tributary to the sovereign of Benin.

Robertson's Notes on Africa, 297. *Le Groing* and *Palisot de Beauvais* in the *Annales des Voyages*. *Smith's Voyage to Guinea*.

BENINI (Vincent), a learned physician, born at Cologne, in 1713. He settled and practised at Padua, where he kept a printing press in his house, from whence he sent into the world several good editions of classical authors. He wrote in Latin, *Notes on Celsus*; in Italian, *Observations upon the Poem of Alamanni*, entitled *Culture*, and a *Translation of the Syphilis of Fracastorius*. He died in 1764.

BENISON, *n. s.* *Benir* to bless; *benissant*, Fr., blessing; benediction: not now used, unless ludicrously.

We have no such daughter; nor shall ever see
That face of hers again; therefore, begone,
Without our grace, our love, our *benison*. *Shakespeare*.

Unmuffle, ye fair stairs, and thou, fair moon,
That won'tst to love the traveller's *benison*. *Milton*.

BENSUWEEF, a town of Egypt, on the west bank of the Nile, in El Wostani, and the residence of a bey. It is adorned with many mosques, and has manufactories of carpets, woollens, and linens. Standing in lat. 29° 9' N., long. 30°. 32' E.

BENLAVERS, a mountain of Scotland, in the county of Perth, supposed to be the third highest in the island of Britain. Height 4015 feet.

BENLOMOND, a mountain of Scotland, in the county of Dumfries, chiefly composed of granite, with immense masses of quartz. It rises from Lochlomon, a beautiful lake, to the height of 3240 feet above its level, and 3262 above the level of the sea. Its sides are covered with fine natural woods, and it gives rise to several rivers.

BENMACDUE, a mountain of Scotland, on the western confines of the county of Aberdeen, and the second highest mountain in the island of Britain. During one of the hottest days of September, Fahrenheit's thermometer was found to stand at 47 degrees on the summit. Height 4300 feet.

BENMORE, a mountain of Scotland, in the county of Perth, of a conical form. Height 3903 feet.

BENNAVENTA, or **BENNAVENNA**, an ancient town of Britain, on the *Ausonia Major*, or the *Antonia* of Tacitus: supposed to be Northampton on the *Nen*; but according to Camden, Weedon, a village six miles to the west of Northampton.

BENNET (Christopher), a physician of the sixteenth century, was a native of Raynton, in Somersetshire. He was educated at Lincoln College, Oxford; and published a treatise on consumptions, entitled, *Theatri Tabidorum Vestibulum*, &c.; also, *Exercitationes Diagnosticæ, cum Historiis demonstrativis, quibus Alimentorum et Sanguinis vitia deleguntur in plerisque morbis*, &c.

BENNET (Henry), earl of Arlington, was born of an ancient family in Middlesex. In the beginning of the civil war, he was appointed under secretary to George Lord Digby, and afterwards entering as a volunteer in the royal cause, received several wounds at Andover. He continued faithful to the royal interest in foreign parts, and was made secretary to the duke of York;

knighted by Charles II. at Bruges in 1658; and sent envoy to the court of Spain. Charles, upon his restoration, made him keeper of the privy purse, and principal secretary of state. He had always a peculiar dislike to the lord chancellor Hyde; who considered him as a concealed papist. In 1670 he was of the council, entitled the *Cabal*, and one of those who advised shutting up the exchequer. In 1672 he was made earl of Arlington and viscount Thetford, and soon after K. G. He was appointed in 1673 one of the three plenipotentiaries to Cologne, to mediate a peace between the emperor and the king of France. The House of Commons, the same year, drew up articles of impeachment against him; but in 1674 he was made chamberlain of the king's household. But his interest declined before his death, which took place in 1685. His letters to Sir William Temple were published after his death, and are much esteemed.

BENNET (Thomas), D. D. an eminent divine, born at Salisbury in 1763, and educated at Cambridge. In 1700 he was made rector of St. James's, Colchester; afterwards he was lecturer of St. Olave's, Southwark, and morning preacher at St. Lawrence, Jewry; at last he was presented to the vicarage of St. Giles's, Cripplegate. He wrote, 1. An Answer to the Dissenters' Plea for Separation. 2. A Confutation of Popery. 3. A Discovery of Schism. 4. An answer to a book entitled Thomas against Bennet. 5. A Confutation of Quakerism. 6. A brief History of the joint Use of pre-conceived Forms of Prayer. 7. An Answer to Dr. Clarke's Scripture Doctrine of the Trinity. 8. A Paraphrase, with Annotations, on the Book of Common Prayer. 9. An Hebrew Grammar, and other pieces. He died October 9th, 1728.

BENNET, an herb; the same with *avens*.

BENNET, in botany. See *CARYOPHYLLUS*.

BENNETT (Agnes Maria), a celebrated novelist, wrote *Anna*, or *Memoirs of a Welsh Heiress*—4 vols. an impression of which was sold on the day of publication. *Juvenile Indiscretions*, 5 vols.; *Agnes de Courci*, 4 vols.; *Ellen, Countess of Castle Howell*, 4 vols.; *The Beggar Girl and her Benefactors*, 5 vols. The last production of her pen was, *Vicissitudes abroad, or the Ghost of my Father*, 6 vols.; 2000 copies of which are said to have been disposed of the day it made its appearance. Most of her novels have been often re-printed, and some have been translated into French and German. She died at Brighton in 1805.

BENNEVIS, a mountain of Scotland, in the county of Dumfries, the highest in the island of Great Britain. It rises 4370 feet above the level of the sea. A great portion of this mountain consists of porphyry, of different shades, and beautiful red granite. It also contains a vein of lead ore, richly impregnated with silver. On one side of the mountain there is an immense precipice. The summit is generally covered with snow.

BENNINGTON, a county of the State of Vermont, in North America, bounded North by Rutland, east by Windham, south by the State of Massachusetts, west by a due north and south line, which divides it from the State of New York.

It is thirty-four miles from north to south, and nineteen from east to west. The population is upwards of 17,000. Bennington and Manchester are the two principal towns. In the mountains are found large quantities of iron ore; and in the neighbourhood of Bennington, the capital, there is a fine marble quarry.

BENNINGTON, a post town of the county, and formerly the seat of government, is situated near the south side of the Hoosack river, and contains a population of about 3000, engaged in manufactures of cotton, wool, and paper. A battle was fought near this town in 1777, between brigadier-general Starke, at the head of 800 militia, and a detachment of general Burgoyne's army, in which, after a doubtful conflict, the Americans were victorious. The county courts are held alternately here and at Manchester. Bennington has also an academy and a weekly newspaper. It is thirty-seven miles north-east of Albany, 298 from Philadelphia, and 395 from Washington.

BENOIT (Renatus), a doctor of the Sorbonne, and rector of St. Eustathius at Paris, in the sixteenth century. He was a secret favorer of the protestant religion; and, that his countrymen might be able to read the bible in their own tongue, he published at Paris the French translation, which had been made by the reformed ministers at Geneva. It was approved of by several doctors of the Sorbonne before it went to press, and Charles IX. had granted a privilege for printing it. Yet when it was published it was immediately condemned. He had been before this confessor to Mary queen of Scots during her stay in France, and attended her when she returned to Scotland. Some time before the death of Henry III., Dr. Benoit, or some of his friends with his assistance, published a book, entitled, *Apologie Catholique*, i. e. *The Catholic Apology*, in which it was showed, that the protestant religion, which Henry king of Navarre professed, was not a sufficient reason to deprive him of the crown of France. When Henry IV. was resolved to embrace the Catholic religion, he also assisted at the assembly in which that monarch abjured protestantism. The king promoted him to the bishopric of Troyes in Champagne, 1597, but he could never obtain the papal bull to be installed. However, he enjoyed the temporalities of that bishopric, till he resigned it. He died in 1608.

BENOIT (Elias), a French protestant divine, born at Paris in 1640. On the revocation of the edict of Nantes, he retired to Holland, and became pastor of the church at Delft, where he died in 1728. He wrote a *History of the Edict of Nantes*, 5 vols. 4to, 1693, and several tracts of lesser note.

BENOWM, the capital of the Moorish kingdom of Ludamar, in central Africa. According to Mr. Park, who was detained here some time in captivity, it presents to the eye the appearance of a number of dirty looking huts, scattered irregularly over a large extent of ground, and resembling a camp rather than a town. Long. $7^{\circ} 10'$ W., lat. $15^{\circ} 5' N$.

BENSERADE (Isaac de), an ingenious French poet of the sixteenth century, born at Lyons-la-Forêt, in Normandy, had the good

fortune to please the cardinals Richelieu and Mazarin. After the death of Richelieu, he got into favor with the duke de Brezé, whom he accompanied in most of his expeditions. When this nobleman died, he returned to court, and where his poetry was highly esteemed. He wrote, 1. A Paraphrase upon Job. 2. Verses for Interludes. 3. Rondeaux upon Ovid. 4. Several Tragedies, A sonnet which he sent to a young lady with his Paraphrase on Job, being put in competition with the Urania of Voiture, caused him to be much spoken of as the head of a party against that celebrated author. Those who gave the preference to Benserade's performance, were styled the Jobists, and their antagonists the Uranists; and the dispute long divided the whole court and the wits. He withdrew at last from court, and retired to Gentilly. The bark of the trees of his garden there were full of inscriptions, which, Voltaire is of opinion, were the best of his productions. Benserade suffered at last so much from the stone, that he resolved to submit to the operation of cutting; but a surgeon, by way of precaution, letting him blood, pricked an artery, and instead of endeavouring to stop the effusion of blood ran off. There was but just time to call Commire, his friend and confessor, who came soon enough to see him die. This happened on the 19th of October, 1691, in the eighty-second year of his age.

BENSON (Dr. George), a learned dissenting clergyman, born at Great Salkeld, in Cumberland, in 1699. At eleven years of age he was able to read the Greek Testament. He afterwards studied at Dr. Dixon's academy at Whitehaven, from whence he removed to the university of Glasgow. In 1721 he was chosen pastor of a congregation of dissenters at Abingdon in Berkshire; in 1729 he received an invitation from a society of dissenters in Southwark, with whom he continued eleven years; and in 1740 was chosen by the congregation of Crutched Friars, colleague to the learned Dr. Lardner. The first fruit of his studies presented to the public was, *A Defence of the reasonableness of Prayer*. The light which Mr. Locke had thrown on the obscurest parts of St. Paul's epistles, by making him his own expositor, encouraged and determined Mr. Benson to attempt to illustrate the remaining epistles in the same manner. In 1731 he published *A Paraphrase and Notes on the Epistle to Philemon*, as a specimen. This was well received, and the author encouraged to go on with his design. Mr. Benson proceeded with great diligence and reputation, to publish *Paraphrases and Notes on the Epistles to the Thessalonians, Timothy, and Titus*; adding, *Dissertations on several important Subjects, particularly on Inspiration*. In 1735 he published his *History of the first Planting of Christianity, taken from the Acts of the Apostles, and the Epistles*, in 2 vols. 4to. He also wrote, *The Reasonableness of the Christian Religion; The History of the Life of Jesus Christ; A Paraphrase and Notes on the seven Catholic Epistles*; and several other works of high repute. Many of high rank in the church of England, as Herring, Hoadly, Butler, Benson, Coneybeare, &c. showed him great marks of favor and regard. He pursued the same studies

with great application and success till the time of his death, which happened in 1763.

BENTHAM (James), an English divine and historian, received the first part of his education at Ely, after which he went to Trinity College, Cambridge. In 1771 he published the *History and Antiquities of the Church of Ely*, with plates, 4to; and was presented to the rectory of Northwold in 1774, but exchanged it for a prebend of Ely in 1779. In 1783 he obtained the rectory of Bow-Brickhill, and when the dean and chapter of Ely resolved upon a general repair of the church, he was nominated clerk of the works. In his work on Ely Cathedral, was first brought forward the presumed origin of the pointed arch, the chief feature of the Gothic style, and that on which the whole seems to be formed. Bentham supposed this kind of arch might have been derived from the intersection of two semi-circular arches, such as are seen on the walls of buildings erected soon after the conquest. Other writers have since adopted this hypothesis, and Dr. Milner, in particular, has supported it with much learned ingenuity. But attempts have been rather unfairly made, to deprive Mr. Bentham of the credit of his suggestion. The writer of the article *Gothic Architecture* in *Rees's Cyclopædia*, also states, that 'the poet Gray drew up the architectural part of the *History of Ely Cathedral*.' This is successfully rebutted in the memoirs of Bentham, prefixed to the new edition of the *History* published in 1812, where it is shown, that the architectural essay in question, far from having been written by Gray, was actually drawn up before Bentham was acquainted with the poet, and was the occasion of their subsequent intercourse. Another extraordinary attack on the reputation of the Ely historian has been made by Cole, the Cambridge antiquary, who coarsely asserts it to have been written by his brother Edward Bentham, divinity professor at Oxford; for which statement there seems to be not the slightest foundation. Mr. Bentham died in 1794, aged eighty-six.

BENTHAM (Thomas), bishop of Litchfield and Coventry, was born at Sherburn in Yorkshire in the year 1513, and educated at Magdalen College, Oxford. He took the degree of A. B. in 1543, and in 1556 was admitted perpetual fellow, and proceeded the year following, which was that of Edward VI's accession. He now threw off the mask of popery, which, during the reign of Henry VIII. he had worn with reluctance. When Mary came to the crown, being deprived of his fellowship, he prudently retired to Basil in Switzerland, where for some time he expounded the Scriptures to the English exiles; but being solicited by some Protestants in London, he returned to London before the death of the queen, and was appointed superintendent of a private congregation in the city. Immediately on the accession of Elizabeth, Bentham was preferred in the church, and in the second year of her reign was consecrated bishop of Litchfield and Coventry. He died at Eccleshal in Staffordshire, in 1578, aged sixty-five. He was particularly celebrated for his knowledge of the Hebrew language. His works are, 1. *Exposition of the Acts of the Apostles*; manuscript. 2.

A Sermon on Christ's Temptation; London 8vo. 3. *Epistle to M. Parker*; manuscript. 4. *The Psalms, Ezekiel, and Daniel*, translated into English in queen Elizabeth's Bible.

BENTHEIM, formerly a county of Westphalia, but now of the kingdom of Hanover, forty-five miles long, and eighteen broad, containing about 25,000 inhabitants. It is a pleasant fertile country, abounding in fruitful fields and luxuriant meadows. The inhabitants, who are chiefly Protestants, are remarkably industrious, and trade in yarn, wool, linen, thread, cattle, and honey. Here are also some extensive woods, and several good stone quarries. The Veitch waters the whole district.

BENTHEIM, the capital of the above county, with a castle, stands on a hill about thirty miles north-west of Munster. This castle was formerly garrisoned by the troops of the bishop of Munster; but was taken by the French, after a heavy bombardment, in 1760. Being soon after re-taken by the allies, part of the works were blown up. It was taken again by the French in 1799, and retained till the peace. Here are two churches, one used by the Protestants, the other by Catholics.

BENTINCK (William), first earl of Portland, was born of a noble family in Holland. He came over to England in company with the prince of Orange, to whom he had endeared himself by a very remarkable instance of affection and fortitude. That prince having the small pox, his physician pronounced it necessary that he should have the warmth of a young person in bed with him; and Bentinck, though he never had the disorder, instantly offered himself for that hazardous service. He in this way caught the disease to such a degree as was considered very dangerous, but he recovered; and ever after his master had the most affectionate esteem for him. When the prince ascended the throne of England, he created Bentinck earl of Portland, and granted him the lordship of several lands in Denbighshire; but parliament being discontented at the grant, it was revoked, and the earl compensated elsewhere. He was employed in different high offices, both civil and military; and attended his master on his death bed. Bentinck died in 1709, and was interred in Westminster Abbey.

BENTINCK (William Henry Cavendish), third duke of Portland, was born in 1738, and educated at Oxford. He sat for some time in the house of commons, as member for Weoboly, and was called to the upper house by the death of his father in 1762. In 1765 he became lord chamberlain during the Rockingham administration. In the American war he acted with the opposition, and in 1782 was appointed lord lieutenant of Ireland, but remained there only three months, in consequence of the breaking up of the administration. After the memorable coalition, which fell before the rising fortunes of Mr. Pitt, the duke acted with the whig opposition until 1792, when he was elected chancellor of Oxford, and soon after joined with Mr. Burke in his alarm at the French revolution. He was, in 1794, made secretary of state for the home department, which he held until the resignation of Mr. Pitt in 1801, and was then

appointed president of the council, which he held until 1805. On the resignation of lord Grenville, in 1807, he was appointed first lord of the treasury, and was nominally prime minister; but the chief duties of administration devolved on Mr. Percival, the chancellor of the exchequer. He died of the stone in 1808, with the character of an upright and respectable, if not very able statesman.

BENTINCK'S ARMS, two branches of an inlet of the North Pacific Ocean, discovered by Vancouver, on the west coast of North America: one to the north-east, the other to the south-east. Long. 233° to $233^{\circ} 21'$ E., lat. $52^{\circ} 0'$ to $52^{\circ} 25'$ N.

BENTINCK'S ISLAND, an island of New Holland, ten or eleven miles in length, near the bottom of the gulf of Carpentaria.

BENTIVOGLIO, a small town of Italy, in the papal territory, ten miles north-east of Bologna, with a castle. Long. $11^{\circ} 34'$ E., lat. $44^{\circ} 47'$ N.

BENTIVOGLIO (Guy), cardinal, born at Ferrara, in the year 1579. He studied at Padua; and leaving the university, went to reside at Rome, where he became universally esteemed. He was sent nuncio to Flanders and France, and in both employments his behaviour was such as gave great satisfaction to Paul V. who made him a cardinal in 1621. Bentivoglio was at this time in France, and when he returned to Rome the king of France entrusted him with the management of the French affairs at that court. Pope Urban VII. had a high regard for him on account of his fidelity, disinterestedness, and consummate knowledge in business. He was much beloved by the people, and esteemed by the cardinals. He died 7th September, 1644. He left several works; the most remarkable of which are, *A History of the Civil Wars of Flanders*; *An Account of Flanders*, with Letters and Memoirs.

BENTLEY (Dr. Richard), an eminent critic and divine, was born at Oulton, in the parish of Rothwell, near Wakefield. His ancestors, possessed an estate, at Heptonstall, in the parish of Halifax. His mother taught him his accidence. To his grandfather Willis, who was left his guardian, he was in part indebted for his education; and, having gone through the grammar-school at Wakefield with singular reputation, he was admitted of St. John's College Cambridge, May 24, 1676; being then little more than fourteen. On the 22d of March, 1681-2, when only nineteen, he stood candidate for a fellowship, and would have been unanimously elected had he not been excluded by the statutes, on account of his being too young for priest's orders. Soon after, he became a school-master at Spalding. But he did not continue long in this situation. From a letter of his grandfather's, it appears, that he was with Dr. Stillingfleet at the deanery of St. Paul's, April 25, 1683. He had been recommended by his college to the dean as preceptor to his son; and Dr. Stillingfleet gave Mr. Bentley his choice whether he would carry his pupil to Cambridge or Oxford. He fixed upon the latter university on account of the Bodleian library, to the consulting of the MSS. of which he applied with the

closest attention. Being now of age he made over a small estate, which he derived from his family, to his eldest brother, and laid out the money he obtained for it in the purchase of books. In July 1683 he took the degree of A. M. at Cambridge. In 1692 Dr. Stillingfleet, being now bishop of Worcester, collated him to a prebend in that church, and made him his chaplain. That learned prelate, as well as Dr. Wm. Lloyd, then bishop of Litchfield, had seen many proofs of Bentley's extraordinary merit, and concurred in recommending him as a fit person to open the lectures upon Mr. Boyle's foundation, in defence of natural and revealed religion. This gave him a fine opportunity of establishing his fame, and he resolved to embrace it. Sir Isaac Newton's Principia had been published a few years, but it was little known and less understood. Mr. Bentley therefore spared no pains, in exhibiting to the public the profound demonstrations, which that excellent work furnishes in proof of a Deity; and applied to Sir Isaac himself for the solution of some difficulties, which had not fallen within the plan of his treatise. His lectures, therefore, highly raised his reputation as a preacher; notwithstanding a mistake, which laid him open to the raillery of Dr. Keill, viz. of proving the moon not to turn round her axis, because she always shows the same face to the earth. In 1693 he was made keeper of the royal library at St. James's. Next year arose the famous dispute between this celebrated critic and the honorable Mr. Boyle, respecting the epistles of Phalaris. The Dr. asserted them to be spurious, the production of some sophist, and altogether contemptible as a literary performance. The chief pieces which appeared in this noted controversy were, 1. Dr. Bentley's Dissertation upon the Epistles of The-mistocles, Socrates, Euripides, Phalaris, and the Fables of Æsop, at the end of the second edition of Mr. Wotton's Reflections on Ancient and Modern Learning; but afterwards printed by Dr. Bentley entire, with great additions to his farther defence of it, in answer to Mr. Boyle. 2. Dr. Bentley's Dissertation on the Epistles of Phalaris, and the Fables of Æsop, examined by the honorable Charles Boyle, Esq.; a book more commonly known by the title of Boyle against Bentley. 3. Dr. Bentley's Answer to the above, commonly known by the name of Bentley against Boyle; a curious piece, interspersed with a great deal of true wit and humor. The victory was at the time adjudged to Mr. Boyle, and the ridicule of the wits exercised upon Dr. Bentley. Thus Dr. Garth:—

So diamonds take a lustre from their foil,
And to a Bentley 'tis we owe a Boyle.

Some wits of Cambridge drew Bentley's picture in the hand of Phalaris's guards; whom they represented putting him into their master's bull; while a label proceeded from the Doctor's mouth with these words, 'I had rather be Roasted than Boyled.' But H. Walpole, speaking of Boyle's translation of the Epistles of Phalaris, says, 'This work occasioned the famous controversy with Dr. Bentley; who alone, and unworsted, sustained the attacks of the brightest

geniuses in the learned world, and whose fame has not suffered by the wit to which it gave occasion:’ and Dodwell, who resided at Oxford during the controversy, declared to the Churchmen, that he never learned so much from any book of the size, in his life, as he had done from Dr. Bentley’s Answer to Boyle. In 1696, at the public commencement, Mr. Bentley was created D.D. by the university of Cambridge; and sometime after admitted ad eundem, in the university of Oxford. In 1700 he was presented to the mastership of Trinity College, Cambridge, which is reckoned worth near £1000 per annum; and, in 1701, was collated to the archdeaconry of Ely. Being thus placed in a state of ease and affluence, he married, and indulged his inclination in critical pursuits. The fruits of his labors, which he occasionally published, displayed such erudition and sagacity, that by degrees, he obtained the character of being the greatest critic of the age. In the meanwhile, however, a complaint was brought against him before the bishop of Ely, by several of the fellows of his college, who charged him with embezzling the public money, and other misdemeanors. In answer to this, he published in 1710, *The present State of Trinity College*, 8vo; and thus began a quarrel, which was carried on with the most virulent animosity on each side, for above twenty years. In 1716, upon the death of Dr. James, he was appointed regius professor of divinity at Cambridge; annexed to which was a good benefice in the bishopric of Ely. King George I. on a visit to the university in 1717, having, as usual nominated by mandate several persons for a doctor’s degree in divinity, our professor, to whose office it belonged to perform the ceremony called creation, demanded four guineas from each person, besides a broad piece of gold, and absolutely refused to create any doctor without these fees: hence there arose a long and warm dispute, during which, the doctor was first suspended, and then degraded; but on a petition to his majesty for relief from that sentence, the affair was referred to the court of King’s Bench, where the proceedings against him being reversed, a mandamus was issued, charging the university to restore him. A concise account of his controversies with his college and the university, may be seen in Mr. Gough’s *Anecdotes of Topography*. There are likewise, in the Harleian collection of MSS. in the British Museum, No. 7523, some authentic papers relative to these proceedings. Dr. Bentley was endowed with a natural hardness of temper, which enabled him to ride out both these storms without any extraordinary disturbance, or interruption to his literary pursuits. His principal works, besides those already mentioned, were, 1. His *Animadversions and Remarks on the poet Callimachus*. 2. *Annotations on the first two Comedies of Aristophanes*. 3. *Emendations, &c. on the Fragment of Menander and Philemon*. 4. *Remarks upon Collin’s Discourse of Free-thinking*. 5. *Beautiful and correct editions of Horace, Terence, Phadrus, and Milton, with notes*. In 1721 he published proposals for printing a new edition of the Greek Testament, and St. Hieron’s Latin version; in

which edition he intended to make no use of any MS. that was not at least 1000 years old. Upon these proposals Dr. Middleton published some remarks; and the work never made its appearance. He died at his lodge in Trinity College, July 14, 1742, aged eighty. To his latest hour, he could read the smallest Greek testament without spectacles. He died of a pleuritic fever.

BENTVOGEL SOCIETY, a celebrated society of Flemish painters, established at Rome, into which they received all of their own nation who came to reside at Rome, and desired to be admitted as members.

BENUM, } Be and num: num is
BENUMMEDNESS, { the past tense and past
participle of niman. Benumen, Saxon; to make torpid; to take away the sensation and use of any part by cold, or by some obstruction; to stupify.

So stings a snake that to the fire is brought,
Which harmless lay, with cold benumbed, before.

Fairfax.

It seizes upon the vitals, and benums the senses;
and where there is no sense, there can be no pain.

South.

Will they be the less dangerous, when warmth shall
bring them to themselves, because they were once
frozen and benumbed with cold?

L’Estrange.

These accents were her last: the creeping death
Benumbed her senses first, then stopped her breath.

Dryden.

BENYOWSKY (Maurice Augustus, count de), a singular adventurer of the last century, a magnate of the kingdoms of Hungary and Poland, and one of the chiefs of the Polish confederacy in 1767. He was taken prisoner by the Russians, and sent in exile to Kamtschatka, where the governor entrusted to his care the education of his son and three daughters: the youngest of these fell in love with him, and her parents consented to the match. But the chief object of Benyowsky being the deliverance of himself and his fellow exiles, he scrupled not in effecting it to kill the governor, and was enabled to seize a vessel and sail from Kamtschatka, accompanied by ninety-six persons. Nothing more is heard of his wife except that she died the following September at Macao. There our adventurer entered into an engagement with the French East India Company, and proceeded with his companions to the Isle of France, whence he sailed for Europe in 1772, and, touching at Madagascar, arrived in France in the July of that year. The French ministry, approving his plan for a settlement, he embarked once more for the Isle of France and Madagascar, but the settlement at the latter place being inadequately supported, fell into great confusion, and Benyowsky abandoned it. Quitting the French service, he induced the natives to believe that he was a descendant of one of their kings formerly carried away to Europe, and was actually elected their chief. On this he sailed to Europe in a brig, which he had freighted for the Cape of Good Hope, to submit proposals for acquiring the aid and protection of Great Britain. He, however, failed in these endeavours, but induced several private

merchants to supply him with a vessel and merchandise to the value of £4000. Touching at the cape, and at Sofala on his return, he anchored at the bay of Atanagara in Madagascar, in July 1785, where he unloaded his cargo, on which those on board sailed away with the vessel and deserted him. Unintimidated by this disaster, he departed for his settlement of Angoneti, and soon had a body of natives under his command, with whom he attacked the French factory. His proceedings now induced the government of the Isle of France to send a ship with sixty regulars to Foulpoint. The count had constructed a redoubt, which he attempted to defend with two cannon, two Europeans, and thirty natives. The latter fled on the first fire, and Benyowsky, receiving a ball in the breast, fell behind the parapet, and in a few minutes afterwards expired. This bold and eccentric adventurer it is evident only wanted a wider theatre to make him a conspicuous subject of history. He met his death in May or June 1786.

BENZOATS, neutral salts composed of earths, alkalis, or metallic oxides, and benzoic acid; the principal are the following:—Benzoat of alumine has a sharp bitter taste, is soluble, deliquesces in the air, and forms dendritical crystals. Benzoat of ammonia is very soluble in water, deliquesces in the air, and forms, with difficulty, feather-shaped crystals. Benzoat of barytes is not alterable by exposure to the air. Benzoat of lime is, perhaps, the only one of these salts found native; it exists abundantly in the urine of cows, and has been discovered in that of some other animals among the herbivorous quadrupeds; it forms sweet tasted, white, shining, pointed crystals, soluble in cold, but more so in hot water. Benzoat of magnesia has a sharp bitter taste, and forms feather-shaped crystals. Benzoat of potash has a sharp saline taste, very soluble in water, deliquesces in the air, and is easily crystallisable in the form of pointed feathers. Benzoat of soda resembles the preceding, except that it effloresces in the air, and its crystals are larger. On account of the weakness of the affinity that benzoic acid has for the different substances with which it unites, benzoats may be decomposed by any of the strong acids.

BENZOIC ACID. This acid was first obtained from the resin which goes under the name of Benzoin, and was therefore called flowers of Benzoin, or Benjamin (see BENZOIN). It is now, however, known as a peculiar acid, not exclusively obtainable from the benzoin, but also to be procured from other vegetable balsams. It is found in Storax, in the Tolu and the Peruvian balsams, in cinnamon, in ambergris, in the urine of children, and, according to some chemists, in the urine of many graminivorous animals. Berzelius has shown it to be the main ingredient of that acid which is procured by the destructive distillation of tallow. It is supposed that very many vegetable substances contain this acid, and especially some of the grasses. Hence it is conjectured the source of its presence in the urine of the graminivora.

Ure, in the *Philosophical Transactions* of 1822, has stated the following as the composition of benzoic acid:—

Carbon . .	66.74
Oxygen . .	28.32
Hydrogen . .	4.94

100

The results of Berzelius's investigation on the same substance do not materially differ.

This acid was first, we are told, described in 1608 by Blaise de Vigenere in his treatise on fire and salt. 'The usual method of obtaining it,' says Dr. Ure, 'affords a very elegant and pleasing example of the chemical process of sublimation. For this purpose a thin stratum of powdered benzoin is spread over the bottom of a glazed earthen pot, to which a conical tall paper covering is fitted; gentle heat is then to be applied to the bottom of the pot, which fuses the benzoin and fills the apartment with a fragrant smell, arising from a portion of essential oil and acid of benzoin, which are dissipated into the air; at the same time the acid itself rises very suddenly in the paper head, which may be occasionally inspected at the top, though with some little care, because the fumes will excite coughing. This saline sublimate is condensed in the form of long needles, or straight filaments of a white color, crossing each other in all directions. When the acid ceases to rise, the cover may be changed, a new one applied, and the heat raised; more flowers of a yellowish color will then rise, which require a second sublimation to deprive them of the empyreumatic oil they contain.'

Scheele's method of procuring the benzoic acid consists in powdering a pound and a half of gum benzoin with four ounces of quicklime, and then boiling them for half an hour in a gallon of water, constantly stirring. When cold, the clear liquor is poured off, and what remains is boiled a second time in four pints of water, the liquor being poured off as before. The mixed liquids are to be boiled to one-half and filtered through paper: muriatic acid is now gradually to be added, until it ceases to produce a precipitate. The liquid is to be decanted off from this precipitate, the powder dried in a gentle heat, and sublimed into cones of white paper, from a proper vessel, placed in a sand bath.

The digestion of the benzoin in hot sulphuric acid has been recommended as the best method of procuring the benzoic acid crystals. 'If,' says Ure, 'we concentrate the urine of horses or cows, and pour muriatic acid into it, a copious precipitate of benzoic acid takes place; and this is the cheapest source of it. Fourcroy recommends employing the muriatic acid, to extract it from the water that drains out of dunghills, cow-houses, and stables.'

Benzoic acid has a very peculiar odor, which is not disagreeable; it is sweetish and hot to the taste; it reddens the color of litmus. It exists in the form of a light powder, crystallised in fine needles. Its specific gravity is 0.667. It is said to be so little alterable by the air as to have been kept in an open vessel twenty years without losing any of its weight. It is occasionally, but not very frequently, employed in medicine: it, however, enters into the composition of the compound tincture of camphor of the London Pharmacopœia.

For its combination with earths, alkalies, &c. see CHEMISTRY.

BENZOÏN, *n. s.* A medicinal kind of resin imported from the East Indies, and vulgarly called Benjamin. It is procured by making an incision in a tree, whose leaves resemble those of the lemon-tree. The best comes from Siam, and is called amygdaloides, being interspersed with white spots, resembling broken almonds.

Trevoux. Chambers.

The liquor we have distilled from benzoïn, is subject to frequent vicissitudes of fluidity and firmness.

Boyle.

BENZOÏN, or **BENJAMIN**. The tree which produces this substance is principally found in the island of Sumatra. Incisions are made into it in order that the juice may exude, which comes from the tree in the form of a thick balsam. It eventually changes to a reddish brown color. It is soluble in alcohol, but is precipitated from it by water. The specific gravity of this resin is 1.092. The opaque fluid formed by the admixture of water with the alcoholic solution of Benzoïn is used by perfumers as a cosmetic under the name of lac virginale. Brande's products, as obtained by distillation from 100 grains of the resin, were benzoic acid nine grains, acidulated water 5.5, butyraceous and empyreumatic oil 60, brittle coal 22, and a mixture of carbonated hydrogen and carbonic acid gas, computed at 3.5. The oil afterwards was found to yield five grains more of the acid, making the proportion 14 to 100.

Benzoïn is soluble also in ether, and in sulphuric and acetic acids. Solutions, likewise, of potash and soda dissolve it. Nitric acids act on it with violence, and a portion of artificial tannin is thereby formed. It is dissolved sparingly by ammonia.

BEPAINT, *v. a.*, from paint; to cover with paint.

Thou knowest the mask of night is on my face,
Else would a maiden blush *bepaint* my cheek.

Shakespeare.

BE'PALE. Be and pale. See PALE.

BEPEARL. Be and pearl. See PEARL.

BEPEPPER. Be and pepper. See PEPPER.

BEPLASTER. Be and plaster. See PLASTER.

BEPLUME. Be and plume. See PLUME.

BEPOWDER. Be and powder. See POWDER.

BE'PRAISE. Be and praise. See PRAISE.

BETROSE. Be and prose. See PROSE.

BE'PURPLE. Be and purple. See PURPLE.

BEQUALIFY. Be and qualify. See QUALIFY.

BE'QUEATH, *Ang.-Sax. becwæthan.*

BE'QUEST, *v. & n.* } To announce; to declare

BE'QUEATHER, } the will or determination;

BE'QUEATHMENT. } a legacy by will.

She had never been disinherited of that goodly portion, which nature had so liberally *bequeathed* to her.

Sidney.

Then weete ye, sir! that we two brethren be,

To whom our sire, Milesio by name,

Did equally *bequeath* his lands in fee,

Two islands, which ye there before you see.

Spenser.

Them therefore as *bequeathing* to the winde,
I now depart, returning to thee never,
And leave this lamentable plaint behinde,
But doo thou haunt the soft downe-rolling river,

And wilde greene woods, and fruitful pastures minde;
And let the flitting aire iny vaine words sever. *Id.*

Let's choose executors, and talk of wills;

And yet not so—for what can we *bequeath*,

Save our deposed bodies to the ground.

Shakespeare.

Methinks this age seems resolved to *bequeath* posterity somewhat to remember it.

Glanville.

For you whom best I love and value most,

But to your service I *bequeath* my ghost.

Dryden's Fables.

He claimed the crown to himself; pretending an adoption, or *bequest*, of the kingdom unto him by the Confessor.

Hale.

BEQUIERES, **BEQUIRES**, or **ABOUKIR**, an island and bay on the coast of Egypt, at the mouth of the Nile, near which admiral Nelson gained, over the French fleet, one of the most complete victories which adorn the annals of Britain.

BER, in botany, a name used by some authors for the Indian jujube; that species of the jujube tree, on which the gum lacca of the shops is usually found.

BERA, king of Sodom, contemporary with Abraham, who had his country terribly ravaged by Chedorlaomer and his allies.

BERA, a district in the island of Celebes, on the east coast, extending from the river Bampang to the point of Lassoa. It was ceded to the Dutch by the rájá of Bony. Much of it is unproductive, but it affords pretty good small ship timber. The most wealthy inhabitants are merchants, and ship builders. There is also a species of cloth manufactured here from the cotton of the district.

BERABZAN, a long lake in New North Wales, lying north and south, and narrowing gradually to the south till its waters join those of Lake Shechary, and form Seal River, which falls into Hudson's Bay, at Churchill Fort.

BE'RAIN. Be and rain. See RAIN.

BERAMS, a coarse cloth, made with cotton thread, which comes from the East Indies, and particularly from Surat.

BERAR, a soubah of the deccan of Hindostan, bounded on the north by Malwa and Allahabad, east by Gundwana, south by Aurungabad and the Godavery, and east by Khandish and Allahabad. Its limits are inaccurately defined; but, including the small modern province of Nandere, which properly belongs to it, the length may be estimated at 230 miles, by 120 the average breadth. Less is known of the interior parts of Berar than of most of the other countries of Hindostan. Nagpoor has been generally called the capital; but that town is in fact in the neighbouring province of Gundwana. The capital of Berar is Ellichpoor. The country in general is elevated and hilly, abounding in strong holds; some of which, as Gawelghur, were thought impregnable, until taken by our army under the intrepid Wellesley. The principal rivers are the Godavery, Tuptee, Poornah, Wurda, and Kaitna. Yet, though well supplied with water, Berar as a whole is but little cultivated, and thinly inhabited. The cultivated parts produce rice, barley, wheat, cotton, opium, sugar, and a little inferior silk. The Berar bullocks are reckoned the best in the Deccan. The

principal towns are Ellichpoor, Gawelghur, Narnallah, Poonar, Nandera, and Patery. Three-fourths of the province are included within the territories of the Nizam, and the remainder is either occupied by, or tributary to, the Nagpoor and Malwah Mahrattas.

BERAT, or **ARNAUTH BELGRADE**, a town of Albania, in European Turkey, with 12,000 inhabitants, the capital of a pachalic. It is on the site of the ancient Eordea, on the river Kevroni, (the Apsus of the ancients), forty miles north-east of Aulona.

BERATE. Be and rate. See **RATE**.

BERAT'TLE. Be and rattle. See **RATTLE**.

BERBER, in the plural *Beräber*, pronounced *Bräber*, in Africa, a people spread over nearly the whole of Northern Africa. The appellation of *Barbary* is said to be derived from them (see **BARBARY**), and they are perhaps the descendants of the ancient Numidians, whose country they occupy. Mount Atlas is their principal abode; to the south they are bounded by the Negro states and the edge of the great Sahara.

BERBERII, in medicine, a name given by some to the psaly.

BERBERINA, in entomology, a species of tipula; wings, sooty, incumbent; the base and marginal spot white; the thorax and abdomen red: it feeds on the barberry, and forms small stromous excrescences on the branches.

BERBERINA, in natural history, a species of vorticella, of a simple oval form, with a branched rigid stem and white granulations. This is *vorticella composita*, *floribus ovalibus muticis*, *stirpe ramosa* of Linn. *Brachionus berberiformis* of Pallas; and *Pseudopolypus beriformis* of Resel. Found in fresh water in Europe; usually in clusters.

BERBERIS, in botany, the barberry, or piperidge bush. A genus of the monogynia order and hexandria class of plants; the characters of which are: **CAL.** consisting of six leaves; the petals six, with two glands at the ungues; no stylus; the berry two-seeded. The species are three, viz. 1. *B. Canadensis*, is a native of that country from whence it takes its name, and formerly common in British gardens. 2. *B. cretica*, with a single flower in each footstalk, at present very rare in Britain; the plants being tender whilst young, and most of them killed by severe frost. It rises three or four feet high, but sends out many stalks from the root, which are strongly armed with spines at every joint: 3. *B. vulgaris*, the common barberry, grows naturally in hedges in many parts of England and some parts of Scotland; but is also cultivated in gardens on account of its fruit, which is pickled and used for garnishing dishes. The berries, which are so acid that birds will not feed upon them, are moderately astringent; and have been given with success in bilious fluxes, and diseases proceeding from heat, acrimony, and thinness of the juices. Among the Egyptians barberries are used in fluxes and in malignant fevers. The roots boiled in ley, dye wool yellow. In Poland they dye leather of a most beautiful yellow with the bark of the root. The inner bark of the stems dyes linen of a fine yellow with the assistance of alum. This shrub should never be per-

mitted to grow in corn lands; for the ears of wheat that grow near it never fill, and its influence in this respect has been known to extend across a field of 300 or 400 yards. Cows, sheep, and goats eat it; horses and swine refuse it.

BERBICE, a river of South America, in the colony of that name, which rises about 100 miles from the coast, and, after a circuitous course, flows into the Atlantic, in the seventeenth degree of north latitude, and fifty-eighth of west longitude. It is a broad stream, generally shallow, with a bar in the sea five miles from its mouth. It is, however, capable of admitting vessels which draw fifteen or sixteen feet of water to Fort Nassau, about fifty miles above its mouth: about a mile from the sea it receives the Canje. The country along its banks is low and flat, but has numerous sugar plantations.

BERBICE, a district and colony of Guiana, named after the preceding river, extends nearly 300 miles from the sea. When the colony in 1796 came into possession of the English, the coast was regularly surveyed, and laid out into two parallel lines of estates, with a navigable canal between them. The river Canje flows behind the second both banks of which are cultivated to a considerable height up the country. The line of estates facing the sea are called the coast estates, the second line consists of the canal estates, and those behind are called the Canje estates. The capital is **NEW AMSTERDAM**, which see.

The chief product of the coast estates is cotton, but the most valuable are those which are adapted to the growth of sugar. The agricultural laborers are chiefly slaves: about 200 are generally employed on an estate which produces an annual average of 140,000 cwt. of coffee, and 10,000 cwt. of cocoa. Besides sugar, coffee, cocoa, tobacco, cotton, and arnotta, are cultivated here. This last was managed exclusively for a long time by the native Indians, who macerated the seed in the juice of lemons, mixed with the dissolved gum of the manna tree, and thus produced a celebrated crimson paint, with which the Indians adorn themselves. The arnotta is now cultivated by the European settlers as a dye-stuff. The population of this colony, according to Mr. Bolingbroke, was, in 1805, 2500 whites, 1000 free people of color, and 40,000 slaves; making a total of 43,500 individuals.

In 1815 a paper returned to the House of Commons, gives the following population:—

Whites	550
Colored people	240
Black	25,169

25,950, making, as compared with Mr. B.'s account, a vast decrease. The climate is certainly very unhealthy, from excess of moisture; but the heat is not usually so great as the latitude alone would lead us to expect. Fahrenheit's thermometer seldom rises above 90°, and in general during May, June, and July, it is a little above 80°. The lowest point to which it descends at any season is 75°: but changes of weather take place very suddenly.

The exports and imports of Berbice,

	Imports.	Exports.
In 1809 { were }	£193,663	£49,662
1810 { valued at }	191,566	51,785

In the years ending the 5th of January, there were imported into Great Britain from Berbice, of rum,—

	1810.	1811.	1812.	1813.
Gallons,	20,355	6193½	1866	23,139

And, in the year ending 5th of January 1813, there was imported of sugar 9084 cwt. In 1819 the exportation of cocoa from the colony amounted to 17,665 cwt. and in 1810, to 22,582 cwt. In the former year the exportation of cotton was 1,874,195 lbs.; and, in the latter year, 1,656,057 lbs. By 56 Geo. III. (1816), c. 91, Berbice is placed on the same footing in relation to the regulations of trade, as the British West India islands. The subjects of the king of the Netherlands, who are proprietors in Berbice, may import into it from the Netherlands the usual articles of supply for their estates, but not for trade; wine imported for the use of their estates, to pay a duty of 10s. per ton. The Dutch proprietors may export their produce, but not to Britain; both exports and imports to be in ships belonging to the Netherlands, the duties to be the same as those payable by British proprietors. The principal commerce of the colony being with the Netherlands, no official returns of the exports and imports have been lately published in this country. See AMERICA, SOUTH, for a general account and history of the British possessions here.

BERCARIA, BERQUERIA, or BERKERIA, in writers of the middle age, denotes a sheep-fold, or sheep-cote, for the safe keeping a flock of sheep. The word is abbreviated from *berbicaria*; of *berbex*, detorted from *vervex*. Hence also a shepherd was denominated *berbicarius* and *berquarius*.

BERCHEM, or BERGHEM (Nicholas), a painter, born at Haerlem in 1624. He was instructed by several eminent masters; and added to their fame. His cattle and figures are justly held in high estimation; and many of them have been finely engraved by Visscher.

BERCHEROIT, or BERKOITS, a weight used at Archangel, and in all the Russian dominions, to weigh such merchandises as are heavy and bulky. It is about 364lbs. English *avoirdupois* weight.

BERCHET (Peter), an eminent historical painter, was born in France in 1659, and at the age of eighteen was employed in the royal palaces. He came to England in 1681, to work under Rambour, a French painter of architecture; but, after staying a year, returned to Marli. He came again, and was sent by King William to the palace he was building at Loo, where he was employed fifteen months; and then came a third time to England, where he had considerable business. Mr. Walpole says, that he then painted the ceiling of the chapel of Trinity College, Oxford, the staircase at the duke of Schonberg's in Pall-mall, and the summer-house at Ranelagh. His drawings in the academy were much approved.

Towards the close of his life he retired to Mary-le-bonne, and died in 1720.

BERCHTOLSGADEN, a town and principality of Germany, thirteen miles south-west of Saltzburg. The district is mountainous, containing six towns and twenty villages. Fossil salt, of which 87,000 quintals are produced annually, is the chief article of trade. The town of Berchtolsgaden contains about 3000 inhabitants. There is a small manufacture of bone and wooden toys here.

BERCIUS, an ancient Briton, unworthy of the name, who urged the emperor Claudius to invade his native country.

BERDA, in ichthyology, a species of sparus, inhabiting the Red Sea. It is of a whitish gray; lateral scales, marked in the middle with a single transverse brown band; dorsal spines recumbent. The body of this fish is oval; back gibbous, with pale bands; white beneath, scales broad, entire. The crown is naked, sloping; iris, white; nostrils, large; four long, conic, subulate, teeth; grinders, numerous, hemispherical, those behind largest; upper lip, long; gill-covers, entire; lateral line, nearest the back; fins, brown; pectoral ones transparent and lanceolate; tail, two-lobed.

BERDASH, in antiquity, was a name formerly used in England for a certain kind of neck-dress; and hence a person who made or sold such neck-cloths was called a *berdasher*, from which is derived the word *haberdasher*.

BERDOA, a town of Persia, in Erivan, seated in a fertile plain, ten miles west of the river Kur, and sixty-two south by east of Gan-gea.

BEREA, BERCEA, or BERRHEA, in ancient geography, a noble city of Macedonia, situated near Pella, the birth-place of Alexander the Great. In this town St. Paul preached with great success.

BEREANS, in ancient church history, the inhabitants of Berea. They are highly commended in scripture for their ready reception of the gospel, upon a fair and impartial examination of its agreement with the Old Testament prophecies.

BEREANS, in modern church history, a sect of Protestant dissenters from the church of Scotland, who take their title from, and profess to follow the example of the ancient Bereans, in building their system of faith and practice upon the scriptures alone, without any regard to human authority.

The Bereans agree with the great majority of Christians, both Protestants and Catholics, respecting the doctrine of the Trinity; which they hold as a fundamental article of the Christian faith; and they also agree in a great measure with the professed principles of both our established churches, respecting predestination and election, though they allege, that these doctrines are not consistently taught in either church. But they differ from other sects, 1, In rejecting all natural religion; 2, in their opinion of faith, holding it to be a simple credence of God's word, but always accompanied with the personal assurance of salvation; 3, they consider unbelief the sin against the Holy Ghost; and 4, they

interpret almost all the Psalms as expressly typical or prophetic of Jesus Christ, in which last point they seem to agree with the Hutchinsonians.

The Bereans first assembled as a separate society of Christians in the city of Edinburgh, in autumn 1773, and soon after in the parish of Fettercairn, their principal leader and founder being a Rev. Mr. Barclay, a seceder from the Scottish church. Their doctrine has found converts in various places of Scotland, England, and America.

BE'REAVE, } Be and reave. Ang.-Sax.
BEREAVE'MENT, } *reafian, bereafian*, to strip
BE'REFT. } of; to deprive of. It has generally the particle of before the thing taken away.

He nigh them drew, to stay the avenger's force;
And gan inquire how was that steed *bereaved*,
Whather by might extort, or else by slight deceived.

Spenser.

Swift running rivers still did stand,
And the wild beasts their furie did withhold,
To follow Orpheus' musick through the land;
And the oakes, deep grounded in the earthly mold,
Did move as if they could him understand;
And the shrill woods, which were of sense *bereaved*,
Through their hard bark his silver sound received.

Id.

All your interest in those territories
Is utterly *bereft* you, all is lost. *Shakspeare.*
Madam, you have *bereft* me of all words,
Only my blood speaks to you in my veins. *Id.*
That when thou comest to kneel at Henry's feet,
Thou mayest *bereave* him of his wits with wonder.

Id.

Bereave me not,
Whereon I live! thy gentle looks, thy aid,
Thy counsel, in this uttermost distress. *Milton.*
The chief of either side *bereft* of life,
Or yielded to the foe, concludes the strife.

Dryden.

BERECYNTIUS, in entomology, a species of papilio, with the wings entire, black above, with a yellow margin, and six ocellar spots under the posterior pair. This is the papilio berecynthia of Cramer, and inhabits Surinam.

BEREGH, a town and county of Hungary, on the north bank of the Theyss, containing together a population of 46,000 persons. There was formerly a castle of the same name in the neighbourhood. It is separated from Galicia by the Carpathian mountains.

BEREGONIUM, in ancient geography, a city of Caledonia, in Argyllshire, said to have been the capital of Scotland, but of which scarce a vestige now remains. It stood between two hills, in the district of Ardchattan, and the common people believe it to have been destroyed by fire from heaven.

BERELLY. See BAREILLY.

BERENGARIANISM, an appellation given, by ecclesiastical writers, to the opinion of those who deny the reality of the body and blood of Christ in the eucharist. The denomination took its rise from Berengarius, who, about A. D. 1035, maintained that the bread and wine, after consecration, do not become the true body and blood of our Lord, but only a figure and sign thereof. Berengarianism was strenuously opposed by Lanfranc, Guitmond, Adelmannus, Albericus, &c.;

and synods were held, wherein the author was condemned at Rome, Versailles, Florence, Tours, &c. He retracted, and returned again to his opinion more than once; signed three several Catholic confessions of faith; in the second, third and fourth councils of Rome: but still relapsed, to his former opinions when the storm was over; though Mabillon maintains, and seemingly on good grounds, that he died an orthodox Catholic.

BERENICE, daughter of Ptolemy Auletes king of Egypt, succeeded her father before his death. This banished prince implored the assistance of the Romans, and Pompey restored him. Berenice, to support herself on the throne, allured a prince, whose name was Seleucus, descended from the kings of Syria, and admitted him to her nuptial bed, and to her sceptre. She was soon weary of him, and put him to death. She next cast her eye on Archelaus, who married her, and put himself at the head of her troops to repulse the Romans. He was killed in battle. Ptolemy returned to Alexandria, and put his rebellious daughter Berenice to death.

BERENICE, queen of Ptolemy Euergetes, king of Egypt, cut off her hair in pursuance of a vow, and consecrated it in the temple of Venus. This being afterwards lost, Conon the mathematician, in compliment to her, declared that the queen's locks had been conveyed to heaven, and composed those seven stars near the tail of the bull, called to this day coma Berenices, or Berenice's hair.

BERENICE, the daughter of Costobarus and Salome, sister to Herod the Great, was married first to her cousin Aristobulus, son of Herod and Mariamne. He having a brother who married the daughter of Archelaus king of Cappadocia, often upbraided Berenice that he had married below himself in wedding her. Berenice related all these discourses to her mother, and exasperated her so furiously, that Salome, who had much power over Herod's mind, made him suspect Aristobulus, and was the principal cause that urged this cruel father to get rid of him. She married again; and having lost her second husband, went to Rome, and got into the favor of Augustus. But, above all, she insinuated herself into the good graces of Antonia, the wife of Drusus, which in the end proved of great service to Agrippa.

BERENICE, the grand-daughter of the preceding, and daughter of Agrippa I. king of Judea, was betrothed to one Marcus, but he died before the marriage. Soon after, she married her uncle Herod, who, at the desire of Agrippa, both his brother and father-in-law, was created king of Chalcis by the emperor Claudius. She lost her husband in the eighth year of the emperor Claudius; and, in her widowhood, it was rumored she committed incest with her brother Agrippa. To put a stop to this report, she offered herself in marriage to Polemon king of Cilicia, provided he would change his religion. He accepted her offers, was circumcised, and married her. Berenice soon left him, and he abandoned Judaism to return to his former religion. She was always on good terms with her brother Agrippa, and seconded him in his attempt

to prevent the desolation of the Jews. She brought Titus into her snares; but the murmurs of the Roman people hindering her from becoming his wife, she was contented with the title of mistress to the emperor. The French stage, in the seventeenth century, resounded with the amours of Titus and Berenice.

BERENICE, in ancient geography, the name of several cities, particularly of a celebrated port town on the Sinus Arabicus; now called **SUEZ**, which see.

BERENICE'S HAIR, or **COMA BERENICES**, a constellation of the northern hemisphere, containing, according to the ancients, but seven stars; but, in the Berlin catalogue, forty-eight. It is in a triangular form, near the tail of Leo.

BERESFORD'S ISLANDS, supposed to be the same which Perouse calls the Sartine Islands, a group of islands in the North Pacific Ocean, and so called by captain Dixon. Long. 129° 57' W., lat. 50° 52' N.

BERESINA, or **BEREZINA**, a river of White-Russia, rising near Polozk, and traversing the government of Minsk, in which it gives its name to a small town, forty-four miles north-east from Minsk. It finally falls into the Dnieper, near the town of Strzesno; and will be ever memorable for the total defeat of the French on its banks, during their retreat from Moscow in 1812.

BEREZOV, a large town of Siberia, on the Sosva, a few miles above its confluence with the Oh. It is the most northern station in Siberia in which the horse can live in health; and has three stone churches and a chapel. It supplies Tobolsk with dried fish in summer, and frozen fish in winter. The inhabitants, who are chiefly Cossacks, subsist by hunting, fishing, and a small commerce in furs.

BER-FISCH, in ichthyology, a name given by the Germans to the common perch.

BERG, a duchy of Germany, in the circle of Westphalia, belonging to Prussia. It is bounded on the north by the duchy of Cleves, on the east by the county of Mark and the duchy of Westphalia, on the south by Wetteravia, and on the west by the diocese of Cologne, from which it is separated by the Rhine. It is about 150 miles in length, and twenty-four in breadth. It is very fruitful along the Rhine, but mountainous and woody towards the county of Mark. Among the various territorial exchanges to which Prussia was forced to accede, in the disastrous war of the French revolution, the duchies of Berg and Cleves were transferred to France. This valuable acquisition Buonaparte then conferred on general Murat, with the title of Duke of Cleves and Berg; but it was re-assigned to Prussia, by the congress, in 1815; and now contains an area of nearly 1200 square miles, with a population of 295,000 individuals. Iron, copper, lead, and quicksilver, are found here, and give employment to a great number of the inhabitants: the manufactures include iron, steel, linen, woollen, cotton, and silk; and are said to be very flourishing.

BERG, a county of the Netherlands, in Guelderland, district of Zutphen. The chief town, a small place, is likewise called Berg.

BERGAMASCO, a province of Italy, late in the territory of Venice, but now belonging to

Austria. It is bounded on the east by the Brescian, on the north by the Valteline, on the west and south by the Milanese. It extends about thirty-six leagues from north to south, and thirty from east to west. It is watered by several rivers, which render it very fertile, and produces great quantities of chestnuts. The northern part, which is mountainous and barren, has mines of iron, and quarries of marble, and other stones. There are a great number of villages, but Bergamo the capital is the only city. Around it is a fertile country in wine. The people are said to be very industrious. They are well stocked with cattle, and make fine tapestry. This province was included in the Italian republic, and divided into two departments, viz. that of Serio, and that of the Adda and Oglio. Its population is about 360,000.

BERGAMO, anciently Bergomum, a considerable town of Northern Italy, the capital of the preceding province. It was built by the Gauls, and stands on ten small hills, in the form of an amphitheatre. It is fortified with walls, bastions, and ditches, besides two castles. To one there is a covered passage from the city. It is said to be seven Italian miles in circumference, and has thirteen parish churches, besides convents, seven hospitals, and 25,000 inhabitants. Before the revolution it was the see of a bishop: the cathedral is a noble structure. Here is also a fine palace, called the Fiera, built in the form of a quadrangle, and containing 500 apartments. In the square within it a great fair is annually held, and it has a marble fountain in the centre. The chief trade is in silk, fine and coarse cloths, camlets, spices, and drugs. It is chiefly supplied with its grain from the Milanese and other parts of Lombardy. After suffering greatly in the wars of the Guelphs and Gibellines, this city was in the twelfth century governed by its own princes. In 1509 Louis XII. seized upon it, but it was soon restored to the Venetians. After Buonaparte had taken it, in 1796, it became the capital of the department of Serio, in the Cisalpine Republic. It lies twenty miles north-west of Brescia, and thirty north-east of Milan. Long. 9° 47' E., lat. 45° 46' N.

BERGAMO (James Philip de), an Augustinian monk, born at Bergamo in 1434, wrote in Latin a Chronicle from the creation of the world to the year 1503, and a treatise of Illustrious Women. He died in 1518.

BERGAMOT, in commerce, a coarse tapestry, manufactured with flocks of silk, wool, cotton, hemp, ox, cow, or goat's hair, and supposed to be invented by the people of Bergamo in Italy.

BERGAMOTS are a species of citron (*citrus medica*), produced at first casually by an Italian grafting a citron on the stock of a bergamot pear tree, whence the fruit produced by this union participated both of the citron and the pear. The fruit has a fine taste and smell, and its essential oil is in high esteem as a perfume.

BERGANDELT, in ornithology, a name by which some have called the *anas tadorna*, shieldrake, or burrough duck; a beautiful species of duck, common on the coasts of Lancashire.

BERGAS, or **BERGASE**, a town of Romania

in European Turkey, the see of a Greek archbishop, seated on the Larissa.

BERGEL, or **MARKTBERGEL**, a large market town in the kingdom of Bavaria, circle of the Rezat, belonging formerly to the principality of Bayreuth, in Franconia.

BERGEN, anciently *Bergi*, a city of Norway, the capital of *Bergenhuus*. It is the see of a bishop, and has a strong castle and a good port. It is a large place; but is subject to fires, being all built of wood. It stands in a deep bay, surrounded with mountains almost inaccessible; the corn consumed is almost all imported; a miscellaneous commerce, and the fisheries, occupying the chief attention of the inhabitants: 12,000 barrels of herrings have of late been exported annually. Other exports are copper, iron, pitch, tar, and hides. The imports, besides grain, are wine, salt, sugar, coffee, tea, and hardware. Population about 15,000. It is 200 miles north-west of Gottenburg, and 350 north by west of Copenhagen.

BERGEN, a town and island of the Baltic, now subject to Prussia. It is the residence of a governor, and is protected by a castle. Here is also a convent of noble nuns, and a population of about 1600 persons. Thirteen miles north-east of Stralsund.

BERGEN, a town of Holland, noted for two bloody battles, on the 19th of September and 2d of October, 1799, between the English and Russian forces, and the Dutch and French, which terminated in favor of the former. It is situated among woods, four miles north-east of Alkmaer.

BERGEN, a mountainous and rough county of New Jersey, bounded on the east by Hudson River, which separates it from the state of New York, north-west by Sussex, south-west by Pegunnock river, which divides it from Morris county, and Pasaick river, which separates it from Essex, north-east by the state of New York, and south by Arthur Kill, or Newark Bay, which divides it from Staten Island. It is thirty miles in length and twenty-five in breadth, divided into six townships. In this county is a mine of copper ore, which has of late been wholly neglected. The chief town is Hakensack.

BERGEN, a town of New Jersey, situated in the preceding county, about three miles west by north of New York city. It is regularly laid out, and contains a reformed Dutch church. It is ninety-two miles north-east of Philadelphia.

BERGENHUUS, the most western province of Norway, very mountainous and barren, sometimes called the bishopric of Bergen. It is divided into fifty-four parishes, but contains few towns beside the capital.

BERGEN-OP-ZOOM, a territory and cidevant marquissate of Dutch Brabant, consisting of a considerable tract of land, containing several villages, besides the town, and some islands in the Scheldt.

BERGEN-OP-ZOOM, a town and fortress of Dutch Brabant, in the above territory; seated on an eminence, in the middle of a morass, about a mile and a half from the eastern branch of the Scheldt, with which it has a communication by a navigable canal. The houses are well built, and the market-places and squares handsome and spacious. The

church, before the last siege, was reckoned a fine edifice. It is very advantageously situated on the confines of Brabant, Holland, Zealand, and Flanders; and is so strong by nature, as well as by art, as to have been reckoned impregnable. The fortifications were the master-piece of that great engineer Cohorn. This place has been the scene of various military operations. In 1588 it was gallantly defended by lord Willoughby against the duke of Parma; and again in 1605. In 1622 it was defended by the Dutch and French against the Spaniards, under Spinola, who lost 10,000 men before it. In 1638 it was again defended by the Dutch against the Spaniards; but in 1747, the French, under count Lowendahl, obtained possession of it from the Dutch, with the loss of 20,000 men. This town was among the conquests of the French republic in 1795; and garrisoned by France during the war. In 1814 Sir Thomas Graham made an unsuccessful attack upon it with a division of the British army. It is eighteen miles north of Antwerp, and contains about 8000 inhabitants.

BERGERA, in botany, a genus of plants, class decandria, order monogynia. *CAL.* five-parted: *COR.* five-petalled: *STIG.* turbinate; berry two-seeded; species one: a tree with a showy head; leaves ovate, lanceolate, unequal, slightly serrate; corymbs terminal and compound. A native of the East Indies.

BERGERAC, a town of France, in the department of the Dordogne, forty-eight miles east of Bourdeaux, on the great road from Auvergne to Bourdeaux. It stands on the east side of the Dordogne, in a beautiful and fertile valley. Before the reign of Louis XIII. it was a much more considerable place than it is at present: when the edict of Nantes was revoked it contained not less than 40,000 Calvinists. This measure was the destruction of its prosperity: the inhabitants, at a late enumeration, were only 8665; but it is still defended by a castle, and has a confined trade in brandy, wine, corn, and chestnuts. It has also manufactures of paper, earthenware, and woollen stuffs.

BERG-GRUIN, in natural history, the name of an earth used in painting, and properly called green ochre, though not known among the color-men under that name. It is found in many parts of Germany, Italy, and England, commonly in the neighbourhood of copper mines, from particles of which metal it receives its color.

BERGHAUSEN, a town of Germany, in the late province of Wetteravia, and circle of the Upper Rhine.

BERGHMOT, **BERGHMOTTE**, or **BERGMOTH**, vulgarly *Barmote*; from *berg*, Sax. a hill, and *moë*, a meeting; a court held on a hill for deciding pleas and controversies among the miners of England in Saxon times.

BERGIA, in botany, a genus of plants, class decandria, order pentagynia. *CAL.* quinque-partite: *PET.* five: *CAPS.* globular, with five protuberances, five-celled, and five-valved: *SEEDS* numerous: species two. 1. *B. aquatica*, native of India. 2. *B. glomerata*, native of the Cape.

BERGMAN (Sir Torbern), a celebrated chemist and natural philosopher, was born in 1735 at Catherineberg in West Gothland. His

father was receiver-general of the finances, and had destined him to the same employment; but nature had designed him for the sciences. To them he discovered an irresistible inclination from his earliest years. His first studies were confined to mathematics and physics: and the efforts that were made to divert him from science having proved ineffectual, he was sent to Upsal with permission to follow the bent of his inclination. Linnæus at that time filled the whole kingdom with his fame. Instigated by his example, the Swedish youth flocked around him; and accomplished disciples leaving his school, carried the name and the system of their master to the most distant parts of the globe. Bergman was struck with the splendor of this renown; he attached himself to the man whose merit had procured it, and by whom he was very soon distinguished. Applying himself first to the study of insects, he made several ingenious researches into their history; and, among others, into that of the genus *tenthredo*, so often and so cruelly preyed upon by the larvæ of the ichneumons, that nestle in their bowels and devour them. He discovered that the leech is oviparous; and that the *coccus aquaticus* is the egg of this animal, from whence issue ten or twelve young. Linnæus, who had at first denied this fact, was struck with astonishment when he saw it proved. *Vidi et obstupui!* he exclaimed, and wrote it in the memoir when he gave it his sanction. Mr. Bergman soon distinguished himself as an astronomer, naturalist, and geometrician; but these are not the titles by which he acquired his fame. The chair of chemistry and mineralogy, which had been filled by the celebrated Wallerius, becoming vacant by his resignation, Mr. Bergman was among the number of the competitors; and without having before this period paid any particular attention to chemistry, he published a memoir on the preparation of alum that astonished his friends as well as his adversaries. Being elected, after considerable opposition, he had now the hard task of satisfying the hopes conceived of him. He did not follow the common track in the study of chemistry. As he had received the lessons of no master, he was tainted with the prejudices of no school. He applied himself to experiments without paying any attention to theories; repeating those often which he considered as the most important and instructive. He first introduced into chemistry the process by analysis; and his views in this respect have been adopted by most modern chemists of eminence. The productions of volcanoes had never been analysed, when Messrs Ferber and Troil brought a rich collection of these into Sweden. At the sight of them Mr. Bergman conceived the design of investigating their nature. He examined first the matters least altered by the fire: he followed them in their changes progressively, imitating their more complicated appearances. In his laboratory, he observed the process of nature; the combat of flames and explosions; the chaos in which the elements seem to clash with, and to confound, one another. The continual application of Mr. Bergman to these studies having affected his health, he was advised to interrupt them if he wished to prolong his life: but he

found happiness only in study, and wished not to forfeit his reputation by a few years more of inactivity and languor. He exhausted his strength, and died in June 1784. The university of Upsal paid the most distinguished honors to his memory; and the academy of Stockholm voted a medal. Dr. Cullen says, 'No name is more illustrious in the annals of chemistry than Bergman's:—no one has contributed more than he to the rapid advancement which this science has made in the present century. Nor has any other philosopher applied the principles of Lord Bacon with greater skill or attention in the investigation of nature. Ardent enthusiasm, and patient assiduity in the pursuits of science; candour, modesty, clearness of judgment, and comprehension of mind; qualities, the union of which constitutes the true philosopher, appear to have been happily conjoined in this great man. The number and the accuracy of his experiments, the simplicity and ingenuity of his processes, the beauty and plausibility of his theories, command the admiration and respect of every intelligent reader of his works.' These are, 1. *A Physical Description of the Earth*, two vols. 8vo. 1770—1774; translated into the Danish, German, and Italian languages. 2. *Various Eloges of the Members of the Academies of Stockholm*. 3. *An edition of Scheffer's Physic*. 4. *Opuscula Physica et Chemica*, 1779—1790; part of which was translated by Dr. Cullen, under the title of *Physical and Chemical Essays*, 2 vols. London, 1786.

BERGMANNIA, in entomology, a species of phalæna tortrix: wings pale yellow; fasciæ of whitish tint, the third bifid. This insect is found in Germany and the northern parts of Europe.

BERGMANNITE. A massive mineral of a greenish, grayish-white, or reddish color. Lustre pearly. Fracture fibrous, uneven, and slightly translucent on the edges. Scratches felspar. Fuses into a semitransparent enamel. It is found at Fredericksvarn in Norway, in quartz and felspar.

BERGOO, or **BERGU**, a considerable Negro state, called *Mobba* by the natives, *Dâr Seleîh* by the eastern, and *Wâdâi* by the western Arabs. It lies north-west of *Dâr Fûr*, and it is dependent on *Bornû*; its sultan, about twenty years ago, effected the conquest of *Bagirmah*, by order of the sovereign of that state. The natives are chiefly Mahommedans, and live in circular reed huts, with conical roofs. But the king and some of the merchants have mud houses. The country is watered by the *Misselâd*, a river which falls into the lake *Fitri*; but has few other permanent streams. *Natron* is the principal export; but chalk, rock-salt, and iron-ore, are found here. The capital is *Wârah*, a walled town, sixteen days distant from *Birmi*, the capital of *Bairni*.

BERG-REICHENSTEIN-KASCHPER-SCHBE-HORY, a royal mining town of Bohemia, in the circle of *Prachin*, having 3000 inhabitants. It is seated on a mountain, which formerly contained gold and silver mines. In the town are several glass-houses. Twenty miles west of *Prachatitz*, and thirty-six W.S.W. of *Bechin*. Long. 13° 26' E., lat. 49° 6' N.

BERGSTADT, a market town of Moravia, in the circle of Olmutz. It had formerly considerable mines in the neighbourhood. Eighteen miles north of Olmutz.

BERG ST. VINOX, *BERG ST. WINOX*, or *BERGUES ST. VINOX*, a town of France, in the department of the North, the *ci-devant* Flanders. It is seated on the Colme, at the foot of a mountain, five miles from Dunkirk, and twenty-one from Ypres. The air is often very unwholesome, especially to strangers. The Colme serves instead of a canal to Hondschotte, St. Omer's, and Gravelines. There is likewise a canal to Dunkirk. The villages in its territory are famous for butter and cheese, of which they export great quantities. The population is about 5000.

BERHYME. *Be* and rhyme. See RHYME.

BERIA, *BERIE*, or *BERRY*, in old writings, seems to signify a large open field; and those cities and towns in England which end with that word, are built on plain and open places, as is proved by the learned Du Fresne, who observes that *beria* Sancti Edmundi, mentioned by Mat. Paris. sub ann. 1174, is not to be taken for the town, but for the adjoining plain. To this may be added, that many flat and wide meads, and other open grounds, are called by the name of *herries* and *berry* fields; thus the spacious meadow between Oxford and Iffley was, in the reign of king Athelstan, called *bery*; and though these meads have been interpreted *demesne* or *manor* meadows, yet they were truly any flat or open meadows that lay adjoining to any villa or farm.

BERIBERI, the name of a disease among the Indians: a species of palsy.

BERITH, a Hebrew word, which, in our version of the Scriptures, is translated *covenant*. The learned Catcott says the root of *berith* is *bar* or *harr*, to cleanse or purify; and in this sense it is used in Jer. ii. 22, and Mal. iii. 2, where it is translated *soap*. Some will have the substance designed in these two texts to be the *kali*, or salt wort, from the ashes of which soap is made; and others, after Rudbeck, make it to be the dye of the purple fish.

BERING'S STRAITS. See BEERING'S STRAITS.

BERKELEY (Dr. George), the celebrated bishop of Cloyne, was the son of a clergyman in Ireland, distinguished by his piety and learning. He was born at Kilerin in 1684, and educated at Trinity College, Dublin, where he attained a fellowship. His first essays as a writer were published in the *Spectator* and *Guardian*, which he adorned with many pieces in favor of virtue and religion. His learning and virtues early introduced him to the acquaintance of many great and learned men; among others to that of the earl of Peterborough, Dr. Swift, and Mr. Pope. The earl made him his chaplain, and took him as his companion on a tour through Europe in 1714-15. During his absence he was elected a senior fellow of his college, and created D. D. *per saltum*. Upon his return, lord Burlington conceived a high esteem for him on account of his great taste and skill in architecture, an art which Mr. Berkeley had made his particular study while in Italy. He was recommended by this nobleman to the duke of Grafton, who took

him over to Ireland in 1721. In 1722 his fortune received a considerable increase from a very unexpected event. On his first going to London, in the year 1713, Dean Swift introduced him to the family of Mrs. Esther Vanhomrigh (the celebrated *Vanessa*), and took him often to dine at her house. Some years before her death, this lady removed to Ireland, and fixed her residence at Celbridge, a pleasant village in the neighbourhood of Dublin, most probably with a view of often enjoying the company of Swift. But finding herself totally disappointed, upon discovering the dean's connexion with Stella, she was so enraged at his infidelity, that she altered her intention of making him her heir, and left her whole fortune (near £8000) to be divided equally between Mr. Marshall, afterwards one of the judges of the court of common pleas in Ireland, and Dr. Berkeley, whom she had not seen for some years. In 1724 the doctor resigned his fellowship, being promoted by the duke of Grafton to the deanery of Derry. Some time before this, he had been projecting a benevolent plan for the better supplying the churches in our foreign plantations, and converting the natives of America to Christianity, by erecting a college in the *Bermudas*, or *Summer Islands*, which see. He was warmly engaged about the same time, in concert with Swift, Bolingbroke, and others, in a scheme for establishing a society for the improvement of the English language, in imitation of the academy of France. But Harley, the great patron of it, falling from power, this design proved abortive. In 1728 Dr. Berkeley married Anne, the eldest daughter of R. H. John Forster, Esq. speaker of the Irish house of commons; and almost immediately after passed over to America to found his college. On his arrival at Newport, in Rhode Island, he contracted for the purchase of lands for the purposed establishment, fully expecting that the money would, according to the charter he had obtained, be immediately paid. His expectations, however, were disappointed; and after various delays and excuses, he was at length informed by bishop Gibson, in whose diocese, as bishop of London, the whole of the West Indies was included, that upon application to Sir Robert Walpole, he received the following remarkable answer: 'If you put this question to me as a minister,' said Sir Robert, 'I must and can assure you, that the money shall most undoubtedly be paid as soon as suits with public convenience; but if you ask me as a friend, whether dean Berkeley should continue in America expecting the payment of £10,000, I advise him by all means to return home to Europe, and give up his present expectation.' Accordingly the dean, after having expended a great part of his private fortune, and more than seven years of his life, in the prosecution of so laudable a scheme, found himself compelled to return to England. In 1734 he was advanced to the bishopric of Cloyne. When the earl of Chesterfield was lieutenant of Ireland, he made him an offer of the richer see of Clogher, but he declined it, saying, his neighbours and he loved one another, and he could not think of forming new connexions in his old days. In 1752, finding the infirmities of age come upon him, he asked leave

to resign his bishopric, and to obtain in lieu of it a canonry of Christ Church, Oxford. But the king declared he should die a bishop in spite of himself, giving him full liberty to reside where he pleased. His last act before he left Cloyne, was to sign a lease of the demesne lands in that neighbourhood, to be renewed yearly, at the rent of £200, which he directed to be distributed every year until his return, among poor house-keepers of Cloyne, Youghal, and Aghada. He now settled at Oxford, to superintend the education of a favorite son, and died there suddenly, on Sunday evening, Jan. 14th, 1753, as he was hearing his lady read a sermon of Dr. Sherlock's. His remains were interred at Christ Church, where there is an elegant marble monument erected to his memory. Pope sums up bishop Berkeley's character in one line. After mentioning some particular virtues that distinguished other prelates, he ascribes

'To Berkeley every virtue under heaven.'

His works are, 1. *Arithmetica absque Algebra*, aut *Euclidæ Demonstrata*, 1707. 2. *Theory of Vision*, 1709. 3. *The Principles of Human Knowledge*, 1710. 4. *Dialogues between Hylas and Philonous*. 5. *Three Sermons in Favor of Passive Obedience and Non-resistance*, 1712. 6. *A Proposal for Converting the Savage Americans to Christianity*, &c. 1725. 7. *The Minute Philosopher*, 2 volumes, 8vo. 8. *The Analyst*, written against the doctrine of fluxions and mathematics in general, as favorable to infidelity! *A Defence of Free-thinking in Mathematics*, 1735. 9. *The Querist*, 1735. 10. *A Discourse addressed to Magistrates*, 1736. 11. *Siris*; a Chain of Philosophical Reflections and Enquiries concerning the Virtues of Tar Water, 1744 and 1747; which was followed by *Further Thoughts on Tar Water*, 1752. In 1784 a new edition of the bishop's entire works was published in two volumes, 4to. Dublin and London.

BERKELEY, a small market town and beautiful vale of Gloucestershire, giving the title to an earldom; about a mile east from the Severn. A religious house existed here in Edward the Confessor's reign. In Berkeley Castle, founded by Roger de Berkeley, soon after the Conquest, Edward II. was cruelly murdered, September, 1327. The assassins were Sir John Maltravers and Sir Thomas Gourney, at the instigation of the queen and her paramour Mortimer. 'His erie,' says Holinshed, 'did move many within the castele and town of Bircklei to compassion, plainly hearing him utter a wailleful noyse, as the tormenters were about to murder him, so that dyvers being awakened thereby (as they themselves confessed), prayed heartilie to God to receyve his soule, when they understode by his erie what the matter ment.' An apartment called the dungeon room is still shown, in which the deed is said to have been perpetrated. Berkeley is the birth-place of Dr. Jenner, the discoverer of vaccine inoculation. It carries on a good trade in timber, coals, malt, and cheese, and is distant fifteen miles S. S. W. of Gloucester, nineteen N. N. E. of Bristol, and 113 west of London.

BERKELY, a fertile and populous county of Virginia, bounded on the east and north by Potomac river which separates it from the state of

Maryland, on the south-east by London county, on the south-west and west by Hampshire, and on the south by Frederic county. It is forty miles in length, and twenty in breadth. Chief town, Martinsburg.

BERKESZ, a free market town, the capital of a circle in the county of Zolnok, Transylvania. In it are several castles, and a Calvinistic church; most of the inhabitants are potters. The environs are rich in grapes, chestnuts, and fruits.

BERKESZ, a market town of Hungary, in the district of Kowar, on the borders of Transylvania, inhabited by aboriginal Hungarians.

BERKHAMSTEAD, or BARKHAMSTEAD, GREAT, a market town of Hertfordshire; formerly of more note than at present. The Romans called it *Durobrivæ*. On the north side of the town are the remains of a castle, which is said to have been once the residence of the kings of Mercia. In this town a parliament was held in 697; and here William the Conqueror, having been stopped by the inhabitants cutting down the neighbouring woods, swore to maintain the laws of his predecessors. Henry II. also for a while kept his court here. The children of James I. were nursed at Berkhamstead, and that prince made it a corporate town; but its privileges were lost in the civil wars. It is situate by the side of the river Gade and the Grand Junction canal, which run together in a line with the high road from Watford, to two miles beyond Berkhamstead. The town consists of one handsome broad street. The church is a large gothic structure, the roof supported by twelve pillars, ornamented with figures of the apostles. It has the remains of several chapels or oratories. The chief trade here is in bowl-turning, shovel and spoon making, &c. It lies nine miles from St. Alban's, and twenty-six north-west of London.

BERKHEEYA, in botany, a genus of compound flowers, dedicated to the honor of Dr. John le Franq van Berkhey. Class and order, *syngenesia polygamia-frustranea*. Natural order *compositæ*. Ess. ch. *receptaculum cellular*. Seeds hairy. Crown chaffy, serrated or fringed. CAL. of one leaf, clothed with imbricated leafy scales. The species of this genus are confined to the Cape of Good Hope and its neighbourhood. They are generally perennial, often shrubby. They embrace Thunberg's whole genus of *robria*, and several of them have been referred by Linnæus to *gorteria*, *atractylis*, or even *xeranthemum*.

BERKHEYDEN, or BRECKBERG (Job), was born at Hærlém in 1637. He studied landscape painting on the borders of the Rhine, and after he had made himself master of that style, practised the painting of figures, taking his models from husbandmen, shepherds, and innkeepers, whom he represented at their feasts, dances, conversations, &c. His pictures were well handled, and agreeably colored, and some of them are very highly esteemed. Having heard much of the munificence of the elector palatine, and finding it difficult to procure an introduction, he fixed upon a scheme, which fortunately answered his purpose. Having often observed the elector going out to the chase, he took particular notice of all the nobility in his train;

and then, in conjunction with his brother, finished two pictures, containing the portraits of the prince, and his principal attendants. When the pictures were finished, Berkheyden prevailed upon an officer of the household to place them in a gallery, through which his highness passed at his return. The prince no sooner observed them, than he expressed the greatest surprise and satisfaction at the performance; enquired after the artist, and ordering them to be brought into his presence, rewarded them nobly for their work. Job Berkheyden died in 1693.

BERKLEY, a township of Massachusetts, Bristol county, and fifty miles south of Boston.

BERKLEY, a town of South Carolina, the chief town of the county of the same name.

BERKLEY, a county of Virginia, which lies west of the Blue Ridge, north of Frederic county, and is separated from the state of Maryland on the north and east by Potomac river. It is about forty miles long, and twenty broad.

BERKLEY'S SOUND, a bay on the north-west coast of North America, on the east side of Quadra's Isles, seventy miles south-east of Nootka Sound.

BERKS, or BERKSHIRE, an inland county of England, which contains the whole of the ancient British principality inhabited by the Atribatii, who are supposed to have come originally from Gaul. When Constantine divided the island into Roman provinces, in 310, this principality was included in Britannia Prima, the first division, whose boundaries were the English channel on the south, and the Thames, and Severn on the north. On the establishment of the Heptarchy, this part of the country was included in the kingdom of the West Saxons. When Alfred, a native of Wantage in this county, divided England into counties, hundreds, and parishes, in 889; this division first received its appellation of Berocshire, or Berkshire. At the period of the conquest, Berkshire had a population of between 40,000 and 50,000. At present it is in the Oxford circuit, the province of Canterbury, and diocese of Salisbury. It is subject to an archdeacon, whose jurisdiction extends no further than the limits of the county, and divided into four deaneries, Abingdon, Newbury, Wallingford, and Reading. The general shape of it somewhat resembles the form of a slipper or sandal. Its boundaries are chiefly natural, and highly picturesque; the Thames meandering in a varied line along its northern and eastern sides, throws it into such an irregular form, that, while in some places it is nearly thirty miles in breadth, in others it is less than four. On the south, the hills of Surrey and Hampshire afford a charming variety of landscape; and from the eminences in its western extremity, the eye is gratified with many enchanting scenes in the adjoining counties of Gloucester, Oxford, and Wiltshire. It extends from 51° 19' to 51° 48' north latitude, and from 34½' to 1° 43' west longitude. Its extreme length from Old Windsor to Buscot is about forty-eight miles; and its extreme breadth from Witham to Sandhurst (which, by the way, is taking rather an oblique line,) about twenty-nine miles. Its circumference is nearly 208 miles.

From the report published by order of the

House of Lords in 1805, it appears that 'the area of Berkshire is 744 square statute miles, equal to 476,160 statute acres; the number of inhabitants on each square mile, containing 640 acres, is 147 persons, making a total of 109,368.' Dr. Beeke, professor of modern history in the university of Oxford, from the trigonometrical survey taken by order of government, makes Berks, including some insulated parts, to contain about 464,500 square acres, according to the following distribution:—

	Acres.
Arable land about	255,000
Meadows and dairy land in the vale	72,000
Sheepwalks, chiefly unenclosed	25,000
Other dry pastures, parks, &c.	30,000
Wastes, chiefly barren heaths	30,000
Woods, copses, &c.	30,000
Other space occupied by buildings, } courts, fences, roads, rivers, &c. }	27,500
Total	469,500

The great natural divisions of Berkshire are four. 1. The Vale, generally called the White Horse Vale, extending from Buscot to Streatley, and bounded on one side by the Thames, and on the other by the White Horse Hills, a continuation of the Chiltern range. 2. The Chalky Hills, which run nearly through the centre of the lower part of the county. 3. The Vale of Kennet. 4. The Forest division, commencing on the east of the Loddon, and extending the breadth of the county to Old Windsor. The principal rivers and streams are the Thames, the Kennet, the Loddon, the Lambourn, the Ock, the Aubourn, the Emme, and the Broadwater. Most topographical writers take notice of a peculiarity in the Lambourn, that its stream is always full in summer, and almost lost in winter; but Mr. Lysons denies this, and contends that it has throughout the whole year an equal fullness.

The substratum of this soil consists generally of chalk and calcareous matter, or of gravel, with clay at greater or less depths. The vale is remarkably fertile, and its prevailing soil, is a strong, gray, calcareous loam, in which vegetable mould is intimately mixed with cretaceous earth. Among the chalky hills, there are intermediate tracts of considerable fertility, where the superficial stratum is composed of vegetable mould, mixed with chalk, flint, and gravel. In general the hills form excellent sheepwalks, being covered with a fine turf. In the vale of Kennet gravel soils predominate, varying, however, considerably in their qualities, admixtures, and depths from the surface. In this district there is a peculiar kind of peat, which is equally valuable as fuel or manure. This has been defined by Kirwan as a 'stratification of fossil trees in all directions, mixed with a reddish or brownish-red slimy moss, formed of the carbonic particles of vegetables, and united with their astringent juices and caloric oleaginous faculae.' Sir Humphrey Davy found it to consist of

Oxide of iron	48
Gypsum	32
Muriate of sulphur and potash	20

The northern parts of the forest district have a gravelly soil, diversified by strong loam and clay; the central parts a tenacious clay; and the southern parts sand and gravel. At Catsgrove, near Reading, there is a stratum of chalk, thirty feet in thickness, lying upon a bed of flint. Above the chalk is a stratum of sandy clay, about a foot thick, covered by a layer of oyster-shells, two feet in depth. Similar strata of sand, with oyster-shells, are found for two miles round Reading, at various depths, from fifteen to twenty-five feet. Here likewise have been discovered an inferior kind of ochre, and different species of echini. Fossil-shells, sharks' teeth, parts of fishes, and other marine productions, are also found in various parts. Pipe-clay and potters-clay are in considerable quantities; and shell-marl was discovered in the vale of Kennet in 1794. There is a mineral spring at Cumnor which possesses a mild cathartic quality; another a mild chalybeate at Sunninghill, near Windsor; and Gorrick-well, in the parish of Oakingham, is strongly impregnated with steel.

The greatest portion of the land in Berkshire is freehold, though there are copyholds in different parts; and leases on lives, and leases renewable every seven years, under deans and chapters, and other corporate bodies, are pretty frequent. The farms are of all sizes, which induces men of various amounts of capital to enter into agricultural pursuits; and while rank and fortune are nowhere more respected or more beneficial in their influence, there is no part of England where a virtuous independence is more general. The late Mr. Pitt is stated to have said on one occasion, 'that no minister of this country could command ten votes in Berkshire.' The total amount of real property, assessed under schedule A, for the property-tax in Berkshire, in 1815, was £652,082; and the amount of the poor rates the same year was £122,352, at the rate of 3s. 9d. in the pound.

The soil is well adapted to wheat and barley, great quantities of which are grown, the latter being chiefly sent to London after being made into malt. There are many large dairy farms, particularly in the White Horse Vale: the cattle and sheep are large and valuable, and of the latter there is a peculiar breed; the distinguishing qualities of which are their great size, their height on the legs, and weight when fatted: they have black faces, Roman noses, black or mottled legs and long tails. The Berkshire swine have also been long famous.

No inland county possesses more advantages in point of navigation than Berkshire. In its western division, no part of the triangle formed by the Thames on the north-east, the Kennet on the south, and the Wilts and Berks' canal on the west, is distant more than twelve miles from water-carriage; and in the east and south-eastern parts, the distance is nowhere greater from the Basingstoke canal. The Kennet and Avon canal, not long since completed, begins a little above Newbury, and runs nearly parallel to the Kennet, till it enters Wiltshire in the neighbourhood of Hungerford.

Berkshire is divided into twenty hundreds,

containing twelve market towns and four royal boroughs. It sends nine members to parliament; the county two; Reading, Windsor, and Wallingford two each, and Abingdon one. The twelve market towns are Abingdon, Farringdon, Hungerford, East Ilsley, Lambourn, Maidenhead, Newbury, Oakingham, Reading, Wallingford, Wantage, and Windsor; Ilsley is a noted sheep market, held on every alternate Wednesday from Easter to Midsummer; 20,000 sheep are sometimes sold in a day, and the annual average exceeds 250,000; Oakingham has a large supply of poultry, chiefly bought for the London market; and Farringdon is famous for its bacon and hams. This county is esteemed healthy, even in the valleys; it produces abundance of timber, principally oak and beech, and has reputable manufactures of woollen, sail-cloth, and paper. At Bisham there are copper-works, rather at present in a declining state, but the mills have been thought the most powerful and complete in the kingdom for rolling sheet copper, making bolts for ship-building, and hammering copper pans and bottoms. From 600 to 1000 tons of copper have been used here annually.

This county has long been distinguished as containing a favorite royal residence—the only one, indeed, that our kings possess worthy the name—at Windsor. The castle was founded by William the Conqueror. Edward III. was born here, where he afterwards instituted the illustrious order of the garter; and its forest has long afforded the pleasure of the chase to our monarchs. The park is stocked with numerous herds of deer, and a part of it has been much improved by the establishment of experimental farms, managed under the immediate direction of his late majesty. In this county are also Frogmore, Cumberland-Lodge, Cranbourn-Lodge, and other residences belonging to the royal family, besides above 150 noblemen and gentlemen's seats.

The Roman Watling-street, from Dunstable, enters Berkshire at the village of Streatley, between Wallingford and Reading, and crossing this county proceeds to Marlborough. Another Roman road from Hampshire, the Spinæ or Camden, enters this county, leading to Reading and Newbury, where it divides: one branch extends to Marlborough in Wiltshire, and the other to Cirencester in Gloucestershire. A branch from the Icknield-street proceeds from Wallingford to Wantage. There is a Roman camp near Wantage on the brow of a hill, of a quadrangular form; there are other remains of encampments at East Hamstead, near Oakingham, White Horse Hill, and Pusey; and upon Sino-dunhill, near Wallingford. At Lawrence Waltham is a Roman fort, and near Drenchworth is Cherbury castle, a fortress of Canute. Uffington castle, near White Horse Hill, is supposed to be Danish; and near it is Dragon Hill, supposed to be the burying-place of Uther Pendragon, the British monarch. Near White Horse Hill are the remains of a funeral monument of a Danish chief, slain at Ashdown by Alfred. On White Horse Hill, near Uffington, is the outline of what is called a horse, although it bears quite as great a resemblance to a greyhound. It is

formed by cutting away the turf from the face of the chalk. Its origin is uncertain, but Mr. Lysons observes, that a singular figure appears frequently on the British coins, resembling this animal, and he, in consequence, ascribes this piece of antiquity to the ingenuity of the Britons. Specimens of Saxon architecture are found in Avington church, and the nave of the church at Windsor. The churches of Uffington, Englefield, and Farringdon, and the chapel of Little Farringdon, are superior specimens of the early Gothic: and of the later Gothic, there is no existing exhibition more complete or beautiful than St. George's chapel, Windsor.

Berkshire has occasionally been the scene of military operations, from the time of Offa until the Revolution. During the civil wars was fought the first battle of Newbury, in which lord Falkland lost his life, in September, 1643, and on the 10th of October of the following year, a second battle of that name, in which both parties claimed the victory; the royal party was expelled from the whole county, excepting Wallingford, in 1646. In 1688 there was a skirmish at Reading, on the eve of the revolution.

The population of Berkshire, in the census of 1821, was as below:—

Males	65,546
Females	66,431
Total	131,977
Families chiefly employed in agriculture	14,769
Families chiefly employed in trade, &c.	8,773
All other families	4,158
Average number of persons in each family	4½

The increase of population at several following periods has been thus stated:—

Dates.	Inhabitants.	Increase.
1700	74,700	24 per cent. in 50 years.
1750	92,700	
1801	112,800	21½ per cent. in 51 years.
1811	122,300	8 per cent. in 10 years.
1821*	134,700	10 per cent. in 10 years.

* Including a proportional part of the army, &c.

See *Lyson's Magna Britannia; Mavor's Agricultural Report of Berkshire; Beauties of England and Wales; Smith's Map of the Strata of England, and Memoir.*

BERKSHIRE, the most westerly county of Massachusetts. It is bounded on the north by the State of Vermont, on the east by Hampshire county, on the west by the State of New York, and on the south by the State of Connecticut. It is fifty-one miles from north to south, and eighteen from east to west, and is divided into twenty-five townships. This county is considerably mountainous and hilly; in some of the hills are found quarries of marble. The chief town is Stockbridge.

BERKSHIRE, a township of Vermont, in Franklin county.

BERLIN, a city of Germany, formerly the capital of the electorate of Brandenburg, and now of the whole Prussian dominions; one of

the largest and best built cities in Europe. The streets are broad, strait, clean, and well paved; and some of them very long and elegant. There are also several large and beautiful squares, with pleasant walks. It is surrounded with handsome gardens, which produce excellent fruit. The Spree, that crosses the city, has communications by canals with the Havel, Oder, and Elbe, as well as with the Baltic Sea and German Ocean, which greatly facilitate commerce. Berlin is divided into five parts, once distinct towns, without reckoning the suburbs, which are extensive. They were first united under one magistrate in 1714. In all, the city contains thirty-three churches, principally Lutheran and Calvinistic, with a few for the Roman Catholics. Contrasting Berlin with Hainburg, Dr. Neale says, 'None of the offensive peculiarities in the appearance of the latter city, are here visible; the traveller, in the course of sixty miles, seems to have borrowed the wings of time, and outstripping the slow and gradual progression of the arts for four centuries, finds himself, on a sudden, placed as it were in the midst of an Italian city, surrounded with wide and dry streets, spacious squares, avenues, bridges, porticoes, palaces, triumphal arches, statues, and cupolas; and, instead of the jutting abutments of mean brick buildings, beholds on all sides the ample proportions of stately edifices—the triumph of human industry over the sterility of nature, a modern Palmyra raised by the wand of an enchanter amidst the hyperborean deserts of Brandenburg.' Frederic II. is supposed to have expended yearly in the improvement of this city 400,000 dollars, about £65,000 sterling, and in that of Potsdam 200,000 dollars, £32,500; the police is well regulated, and the produce of the excise is above £20,000 sterling. In the suburb called Spandau is a royal palace furnished in exquisite taste. Adjoining to Stralau is a house and garden belonging to the king. The royal gate of the city is defended by a half moon, and two bastions, covered with brick; it fronts the royal street, which is one of the longest and most frequented in the city, and it contains several handsome houses, particularly those belonging to the ministers of state. The royal street is crossed by five others. On the new bridge, which is of stone, over the Spree, is an equestrian statue of William the Great, which is esteemed an exquisite piece of workmanship. After passing this bridge, the king's palace appears, which is a superb edifice, four stories high. No palace in Europe is more magnificently furnished. Its fine gardens, however, are now converted into a place of arms. The king's stables near the palace, are large, and front the great street. The mangers are of stone, and the pillars, that divide the stalls, of iron, adorned with the king's cypher. Over the riding-house is a theatre, where plays have been acted and balls given for the entertainment of the court. The arsenal consists of four rectangular buildings, forming a court in the middle; each front has three large porticoes. On the principal gate is a medallion of Frederic II. in bronze. We follow, in the rest of our description, the main divisions of this noble city.

I. Berlin Proper, founded by the margrave Albert, surnamed the Bear, in the year 1163, contains thirty-nine streets. The best buildings in this part of the city are the post-office, the governor's house, and the council-chamber; the Calvinist parish church, and the Joachimsthal academy; the garrison church, built in 1722, and adorned with the portraits of generals Schwerin, Keith, Winterfeld, Zeithen, and Von Kleist, the poet. Here also are deposited a number of colors and other trophies taken in the field. The other buildings are the Lutheran parish churches of St. Nicholas and St. Mary, the Brandenburg county meeting-house, the Jewish synagogue, the new guard-house, the French church, the united Berlin and Coln Lutheran academy (the funds for which were left by a Venetian merchant), the royal arsenal, from which the whole Prussian army is supplied with clothing; Frederic's hospital, in which above 800 children are educated gratis; the porcelain manufactory, the seminary for cadets, in which 224 young noblemen are instructed in language, sciences, and the exercises of the field; the new theatre, &c. The suburbs of Berlin Proper are the King's quarter, the Spandau quarter, Sophienstadt, and the Stralau quarter. In these are to be seen the large workhouse, the new mint, the public storehouse, the summer palace of Mon Bijou, with its pleasure gardens, the extensive hospital of La Charité, the sugar refineries, and the hospital of invalids, built in 1748, and fitted to contain above a thousand inmates. About two miles from the town is the mineral spring called Frederic's Well, with a bath, and other conveniences; it was first opened in 1761. Across the main branch of the Spree, between Berlin Proper and Coln, there is a fine free-stone bridge, of five arches, and 160 feet in length, ornamented with the statue of the elector Frederic William.

II. Coln, or Cologne on the Spree, also founded by the margrave Albert, and at one time surrounded with walls and ditches. The Spree here divides itself into two branches, forming a sort of island on which the town is built. The streets are twenty-five in number, regular, and well built. The most remarkable edifice here is the royal castle, 430 feet in length, and 276 in breadth. In it is the king's library, which contains upwards of 200,000 volumes, and receives a frequent increase, as two copies of every new book must be deposited in it by the publishers. In this castle are also to be seen the cabinet of antiquities, minerals, and medals, with the museum of natural and artificial curiosities. In this quarter of the town are the principal government offices, such as the council of state, the general directory of war, finance, and royal domains, the war treasury, &c. Near the castle stands the magnificent cathedral belonging to the Calvinists, first opened for public worship in 1750. The other objects worthy of notice, are the new custom-house, the royal mews, the gallery of paintings, the military school, in which fifteen young noblemen are educated for a military life at the expense of the state, the market-place, the new tilt-yard, &c. New Coln, which once formed a part of the old

town, consists of four streets, running parallel to the bank of the Spree. Here are large store-houses of salt and iron, with sugar refineries, and the observatory of Krosigke. The suburb of Coln, or, as it is sometimes called, of Coppenick, is finely situated, and was first included within the outer walls in 1736.

III. Fredericswerder, or Frederic's Island, was founded by the elector Frederic William I. and is composed of nineteen streets. The principal church is divided between the German and French Protestants, and at some distance from it is the French academy, as also the Fredricswerder academy, which was rebuilt in 1794. Other excellent establishments in this part of the town are the medical college, the old custom-house, the old mint, the royal hunting lodge, in which is at present the royal bank, the palaces of the margrave Von Schwedt and the prince of Prussia, the royal arsenal and foundry, the stamp-office, &c. In this quarter of the city, likewise, is the principal Lombard, where money is lent on goods.

IV. Dorotheenstadt, or New Town, founded by the same elector, and named after his wife. It lies between Fredericswerder, Fredericstadt, and the Spree, and is not of great size, having only six regular streets, but in these are some splendid buildings. We notice the Lutheran, German, and French reformed church, so called from its being used in common by all three communions, the palace of prince Henry, now the university, the king's mews, the building formerly occupied by the academy of painting, sculpture, and architecture; the royal academy of sciences, with its elegant hall, library, and cabinet of medals, the observatory, the anatomical theatre, the handsome opera-house, the principal Catholic church, built in 1773. Here also is a fine alley of linden trees, above half a mile in length, and 160 feet wide, with various other promenades and labyrinths. The university was instituted so lately as 1810, and is rather the union of several former seminaries than a new establishment; the number of students in the first session was 232.

V. Fredericstadt, founded by the elector Frederic III. in 1688, is the largest of the five towns of which the city of Berlin is composed, and contains twenty-three broad and well-built streets, of which Leipziger-strasse is the most remarkable for beauty, and Friedrick-strasse for length. Here are situated the principal courts of law, the gold and silver fabrics, connected with the orphan-house at Potsdam, the porcelain manufactory, the magnificent palace of the grand master of the order of Malta, the palace of count Reuss, the Jerusalem, Trinity, and French churches, and the Bethlem church, belonging to the Lutherans of Bohemia. Here also are the statues of general Schwerin and Winterfeld, and the excellent seminaries called Realschule, in which are taught the languages, and all the arts and sciences of civil life.

Berlin contains a population of about 180,000 individuals, besides the military, who are seldom less than 30,000. Nearly one-fourth of the people are employed in various manufactures, the principal of which are silk, porcelain, cotton,

linen, laces, jewellery, clocks and watches, and several metallic articles. In the silk manufactories, the number of looms is above 2000, employing in all nearly 3000 workmen, and working silk to the value of about £400,000 a-year; of this nearly one-fourth is exported. This city was taken October 9, 1760, by an army of Russians, Austrians, Saxons, &c. who totally destroyed the magazines, arsenals, and foundries, and seized an immense quantity of military stores, and a number of cannon and arms. Berlin again suffered the fate of a captured city, after the battle of Jena, in 1806. It is forty-two miles north-west of Frankfort on the Oder, ninety north of Dresden, and 300 north by west of Vienna. Long. 13° 31' E., lat. 52° 32' N.

BERLIN, a flourishing town of York county, Pennsylvania; situated on the south-west side of Conewago creek, at the confluence of a small stream. It is thirteen miles west of York-town, and 101 west of Philadelphia.

BERLIN, a thriving town of Somerset county, Pennsylvania; situated on a branch of Stony creek, which empties into Conemaugh river, on the west side of Allegany mountain. It is thirty miles west by south of Bedford, and 240 west of Philadelphia.

BERLINS, though named from the preceding city, are said by some to be the invention of the Italians, and the word to be derived from *berlina*. The *berlin* is a very convenient machine to travel in, being lighter, and less apt to be overturned than a chariot. The body is hung high, on shafts, by leather braces; and, instead of side windows, some have screens to let down in bad and draw up in good weather.

BERLINA, a name given in Italy to a sort of stage whereon criminals are exposed to public shame.

BERLUCCIO, in ornithology, the name of a small bird of the *bortulanus* kind, and much resembling the yellow-hammer, but something smaller, and longer-bodied.

BERMUDA HUNDRED, a port of entry, and post-town of Virginia. It is situated in Chesterfield county, on the west side of James river, a few miles above the junction of the Appomattox, and about nineteen direct below Richmond. It is 315 miles south-west by south of Philadelphia.

BERMUDAS, or the SUMMER, or SOMER'S ISLANDS, a cluster of islands in the Atlantic Ocean, lying almost in the form of a shepherd's crook, in long. 64° 0' W., lat. 32° 20' N. between 200 and 300 leagues distant from the nearest place of the continent of America, or any of the other West India Islands. The whole number of the Bermudas is said to be about 400, but very few of them are habitable. The principal is St. George's, which is not above sixteen miles long, and three at most in breadth. St. George's town is at the bottom of the principal haven; and is defended by four forts, which command the entrance. The town has a handsome church, a library, and a good town-house, where the governor, council, &c. assemble. It is universally agreed that the climate of this and the other Bermudas has undergone a surprising alteration for the worse since they were first discovered;

the air being much more inclement, and the soil more barren, than formerly. This is ascribed to the cutting down those fine spreading cedars, for which the islands were famous, and which sheltered them from the blasts of the north wind at the same time that it protected the undergrowth of the delicate plants. In short, the Summer Islands are now far from being desirable spots and their natural productions are but just sufficient for the support of the inhabitants. The cultivated districts are appropriated to the growth of Indian corn, pulse, fruits, and vegetables. The first yields two crops a year, one harvest being in July, and the other in December. In 1785 the growth of cotton was attempted, but with no great success, there not being more than 200 acres appropriated to it. At first tobacco was raised upon these islands; but being of a worse quality than that growing on the continent, the trade is now almost closed. Large quantities of ambergris were also originally found upon the coasts, and afforded a valuable commerce; but that trade is also reduced, as well as their whale trade. The Bermudas, however, might still produce some valuable commodities, were they properly cultivated. About three or four feet below the surface, a chalky stone is found which is easily chiseled, and is exported for building houses in the West Indies. Their palmetto leaves, if properly manufactured, might turn to excellent account in making hats: and their oranges are still valuable. The soil is also said to be excellent for the cultivation of vines. The chief resource of the inhabitants for subsistence is in the remains of their cedar wood, of which they fabricate small sloops, with the assistance of the New England pine, and sell them in the American ports. Their turtle trade is also of value; they rear a great variety of tame fowl, and have wild ones in vast plenty. The red wood peculiar to these islands, feeds worms, which change to flies, a little larger than cochineal, instead of which they are used. Another plant peculiar to them is a kind of creeping darnel, whose root is most powerfully emetic. Fish likewise abound upon the coast. Among the insects, the spider is remarkable for its size, and its beautiful colors diminish the disgust it inspires: Its web is in color and substance a perfect raw silk, and running from tree to tree, small birds are sometimes so entangled in it, as hardly to be able to escape. No species whatever of venomous animals are found here. All the attempts to establish a regular whale fishery on these islands have hitherto proved unsuccessful. The water, except that which falls from the clouds, is brackish; and the same diseases reign here as in the Carribee Islands. They have seldom any snow, or even much rain; but when it does fall, it is with great violence, and the north or north-east winds render the air very cold. The storms come with the new moon: and if there is a halo or circle about it, it is a sure sign of a tempest, which is generally attended with dreadful thunder and lightning. There are but two places on the large island where a ship can safely come near the shore, and these are so well covered with high rocks, that few will choose to enter it without a pilot; a vessel of ten tons burden can

scarcely enter the roads. The Bermudians have been characterised as remarkable for the kind treatment of their slaves, and their general good morals. The women are thought handsome, but given to dress. A royal dock-yard and naval arsenal have lately been established here for refitting the king's ships, belonging to the North American station. This has consequently increased the population of the Archipelago, which is estimated at about 70,000, half being slaves.

Other of the Bermudas are St. David's, Cooper's, Ireland, Somerset, Long Island, Bird Island, and Nonsuch. A few villages and farms are scattered over most of them.

The official value of the imports and exports of the Bermudas was

	Imports.	Exports.
For 1809,	£11,648	£34,279
1810,	1,137	36,613

The north point of these islands lies in lat. 32° 34' N., long. 63° 28' W.

John Bermudas, a Spaniard, is commonly said to have discovered these islands in 1527; others attribute the discovery to Henry May, an Englishman, who was shipwrecked upon St. George's. Shortly after, the deputy governors of Virginia were also wrecked here, and built each of them a new ship of the cedar they found, in which they sailed to Virginia. On their arrival, that colony was in such distress, that lord Delawar, upon the report which his deputy governors made him of the plenty they found at Bermudas, despatched Sir George Summers to bring provisions from thence to Virginia. Sir George, after a tedious voyage, reached the place of his destination, where soon after his arrival, he died, and the sailors he had left departed in their cedar ship for England. Two sailors, Carter and Waters, being apprehensive of punishment for their crimes, had secreted themselves, however, when Sir George was first wrecked upon the island, and had ever since lived upon the natural productions of the soil. Upon the second arrival of Sir George, they enticed one Chard to remain with them: but, differing about the sovereignty of the island, Chard and Waters were on the point of cutting one another's throats, when they were prevented by the prudence of Carter. Soon after they found a piece of ambergris weighing about eighty pounds, besides smaller pieces, which in those days were sufficient, if properly disposed of, to have made each of them master of a fortune. They, therefore, came to the resolution of transporting themselves, and it, in an open boat to Virginia or Newfoundland. In the mean time, the Virginia Company claimed the property of the Bermudas islands; and sold it accordingly to 120 persons of their own society, who obtained a charter from king James. This New Bermudas Company, as it was called, now fitted out a ship with sixty planters on board to settle on the Bermudas, under the command of Richard Moor. The new colony arrived upon the island just at the time the sailors were about to depart with their ambergris; which Moor having discovered, he immediately seized and disposed of it for the benefit of the company.

So valuable a booty gave them abundant spirits, and the adventurers settled themselves upon St. George's island, where they raised cabins. Moor, we are told, built eight or nine forts or rather blockhouses, and planned out the town of St. George as it now stands. The fame of this settlement awakened the jealousy of the Spaniards, they appeared off St. George's with some vessels; but being fired upon from the forts, sheered off; though the English at that time were so ill provided for a defence, that they had scarcely a barrel of gunpowder on the island. During Moor's government, the Bermudas were so infested with rats, which had been imported into them by the English ships, that they even covered the ground, and had nests in the trees. This calamity lasted five years, and at last suddenly ceased. Moor was succeeded by a Captain Daniel Tucker, who improved upon all his predecessor's schemes, and particularly for the culture of tobacco. In 1619 Captain Tucker resigned his government to Captain Butler. By this time the high character which the Summer Islands bore in England rendered it fashionable for men of the highest rank to encourage their settlement; and several of the first nobility of England purchased plantations here. Captain Butler brought over with him 500 passengers, who became planters on the islands, and raised a monument to the memory of Sir George Summers. The island now contained about 1000 whites, and Captain Butler applied himself to give it a new form of government by introducing an assembly: the government till this time being administered only in the name of the governor and council. A body of laws was likewise drawn up. We shortly after read of 3000 English being settled in the Bermudas, and several persons of distinction had the curiosity to visit them from England. Among these came Waller the poet, who has celebrated this spot in one of his poems, as the most delightful place in the world. The accounts given of the serenity of the climate, induced the ingenious bishop Berkeley to form a plan for founding a college there, for the purpose of propagating Christianity among the American Indians. In 1725 he published a proposal of this kind in London, which after some time was approved by the government, and subsequently brought into the House of Commons by Sir Robert Walpole. A charter was ultimately granted by his Majesty for the establishment of a college, to be called St. Paul's College, in Bermudas, to consist of a president and nine fellows, who were bound to maintain and educate the children of American Indians at £10 a year each. To promote this philanthropic purpose, the parliament passed a vote for £20,000. In 1728 Berkeley sailed to America to carry his intentions into effect; but after he had been kept waiting there for some time, the money was not paid, and the scheme was relinquished.

BERN, or BERNE, a canton of Switzerland, which holds the second rank in the diet; although it is by far the largest, containing, before the late revolutions, almost one-third of the whole country. Its present boundaries are Uri, Underwalden, and Lucerne on the east; Aargau and Solothurn

on the north; the Jura mountains, Fribourg, and Vaud on the west, and Valais on the south. It was increased in 1815 by the greater part of the bishopric of Bale, and the town and territory of Bienne; but had previously lost, in 1793, more than a fourth of its former extent, the two new cantons of Aargau and Vaud (including the bailiages of Peterlingen and Avenche) being erected out of it. The portion left is divided into the five districts of Bern (the town), the Oberland, the Landgericht, the Emmenthal, and the Seeland, each of which is subdivided into thirteen tribes or corporations. The large council now consists of 195 members, who are chosen by these corporations, and form the legislature of the canton, a committee of which bears the name of the small council, and has at its head two magistrates, possessed of the executive power. The great council assembles for only three weeks in the half year; the other is permanent. The established religion is Calvinism, nearly the same with that of the church of Scotland. The ministers are divided into deaneries and classes, and hold yearly chapters and synods. They are kept in a greater dependence on the civil power here than in the other cantons, and none suffered to interfere in matters of state; but religious discipline is here very strict. The canton is divided into twenty-four upper bailiwicks, and comprehends 3872 square miles, and 215,000 inhabitants. The southern boundary, viz. that on the side of the Valais, consists of a chain of very high mountains; towards the north the country begins gradually to flatten, and is in many places highly productive in fruit, vines, and corn. Of the last of these articles, however, the total quantity yielded is not sufficient to supply the domestic consumption. In the mountainous parts the principal object of attention is the breeding of cattle and horses, the export of which, as well as of cheese, is very extensive. Salt is found in a few places. Accounts are kept in batzen and kreutzers: a piece of ten batzen is also called a frank, and is worth forty-four Rhenish kreutzers, or about 15*d.* sterling.

Bern joined the Swiss confederacy in 1353, and enjoyed, from its size and political importance, the next place among the cantons, to Zurich. The legislative power was vested in the great council of 299; the executive was in the hands of the small or daily council of twenty-seven, chosen out of the former. This canton, at an early period of the Reformation, withdrew from the church of Rome, and by secularising the revenues of its numerous and opulent ecclesiastical establishments, materially enriched the public treasury. The change of faith was probably attended by few excesses, as many ancient monastic buildings remain. An aristocratic spirit, however, gradually prevailed in the constitution, and in 1764 a law was passed, by which 243 patrician families were declared the only persons eligible to seats in the council, and consequently to offices of trust or distinction. This step excited great clamor, particularly among the inhabitants of the Pays de Vaud, who considered themselves treated as a conquered people; and on the entry of the French in 1798, the aristocratic party was overthrown, and a new constitu-

tion framed. Buonaparte erected the Pays de Vaud into an independent state, thus depriving Bern of the most profitable portion of its territory; and the congress at Vienna, in 1815, when it professed to bestow on it an equivalent in the Evêché, confirmed the disruption of the Pays de Vaud. What remains of this canton, however, is unrivalled in its scenic attractions. In Oberland the range of the Alps is fully as magnificent, and perhaps bolder in its outline than that of Chamouni; the verdure and the foliage are enchantingly rich, and the cascades are both numerous and beautiful. At Breintz the Giesback has seven successive falls; and the Staubbach is thrown down above 900 feet of perpendicular descent. At Hindelbank, about seven miles from Berne, is a chef d'œuvre of Nahl, the monument of Mad. de Langhans, which the traveller should also notice: nor, if objects of philanthropy have charms for him, will he omit to visit the well ordered seminary of Professor Fellenberg at Hofwyl, whose system of education, both for the poor and wealthy, is admired throughout Europe. The buildings which were only finished in 1822, are more considerable in extent than those of almost any other public institution in Switzerland. The prevailing language is German, but the higher orders speak French. The whole area is now calculated at 3872 square miles, and the population at 232,000. The chief manufacture is linen, of which 10,000 bales are exported annually by way of Lyons, silk goods, stockings; and clocks and watches are also made in the town. Hides, horses, cattle, cotton cloth, and cheese are also exported.

BERN, a city of Switzerland, and capital of the preceeding canton, is situated upon a peninsula formed by the Aar. It is said that the taking of a bear by Berchtold V., Duke of Zœringhen, on the day on which the foundation of this city was laid, gave occasion to its name; hence it is often in Latin called *Arctopolis*, i. e. the city of the bear, and has a bear for its coat of arms. Near the Neufchâtel gate are always kept a number of bears, in two enclosures, with trees for them to ascend and play upon. The houses are mostly built of white free-stone, and in the principal streets, have piazzas or arches under them. Most of the streets are paved with flints, and traversed by a canal lined with stone, which is brought from a considerable distance. The city is large, standing almost in the middle of the canton, and containing several churches, of which one is called the Great Church, and its first minister the dean, who is the head of the city clergy. From an inscription near the door of this church, it appears that the first stone of it was laid in 1421. It is a fine gothic edifice. In this city is also a college, a large public library, and a museum; a guildhall; a well stored arsenal; and several hospitals. In the arsenal is a wooden statue of the famous William Tell. On the east side of the city is a handsome stone bridge; and near the great church a very fine platform, several hundred feet in height, which makes a most delightful walk.

Bern stands 1700 feet above the level of the lake of Geneva, from which city it is seventy-

five miles distant; and fifty from Basle and Zurich. Population 12,900.

The **BERN MACHINE** is an engine for rooting up trees, invented by Peter Sommer, a native of Bern in Switzerland. There is nothing in the construction of this machine which entitles it to a particular description. The contrivances for tearing up trees that exhibit ingenuity or originality of construction, will be found under **TREES**. See on this subject also *Young's Natural Philosophy*, vol. ii. p. 199.

BERNACLE, in ornithology, a species of goose. See **ANAS** and **BARNACLE**.

BERNARD (Dr. Edward), a learned astronomer, linguist, and critic, was born at Perry St. Paul, on the 2d of May, 1638, and educated at Oxford, where he became, in 1669, Savilian professor of astronomy. His principal works are: 1. *Tables of the Longitudes and Latitudes of the Fixed Stars*. 2. *De Mensuris et Ponderibus Antiquis Libri Tres*, 8vo. Oxon. 1688. 3. *Orbis eruditi Literatura à Caractere Samaritano deducta*, printed at Oxford, from a copperplate, on one side of a broad sheet of paper, presenting at one view the alphabets of different nations. 4. *Etymologicum Britannicum*, &c. printed at the end of Dr. Hick's *Grammatica Anglo-Saxonica*, &c. 4to. Oxon. 1689. 5. *Chronologiæ Samaritanæ Synopsis*, in two tables, besides notes on part of *Stephanus Byzantinus*; and on *Cotelerius*' edition of the ancient fathers.

BERNARD (St.), the first abbot of Clairvaux, was born A. D. 1091, in the village of Fontaine, in Burgundy. He acquired so great a reputation by his zeal and abilities, that all the affairs of the church appeared to rest upon his shoulders, and kings and princes seemed to have chosen him for a general arbitrator of their differences. It was owing to him that Innocent II. was acknowledged sovereign pontiff; and after the death of Peter Leonis, anti-pope, that Victor, who had been named successor, made a voluntary abdication of his dignity. He convicted Abelard at the council of Sens, in 1140. He opposed the monk Raoul, who persecuted the followers of Arnold of Brescia; and in 1148 he obtained the condemnation of Gilbert de la Poree, bishop of Poitiers, and Eon de l'Etoile, at the council of Rheims. Bayle says he thus verified his mother's dream, that she should bring forth a white dog, whose barking should be very loud! He preached up the crusade under Louis VII. and when complaint was made that he had brought an infinite number of Christians to slaughter, without going out of his own country, he said that the sins of the Croisades had hindered the effect of his prophecies. He is said to have founded 160 monasteries, and to have wrought a great number of miracles. He died August 20th, 1153, aged sixty-three. The best edition of his works is that of 1690, by father Mabillon.

BERNARD (Sir Thomas), a modern scholar and philanthropist, was the son of Sir Francis Bernard, formerly governor of New Jersey, and afterwards of Massachusetts's Bay. He was educated at Harvard College, in New England, after which he came to this country, and studied the law at Lincoln's Inn. He was called to the bar in 1780, but practised only as a conveyancer.

Appointed treasurer to the Foundling Hospital in 1795, he greatly improved the estates belonging to that charity; and he was the principal projector and supporter of the Society for Bettering the Condition of the Poor. Sir Thomas likewise displayed a considerable taste in the fine arts, and was active in the establishment of the Royal Institution and the British Gallery. In 1809 he succeeded to the title of baronet, and was soon afterwards made doctor of civil law at Oxford. He was also chancellor of the see of Durham. His publications chiefly relate to the management or instruction of the poor; except a work entitled *Spurina, or the Comforts of Old Age*, 8vo. which exhibits considerable learning. He died at Leamington Spa, in Warwickshire, in 1818, aged sixty-seven.

BERNARD CASTLE, a market town in the parish of Gainsford, Darlington Ward, Durham, 246½ miles north from London, on the banks of the river Tees. It was originally built by Bernard Baliol, great grandfather to John Baliol, king of Scotland. The castle, belonging to the earl of Darlington, is of great antiquity. The principal street is spacious, and nearly three-fourths of a mile long, and the houses neat. The market-house is an open structure of fine free-stone, covered with slate, and surrounded by an octagonal colonnade; and here is held one of the greatest corn-markets in the north of England. About two miles from this place a sulphurous water springs from a rock in the bed of the river Tees. This town was formerly famous for the manufactory of white leathern breeches, and for tammies or Scotch camlets: in the manufactory of which, a number of weavers are yet employed. Here is an ancient hospital, founded by John Baliol. Here are four annual fairs, and a market on Wednesday.

BERNARD (St.), THE GREAT, in geography, a mountain of Switzerland, in the Valais, on the frontiers of Piedmont, fifteen miles N.N.W. of Aosta. It has long been celebrated for its romantic and picturesque scenery, and is always visited by travellers. Hannibal has been supposed to have conducted the Carthaginian army by this pass into Italy; and it was by the same route that Buonaparte led his troops to the plains of Lombardy before the battle of Marengo. The summit of this mountain is about 11,000 feet above the level of the sea; the highest pass is about 8000 feet. Here a monastery has been for nearly nine centuries devoted to the accommodation of all travellers who choose to stay to refresh themselves; and they and their horses are most hospitably entertained gratis for three days. When the weather is bad, the monks and their servants, assisted by a peculiar breed of dogs, traverse all parts of the mountains in search of travellers who have lost their way. When every trace of a road has been defaced by a fall of snow, the dogs will point out the path to the guides; and even when the traveller has been overwhelmed, and lies sunk beneath the snowy mass, these animals will frequently discover him. The revolutions of Europe, we greatly regret to add, have deprived this noble establishment of the greatest part of its possessions, so that contributions for its support are

now thankfully received by the fraternity. The summit, Velan, is in lat. $45^{\circ} 48'$ N. and long. $7^{\circ} 2'$ E.

BERNARD (Little St.), is to the south-west of the Great St. Bernard, on the opposite side of Mont Blanc. It forms a part of the ancient Alpes Graie. The pass lies over this into Savoy; the summit is 7200 feet from the level of the sea.

BERNARD'S TOWN, a town of New Jersey, in Somerset county. Also a township of Massachusetts, in Hampshire county, 110 miles from Boston.

BERNARDINE (St.), was born at Massa, in Tuscany, in 1380. In 1404 he entered into a Franciscan monastery near Sienna, where he became a famous preacher, and was afterwards sent to Jerusalem as commissary of the Holy Land. On his return to Italy, he preached with such applause, that the cities of Ferrara, Sienna, and Urbino, desired pope Eugenius IV. to appoint him their bishop; but Bernardine refused the honor, accepting only the office of vicar-general of the friars of the Observance for all Italy. He repaired and founded above 300 monasteries in that country; died in 1444; and was canonised in 1450 by Pope Nicholas. His works were published at Venice in 1591, in 4 vols. 4to.

BERNARDINES, an order of monks, founded by Robert, abbot of Moleme, in the beginning of the twelfth century, and reformed by St. Bernard. They wear a white robe with a black scapulary; and when they officiate are clothed with a large white gown with great sleeves and a hood. They differ but little from the Cistercians.

BERNAU, a town of the Middle Mark of Brandenburg, Prussia. The principal trade is in beer, of which large quantities are brewed. It is seated on the Pancho, fourteen miles N.N.E. of Berlin.

BERNAY, a town of France, in the department of the Eure, Upper Normandy. It contains 6470 inhabitants, and carries on a considerable trade in corn, cattle, cider, and flax, with manufactures of paper, wax-candles, linen and woollen cloths. It stands on the Carentonne, sixteen miles E.S.E. of Lisieux, and twenty-eight W.N.W. of Evreux.

BERNBURG, a district and small town of Germany, in the principality of Anhalt. The town stands on both the banks of the Saale, the opposite parts being united by a bridge. It is defended by a castle strongly situated on a rock, and encompassed with ditches. The population of the district is about 30,000; it is fertile, and yields from its mines, wines, and fruits, an annual revenue of 200,000 dollars. The population of the town does not exceed 3000; manufactures of iron, earthenware, starch, glass bottles, and powder. It is about twenty miles west of Dessau, and the same distance south of Magdeburg.

BERNERAY, one of the smaller Hebrides, about five miles in circumference, of sandy soil, but productive when manured. In the centre is a fresh water lake, abounding in eels. This island is supposed to have been once entirely de-

voted to religious ceremonies; it has still a wood of yew trees, which it is thought formed a holy grove, and the remains of two chapels, dedicated to St. Asaph and St. Columbus. Remarkable phenomena are exhibited here by the tides. Long. $7^{\circ} 8'$ W., lat. $57^{\circ} 42'$ N.

BERNERAY GREAT, an island of the Hebrides, on the north-west side of the island of Lewis, in Loch Roag, about twelve miles long and four broad.

BERNERAY, LITTLE, a small island of the Hebrides, on the north-west side of Lewis, in Loch Roag, four miles long, and one broad.

BERNERS (Juliana), daughter of Richard Berners, of Berners Roding, and sister of lord Berners, was born at Roding, in Essex, about the beginning of the fifteenth century. She is celebrated by various authors as very learned; and, doubtless, had the best education that could be obtained in that age, as she was appointed prioress of Sopewell nunnery, near St. Alban's, about 1460, or rather earlier. She was very beautiful, and fond of masculine exercises, such as hunting, hawking, &c.; writing treatises on these subjects, as well as upon Heraldry, which were so popular, that they were published in the very infancy of printing. Her treatise on Hunting is written in rhyme, and affords strong evidence of the barbarity of that age. Her work on heraldry begins with the following curious piece of information: 'Of the offspring of the gentilman Jafeth (she certainly meant Shem), came Hlabraham, Moyeses, Aron, and the profettys; and also the kyngs of the right lyne of Mary, of whom that Gentilman Jhesus was borne, very God and man; after his manhode kyng of the land of Jude and of Jeus, gentilman by his modre Mary, prince of cote armure,' &c. We have given a more engaging extract from her treatise on Fishing, in the article **ANGLING**, which see. The time of her death is not known.

BERNHARDIA, in botany, a name given by Houston to a genus of plants, characterised by Linnæus under the name of croton.

BERNICLA, in ornithology, the trivial name of a species of goose. See **ANAS**.

BERNICLE, in natural history, a species of shell fish, called by some *concha anatifera*. It is composed of five shells or valves, and agrees according to Lister with the pholas, both in the disposition and number of its valves.

BERNICLE, in zoology, a species of lepas. See **LEPAS**.

BERNIER (Francis), surnamed the Mogul, on account of his travels and residence in that country, was born at Angers, in France. Having taken his degree of M.D. at Montpellier, he set out, in 1654, and travelled to Egypt, the Holy Land, and the empire of the Moguls. He wrote: 1. *Histoire de la Dernière Revolution des Etats du Grand-Mogul*, 4 vols. 12mo. 1670, 1671, often reprinted under the title of *Voyages de François Bernier*, and translated into English, 8vo. 1671, 1675. 2. *Memoires sur le Quétisme des Indes*, &c.

BERNIER'S ISLAND, a small island situated near the mouth of Shark's Bay, on the west coast

of New Holland, so called by the French expedition of discovery, fitted out in 1801. It is, in a great measure, surrounded by coral reefs, which render the approach very dangerous. The vegetation is almost confined to a species of cypripedium, the roots of which cover the ground. Here is a beautiful species of kangaroo; and some lizards were discovered between four and five feet in length. The island is situated in the twenty-fifth degree of south latitude.

BERNINI (John Laurence), called cavaliero Bernini, a Neapolitan, famous for his skill in painting, sculpture, architecture, and mechanics. He resided chiefly at Rome, and first began to be known under pope Paul V. who died in 1621, his successor, Gregory XV. conferred on him the honor of knighthood. Urban VIII. employed him in decorating the church of St. Peter, and other public works; and Rome was indebted to him for some of its greatest ornaments. He executed three busts of Charles I. of England, from a picture by Vandyck; on viewing which, he is said to have observed, that it was 'the most unfortunate looking face he ever beheld.' In consequence of the pressing invitation of Louis XV. he visited Paris, though then about sixty-eight years of age; and after making a bust of that monarch, returned to Rome, where he died in 1680, aged eighty-two.

BERNO, abbot of Richenou, in the diocese of Constance, who flourished about A.D. 1008, is celebrated as a poet, orator, musician, philosopher, and divine. He was the author of several treatises on music, particularly *De Instrumentis Musicalibus*, *De Mensura Monochordi*, &c. But the most celebrated of his works is a treatise *De Musica*, seu *Tonis*, which he wrote and dedicated to Pelegrinus, archbishop of Cologne. He was highly favored by the emperor Henry II. and succeeded so well in his endeavours to promote learning, that his abbey of Richenou was as famous in his time, as those of St. Gaul and Cluni, then the most celebrated in France. He died in 1048, and was interred in the church of his monastery, which he had dedicated to St. Mark.

BERNOULLI, or **BERNOULLI** (Daniel), the son of John Bernoulli, a celebrated physician and philosopher, was born in Groningen, February 9th 1700. He was intended for trade, but his genius quickly led him into different pursuits. He passed some time in Italy, and at twenty-four refused to be president of an academy meant to have been established at Genoa. He spent several years at St. Petersburg with great credit; and in 1733 returned to Basil, where he successively filled the chair of physic, and of natural and speculative philosophy. In his first work, *Exercitationes Mathematicæ*, he took the only title he then had; viz. 'Son of John Bernoulli,' and never would suffer any other to be added to it. This work appeared in Italy with the great inquisitor's privilege added to it, and it classed Bernoulli in the rank of inventors. He now gained or divided nine prizes, from the Academy of Sciences, which were contended for by the most illustrious mathematicians in Europe. His first prize he gained at twenty-four years of age. In 1734 he divided one with his father, which the latter is said to have

construed into a want of respect. Besides this, he declared his conviction of the philosophic triumph of Newton, against whom his father had contended all his life. In 1740 Mr. Bernoulli divided the prize, *On the Tides of the Sea*, with Euler and McLaurin. In 1738 he succeeded his father in the Academy of Sciences, and was himself succeeded by his brother John; this place, since its first erection, i. e. eighty-four years, never having been without a Bernoulli to fill it. He was extremely respected at Basil; and to bow to Daniel Bernoulli, when they met him in the streets, is said long to have been the first lesson which every father gave his children. He used to mention two adventures, which he said had given him more pleasure than all the other honors he had received. He was travelling with a learned stranger, who, being pleased with his conversation, asked his name: 'I am Daniel Bernoulli,' answered he, with great modesty; 'And I,' said the stranger (who thought he meant to laugh at him), 'am Isaac Newton.' Another time he was giving a dinner to the famous Koenig the mathematician, who boasted, with a sufficient degree of self-complacency, of a difficult problem he had resolved with much trouble. Bernoulli went on doing the honors of his table; and, when they went to drink coffee, presented him with a solution of his problem, more elegant than his own. He died in 1782.

BERNOULLI (James), a celebrated mathematician, born at Basil, the 27th of December 1645. Having taken his degrees in the university of Basil, he applied himself to divinity, not so much from inclination as complaisance to his father. He gave, however, very early proofs of his genius for mathematics, and soon became a geometrician, without any assistance from masters, and at first almost without books; for he was not allowed to have any of this kind: and if one fell by chance into his hands, he was obliged to conceal it. This severity made him choose for his device, *Phæton driving the chariot of the sun*, with these words, *Invito patre sidera verso*, 'I traverse the stars against my father's inclination.' In 1656 he began his travels. When he was at Geneva, he fell upon a method to teach a young girl to write, though she had lost her sight when she was but two months old. At Bourdeaux he composed universal gnomonic tables, but they were never published. He returned from France to his own country in 1680. About this time there appeared a comet, the return of which he foretold; and wrote a small treatise upon it, which he afterwards translated into Latin. He went soon after to Holland, where he studied the new philosophy. After having visited Flanders and Brabant, he came to England. Here he contracted an acquaintance with the most eminent scientific men of the day; and had the honor of being frequently present at the philosophical conferences held at the house of Mr. Boyle. He returned to Basil in 1682; and gave a course of lectures in natural philosophy and mechanics. In 1682 he published his *Essay of a New System of Comets*; and the year following, his *Dissertation on the Weight of Air*. Leibnitz, about this time, having published in the *Acta Eruditorum* at Leipzig, some heads of

his new Calculus Differentialis, or Infimins petitis, Bernouilli, and one of his brothers, discovered at once the beauty and extent of it, and unravelled its profoundest problems with such success, that Mr. Leibnitz declared the invention belonged to them as much as to himself. In 1687, the professorship of mathematics at Basil being vacant, James Bernouilli was appointed to it, and discharged his trust with such universal applause, that a great number of foreigners attended his lectures. In 1699 he was admitted, as a foreign member, into the Academy of Sciences at Paris; and in 1701 he received the same honor from that of Berlin. He wrote several pieces in the *Acta Eruditorum* of Leipsic, the *Journal des Scavans*, and the *Histoire de l'Academie des Sciences*. But his assiduous application to his studies brought on the gout, and by degrees a slow fever, of which he died, Aug. 16th, 1705, aged fifty-eight. He appointed that a spiral logarithmical curve should be inscribed upon his tomb, with the words, *Eadem mutata resurgo*.

BERNOULLI (James), the son of John Bernoulli, grandson of John, and nephew of Daniel, was born at Basil in October 1759, and was educated for the law. But at twenty years of age he read public lectures on experimental philosophy in the university of Basil, for his uncle Daniel. Being disappointed of succeeding him, he accepted the office of secretary to count Breuner, the emperor's envoy to the republic of Venice; and remained in this city till 1786, when, on the recommendation of his countryman, M. Fuss, he was invited to succeed M. Lexell in the academy of St. Petersburg, where he continued till his death, the 3d of July 1789. He had, at this time, been married only two months, to the youngest daughter of John Albert, the son of the celebrated Leonard Euler.

BERNOULLI (John), the brother of James, and also a celebrated mathematician, was born at Basil the 7th of August, 1667. He labored with his brother to discover the method used by Leibnitz, in his *Essays on the Differential Calculus*, and gave the first principles of the *Integral Calculus*. Our author also, with Messrs. Huygens and Leibnitz, was the first who gave the solution of the problem proposed by James Bernoulli, concerning the catenary, or curve formed by a chain suspended by its two extremities. John Bernoulli had the degree of doctor of physic at Basil, and two years afterwards was named professor of mathematics in the university of Groningen. It was here that he discovered the mercurial phosphorus or luminous barometer; and resolved the problem proposed by his brother concerning Isoperimetricals. On the death of his brother James, the Academic Senate of Basil appointed him to succeed him, without assembling competitors; an appointment which he held during his whole life. In 1714 was published his *Treatise on the Management of Ships*; and in 1730 his memoir on the *Elliptical Figure of the Planets* gained the prize of the Academy of Sciences. The same academy also divided the prize, for the question concerning the inclination of the planetary orbits, between our author and his son Daniel. John Bernoulli was

a member of most of the academies of Europe, and received as a foreign associate of that of Paris in 1699. After a long life spent in the constant study and improvement of all the branches of the mathematics, he died on the 1st of January 1748, in the eighty-first year of his age. Of five sons which he had, three pursued the same sciences with himself. One of these died before him ; but the two others, Nicholas and Daniel, he lived to see become eminent and much respected. The writings of this great man were dispersed through numerous periodical memoirs of the learned academies of Europe, as well as in many separate treatises : and the whole of them were carefully collected and published at Lausanne and Geneva, 1742, in four volumes, quarto.

BE'ROBBED. Be and rob. See ROB.

BEROLINENSIS, in entomology, a species of cantharis; color, black; antennæ, and wing-cases yellowish, with black tips; legs ferruginous. Also a species of curculio; color, whitish, varied beneath; thorax black, sides variegated; two undulated black bands on the wing-cases. Also a species of cryptocephalus, crioceris. The head and thorax are scarlet and glossy; wing-cases and eyes black; legs fulvous; a native of Prussia.

BEROE, or BERŒA, in ancient geography, a town of Syria; it has been the tradition for some ages, that it is the modern Aleppo. It is called Chalep in Nicetas, Nicephorus, and Zonaras.

BEROEA. See BEREA.

BEROOT, or BAIROUT. See BAIROUT.

BEROSUS, priest of the temple of Belus at Babylon, in the time of Ptolemy Philadelphus, wrote the history of Chaldaea, which is often cited by the ancients, and of which Josephus gives some curious fragments. The Athenians, according to Pliny, caused his statue with a golden tongue, to be placed in their Gymnasium. See BABYLONICS.

BEROTH, or BERTHAL, a city of Syria, supposed to be the same with Chun, which was conquered by David, and from which he carried off a great deal of brass. Some reckon it the same with Berytus. See 2 Sam. viii. 8, and 1 Chron. xviii. 8.

BERQUARIA, or BERQUERIA. See BER-
CABIA, and BERICABIA.

BERQUIN (Lewis de, lord of Berquin), a French Protestant martyr, was a native of Artois, and for some time king's counsellor to Francis I. He published a book against the monks, which engaged him in a controversy with William Quernus, one of the most violent inquisitors of his time, and at last subjected him to a prosecution for heresy. The articles of accusation were chiefly drawn from his writings; but upon trial he was acquitted. His accusers alleged, that the royal influence saved him on this occasion. On a second trial the decision was that his books should be burnt, and himself along with them, unless he should retract and make submission. But Francis I. returning from Spain, wrote to the parliament to be cautious how they proceeded in the affair against his counsellor. Accordingly Berquin was soon after liberated; and, contrary to the advice of his friend Erasmus, commenced

a prosecution for irreligion against his accusers. The issue now was, that he was sentenced to make a public recantation; which he, with the greatest heroism, refusing, he was condemned as an obstinate heretic, to be strangled on the Grève, and afterwards burnt. This cruel death he suffered at Paris, A.D. 1529; being then about forty years of age.

BERQUIN (Arnauld), a celebrated French author, born at Bourdeaux in 1749. His *Idylls*, abounding in good sense and sweetness, spread his reputation as an ingenious and agreeable writer; and quickly passed through several editions. The work, however, which has given the greatest celebrity to his name, is his *Ami des Enfans*, the *Children's Friend*, in 6 vols. 12mo. It has gone through many editions, and been translated into English and other languages. Berquin died in 1791.

BERRA, in old records, a plain open heath.

BERRE, a lake of France, in the department of the mouths of the Rhone, and ci-devant province of Provence.

BERRE, a strong town of France, situated on the above lake. It is remarkable for the quantity and goodness of the salt made in it, but the air is unwholesome. It was taken by the duke of Savoy, after a long siege, in 1591, during the wars of the league; and though all the rest of the province submitted to Henry IV. he could not drive the Savoyards from Berre, till it was given up in 1598, in consequence of the treaty of Vervins. It lies thirteen miles south-west of Aix.

BERRETINI DA CORTONA (Peter), painter of history and landscape, was born at Cortona in 1596, and was a disciple either of Comodi or Ciarpa, or both. He went young to Rome, and studied the antiques, the works of Raphael, Buonarroti, and Polidoro; by which he highly improved his taste. He worked with remarkable freedom; his figures are admirably grouped; his distribution is truly elegant, and the chiaro-scuro judiciously observed. Through his whole compositions there appears uncommon grace, particularly in making the airs of his heads always agreeable. His coloring in fresco is far superior to what he performed in oil. By the best judges it is agreed that he must be allowed to have been the most agreeable mannerist that any age has produced. He died in 1669. Some of his most capital works are in the Barberini palace at Rome, and the Palazzo Pitti at Florence.

BERRETONI (Nicholas), history painter, was born at Macerata in 1617, and became a disciple of Carlo Maratti, with whom he attained such excellence, that he excited the envy of his master. His early works, after he quitted the school of Maratti, were in the style of Guido; and they could not have a higher encomium. He died in 1682.

BERRIMAN (Dr. William), was the son of Mr. John Berriman, apothecary in London, where he was born in 1683. He studied at Oriel College, Oxford, where he took his degrees, and became lecturer of Allhallows, in Thames Street, and St. Michael's, Queenhithe. In 1720 he was appointed chaplain to Dr. Robinson, bishop

of London, who collated him to the living of St. Andrew's Undershaft; and in 1727 he was elected fellow of Eton College. He died in 1750, aged sixty-two. He wrote, 1. A seasonable view of Whiston's Account of Primitive Doxologies. 2. An Historical Account of the Trinitarian Controversy, in eight sermons, at Lady Moyer's lecture. 3. Brief Remarks on Mr. Chandler's Introduction to the History of the Inquisition. 4. Sermons at Boyle's lectures, 2 vols. 8vo. 5. Christian Doctrines and Duties explained and recommended, in 2 vols. 8vo.; and other works.

BERRY, *v. & n.* Sax. *berig*, from *bean* to bear. Any small fruit, with many seeds or small stones.

She smote the ground, the which straightforth did yield

A fruitful olive tree, with *berries* spread,

That all the gods admired.

Spenser.

The strawberry grows underneath the nettle,

And wholesome *berries* thrive and ripen best,

Neighbour'd by fruit of basest quality. *Shakspeare.*

For drink, the grape

She crushes; inoffensive must, and meaths

From many a *berry*, and from sweet kernels pressed

She tempers dulcet creams. *Milton.*

— and *berry*-bearing thorns,

That feed the thrush (whatever some suppose),

Afford the smaller minstrels no supply. *Cowper.*

BERYL. Lat. *beryllus*; Gr. *βερύλλος*. A kind of precious stone.

May thy billows roll ashore

The *beryl* and the golden ore.

Milton.

The *beryl* of our lapidaries is only a fine sort of cornelian, of a more deep bright red, sometimes with a cast of yellow, and more transparent than the common cornelian. *Woodward.*

BERRY (Sir John), a brave English naval officer, was born at Knowston in Devonshire, in 1635. He received the honor of knighthood for his gallant conduct at the battle of Southwold Bay. In 1682 he was captain of the Gloucester frigate, in which he was conveying the duke of York to Scotland, but either by the inattention or unskilfulness of the pilot, the ship was lost at the mouth of the Humber. Berry, however, by his uncommon presence of mind, saved the Duke, for which he was advanced to a flag. He commanded under lord Dartmouth at the demolition of Tangier; and on his return was made a commissioner of the navy, which he held with his other appointments after the Revolution. He was poisoned on board his ship, lying at Portsmouth, in 1691.

BERRY, or BERRI, a former province and duchy of France, bounded on the south by La Marche, on the west by Touraine and Poitou, on the north by the Blaisois, Sologne, the Orlannois Proper, and the Gatinois, and on the east by the Nivernois and the Bourbonnois. It is fertile in timber, corn, and wine. The wool is much esteemed, and large and fine pastures abound here: considerable quantities of cloth are also made in the province. The Cher divides the province into Upper and Lower Berry; the former being on its east, and the latter on its west bank. It is also now divided into the departments of Cher and Indre, the capital of the one being Bourges, and that of the other Chateauroux. Since the

reign of king John, Berri has given a title to one of the royal family of France.

BERRY ISLANDS, a cluster of small islands among the Bahamas, to the north-west of New Providence, and upon the south side of the channel communicating with the Florida stream. Long. $79^{\circ} 10' W.$, lat. $25^{\circ} 28' N.$

BERS, in ancient medicine, an electuary used by the Egyptians to excite delirium.

BERSA, in old law, a bound, compass, or fence.

BERSARIH, in writers of the middle age, a kind of hunters, who pursued wild beasts. The word seems derived from the barbarous Latin bersare, to shoot with a bow; on which supposition it should denote archers only. Or it might be derived from bersa, the fence of a park; in which view, it should import those who hunt in parks or forests. Hincmar speaks of inferior officers in the court of Charlemagne, denominated bersarii, veltrarii, and bevarii. Spelman takes the first to denote those who hunted the wolf; the second those who had the superintendency of the hounds for that use; and the third those who hunted the beaver.

BERSATRIX, in old records, a rocker of young children in a cradle.

BERSCHETE, a sea-port town of Istria, on the coast of the Adriatic. It stands on a high rock, about twelve miles south of Fiume, and is noted for its trade in wine and oil. Lat. $45^{\circ} 27' N.$, and long. $14^{\circ} 35' E.$

BERSE, in botany, the name given by French writers to the sphondylium, or cow parsnip, a species of umbelliferous plants common in our meadows, and known by its large rough leaves and remarkable height.

BERTHEAU (Charles), a French protestant divine, born in 1610, at Montpellier, where his father, Charles Bertheau, was minister. He studied in France and Holland, and was admitted minister at Vigan, in 1681, when only twenty-one years of age. In 1682 he was chosen pastor of the church in Montpellier, and soon after promoted to that of Paris. But the revocation of the edict of Nantz drove him, and thousands more, to seek shelter from persecution in our land of liberty. He came to England in 1685, and in 1686 was called to the Walloon church, in London, where he discharged his pastoral duties for about forty-four years, with much applause. He died, December 25th 1732, having previously published Discourses on the Catechism, and two volumes of Sermons.

BERTHIER (Alexander), prince of Neufchatel, in the reign of Napoleon. We first hear of him when Duphot was killed in a popular tumult at Rome; Berthier was then despatched thither by the French Directory, and entering the city on the 10th of February, 1798, dissolved the papal government. On the 15th he proclaimed the Roman Republic, and sent pope Pius VI. a prisoner to France, where he died. In 1800 Berthier commanded in Italy, and gained a complete victory over the Austrians, at Montebello. He afterwards served in the unfortunate expedition to St. Domingo. He was finally rewarded with the rank of marshal; made duke of Neufchatel in 1806; and in 1809

prince of Wagram and Neufchatel. He executed some important trusts under Napoleon, and was with him at the period of his first abdication in 1814; a short time subsequent to the completion of which, Berthier was killed by falling, or being thrown, from a window into the street.

BERTHIER (Victor Leopold), a brother of the preceding, rose to the rank of general of division in the French service, and was distinguished at the battle of Austerlitz, and the taking of Lubek. He died at Paris in 1807.

BERTHING, in sea language, denotes the raising or bringing up of ship sides. Thus they say, a clincher has her sides berthed up before any beam is put into her.

BERTHINSECK, an old feudal law, by which a man was not to be hanged for stealing a sheep or a calf, that he could carry away in a sack on his back; but only whipped.

BERTHOLLET (Claude Louis), a modern French chemist, was a native of Talloire, in Savoy. He studied medicine at Turin, and took a doctor's degree; after which he practiced at Paris, and obtained the appointment of physician to the duke of Orleans. His earlier researches in chemistry led him to consider the composition of ammonia, the combinations of azote, and the nature of what Sir Humphrey Davy has called chlorine, or oxygenated muriatic acid. He was admitted a member of the Academy of Sciences in 1780, and supplied to it some valuable contributions. In 1792 he was nominated a member of the committee on coinage; and, in 1794, of the committee on agriculture and the arts. He was also made professor of chemistry in the Polytechnic school; and nominated a learned member of the National Institute. His name was inscribed first on the list. In 1796 he was sent by the French authorities into Italy, to select objects of art and science to be transferred to Paris. In 1798 Buonaparte took Berthollet with him to Egypt, and on returning as he did with that general to Europe, he was appointed a member of the conservative senate under the consular government. On the restoration of Louis XVIII. in 1814, Berthollet was nominated a member of the chamber of Peers, with the title of count; and as he did not take his seat in the chamber during the hundred days of Buonaparte's second reign, he retained his rights and dignity on the second restoration of the Bourbons. He had long fixed his residence at the village of Arcueil, near Paris, where he associated a body of scientific students, who aided him in his experimental investigations: and here he died after a short illness in 1822, aged seventy-four. The separate works of Berthollet are—*Observations sur l'Air*, 1776; *Precis d'un Théorie sur la Nature de l'Acier, sur ses préparations, &c.* 1789; *Eléments de l'Art de la Teinture*, first published in 1 vol. 8vo, and enlarged to 2 vols. 1804; *Description du Blanchiment des Toiles*, 1795; *Recherches sur les Loix d'Affinité*, 1801; *Essai de Statique Chimique*, 1803, 2 vols. 8vo. Most of which have been translated into English.

BERTHOLON (N. de St. Lazare), was born at Lyons, and received the rudiments of his education at St. Lazare, which he quitted for Mont-

pelier, where he became professor of medicine and philosophy. He was subsequently called to fill the historical chair in the central school of Lyons, where he continued till his death in 1799. His works are treatises On the Electricity of the Human Body in a Healthy and in a Diseased State; one entitled *De l'Electricité des Vegetaux*, in 8vo; and another, *De l'Electricité des Meteoros*. An Essay on the Method of ascertaining the period at which Wine in a state of fermentation has acquired its greatest strength; another on the Means most conducive to the Prosperity of the manufacturing interest at Lyons; *Theorie des Incendies*, 4to; *Preuves de l'efficacité des Paratonnerres*, 4to; *Des Avantages que la Physique et les Arts peuvent retirer des Érostats*, 8vo; *De l'eau la plus propre à la Vegetation*, in 4to, &c. &c. He was also the discoverer of several ingenious inventions; and first introduced lightning conductors, on Franklin's principle, into France.

BERTHOUD, a county and bailiage of six parishes in the canton of Bern, Switzerland, nine miles north-east of Bern. There are some baths here, much frequented.

BERTHOD (Ferdinand), a celebrated French mathematician, was born in the county of Neuchâtel in 1727. His father's profession was that of architect, and the son was intended for the church, but, having shown a taste for mechanical contrivances, an experienced workman was obtained to instruct him in clock-making; and he was afterwards sent to Paris to improve in that art. He settled in Paris in 1745, and applied himself to the making of chronometers. By order of the French government, a voyage was made from La Rochelle to the West Indies and Newfoundland, for the express purpose of trying the chronometers of Berthoud, when it was found that they gave the longitude with only a quarter of a degree of longitude of error, after a cruise of six weeks. Satisfactory results were also obtained from his chronometers in the expedition of Verdun, Borda, and Pingré, which was appointed to try them, together with those of Le Roy. Berthoud finally became chronometer-maker to the Admiralty, and member of the French Institute and Legion of Honor; and, being regular in his habits of life, retained the use of his faculties to the last. He died, of hydrothorax, at his country-house, in the Valley of Montmorency, in 1807, at the age of eighty. His principal published works are—*Essai sur l'Horlogerie*, 1786, 2 vols. in 4to; two Tracts on Chronometers, 1773; *De la Mesure du Temps*, 1787, in 4to; *Les Longitudes par la Mesure du Temps*, 1775, in 4to; a Tract on Chronometers, 1782, in 4to; *Histoire de la Mesure du Temps par les Horloges*, 1802, 2 vols. in 4to; *l'Art de Conduire et de Régler les Pendules, et les Montres*, 1760, in 12mo. In this last tract popular directions are given for regulating clocks and watches.

BERTIE, a populous and fertile county of Edenton district, North Carolina. It is bounded on the east by Albemarle sound, on the north-east by Hartford county, on the north by Northampton, on the north-west by Halifax, and on the south and south-west by Roanoke River, which divides it from Martin and Tyrrel coun-

ties. The lands in this county are low and fertile. The chief town is Windsor.

BERTIERIA, in botany, a genus of plants: class, pentandria; order, monogynia. *Cox.* four-cleft: *stig.* bilamellate; berry, two-celled, and many seeded. Species, one: a shrub with downy branches, and white, panieled, terminal flowers; a native of Guiana.

BERTINERO, a town of Romagna in Italy, with a strong citadel. It is the see of a bishop; and seated on a hill.

BERTIOGA, a sea-port of Brasil, five leagues south of St. Sebastian, with an excellent harbour. The inhabitants are very enterprising in the whale fishery; but the climate is often overpowering to Europeans.

BERTIUS (Peter), professor of philosophy at Leyden, was born in Flanders in 1565. He lost his professorship for taking part with the Arminians, upon which he went to Paris; where, in 1620, he abjured the protestant religion, and was made Cosmographer to the king, and royal Professor of Mathematics. He died in 1626, aged ninety-four. He published, 1. *Commentaria in Rerum Germanicarum*; in 12mo: 2. A good edition of Ptolemy's Geography, in Greek and Latin; folio: 3. *De Aggeribus et Pontibus*: 4. *Introductio in Universam Geographiam*; besides several tracts.

BERTRAM (Cornelius Bonaventure), a native of Tours in Poitou, was born, 1531, of a respectable family. He became professor of Hebrew at Geneva, Lausanne, and Frankendal, and in 1588 corrected Calvin's version of the Old Testament. He was also the author of a treatise on the Jewish republic, Geneva, 1580, and Leyden, 1641; *Lucubrations Frankendalenses*, 1585; and a parallel between the Hebrew and Syriac languages; besides which, he superintended the publication of a new edition of Pagnin's Thesaurus. He died at Lausanne in 1594.

BERTRAM (Philip Ernest), was a native of Zerbst, born 1726. He became professor of the law at Halle, and published a history of Anhalt in 8vo; a continuation of that of Spain by Herrera, 4to; and a Treatise on the History of Learning, 4to; and died in 1777.

A monk of this name, but more generally known by that of Ratramnus, belonged to the abbey of Corbie, in the ninth century. He wrote against Hincmar, archbishop of Rheims, on the subject of predestination; and his treatise, comprised in two books, is to be found in the *Vindicia Predestinationis*. He also wrote a work against transubstantiation (two editions of which have since been published; the one in 12mo, 1686, in Latin and French; the other in English, printed at Dublin, 1753), and another on the miraculous conception.

BERVIE, or **BERVY**, a royal burgh and parish of Scotland, in Kincairdineshire, seated on the mouth of a river of that name. Its charter was granted in 1342, by king David II.; who, in returning from England, was forced by stress of weather, to land here, where he met with the utmost attention. It has a weekly market, and fairs in May and September. It appears to have been formerly a fishing station; but the fisher-

men have long been removed to Gourdon. Bervie also was long famous, or rather infamous, for smuggling. Manufactures of sail-cloth, thread, and linen yarn, have been established here; and the first machine erected in Scotland for spinning flax, was set up at Bervie. It unites with Arbroath, Brechin, and Montrose, in sending a member to the British parliament; and is situated twenty-three miles south-west of Aberdeen, and thirteen north of Montrose. Long. $2^{\circ} 0' W.$, lat. $56^{\circ} 40' N.$

BERULIANS, a sect of Christians in the twelfth century, who affirmed that all human souls were created in the beginning of the world.

BERWICK (James Fitzjames, duke of), the natural son of James duke of York, afterwards James II. by Arabella Churchill, sister of the duke of Marlborough, was born in France in 1670, and, embracing a military life, served under the duke of Lorraine at the siege of Buda in 1686, where he was wounded. He also distinguished himself in Ireland, in the contest between James and William III. He rose, in the service of France, to the rank of marshal; and commanded in Spain during the war of the succession, particularly at the battle of Almanza in 1707, when he defeated Charles II. and established his competitor Philip on the Spanish throne. He put an end to this war in 1714, by the taking of Barcelona. On hostilities arising between France and Germany, in 1733, the duke of Berwick was again called into the field; and at the siege of Philipsburgh, the following year, he was killed by a cannon shot, June 12th. His Memoirs, written by himself, were published at London in 1779.

BERWICK-UPON-TWEED, so called to distinguish it from North Berwick in East Lothian, is an English town of some importance, situated on the north side of the Tweed, and within one mile of the sea; the river being navigable up to the town. At the mouth of the Tweed, however, is a bar, so that the port can only be entered by vessels of small draught. Berwick formerly imported considerable quantities of timber, iron, and flax, from the Baltic; but its chief dependence has been recently upon the export of salmon to London, sent fresh in boxes stratified with ice; and in the distribution of the agricultural produce of Berwickshire, Tiviotdale, North Durham, and the northern part of Northumberland. The Berwick smacks have long been noted for safe and expeditious sailing.

Berwick, when it belonged to Scotland, was a principal royal borough, and regularly fortified, first on the ancient Scottish, and then on the old Spanish or Italian system. Remains of both systems appear, together with the ruins of its castle: the town is also surrounded with walls, on which cannon are mounted. The bridge over the Tweed contains fifteen arches, and measures 1164 feet long and seventeen feet wide. It was begun in the reign of queen Elizabeth, and ended in the tenth of Charles I.

Berwick has long been annexed to England, with a triangular territory reaching about four miles up the river Tweed, and nearly as much along the sea, containing from four to five thou-

sand acres of useful farm land. It is governed of course by the English law, and the town authorities are a mayor and four bailiffs, who constitute the sheriff. The mayor, recorder, and justices, or all who have been mayors, hold general and quarter sessions, and a court of gaol-delivery at one or other of the quarter sessions, when necessary. The guild or corporation consists of the mayor and all the burgesses, nearly a thousand, in whom are all elections, and the entire management of a very valuable landed property within the bounds, the far greater part of which they divide among themselves, instead of applying it to great and useful public purposes. In 1796 the population was estimated at 7930; it is now above 8000. The town-house is a handsome structure, with a stately spire 150 feet high, and a choir of eight bells. The barracks, capable of accommodating 600 men, form, with the storehouse, a handsome square. The staff of the garrison consists of a governor, lieutenant-governor, fort-major, &c. The corporation possesses the manor of Tweedmouth and Spittal, in the county of Durham. The borough sends two members to parliament. Besides the church, which is a spacious building, without a spire, there are four places of worship for Presbyterians; and the Baptists, Methodists, and Catholics, have each a chapel. The town is well supplied with water from springs about a mile and a half without the walls, whence it is conveyed to a large reservoir, sixty feet in length, sixteen broad, and eight deep. There are no manufactures of any importance: but here have been sometimes shipped in one year, besides salmon, 60,000 quarters of grain, 2000 packs of wool, and eggs to the value of £20,000; the salmon fisheries have let for more than £10,000 yearly. Many improvements have been made latterly; the streets are well-paved, and the foot-paths made comfortable; a new pier stretches a considerable way into the sea.

In Domesday-book, Berwica denotes a grange or farm village belonging to some town or manor; and is equivalent to Bere-tun or Barton, still having that signification in Devonshire, and other parts of England. Chalmers hesitates between the former etymology of this place, and the Anglo-Saxon Bar, nudus, bare; and Wic, vicus, castellum, sinus; a village, castle, or curving reach of a river.

Berwick was formerly the chief town of the county of this name, and the theatre of many bloody conflicts between the English and the Scots. After repeated sieges, it was, in 1502, finally ceded to England; and by a treaty between Edward VI. and Mary queen of Scotland, declared to be a free town, independent of both states. Upon the death of Elizabeth, in 1603, James VI. of Scotland was proclaimed here; and, when that monarch passed through the town, he confirmed its ancient privileges, and added many, which still remain. Its market days are Wednesday and Saturday; and a fair is annually held for the sale of horses and black cattle, on the Friday of Trinity week. It is 336 miles north-west from London, and fifty-four south-east from Edinburgh.

BERWICK, NORTH, a royal burgh and sea-port

on the coast of Haddington, Scotland, of considerable antiquity ; but its old charter being lost, it obtained a new one from James VI. It joins with Jedburgh, Lauder, Haddington, and Dunbar, in electing a member of Parliament. A small quantity of kelp is annually made ; but its only regular trade consists in the exportation of grain. It is situated thirty miles north-west of Berwick.

BERWICK, or Abbotstown, a town of the United States, in York county, Pennsylvania, thirteen miles west of York, and 103 west by south of Philadelphia. Lat. $39^{\circ} 52' N$.

BERWICK, or NEW BERWICK, a small town of the United States of America, Northumberland county, Pennsylvania, on the north side of the east branch of Susquehannah river, 160 miles north-west of Philadelphia. Lat. $41^{\circ} 2' N$.

BERWICKSHIRE, a county situated at the south-east extremity of Scotland, on the shores of the German or British Ocean, and adjoining the north-east border of England. It derives its name from Berwick-upon-Tweed, which was formerly its head borough, or county town ; and is bounded on the east by the German Ocean, and a part of the mouth of the Firth of Forth ; on the north by East Lothian ; on the north-west by Mid-Lothian ; and by Roxburghshire on the west and south-west. The southern boundary is formed by the river Tweed, dividing it from Roxburghshire on the west, Northumberland in the middle, and North Durham in the east. This county, formerly inhabited by the ancient British nation, called *Ottadini*, was part of the Roman province of *Valentia*. Many hill forts are to be found on its eminences, interspersed with a few Roman camps. One singular remnant of antiquity, called *Herritsdyke*, may be traced in an oblique direction almost through the whole extent of the county, from a camp or hill fort, on *Harefaulds* in *Lauderdale*, to the banks of the *Whittader*, near the *Tweed*, a distance of twenty-three miles, in a strait line ; which seems to have been intended as a defence against the sudden incursions of the neighbouring barbarous tribes. *Home castle*, and *Fast castle*, are the only ruins of border fortresses of importance. On a flat elevated peninsula, close to *Eyemouth*, still called 'the fort,' there are very distinct remains of a regular modern fortification, forming a crown-work across the gorge, which joins this peninsula to the main land. It was the work of a French engineer during the minority of *Mary queen of Scots*. *Dunse* is the capital : for *Berwick* does not now belong to Scotland ; and the other towns are few and inconsiderable ; *COLDSTREAM*, *GREENLAW*, *LAUDER*, and *EYEMOUTH*, being all that are worth naming. See these articles in our work. The extreme length is $31\frac{1}{2}$, and the extreme breadth $19\frac{1}{2}$, statute miles ; and the entire superficies of the county extends to about 285,000 English acres, of which about 100,000 are arable, and 185,000 are composed of moors and hill pasture.

Lammermoor is the north-eastern hill district of this county ; having *Lauderdale* on the west, and the *Merse* on the south and south-west. Besides these three large divisions, the county is divided into three presbyteries, *Churnside*,

Dunse, and *Lauder* ; and these are subdivided into thirty-one parishes. The districts of *Lammermoor* and *Lauderdale* are of considerable extent, and the general range of hills runs inland from the sea, at *St. Ebb's Head*, nearly west ; but intersected by many narrow vales, chiefly tending towards the south, in which most of the streamlets flow ; though the rivers of the vale land run from the west towards the east. From the main range of hills, various spurs jut out towards the south ; and there are several detached or isolated hills in different places of the vale of the *Merse*. That vale is also much diversified by numerous swells and knolls, and winding deep dells, in which the streamlets of the lower country flow in search of the larger waters and rivers. The northern sides of the *Lammermoor* hills are of considerable steepness, but belong to *East Lothian* ; while the southern slopes are moderate, and blend gradually into the vale. In many places the tops of the hills form extensive elevated table-lands, which slope almost insensibly towards the south. The higher land is usually a bare unfruitful moor ; while the slopes, called the *moor edges*, are generally useful land, and sometimes of excellent quality. Two of the table-lands are crossed by the principal great roads leading from *Edinburgh* to *Berwick* and *Kelso* ; one at the *Press inn*, called *Coldingham Moor*, once a royal forest ; the other at *Blackshiels*. But the features of this county have been little attended to in any survey. *Clint Hill*, at the north-west extremity of the *Lammermoor* chain, is said to be 1544 feet above the level of the sea ; the general range may average about 1000 feet ; the whole terminating in three precipitous rocky promontories, at *St. Ebb's Head* on the south, *Earn's Cleugh* in the middle, and *Fast Castle* on the north. The *Tweed* rather skirts *Berwickshire* in a winding course of forty miles, than belongs to the county, as no portion of its territory crosses that fine stream. *Whittader* and *Blackadder* are the principal rivers, though the former rises in *East Lothian* ; and both united run into the *Tweed* near *Berwick*. *Lander* or *Leader*, entirely belonging to *Lauderdale*, and giving name to it, runs from north to south, and falls into the *Tweed* at the south-west corner of the county. *Eden*, which rises at the west end of the *Merse*, runs into the *Tweed* in *Roxburghshire*. The *Eye* is the only stream of any consequence in the county which runs directly into the sea.

This cannot be called a mineral district. The rocks and lower hills are composed of most irregularly stratified schistose stone, or hardened clay, with yolks of whin-stone, and very thin quartz veins, mixed with a kind of steatitic half-lapidified substance, called *leck*. In the higher muirs, there is a good deal of amorphous and splintery trap, or bastard whin-stone. Rocks of *breccia*, or coarse pudding-stone, are found in several parts : the outer pier of the harbour of *Eyemouth* is built, without cement, of a stone of this kind, found in a rocky promontory contiguous ; and has withstood for almost forty years the fury of the German Ocean without any apparent waste. No coal worth working has ever been found in this county ; that article is

therefore procured partly by sea, but chiefly by an expensive land-carriage from the Lothians, and from the south side of the Tweed. The whole coast has but two ports into which any thing of importance can be brought. Yet, under these obvious disadvantages, a large portion of the county, indeed almost the whole of the Merse, is cultivated in the best style of modern husbandry. No district of the same extent in Britain, unites more successfully the most improved management of arable land, with that of live stock and pasture. The leading feature in the husbandry of this neighbourhood is, the alternation of corn with pulse, herbage, or roots; or what is commonly called white and green crops: but the farmers of Berwickshire, adopting this course invariably, have rendered it more productive, and better suited to their soil and climate, by reserving their cultivated herbage, red and white clovers, with rye grass, from the plough, for two or more years, so that above half the cultivated land is always pastured by sheep and cattle. In the most improved parts the sheep are almost universally of the New Leicester breed, and the short-horned English breed of cattle are in much request. Farms, which are generally held on leases of nineteen years, are of all sizes, from 40 to 1000 acres and upwards; but the more common size, in the Merse, is from 400 to 600 acres. The farm-houses, out-buildings, and cottages, recently erected, are very substantial and convenient. In 1795 the rental of the county was £112,000; but as assessed to the property tax in 1811, it was £240,126; so that in sixteen years the value of property had more than doubled.

Paper is almost the only manufactured article exported from this county: but here are bleach-fields, breweries, corn-mills, and other small establishments for the home supply; some of the millers also are in the practice of purchasing grain, which they sell in Berwick and Dalkeith markets, after converting it into flour, meal or shelled barley. The chief exports, therefore, are raw produce; the imports coal, iron, lime, timber, and groceries. The value of the cattle and sheep driven to Edinburgh, to Morpeth, and several markets in England, amounts to a very large sum; the stationary live stock alone having been estimated, several years ago, at nearly half a million sterling. There are eight small fishing stations on the coast. Eyemouth, the principal harbour, has been improved at a great expense, and is private property. Here there is a profitable sea fishery; and one still more advantageous, for salmon, is carried on in the Tweed.

Berwickshire exhibits numerous traces of military operations and ruins. Perhaps its most interesting remains of antiquity, however, are the nunnery of Coldingham and Dryburgh abbey. A deep glen, called the Pease, in the north-east angle of the county, on the road from Edinburgh to Berwick, has been celebrated in history as one of the natural defences of Scotland. The bridge which has been thrown over it, consists of four arches; and its romantic situation, and stupendous height of 123 feet from the small stream below, render it an object of considerable curiosity. Comparing the number of inhabitants at the three periods when the different censuses

have been taken, we shall perceive that no great increase has taken place:

	Inhabitants.	
In 1801 there were	31,600	} Increase 1 per cent.
1811 . . .	31,800	
1821 . . .	34,100	

BERY, or BURY, in the Saxon language, from beorg, Sax. a hill or castle, signifies the villa or seat of a nobleman; a dwelling or mansion house, being the chief of a manor; for heretofore noblemen's seats were castles situated on hills, of which we have still some remains; as in Herefordshire there are the beries of Stockton, Hope, &c. It was anciently taken for a sanctuary.

BERY. See BERIA.

BERYL, in natural history, called also aqua marina, is a pellucid gem of a bluish green color, found in the East Indies, and about the gold mines of Peru; we have also some from Silesia, but what are brought from thence are oftener colored crystals than real beryls; and when they are genuine, they are greatly inferior both in hardness and lustre to the oriental and Peruvian kinds. The beryl, like most other gems, is met with both in the pebble and columnar form, but in the latter most frequently. In the pebble form it usually appears of a roundish but flattened figure, and commonly full of small flat faces, irregularly disposed. In the columnar or crystalline form, it always consists of hexangular columns, terminated by hexangular pyramids. It never receives any admixture of color into it, nor loses the blue and green, but has its genuine tinge in the degrees from a very deep and dusky, to the palest imaginable of sea-water hue. The beryl in its perfect state approaches to the hardness of garnet, but is oftener softer; and its size is from that of a small tare to that of a pea, a horse-bean, or even a walnut. In many respects the beryl resembles the emerald; but chiefly in the crystals of both being divisible parallel to the sides and extremities of a regular hexahedral prism. Externally the beryl is shining, with a vitreous lustre. In general it is transparent, though sometimes only semi-transparent. The specific gravity is 2.7. Vauquelin analysed a specimen of it, and found it to contain, 69 silica, 15 alumina, 14 glucina, 1 oxide of iron, and 2 lime; by the analysis of this stone Vauquelin discovered the earth he called glucina. When cut, and polished, the beryl has a considerable lustre, and is ranked among gems; though when compared with the ruby, topaz, sapphire, &c. its value is very trifling.

The beryl seems to have received its Hebrew name from the resemblance of its color to that of the sea. It was the tenth stone in the breast-plate of the Jewish high-priest; whereon Zebulon, whose dwelling was at the haven of the sea, was engraved. It may be imitated, by adding to twenty pounds of crystal glass, made without manganese, six ounces of calcined brass or copper, and a quarter of an ounce of prepared zaffre. Beryls have also had cabalistic uses. 'A beryl,' says Aubrey, in his Miscellanies, 'is a kind of crystal that hath a weak tincture of red. There are certain formulas of prayer to be used before they make the inspection, which they term a *call*. In a manuscript of Dr. Forman of Lambeth, which Mr. Elias Ashmole had, is a discourse of this

and the prayer; also there is a *call* which Dr. Napier did use. James Harrington, (author of *Oceana*), told me that the Earl of Denbigh, then ambassador at Venice, did tell him that one did show him three several times, in a glass, things past and to come. When Sir Marmaduke Langdale was in Italy, he went to one of these magi, who did show him a glass, where he saw himself kneeling before a crucifix. He was then a Protestant; afterwards he became a Roman Catholic. He told Mr. Thomas Henshaw, R. S. S. this himself.

BERYLLINA, in entomology, a species of chrysis. The head and thorax are of a greenish blue, abdomen green, rufous and blue, legs blue, with testaceous-dots.

BERYLLINUS, a species of *cimex spinosus*; thorax spined obtusely, and dentated; tips of the spines and bifid shield of the head greenish blue.

BERYLLUS, in entomology, a species of *cimex rotundatus*, that inhabits India. Middle size, pale border of the thorax orange; on the wing-cases, a ferruginous spot, and marginal black lines.

BERYTUS, in ancient geography, a sea-port town of Phœnicia, on the Mediterranean, so ancient as to be thought to have been built by Saturn. It was destroyed by Tryphon, but rebuilt by the Romans. Agrippa placed here two legions, whence it became a colony. It enjoyed the *jus Italicum*, and had an excellent school for the study of the law in Justinian's time. It is now called **BAIROUT**, which see.

BES, or **BESSIS**, an ancient Roman weight containing two thirds of the *as*, or eight uncie. The bes originally weighed two asses; whence the origin of the word, quasi *binus as*.

BES was also used in land-measuring, to denote two thirds of the *jugerum*, or acre. See **JUGERUM**.

BESAILE, in common law, a writ that lies where the great-grandfather or great-grandmother was siezed the day that he or she died, of any lands or tenements in fee-simple; and after his or her death, a stranger entered the same day upon him, and keeps out the heir.

BESAINT. Be and saint. See **SAINT**.

BESANCON, an ancient and populous city of France, once the capital of the *ci-devant* province of Franche Comté, and now the head of an *arrondissement*, and chief town of the department of the Doubs. It has an university, now called a lyceum, and had formerly a parliament. It is seated on the Doubs which divides it into two parts, the greatest of which is a peninsula. The entrance is nearly closed by a mountain, on which is built a large fort, that commands the city. It is entered by six gates. There are many names of places, in and about the city, that are plain indications of its antiquity, as Chamars, Campus Martis, Chamuse, Campus Musarum, Chandane, Campus Diane, &c. The metropolitan church is built at the bottom of St. Stephen's hill, and is a very handsome structure. The great hospital of the order of the Holy Ghost is also a structure worth seeing. The streets are wide and handsome, and the houses are generally of stone, and well built; particularly in the neighbourhood of the square called Battan. On the invasion of

Gaul by the Romans, it was a town of some importance, and received successively the names of *Civitas Sequanorum*, *Chrysopolis*, and *Vison-tium* or *Vesontio*, of which its present name seems to be a corruption. Cæsar took it from the *Sequanani*. It was at the height of its prosperity in the reign of Aurelian, but was afterwards nearly destroyed by the Germans and Huns. The Burgundians rebuilt it; and it received great privileges as a city of the empire, but was ceded to Spain at the peace of Westphalia. In 1668, and 1674, it was taken by the French, and confirmed to that power at the peace of Nimeguen. The archbishop was a prince of the empire until the peace of Ryswick. At present it is a bishop's see, and the metropolitan has for his diocese the departments of the Doubs, the upper Saone, and the Jura; under him are the bishops of Autun, Metz, Strasburg, Nancy, and Dijon. Here is a celebrated school of artillery, and a manufactory of arms. Other manufactures are silk stockings, woollen stuffs, linen, calico, leather, hats, clocks, and watches. The trade is in corn, wine, cattle, cheese, iron, pins, &c. The population is about 28,200. The learned institutions comprise an Academy of Sciences founded in 1752, a Literary and Military Society founded in 1753, and an Academy of Painting and Sculpture founded in 1773; which were all suppressed by the revolution, but have lately been revived. The public library contains some rare manuscripts, and a good collection of medals. The *arrondissement* has a population of 93,000, in seven cantons. Fifty-six miles east of Dijon, and 235 south-east of Paris.

BESANT, or **BEZANT**. See **BEZANT**.

BESBOROUGH ISLAND, an island on the north-west coast of America, in Norton-Sound, about six miles from the main land. Long. 161° 15' W., lat. 64° 10' N.

BESCATTER. Be and scatter. See **SCATTER**.

BESCHECK, a lake of Macedonia, in European Turkey, near the smaller lake of St. Basil, with two towns in its vicinity, called the greater and lesser Bescheck. It is about twelve miles in length, and six or eight in breadth; the adjacent country is very beautiful.

BESCHITAN, or the Five Mountains, a mountain range of Asia, in the government of Caucasus, forming the most northern of the Caucasian chain. A pyramid of hewn stone was shivered to pieces by lightning here about the year 1801. A hot spring of a sulphureous nature, and of the temperature of 156 degrees, is discharged from the side of the mountain, which, on the approach of rain is completely enveloped in vapor, and proves a true barometer to the neighbouring inhabitants. This range was known to Ptolemy by the name of the Hippiæ, or horse mountains, and very fine horses are still bred. The Circassians who dwell among these mountains, submitted to the czar Iwan Wassiliewitch in 1553. There is now an establishment of missionaries at its base, belonging to the Scottish Missionary Society and over which a native of North Britain has long presided. Distant 30 miles from Georgiefsk.

BESCORN. Be and scorn. See **SCORN**.

BESCRATCH. Be and scratch. See **SCRATCH**.

BESCRAWL'. Be and scrawl. See SCRAWL.
 BESCREEN'. Be and screen. See SCREEN.
 BESCRIB'BLE. Be and scribble. See SCRIBBLE.

BESCUM'BER. Be and scumber. From Dutch *schuymer*, scum. To do any dirty act; to dirty; to scatter dirt or filth.

Our Muse is in mind for the untrussing a poet;
 I slip by his name; for most men doe know it;
 A critick, that all the world *bescumbers*
 With satyricall humours and lyrical numbers.

Ben Jonson.

BESCUTCH'EON. Be and scutcheon. See SCUTCHEON.

BESEEH'. } Be and See. Goth. *saihwān*;
 BESEEN'. } Ang.-Sax. *seon*, *beseon*; Dutch
zien; Germ. *sehen*. To see, to look at. Vide SEE.

BESEECH', v.&n. } From Sax. *pecan*;
 BESEECH'ING, n. } Dutch *versoeken*. To
 BESEECH'ER, } entreat; to supplicate;
 BESEEK', } to implore; sometimes
 BESOUGH'. } before a person. To
 beg; to ask before a thing.

I *beseech* thee for my son Onesimus, whom I have
 hogotten in my bonds. Philemon, 10.

I *beseech* you, Sir, pardon me; it is only a letter
 from my brother, that I have not all over-read.

Shakspeare.

But the voice of God
 To mortal ear is dreadful; they *beseech*
 That Moses might report to them his will,
 And terror cease; he grants what they *beseought*.

Milton.

But Eve fell humble, and *beseought*
 His peace, and thus proceeded in her plaint. Id.
 Before I come to them, I *beseech* your patience,
 Whilst I speak something to ourselves here present.

Sparr.

I, in the anguish of my heart, *beseech* you
 To quit the dreadful purpose of your soul.

Addison.

BESEEM', } Be and seem. Dutch *be-*
 BESEEM'ING, n. } *ziemen*. To become; to be
 BESEEM'LY. } fit; to be decent for.

What form of speech or behaviour, *beseemeth* us in
 our prayers to Almighty Good? Hooker.

This oversight

Beseems thee not, in whom such virtues spring.

Fairfax.

Verona's ancient citizens

Cast by their brave *beseeming* ornaments.

Shakspeare.

What thoughts he had, *beseems* not me to say;
 Though some surmise he went to fast and pray.

Dryden.

BESEEN'. From *besie*, skinner. This word,
 says Johnson, I have only found in Spenser.
 Adapted, adjusted, becoming.

Forth came that ancient lord and aged queen,
 Armed in antique robes down to the ground,
 And sad habiliments right well *beseen*.

Fairie Queene.

Then her they crowne their goddess and their
 queene,

And deck with flowres thy altars well *beseene*.

Spenser.

BESET'. Be and set. Sax. *berettan*. To
 besiege; to hem in; to enclose, as with a siege.
 To waylay; to surround. To embarrass, to per-

plex; to entangle; without any means of escape.
 To fall upon; to harass.

Alas! (quoth Absalon), and wala wa!

That trewe love was ever so yvell *besette*,
 Than kiss me—sin that it may be no better.

Chaucer. Canterbury Tales.

But they him spying, both with greedy force
 At once upon him ran, and him *beset*
 With strokes of mortal steel. Faerie Queene.

Draw forth thy weapon, we' are *beset* with thieves;
 Rescue thy mistress. Shakspeare.

Thus Adam, sore *beset* replied. Milton.

Sure, or I read her visage much amiss,
 Or grief *besets* her hard. Rowe.

We be in this world *beset* with sundry uneasinesses,
 distracted with different desires. Locke.

Cato shall open to himself a passage. Addison.

True fortitude I take to be the quiet possession of
 a man's self, and an undisturbed doing his duty,
 whatev' evil *besets*, or danger lies in his way. Id.

I know thou lookest on me as on a wretch

Beset with ills, and covered with misfortunes.

Id.

BESEW'. Be and sew. See SEW.

BESHADÉ'. Be and shade. See SHADE.

BESHINE'. Be and shine. See SHINE.

BESHREW'. Be and shrew. The original
 of this word is somewhat obscure; as it evidently
 implies to wish ill, some derive it from *heschryen*,
 Germ. to enchant. Topsel, in his Book of Ani-
 mals, deduces it from the shrew mouse, an ani-
 mal, says he, so poisonous, that its bite is a
 severe curse. A shrew likewise signifies a scold-
 ing woman; but its origin is not known.

Beshrew thee, cousin, which did'st lead me forth
 Of that sweet way I was in to despair. Shakspeare.

Now much *beshrew* my manners and my pride,
 If Hermia meant to say Lysander lied. Id.

Nay, quoth the cock, but I *beshrew* us both,
 If I believe a saint upon his oath.

Dryden's Fables.

BESHUT'. Be and shut. See SHUT.

BESIDE'. } Be and side. Ang.-Sax. *side*;

BESIDES'. } Dutch *siide*; Germ. *seyt*; Swed.
sida; by the side; distinguished from behind
 and before; out of the right course, either of
 path of direction, of mind. Something placed
 by the side; in addition; over and above, not
 according to though not contrary; not of the
 number.

And him *beside* marcht amorous Desyre,
 Who seemd of ryper yeares then the other swayne
 Yet was that other swayne this elder's sire,
 And gave him being, commune to them twayne.

Spenser.

The men said unto Lot, hast thou here any *besides*?

Genesis.

Festus said with a loud voice, Paul, thou art
beside thyself; much learning doth make thee mad.

Acts.

Thereto a great advantage eke he nas
 Through his three double hands thrise multiplyde,
Besides the double strength that in them was:
 For still when fit occasion did betyde,
 He could his weapon shift from syde to syde,
 From hand to hand; and with such nimblesse sly,
 Could wield about, that ere it were espyde,
 The wicked stroke did wound his enemy
 Behinde, *beside*, before, as he it list apply. Spenser.

Only be patient, till we have appeased
The multitude *beside* themselves with fear. *Shakspeare.*

You are too wilful blame,
And, since your coming here, have done
Enough to put him quite *beside* his patience. *Id.*

Beside the hearse a fruitful palm-tree grows,
Ennobled since by this great funeral. *Fairfax.*

He caused me to sit down *beside* him. *Bacon.*
Doubtless, in man there is a nature found,
Beside the senses, and above them far. *Sir J. Davies.*

Of vagabonds we say
That they are ne'er *beside* their way. *Hudibras.*

At his right hand, Victory
Sat eagle-winged: *beside* him hung his bow. *Milton.*

Fair Lavinia fled the fire
Before the gods, and stood *beside* her fire. *Dryden.*

Besides, you know not, while you here attend,
The' unworthy fate of your unhappy friend. *Id.*

Fair is the king-cup that in meadow blows;
Fair is the daisy that *beside* her grows. *Gay.*

Now under hanging mountains,
Beside the falls of fountains,
Unheard, unknown,

He makes his moan. *Pope.*

And dead, as living, 'tis our author's pride
Still to charm those who charm the world *beside*. *Id.*

The Stoicks did hold a necessary connexion of
causes; but they believed that God doth act præter et
contra naturam, *besides* and against nature. *Bramhall.*

Providence often disposes of things by a method
beside and above the discoveries of man's reason. *South.*

It is *beside* my present business to enlarge upon
this speculation. *Locke.*

Outlaws and robbers, who break with all the world
besides, must keep faith among themselves. *Id.*

Precepts of morality, *besides* the natural corruption
of our tempers, are abstracted from ideas of sense. *Addison.*

Some wonder that the Turk never attacks this
treasury. But, *besides* that he has attempted it for-
merly with no success, it is certain that the Venetians
keep too watchful an eye. *Id.*

BESIEGE', *v. & n.*, } Be and siege. See
BESIEGE'MENT, } SIEGE. To beleague;
BESIEGE'ER, } to lay siege to; to be-
BESIEGE'ING. } set with armed forces;
to endeavour to win a town or fortress, by sur-
rounding it with an army, and forcing the de-
fendants, either by violence or famine, to give
admission.

And he shall *besiege* thee in all thy gates, until thy
high and fenced walls come down. *Deuteronomy.*

And after of her mischefe and her woe,
Now that she was *besieged* and ytake. *Chaucer. Cant. Tales.*

The queen, with all the northern earls and lords,
Intends here to *besiege* you in your castle. *Shakspeare.*

Thou shalt behold
Whether by supplication we intend
Address, and to begirt the almighty throne
Beseeching or *besieging*. *Milton.*

There is hardly a town taken in the common forms,
where the *besiegers* have not the worse of the bargain. *Swift.*

BESIL'VER. Be and silver. See SILVER.

BESISTAN, or BEZESTEIN, a name given by
the Turks to those places at Constantinople,
Adrianople, &c. where the merchants have their
shops, and expose their merchandises to sale.
Synonymous, therefore with BAZAAR, which see.

BESIT'. Be and sit. See SIT.

BESLAVE. Be and slave. See SLAVE.

BESLAVER'. Be and slaver, or slabber. See
SLAVER.

BESLER (Basilius), an apothecary at Nurem-
berg in Germany, and an eminent botanist, pub-
lished a work entitled Hortus Eystetensis, and
gave name to the genus of plants called *besle-*
ria.

BESLERIA, in botany, a genus of the angio-
spermia order, and didymia class of plants. Of
this genus there are three species; viz. 1. B.
christata, with stalks growing single, and a five-
leaved involucre. 2. B. *lutea*, with simple
footstalks growing in clusters, and spear-shaped
leaves. 3. B. *melitifolia*, with branching foot-
stalks and oval leaves. All are natives of the
warm parts of America, and cannot be preserved
in this country without artificial heat

BESLIME'. Be and slime. See SLIME.

BESLUB'BER. Be and slubber, slobber,
slaver. See SLAVER.

BESLUR'RY. Be and slurry. See SLURRY.

BESMEAR'. Be and smear. See SMEAR.

BESMIRCH'. Be and smirch. See SMIRCH.

BESMOOTH'. Be and smooth. See SMOOTH.

BESMUT'. Be and smut. See SMUT.

BESNOW'. Be and snow. See SNOW.

BESNUFFED. Be and snuff. See SNUFF.

BESOLDE (Christopher), born at Tubingen,
1577, published a Synopsis of the Art of Politics,
and of the Transactions from the Creation of the
World to the reign of the emperor Ferdinand,
both in 8vo; A History of the Ottoman Em-
pire; A Brief Account of the Kings of Jerusa-
lem; Documents Illustrative of the History of
the Religious Houses in Wirtemberg, 4to; a
quarto volume of Philological Dissertations;
Documents connected with the Collegiate Church
of Stutgard, and with the Church of Backhenang;
and two treatises, entitled Virginum Sacrarum
Monumenta, and Prodomus Vindiciarum Eccle-
siast. Wirtemb. 4to. He made a public abjura-
tion of Protestantism, and died in 1638

BESOM. From Germ., *butzen*, to cleanse;
Sax. *beſm, heſma*; an instrument to sweep with.

I will sweep it with the *besom* of destruction, saith
the Lord of hosts. *Isaiah xiv. 22.*

Bacon commended an old man who sold *besoms*:
a proud young fellow came to him for a *besom* upon
trusty; the old man said, Borrow of thy back and
belly, they will never ask thee again; I shall dun
thee every day. *Bacon.*

BESORCH, a coin of tin, or some base
metal, current at Ormus, at the rate of seven
forty-ninth parts of a farthing sterling.

BESORE'. Be and sore, Ang.-Sax. *syrwan*,
syrwan, syrewn; to vex; teaze; to hurt; to
annoy; to mortify.

So him they led on to the courts of day,

Where never war nor wounds abide him more;

But in that house eternal peace doth play,

Acquiescing the souls that new *besore*,

Their way to heaven through their own blood did
score.

G. Fletcher. Christ's Triumph after Death.

BESORT', *v. & n.* From the Latin *sors*; to
suit; to fit; to become; to arrange and dis-
pose wild distinct classes or kinds.

Such men as may *besort* your age,
And know themselves and you. *Shakspeare.*

I crave fit disposition for my wife,
With such accommodation and *besort*,
As levels with her breeding.

Id.

BESOT', } Be and sot. Can it be,
BESOT'TED, } says the Ency. Met. from
BESOT'TEDLY, } sodden, sod, sot? One
BESOT'TEDNESS. } who soddens himself with
clinking. Thersites calls Ajax 'a sodden-witted
lord.' To infatuate; to stupify; to dull; to
take away the senses by enjoyment and too much
indulgence to doating.

Paris, you speak
Like one *besotted* on your sweet delights. *Shakespeare.*
Trust not that beauty; but restore the prize
Which he, *besotted* on that face and eyes,
Would rend from us. *Dryden.*

Swinish gluttony
Ne'er looks to heaven amidst his gorgeous feast,
But, with *besotted* base ingratitude,
Crams, and blasphemous his feeder. *Milton.*

Or fools *besotted* with their crimes,
That know not how to shift betimes. *Huainbras.*
He is *besotted*, and has lost his reason; and what
then can there be for religion to take hold of him by?
South.

BESOUR'. Be and sour. See SOUR. To
wax sour, or sharp.

How should we abhor, and loath, and detest this
old leaven that so *besoures* all our actions; this hea-
thenism of unregenerate carnal nature which makes
our best works so unchristian. *Hammond.*

BESOZZI, or BEZUTIUS (Ambrose), a painter
of eminence, born at Milan in 1648. He worked
some time under Joseph Danedi, or Montalti, and
afterwards went to Rome, where he studied from
the antiques and the pictures of the greatest mas-
ters, and at last perfected himself in the school
of Ciro Ferri. His great excellency consisted in
painting architecture, friezes, imitations of bass-
relievos, and other decorations. He died at
Milan in 1706, aged fifty-eight.

BESPAN'GLE. Be and spangle. See
SPANGLE. Any thing shining; brilliant; drops
in clusters.

For now the last day's evening dew
Even to the full itself doth shew,
Each bough with pearl bespangling. *Drayton.*

Not Berenice's locks first rose so bright,
The heavens *bespangling* with dishevelled light. *Pope.*

BESPAT'TER. Be and spatter. See SPAT'TER.
To besmear and soil by spitting; to throw filth
at random at any object, so as partially and ir-
regularly but not wholly to cover it; figuratively,
to asperse and calumniate.

Those who will not take vice into their bosoms,
shall yet have it *bespatter* their faces.

Government of the Tongue.

His weapons are the same which women and chil-
dren use; a pin to scratch, and a squirt to *bespatter*.
Swift.

Fair Britain, in the monarch blest,
Whom never faction could *bespatter*. *Id.*

BESPAWL'. Be and spawl, Ang.-Sax.
spætan. To spit; to spattle. See SPAUL.

They *bespattled* hymn, and *byspitted* hymn.

Ball. Acts of English Volaries.

See how this remonstrant would invest himself,
conditionally, with all the rheum of the town, that
he might have sufficient to *bespawl* his brethren.

Milton. Animad.

BESPEAK', } Be and speak. See SPEAK.
BESPEAK'ER. } To bespeak is not merely to

give utterance to words; we use it to express a
wish; to put in a claim; to order, as of a
tradesman, for something forthcoming; to be-
speak a play is to request its performance at a
particular time; to request attention; to ad-
dress; to betoken; to foreshow.

With hearty words her knight she 'gan to cheer,
And, in her modest manner, thus *bespoke* :
Dear knight— *Faerie Queene.*

If you will marry, make your love to me!
My lady is *bespoke*. *Shakespeare.*

Here is the cap your worship did *bespeak*. *Id.*

He shook his mitred locks, and stern *bespoke*

How well could I have spared for thee, young swain,
Enow of such as for their bellies' sake

Creep, and intrude, and climb into the fold. *Milton.*

At length with indignation thus he broke

His awful silence, and the powers *bespoke*. *Dryden.*

Then staring on her with a ghastly look,

And hollow voice, he thus the queen *bespoke*. *Id.*

My preface looks as if I were afraid of my reader,

by so tedious a *bespeaking* of him. *Id.*

When Baboon came to Strutt's estate his trades-

men waited upon him to *bespeak* his custom. *Arbuthnot.*

O do not run too fast : for I

Will but *bespeak* thy grave and die. *Marvel.*

A heavy writer was to be encouraged, and accord-

ingly many thousand copies were *bespoke*. *Swift.*

They started fears, *bespoke* dangers, and formed

ominous prognosticks, in order to scare the allies. *Id.*

When the abbot of St. Martin was born, he had so

little the figure of a man, that it *bespoke* him rather a

monster. *Locke.*

He has dispatched me hence,

With orders that *bespeak* a mind composed. *Addison.*

They mean not with love to be the *bespeaker* of the

work, but delight in the work itself. *Watton.*

There dwelt a sage called Discipline; his head,

Not yet by time completely silvered o'er,

Bespoke him past the bounds of peakish youth,

But strong for service still and unimpaired. *Cowper.*

BESPECK'LE. Be and speckle. See SPECKLE.

A peculiar kind of spotting; an intermixture of
colors; to mark.

Her chaste and modest vail, surrounded with cele-
stial beams, they overlaid with wanton tresses, and in
a flaming tire *bespeckled* her with all the gaudy al-
lurements of a whore.

Milton. Of Reformation in England.

BESPENT'. Be and spend, from the Latin
pendo, to weigh. See SPEND. To weigh out;
to give out; to distribute.

BESPET', } Be and spit. See SPIT.
BESPIE', }

BESPICE'. Be and spice. See SPICE. To
mix various species of aromatics; to drug or to
flavor liquor with aromatic ingredients.

Thou might'st *bespice* a cup
To give mine enemy a lasting wink. *Shakespeare.*

BESPOT'. Be and spot. See SPOT. To
cover with spots.

Thy blameful lines, *bespotted* so with sin,
Mine eye would cleanse, e'er they to read begin.

Drayton.

BESPREAD'. Be and spread. See SPREAD.

At peep of day, when in her crimson pride

The morn *bespreads* with roses all the way

Where Phœbus' couch with radiant course must glide,

The hermit bends his humble knees to pray.

Thomas Lodge.

BESPRENT'. To besprinkle.

And first within the porch and jaws of hell
Sate deep remorse of conscience, all *besprent*

With tears. *Mirror for Magistrats.*

My head *besprent* with hoarie frost I finde,
An by myne eye the crowe his clawe doth wrigat.

Spenser.

His nuptial bed,
With curious needles wrought, and painted flowers
bespread.

Dryden.

They ceased ; when on the tuneful stage
Advanced a bard, of aspect sage ;
His silver tresses, thin *besprent*,
To age a graceful reverence lent.

Warton.

BESPRINKLE. Be and sprinkle. See
SPRINKLE. To asperse ; to scatter about ; to
wet any object, as by showers or drops.

Herodotus, imitating the father poet, whose life he
had written, hath *besprinkled* his work with many
fabulosityes.

Brown.

A purple flood
Flows from the trunk, that welters in the blood :
The bed *besprinkles*, and bedews the ground.

Dryden.

BESPURT. Be and spurt. See SPURT. To
cast forth ; a rapid irregular movement ; to spurt
water is to eject it from a syringe, from the
mouth, or any vessel ; to bespurt is thus to cast
any fluid upon an object.

I suppose, and more than suppose, it will be no-
thing disagreeing from Christian meekness, to handle
such a one in a rougher accent, and to send home his
haughtiness well *bespurred* with his own holy water.

Milton.

BESSARABIA, a territory of Russia in Eu-
rope, comprehending a part of Moldavia ceded
by the Porte at the peace of Bukharest in 1812,
and Bessarabia Proper, called Búják by the
Turks. Between 45° and 48° N. lat., 28° and
31° E. long., containing about 8800 square miles.
It is bounded on the south by the Pruth and the
Danube, on the west by a small river, called
Rakitno, on the north by the Dniester, and on the
east by the Black sea ; and divided into two
parts : 1. The Moldavian division containing
seven trinités, or circles ; Khotini, Khotim, or
Koczim, Soróka, Orkhéi, Faltshí, Khotornitchan,
Codrz, and Gretchan. 2. Bessarabia Proper,
subdivided into the circles of Bender, Kausharian,
and Ismâil-Tomarovian. Bessarabia Proper was
the Scythian desert of the ancients. The popu-
lation has been estimated at 300,000 ; but it is
probably much below that number, as the country
has been almost depopulated by the wars of the
neighbourhood. Bulgarians, Moldavians, Ar-
menians, Jews, Tartars, and Servians constitute
the bulk of its inhabitants ; and to these may be
added Gipsies. In the lakes of Ak-kirman, salt
is manufactured, shagrin at Ismâil ; these are
almost the only manufactures. The Russian
government has raised a considerable revenue
from the fisheries, and salt works, as likewise
from duties on spirits, &c. the whole amounting
to perhaps 3,000,000 piastres or £150,000.

BESSARION, titular patriarch of Constanti-
nople, was born at Trebizond. He was very
zealous to reunite the Greek with the Latin church,
and engaged the emperor John Paleologus to
interest himself in bringing about this great work.
He appeared at the council of Florence, and
harangued the fathers on this topic. The Greek
schismatics conceived so mortal an aversion to

him, that he was obliged to remain in Italy, where
pope Eugenius I. honored him with the purple
in 1439. He fixed his abode in Rome, and
would have been raised to the papal chair, if
cardinal Alain had not opposed it, as injurious
to the Latin church to choose a Greek, however
illustrious. He was employed in several embas-
sies, but that to France proved fatal to him.
When legate to this court, he happened to visit
the duke of Burgundy, before he saw Louis XI.
which so piqued the capricious haughty mo-
narch, that he gave him a very ungracious recep-
tion. He even took the cardinal legate by the
beard, saying Barbara Græca genus retinent quod
habere solebant ; an affront which so chagrined
him, according to Matthieu, as to occasion his
death at Ravenna, upon his return in 1472.
Bessarion loved and protected the literati.
Argyropilus, Theodore of Gaza, Poggio, Lau-
rentius Valla, &c. formed in his house a kind of
academy. His library was large and curious ;
and the synod of Venice long preserved it. He
left some works, which rank among those which
helped to revive letters ; as, Defensio Doctrinæ
Platonice, &c. Translations of some pieces of
Aristotle, Orations, Epistles, &c.

BESSE, a copper coin, current at the island
Ormus, in the Persian gulf, equal to four cosbegs,
or 1½d sterling.

BESSE, in ichthyology, the sea wolf.

BESSI, the ancient inhabitants of Bessica, a
fierce and barbarous people, noted for their rob-
beries. Their chief city Uscudama is now known
by the name of Adrianople. They lived under
their own kings till the consulate of M. Licinius,
Lucullus, and C. Cassius Varus ; when Lucullus
invaded their country, and having gained a great
victory over them, took their metropolis, and
subjected the whole nation to the Roman laws.
The Romans, notwithstanding they had subdued
them by force of arms, still suffered them to live
under their own kings. But Piso, while he
governed Macedon as proconsul, having treache-
rously seized Rabocentus, whom Suetonius calls
prince of the Bessi, caused him to be publicly
beheaded. This so exasperated the nation, that
they revolted ; but were overcome by Octavius
the father of Augustus. During the civil wars
of Rome, they attempted anew to recover their
liberty, but were again defeated by the famous M.
Brutus. In the reign of Augustus, one Volo-
gesus, a native of the country, and priest of Bac-
chus, having, under pretence of religion, drawn
together great crowds of people, made himself
master of this country ; and entering the Cher-
sonesus, committed the most dreadful ravages.
He was at last, however, overcome by L. Piso ;
who obliged the inhabitants to lay down their
arms. From this time the Bessi continued sub-
ject to the Romans, without attempting any more
to recover their liberty.

BESSICA, in ancient geography, a district of
Thrace towards mount Hæmus, to the south of
the Hebrus ; inhabited by the Bessi.

BESSIS CENTESIMÆ denotes two thirds of
centesimal interest, or usury at 8 per cent.

BEST, *adj. & adv.* Used as the irregular
BEST'NESS.

superlative of good. Sax.
bet, bezepa, beþft, good, better, best. That

which has good qualities in the highest degree ; the utmost power ; the highest perfection. To improve to the utmost.

For I dare swere wel, if that she
Had among tenne thousande ybe,
She wolden have be, at [with] the *beste*,
A chefe myroure of all the feste.

Chaucer. Boke of the Duchesse.

He shall dwell in that place which he shall choose,
in one of thy gates, where it liketh him *best*.

Deut. xxiii. 16.

And he will take your fields, even the *best* of them,
and give them to his servants. *1 Sam. viii. 14.*

When the *best* things are not possible, the *best* may
be made of those that are. *Hooker.*

Let there be freedom to carry their commodities
where they may make the *best* of them. except there
be some special cause of caution. *Bacon.*

The duke did his *best* to come down. *Id.*

I profess not talking : only this,
Let each man do his *best*. *Shakspeare.*

When he is *best*, he is little more than a man ;
and when he is worst he is little better than a beast. *Id.*

He does this to the *best* of his power. *Locke.*

I think it a good argument to say, the infinitely
wise God hath made it so, and therefore it is *best*.
But it is too much confidence in our own wisdom, to
say, I think it *best*, and therefore God hath made it
so. *Id.*

My friend, said he, our sport is at the *best*.
Addison.

His father left him an hundred drachmas ; Alnas-
char, in order to make the *best* of it, laid it out in
glasses. *Id.*

We set sail, and made the *best* of our way till we
were forced, by contrary winds, into St. Remo. *Id.*

An evil intention perverts the *best* actions, and
makes them sins. *Id.*

BESTAIN'. Be and stain. Chaucer uses
distan. See STAIN. To mark with spots ; to
spoil or vitiate the color.

We will not line his thin *bestained* cloke
With our pure honours. *Shakspeare.*

BESTARCHIA, a dignity in the courts of the
emperors of Constantinople, supposed to answer
to that of the master of the chancery among us.
The word seems to have been formed from *vestar-*
tarcha, by a change of the *v* into *b*.

BESTEAD'. Be and stead. See STEAD.
To be in place ; to be in stead. It also signifies
accommodation, good or ill : when used in this
sense, Dr. Johnson says it should be written
bested. Milton uses it in the sense of advantage,
—' How little you *bestead* ;' that is confer, or
bestow.

For were a manne for her *bestadde*,
She woulde ben right sore a dradde.

Chaucer. Romaunt of the Rose.

They shall pass through it hardly *bestead*, and
hungry. *Isaiah.*

Hence, vain deluding joys !

The brood of folly, without father bred ;

How little you *bestead*,

Or fill the fixed mind with all your toys !

Milton.

He who looks so deformedly and dismally, who to
outward sight is so ill *bestead*, and so pitifully ac-
counted, hath latent in him much of admirable beauty
and glory. *Barrow.*

BESTIAL', *n.* & *adj.* } See BEAST. To re-
BESTIAL'ITY, } duce what is in its own
BESTIALIZE, } nature superior, to the
BESTIALLY. } condition or state of a
beast ; a degradation of reason and of humanity.

I have lost the immortal part of myself, and what
remains is *bestial*. *Shakspeare. Othello.*

O foul descent ! that I who erst contended
With gods to sit the highest, am now constrained
Into a beast, and mixed with *bestial* slime,
This essence to incarnate and imbrute,
That to the height of Deity aspired.
But what will not Ambition and Revenge
Descend to. *Milton.*

For those, the race of Israel oft forsook
Their living strength, and unfrequented left
His righteous altar, bowing lowly down
To *bestial* gods. *Id.*

The things promised are not gross and carnal,
such as may court and gratify the most *bestial* part
of us. *Decay of Piety.*

His wild disordered walk, his haggard eyes,
Did all the *bestial* citizens surprize. *Dryden.*

What can be a greater absurdity, than to affirm
bestiality to be the essence of humanity, and darkness
the centre of light ?

Arbuthnot and Pope's Mart. Scrib.

Thus fornication, incest, rape, and even *bestiality*,
were sanctified by the amours of Jupiter, Pan, Mars,
Venus, and Apollo. *Goldsmith.*

BESTIARII, in Roman antiquity, those who
fought against beasts, or who were exposed to
them by the sentence of the law. There were
four kinds of *bestiarii* ; viz. 1. Those who made
a trade of it, and fought for money. 2. Such
young men as, to show their strength and dex-
terity in managing their arms, fought against
beasts ; Augustus encouraged this practice in
young men of the first rank ; Nero exposed him-
self to it : and it was for the killing beasts in the
amphitheatre, that Commodus acquired the title
of the Roman Hercules. 3. The third kind was,
where several *bestiarii* were let loose at once,
well armed, against a number of beasts. 4. The
fourth kind were those condemned to the beasts.
consisting either of prisoners taken in war, or
slaves guilty of some enormous crimes ; these
were exposed naked, and without defence : nor
did it avail any thing to conquer and kill the beast,
fresh ones being continually let loose on them, till
they were put to death. But it seldom happened
that two were required for the same man ; on
the contrary, one beast frequently despatched
several men. Cicero mentions a lion, which
alone despatched 200 *bestiarii*. Those who
succeeded the first were called *εφεδροι*, and the
last *εσχαστοι* ; among the Romans *meridiani*.

BESTICK. Be and stick. See STICK. Ang-
Sax. *sticcan*. To stick, to pierce.

Truth shall retire

Bestuck with slanderous darts ; and works of faith
Rarely be found : so shall the world go on,
To good malignant, to bad men benign. *Milton.*

BESTILED. Be and still. See STILL.
To make quiet ; to calm ; to tranquillise.

The choral muses droop ! Their harps unstrung,

The lutes and laurel wreaths neglected fall !

Commerce *bestilled* her many-nationed tongue,

Whilom so busy in her bustling hall. *Cunningham.*

BESTIR. Be and stir. See **STIR**. To steer, to move, to put into vigorous action. It is seldom used otherwise than with the reciprocal pronoun.

I am scarce in breath, my lord.—No marvel, you have so *bestirred* your valour, you cowardly rascal!
Shakespeare.

As when men wont to watch
On duty, sleeping found by whom they dread,
Rouse and *bestir* themselves ere well awake.

Milton.

Bestirs her then, and from each tender stalk
Whatever earth, all-bearing mother, yields,
She gathers.

Id.

But, as a dog that turns the spit
Bestirs himself, and plies his feet
To climb the wheel, but all in vain,
His own weight brings him down again.

Hudibras.

What aileth them, that they must needs *bestir*
themselves to get in air, to maintain the creature's life.

Ray.

BESTORM. Be and storm. See **STORM**. To agitate, to drive about furiously; to assail with irresistible violence.

Religion! Providence! an after state!
Here is firm footing; here is solid rock!
This can support us; all is sea besides:
Sinks under us, *bestorms*, and then devours.

Young.

BESTOW. } Ang.-Sax. stow. That is
BESTOW'ING. } place. Bestow is to collect
BESTOW'ER. } into a place; to put, to confer,
to give or grant. It has a very extensive applica-
tion, as the following extracts will show.

All the dedicated things of the house of the Lord
did they *bestow* upon Baalim. 2 Chron. xxiv. 7.

And thou shalt *bestow* that money for whatsoever
thy soul lusteth after, for oxen, sheep, or for wine.
Deut. xiv. 26.

And when he came to the Tower, he took them
from their hand, and *bestowed* them in the house.
2 Kings v. 24.

Our Saviour doth plainly witness, that there should
not be as much as a cup of cold water *bestowed* for his
sake, without reward. *Hooker.*

All men would willingly have yielded him praise;
but his nature was such as to *bestow* it upon himself,
before any could give it. *Sidney.*

Good reverend father, make my person yours;
And tell me how you would *bestow* yourself.
Shakespeare.

And though he was unsatisfied in getting,
Which was a sin; yet in *bestowing*, madam,
He was most princely.

Id.

That bay they enter which unto them owes
The noblest wreaths which victory *bestows*.

Marvell.

Sir Julius Cæsar had, in his office, the disposition
of the six clerks' places; which he had *bestowed* to
such persons as he thought fit. *Clarendon.*

Spain to your gift alone her Indies owes,
For what the powerful takes not, he *bestows*.

Dryden.

They all agree in making one supreme God; and
that there are several beings that are to be worshipped
under him; some as the *bestowers* of thrones, but
subordinate to the Supreme. *Stillington.*

BESTRAUGHT. *part.* Of this participle
I have not found the verb; by analogy we may

derive it from *bestract*; perhaps it is corrupted
from *distraught*. Distracted; mad; out of one's
senses; out of one's wits.

O goddesse sonne, in such case canst thou sleepe
Ne yet, *bestraught*, the daungers doest foresee
That compass thee? or hearest the faire windes blowe?
Surrey.

Ask Marian, the fat alewife, if she knew me not.
What! I am not *bestraught*. *Shakespeare.*

BESTREAK. Be and streak. See **STREAK**.
To draw a stroke with a pen, a line; to bestreak
is to mark with lines.

Besides, as presents for my soul's delight,
Two beauteous kids I keep *bestreaked* with white.
Beattie.

BESTREW. } Be and strew. See **STREW**.
BESTROWN. } To scatter; to disperse; to
sprinkle over a surface.

Good morrow to this primrose too,

Good morrow to each maid,

That will with flowers the tomb *bestrew*

Wherein my love is laid. *Herrick.*

Those blossoms also, and those dropping gums,
That lie *bestrown* unsightly and unsmooth,
Ask riddance, if we mean to tread with ease.

Milton.

Pale pansies o'er his corpse were placed,

Which, plucked before their time,

Bestrewed the boy, like him to waste

And wither in their prime. *Collins.*

BESTRIDE. Be and stride. See **STRIDE**.
To stretch; generally applied to the legs; whe-
ther to cross a horse, to pass over, to pass on
with effect, to walk with energy, or to stand
over an object; to command or secure it.

He bestrid

An o'erpressed Roman, and i' the consul's view

Slew three opposers: Tarquin's self he met,

And struck him on his knees. *Shakespeare.*

If thou see me down in the battle, and *bestride* me,
so; 'tis a point of friendship. *Id.*

He doth *bestride* a bleeding land,

Gasping for life under great Bolingbroke. *Id.*

Why, man, he doth *bestride* the narrow world
Like a colossus. *Id.*

That I see thee here,

Thou noble thing! more dances my rapt heart,

Than when I first my wedded mistress saw

Bestride my threshold. *Id.*

He *bestrides* the lazy pacing clouds,

And sails upon the bosom of the air. *Id.*

Venetians do not more uncouthly ride

Than did their lubber state mankind *bestride*. *Dryden.*

Make him *bestride* the ocean, and mankind

Ask his consent to use the sea and wind. *Waller.*

The bounding steed you pompously *bestride*,

Shares with his lord the pleasure and the pride. *Pope.*

With the first pause the resting rowers gave,

He waits not—looks not—leaps into the wave,
Strives through the surge—*bestrides* the beach—and

high

Ascends the path familiar to his eye. *Byron.*

BESTRUT. Be and strut. See **STRUT**. The
common word is a-strut, assumed consequence
in walking. Swelled out, distended, is the pri-
mary sense: 'Paps *bestrut* with milk,' occurs in
Holland's *Plutarch*.

BESTUD'. Be and stud. Ang.-Sax. *studu* : A post, ; a pillar; any thing fixed; from *stæd*, *stud*, the past participle of the verb to stand.—*Ency. Met.* To bestud, is to fix any thing like gems in a crown, or stars in the firmament, that keep their places.

And when the golden glorious sun goes down,
Would she put on her star-bestudded crown. *Drayton.*

The sea o'er fraught would swell, and the' unsought
diamonds

Would so imblaze the forehead of the deep,
And so bestud with stars, that they below
Would grow inured to light, and come at last
To gaze upon the sun with shameless brows.

Milton's Comus.

BESWAD'DLED. Be and swaddle. See **SWADDLE.** To swathe, to fasten, to bind together.

Hence cradles see, with lispings statesmen spawn!
And infant limbs beswaddled in the lawn. *Whitehead.*

BESWYN'KLE. Ang.-Sax. To labor, Hence Chaucer calls a laborer, *swinker*.

BET, v. & n. } Sax. *peððian*, to wager; *peð*,
BET'ING, } a wager; from which the etymologists derive bet. I should rather imagine it to come from *betan*, to mend, increase, or bet, as a bet increases the original wager. A wager; something laid to be won upon certain conditions. *Betan* is to better, to support, says the *Ency. Met.*; and hence concludes, that to bet is to support an opinion by risking any thing upon it.

He drew a good bow : and dead? John of Gaunt
loved him well, and *betted* much upon his head.

Shakespeare.

He flies the court for want of clothes;
Cries out 'gainst cocking, since he cannot bet.

Ben Jonson.

The god unhappily engaged,
Complained, and sighed, and cried, and fretted,
Lost every earthly thing he *betted*. *Prior.*

The hoary fool, who many days
Has struggled with continued sorrow,
Renews his hope, and blindly lays
The desperate bet upon to-morrow. *Id.*

His pride was in piquette,
Newmarket fame and judgment at a bet. *Pope.*
The gamester too, whose wits all high or low,
Oft risks his fortune on one desperate throw,
Comes here to saunter, having made his bets,
Finds his lost senses out and pays his debts.

Goldsmith.

BETA, *βeta*, the second letter in the Greek alphabet, answering to our B; also used by the Greeks as a numeral for two.

BETA, in botany, the beet; a genus of the digniana order, and pentandria class of plants; ranking in the natural method under the twelfth order, holoraceæ: *CAL.* four leaves; there is no corolla; the seeds are kidney-shaped, and situated within the base of the calyx. There are four species, viz. 1. *B. cicla*, the root of scarcity, has been much recommended to agriculturists of late years. Mr. Loudon (*Practice of Agriculture*, l. iii. p. 798,) says, 'it is supposed by Professor Thær to be a mongrel between the red and white beet. It has a much larger bulb than either, and that bulb, in some varieties, grows in great part above ground. It has been a good deal cultivated in Germany and Switzerland, both for its

leaves and roots; the leaves are either used as spinach or given to cattle; and the roots are either given to cattle, used in distillation, or for extracting sugar. The culture of the field-beet in Britain is very recent, and it may be questioned whether it has any advantages over the turnip for general agricultural purposes. It admits, however, of being cultivated on ridgelets, and with as little manual labor as the turnip, while it will prosper on a stronger soil, and near large towns it is not liable to the depredations usually committed on turnips or carrots, as the root is unpalatable either raw or boiled. The variety preferred in Germany is one slightly tinged with red for cattle, and the pale-yellow variety for the distillery and sugar manufacture. It is also called the field-beet, and is in England, particularly near London, applied to the fattening of stock, and the feeding of milch cows. Their milk is said to be much improved and increased by it. 2. *B. hortensis*, the common white beet, is cultivated in gardens for the sake of its leaves, which are frequently used in soups. The root seldom grows larger than a man's thumb. 3. *B. maritima*, the sea beet, grows naturally by the sea side, and in salt marshes, in many parts of England. It has been supposed by many to be only a variety of the common white beet; but Mr. Miller assures us he has been unable to make any variation in them by culture. The Hortus Kewensis distinguishes a species of this name by its having its flowers in pairs. 4. *B. vulgaris*, the red beet, with a pyramidal root, has large, thick, succulent leaves, which are for the most part of a dark green or purple color. The roots are large, and of a deep red. The larger these roots grow the tenderer they are, and the deeper their color the more they are esteemed. The varieties of this species are the common red beet, the turnip-rooted beet, and the green-leaved red beet.

The common white beet is sown by itself, in the beginning of March, upon an open spot of ground, not too moist. When the plants have put out four leaves, the ground should be hoed as for carrots, carefully cutting up the weeds, and also the plants where too near each other, leaving them at least six inches asunder. In three or four weeks, the ground should be hoed a second time, to cut up the weeds and thin the plants, for by this time they will be out of danger; so should not be left nearer than eight or nine inches, if regard is had to the goodness of the leaves; and if it be of the Swiss kind, with broad leaves, the plants must not be nearer than a foot. In six weeks after, the ground should be hoed over a third time, to destroy weeds. After this the plants will spread and prevent the weeds from growing, and the leaves will soon be fit for use. The outer large leaves should be first gathered, leaving the small inner ones to grow large; by which method a small spot of ground will supply a moderate family for a whole year, provided the plants are not allowed to run to seed, for in that case they will not be good. The red beet is frequently sown with onions, carrots, or parsnips; but if these are not to be soon removed, the beets ought to be sown by themselves. They require a deep light soil;

the seeds should be sown in March, and must be treated in the same manner as the former sort; but the plants should not be left nearer than a foot, or in good land a foot and a half; for the leaves will cover the ground at that distance. The roots will be fit for use in autumn, and continue good all winter; but in the spring, when they begin to shoot, they will be hard and stringy.

The juice expressed from the roots is a powerful errhine. The root of the red beet is sometimes used to improve the color of claret. By some it is recommended to cultivate the white beet in large quantities as food for cattle. Margraff, the Prussian chemist, first procured sugar from the root of the white beet in 1747. At the commencement of the present century the chemists of France bestowed great attention upon this subject. For a description of the mode of preparing the sugar, see Huët de la Croix, *Notice sur la Betterave, considérée principalement sous le rapport des bénéfices que sa culture doit procurer au cultivateur*, 8vo. Paris, 1812.

BETAG'. Be and tag. To tack or tag; to knit, bind, connect.

The last grave fop of the last age,
In a superb and feathered hearse,
Bescutcheoned and *betagged* with verse.

Churchill.

BETAH, or **ṬIBḤATH**, a city of Syria, which David took from Hadadezer. 2 Sam. viii. 8.

BETAILED. Be and tail. See **TAIL**.

BETAKE'. Be and take. See **TAKE**. To give, to recommend, to take to, commit to, deliver to, resort or recur to.

I trust in Goddes bountie; and therefore
My marriage, and min estat, and rest,
I him *betake*, he may don as him lest.

Chaucer. *Canterbury Tales*.

But Absolon! that saith full oft; Alas!
My soul *betake* I unto Sathanas,
But me were lever than all this town (quod he),
Of this despit awroken for to be.

Id.

Then to his hands that writ he did *betake*,
Which he disclosing read.

Spenser.

The adverse party *betaking* itself to such practices
as men embrace, when they behold things brought to
desperate extremities.

Hooker.

Thou tyrant!
Do not repent these things; for they are heavier
Than all thy woes can stir: therefore *betake* thee
To nothing but despair.

Shakspeare.

The rest, in imitation, to like arms
Betook them, and the neighbouring hills uptore.

Milton.

Soft she withdrew; and like a wood-nymph light,
Oread or Dryad, or of Delia's train,
Betook her to the groves.

Id.

With ease such fond chimeras we pursue,
As fancy frames for fancy to subdue;
But when ourselves to action we *betake*,
It shuns the mint, like gold that chymists make.

Dryden.

BETALK'. Be and talk. See **TALK**. To tell; to give an account.

BETEL, or **BETLE**, in botany, a name given to an Indian plant (a species of piper). See **PIPER**.

BETEL, or **BETELE**, is more commonly used for a compound masticatory, in great request in

the East; composed of the nut of the areca catechu, in the proportion of one-half, one-quarter of quick lime, and one-quarter of the leaves of the piper betle and tobacco. The lime used with the nut is called chunam, and is obtained from the calcination of shells, as producing the finest kind; it is employed either boiled or raw. The latter has undergone no change; the former is cut in slices, boiled with a small quantity of terra japonica, and then dried.

The immediate consequences of eating this compound are reddening the saliva, and giving a bright hue to the lips; in progress of time, the teeth are rendered quite black by it; if the chunam be omitted, the saliva will not be tinged; and its pernicious operation on the enamel of the teeth may be averted, by rubbing them with a preparation that coats them with a black substance, which does not yield to any dentrifice, and preserves them from corrosion. The effects which recommend it are the dispelling of nausea, exciting an appetite, and strengthening the stomach. It also possesses nutritious and enlivening qualities, which render it particularly acceptable.

As an article of luxury betel has given rise to various ceremonial usages in the East. Persons of the more polished classes, after the first salutation, present it as a token of politeness: to omit it would be considered neglect, and its rejection would be an affront. No one of inferior rank should address a dignified individual without the previous chewing of betel; two people seldom meet without exchanging it; and it is always offered on occasion of ceremonious interviews.

The box containing it is of silver or gold, and of elegant workmanship. In some countries it is not uncommon for the guest who receives the betel from his host to pass it between his thumb and fore-finger, and apply his own chunam, which never gives offence. Philtres and charms are often conveyed with the chunam. The Mahomedans abstain from it as an indulgence during the Ramadan, and females of the higher ranks are said to pass their lives in doing little else than chewing it. When the Cingalese retire to rest at night they fill their mouths with it, and retain it there until they awake. The poor keep it in straw purses, lodged in some fold of their dress. Betel is a considerable article of traffic in India, China, and indeed throughout Asia. In the British settlements of Bombay, Madras, and Bengal, the value of it, as an import, recently amounted in a single year to £138,836.

BETELGUELE, or **BEDELGAEEF**, a fixed star, of the first magnitude, in Orion's hind shoulder.

BETEN, in ancient geography, a town in the tribe of Ashur.

BETEEM'. From Ang.-Sax. *tæmian*. To pour forth; to produce; to give; to grant; to bestow.

So would I, said the' enchanter, glad and fain
Beteem to you his sword, you to defend;
But that this weapon's power I well have kenned
To be contrary to the work that ye intend.

Faerie Queene.

Rain, which I could well

Beteem them from the tempest of mine eyes.

Shakspeare.

Although he could have well *beteemed* to have thanked him of the ease he professed, yet loving his own handy-work, modestly refused him.

Milton. Animad.

BETH, the second letter of the Hebrew alphabet, answering to our B, and used also by the Jews as a numeral for two. Beth, in literary history, makes the title of a multitude of books in the Hebrew language; e. gr. Beth Avoth, or the house of the fathers; Beth Elohim, or the house of God; Beth Israel, or the house of Israel, &c.

BETHABARA, in ancient geography, the house of passage; a term therefore by many referred to the passage at Jericho, where the Israelites passed over dry-shod; by Lightfoot, to the passage at Scythopolis: but Cellarius refers it to the mid-way between both, because there were doubtless several passages or fords on the Jordan. Here John is said to have baptised on the other side Jordan, John i. 28.

BETHABARA, a town of North Carolina, on the west side of Grassy Creek, which unites with the Gargales, and several others, and falls into the Yadkin. This town was settled in the year 1753 by the Moravian brethren, who emigrated from Pennsylvania. It is seven miles north-west of Salem, and 183 west of Halifax.

BETHAGLIA, or **BETH-HOGLAI**, a town of the tribe of Benjamin (Joshua xviii. 21). In Jerome's time there was a village called Agla, ten miles from Eleutheropolis, towards Gaza, and supposed to be Bethaglia.

BETHANIA, a post-town of North Carolina, four miles north-west of Bethabara. It is regularly laid out, and was settled about the year 1759, by Moravians from Pennsylvania. It is ten miles north-west of Salem.

BETHANIA, or **BETHANY**, a village and tract of land, at the foot of mount Olivet, on the west side, about two miles east of Jerusalem, where Lazarus dwelt and was raised from the dead; and where the ascension of our Saviour happened. The Turks still pretend to show Lazarus's house and grave. They also show the house of Mary Magdalen, at a little distance. Dr. Richardson was shown them both, as he was told, in 1818. The name of Bethany was sometimes extended to the whole tract of ground from the village itself to Bethpage (John xxiv. 50, Acts i. 12.), a circumstance which ought to be borne in mind, in order to prevent an apparent contradiction between the account of the resurrection given by St. Luke in his Gospel, and that afterwards given in the Acts of the Apostles. The Bethany mentioned in the Gospel, is the district including the part of the Mount of Olives mentioned in the Acts.

BETHARA, a place south of the Galilean Sea; upon the borders of Ephraim, where the Midianites, pursued by Gideon, crossed the Jordan.

BETHARAN, in ancient geography, a town of Paræa, on the other side Jordan, said to have been called Livias or Libias, in the Greek manner, by Herod, in honor of Livia; and of the same latitude almost with Jerusalem; called also Julius by Josephus, who always calls the Livia of Augustus Lia.

BETHAVEN, in ancient geography, a town in the tribe of Ephraim, south-east of Bethel (Josh. vii. 2). It is also a name given to Bethel by Hosea, after the establishment of the idolatry of Jeroboam there; meaning it to have become the house of iniquity, from being the house of God.

BETHBARA, a place in the land of Galilee, where Gideon called the Ephraimites to stop the flying Midianites (Judg. vii. 24), supposed to be the same with Bethara.

BETHICAR, a city of the Danites, to which the Israelites under Samuël pursued the Philistines. 1 Sam. vii. 11.

BETH-DAGON, a city of Palestine, on the borders of the land of Israel.

BETHEL, a city of Samaria, on the borders of the tribe of Benjamin, anciently called Luz; but they seem to be distinguished (Joshua xvi. 2). They were, however, contiguous places. Bethel was properly the place of Jacob's vision, and Luz, or Lus, an adjoining town, afterwards called Bethel. It was twelve miles north-east of Jerusalem. Dr. Clarke remarks, that the nature of the soil is still an existing comment upon the record of the stony territory, where he took of the stones of the place, and put them for his pillow.

BETHUR, or **BITHUR**, a city of Palestine, which some place near Jerusalem, and others near Casarea and mount Carmel. About A. D. 130 it sustained a terrible siege, when the blood, which ran down the river, is said to have colored the waters of the sea to some distance.

BETHESDA, (called in the Greek, *κολυμβηθρα Προβατικη*, and thence in the Vulgate, *Piscina Probatica*, because, according to some, the sheep were washed in it, which were appointed for sacrifices,) was the Hebrew name for a pool or public bath, which had five porticoes, piazzas, or covered walks around it. It was called Bethesda, *בֵּית הַחֶמֶד*, Beth Chesda, or the House of Mercy, because, as Pool, in his Annotations, observes, the erecting of public baths was an act of great kindness to the common people, particularly a bath with the virtues of the description this possessed. From the Greek word *κολυμβηθρα* being used by Josephus (Antiq. xv. 3), to denote the baths of Jericho, Macknight, in his Harmony of the Gospels, concludes that their opinion is without proper foundation, who affirm, that this pool served for washing the sheep designed for sacrifice, before they were driven into the temple, and for washing the entrails of the beasts sacrificed there. Besides, he thinks it inconsistent with the situation of Bethesda, near the sheep-gate, or market, as our English translators have rendered the Greek *ἐν τῇ προβατικῇ κολυμβηθρᾷ*, though some copies have it, *ἐν τῇ*, &c., in the south-east wall of the city. The nature of the cures performed here, as recorded John v. 2, 3, &c., has been much controverted. Some writers confine the miracle to the season of the particular feast mentioned in verse 1, as they understand *κατὰ καιρὸν*, by times, verse 4, which our translators render, a certain season, to mean at that season, since the evangelist does not say that the waters of Bethesda had their sanative quality at any other feast; and they instance the

silence of Philo and Josephus respecting this miracle as confirming their interpretation. Macknight observes, that the silence of these writers is worthy of little regard, as they have omitted greater transactions which they had an opportunity to know. It must here be observed, that the fourth verse of this chapter of St. John is not in Beza's Cambridge MS. nor in one or two more of some authorities. Griesbach has marked it as doubtful, yet he leaves it in the text. But though it should be rejected, the difficulty for which some would have it cancelled, remains: because the seventh verse implies, that cures were performed in this pool, and that only one at a time was cured; if so, it is as easy to conceive that an angel moved the water, and gave it its healing quality, as to fancy those cures were performed miraculously in any other way. Grotius, Lightfoot, and Doddridge, think that the angel is said to have descended, not because he was ever seen to do so, but because the Jews were persuaded that God brought such things to pass by the ministration of angels; so that from that violent motion of the water, and the cure following it, the presence of an angel was inferred. Dr. Hammond supposes, that the waters became medicinal by being impregnated with a healing warmth from the blood and entrails of the sacrificed beasts that were washed there. Whitby asks, how this healing virtue, if natural, could be applied to the cure of all diseases? how one only could be cured when many, probably, entered at the same moment? and why, since numerous victims were slain at other feasts, should the case occur only at the passover? Lightfoot, also, shows, that the entrails were washed in a laver in the temple, and not in this pool.

Doddridge believes the waters to have been partly mineral and medicinal, to have been used for general bathing; and to have been endowed with a miraculous power not long before the ministry of Christ. He, also, holds, that the virtue ceased either immediately after the miracle, or at the death of Christ; and that this accounts for the silence of Josephus. Maundrell, who visited the Holy Land in 1696, describes a Bethesda, which our modern travellers, Dr. Clarke and Dr. Richardson, do not mention. Maundrell says, it was 140 paces in length, forty in breadth and eight in depth; dry, and having at its western end three blind arches, which he supposes were remains of the five porches; but how did these survive the destruction of Jerusalem?

BETH-GAMUL, a city of the tribe of Reuben, which was taken by the Moabites, and afterwards pillaged by the Chaldeans.

BETH-HACCEREM, a city, seated on a hill, between Jerusalem and Tekoah, and noted for its vineyards,

BETH-HOGLAH, a city belonging to the Benjamites, about half way between Jericho and Jordan.

BETH-HORON, in ancient geography, two towns of Samaria; both in the tribe of Ephraim, built by Sherai, grand-daughter of Ephraim, 1 Chron. viii. 24, and both restored by Solomon, after falling to decay. 1 Kings ix. 17, and 2 Chron viii. 5, viz.

1. BETH-HORON, NETHER, was situated on a

mountain, and therefore Josephus and Jerome mention going up or ascending. It stood on the public road to Lydda and Casarea, distant 100 stadia, or twelve miles, from Jerusalem. On account of this vicinity, some allot it to the tribe of Benjamin.

2. BETH-HORON, UPPER, was distant almost the whole breadth of the land of Ephraim, from the Nether Beth-Heron, the Upper being in the north and the Nether in the south of that tribe. Josh. xvi.

BETHINK'. Be and think. See THINK. To recal to reflection: to bring back to consideration, or recollection. It is generally used with the reciprocal pronoun, and *of* before the subject of thought.

They were sooner in danger than they could almost *bethink* themselves of change. *Sidney.*

Cease then my tongue, and lend unto my mind,
Leave to *bethink* how great that beautie is
Whose utmost parts so beautifull I fynd. *Spenser.*

I, better *bethinking* myself, and misliking his determination, gave him this order. *Raleigh.*

He himself,
Insatiable of glory, had lost all:
Yet of another plea *bethought* him soon. *Milton.*
The nets were laid, yet the birds could never *bethink* themselves, till hampered and past recovery. *L'Estrange.*

Ah *bethink* how through thy regions
Midnight horror fearful howled,
When like wolves the Danish legions
Through thy trembling forests prowled.
Mickle. Ballad.

Borne in his arms from yon Serai
Say wert thou lingering there with him to fly?
Thou needest not answer—thy confession speaks,
Already reddening on thy guilty cheeks;
Then lovely dame *bethink* thee! and beware. *Byron. Corsair.*

BETH-JESIMOTH, a city of the Reubenites, about ten miles east of the Jordan. It was taken by the Moabites, and afterwards destroyed by the Chaldeans.

BETHLEHEM, בֵּית־לֶחֶם i. e. the house of bread; called also Bethlehem Ephratah, a town of Palestine, in the tribe of Judah, the birth-place of David and of our Saviour. It was once much more flourishing than at present, and stands on an eminence, six miles south-east of Jerusalem, in a country full of hills and valleys.

Mr. Parsons visited it in 1821, and says, passing from Bethany through the beautiful plain, called the valley of Rephaim, 'Bethlehem, at this distance, assumes an appearance of splendor far beyond what it actually possesses. The monastery erected over the manger, stands a little east of the village. Still further eastward, we saw the valley where the shepherds heard the angels sing, at the birth of the Saviour.' Here is a convent, containing three religious houses devoted to the Greeks, Franks, and Armenians, and described as a massy, heavy-looking structure, more like a fortification. A grotto, said to contain the manger in which our Lord lay, has an altar, a fine picture, and numerous silver and crystal lamps; ten monks constituted the whole society here a few years since, most of whom were Spaniards. The population of Bethlehem is said by Mr. Parsons to

consist of about 1500 Catholics, 1000 Greeks, a few Armenians, and a few Turks. The inhabitants are chiefly employed in making wooden crucifixes and crowns, which are set in mother-of-pearl, and exported into different parts of Europe and Asia. But its chief ornament is the stately church, erected by the empress Helena, over the place where the Saviour was born, and bearing her name. It is built in the form of a cross, and the top of it commands a fine view of the surrounding country. The roof is of cedar, covered with lead, and supported by four rows of lofty pillars, ten in a row, and each formed of one entire piece of white marble. The walls were overlaid with the same beautiful stone, but it is said that the Turks have carried it away to adorn their mosques. The upper ends of the cross terminate in three semicircles, in each of which there is an altar. Over the chancel is a large cupola, of which the outside is covered with lead, and the inside adorned with beautiful mosaic workmanship. There are also shown the tomb of Rachael, the wells for the water of which David longed, the fountains of Solomon, the cave in which David cut off the skirt from the robe of Saul, &c. &c. Perhaps these traditional vestiges of our religion, whether in each particular true or false, have kept alive the remembrance of its leading events in ages, and amongst modern tribes, that have had no access to superior evidence. Dr. Clarke was particularly struck, throughout his travels in Judea, with the singular coincidence between its general present appearance and the descriptions of the Bible.

BETHLEHEM, a town in the land of Zebulon. Josh. xix. 5.

BETHLEHEM, a post and borough town of the United States, in Pennsylvania; pleasantly situated in Northampton county, on the north side of Lehigh river, over which is a large wooden bridge. It is partly built upon an eminence, and partly on the bank of Manakisy Creek, which runs into the Lehigh on the west side of the town. The town is laid out in regular streets, and built chiefly of limestone. The town contains a population of about 1500 individuals, who are all Moravians. Two schools here, one for boys, and another for girls, are in high repute. Besides the common dwelling-houses, it contains a large church, and extensive buildings, appropriated to the different classes of the society; as the unmarried men, the young women, and the widows. Various manufactures are carried on, and the strictest discipline is attended to. Dr. Franklin visited this settlement, soon after its establishment, and was much pleased with their peaceable manners, their social, disinterested habits, and their orderly worship. He enquired into their alleged use of the lot in marriage; and was told it was by no means general; but that the elders of the community, being generally consulted by the young persons of each sex, gave them that advice as to proper objects, which was generally followed. 'But if it occurred that two or more young women were thought equally proper for a young man,' he tells us, 'the lot was appealed to and the decision final.' When Franklin observed that such matches, not made by mutual choice, might end unhappily; 'so they

might,' said the Moravians, 'if the parties were to choose for themselves.' It is twelve miles south-west of Easton, and fifty-three north by west of Philadelphia. Long. 0° 14' W. lat. 40° 37' N.

BETHLEHEM, a town of the United States, with a post office, in Litchfield county, Connecticut, on the head of Southbury river, which runs into the Housatonic. It is about eight miles south of Litchfield, and 196 from Philadelphia.

BETHLEHEM-EPHRAIM. See **BETHLEHEM**.

BETHLEHEMITES, or **BETHLEMITES**, in church history, were monks introduced into England, A. D. 1257, habited like the Dominicans, except that, on their breast, they wore a star with five rays, in memory of the star or comet which appeared over Bethlehem at the nativity of our Saviour. They were celled at Cambridge, and had only one house in England. Also an order of religious in Peru, who came originally from Guatemala in Mexico, where they were instituted by the venerable Peter Joseph of Betanur, for the service of the poor. Innocent XI. in 1687, approved the institute.

BETHLEN, a walled market town of Transylvania in what is called the inner county of Szolnok. It stands on the river Tzamos, and has a castle.

BETH-PEOR, a town of the Reubenites, on the other side Jordan, at mount Fogor, over against Jericho, six miles above Livias. It had a temple sacred to the idol Baal-Peor, Numb. xxv. 5, called Bel-Phegor by the Vulgate, and interpreted Priapus by Jerome.

BETHPHAGE, a place at the west declivity of mount Olivet, Matt. xxi. 1, from which it is supposed that the whole of that declivity, with a part of the valley, and the extreme skirts of the city, went under the common name of Bethphage.

BETHRAL. From thrall. To enslave; to conquer; to bring into subjection. See **THRALL**.

Ne let that wicked woman 'scape away,

For she it is that did my lord *bethral*.

Shakespeare.

BETHSAIDA, the house of hunting or fishing, a town near the desert of the same name in Galilee, on the western shore of the lake Gennesareth. It was the city in which St. Andrew and St. Peter followed their fishing trade; as also the native place of St. Philip. The unbelief of its inhabitants drew down from our Saviour a bitter denunciation. Matt. xi. 21.

BETHSAN, **BETHSIAN**, or **BETHSHEAN**, a town of Samaria, in the half tribe of Manasseh, on the borders of Galilee, about half a league from the Jordan, having half of its territory in the Peræa. It was afterwards called Scythopolis; and was distant from Tiberias, on the lake Gennesareth, 120 stadia, or fifteen miles to the south; and from Jerusalem to the north 600 stadia, or seventy-five miles. Josephus says, it was the greatest city of all the Decapolis. It is called Baeson by Stephanus.

BETH-SHEMESH, a city of Judah, which belonged to the priests: memorable for the return of the ark to it, by the Philistines, as well as for the severe punishment of the inhabitants

for their profanity in looking into it. 1 Sam. vi. 12—19. The circumstance of 75,000 being here stated to be slain in one village has been thought incredible. But the present Heb. text supports our common rendering. Dr. Kennicott, however, instances three reputable MSS. in which the words אֵלֶּיךָ אִישׁ (kechamashim) for חַמָּשִׁים (chamashim). The passage would then read, 'He smote of the people seventy men, equal to (or rulers of) 50,000 men': that is they were governors or chiefs of the people. This was also the name of 2. A town of Egypt, supposed to be the same with Aven, or On. 3. A town of Israel, on the frontiers of the tribe of Issachar. 4. A town of Palestine, belonging to the tribe of Naphthali, from which the Canaanites were not expelled.

BETH-SHITTAH, a district of Palestine, to which the Midianites fled when they were routed by Gideon. It belonged to the Manassites; and is supposed to have been situated south-west of the sea of Tiberias.

BETH-TAPPUAH, a city on the south-west border of Canaan; said to have been situated fourteen miles beyond Raphia, not far from the Nile.

BETHUEL, the son of Nahor, cousin of Abraham, and father of Laban and Rebekah.

BETHUEL, or BETHUL, a city of the Simeonites, the scene of the apocryphal story of Judith and Holophernes.

BETHUMP'. From thump. To beat; to lay blows upon; a ludicrous word.

I was never so *bethumpt* with words,
Since first I called my brother's father dad.

Shakspeare.

BETHUNE, a town of France, in the department of the Pas de Calais (the ci-devant Artois), containing 7000 inhabitants. It is the capital of an arrondissement of eighteen cantons; is surrounded with walls, and has been well fortified. The city and the castle taken together are of a triangular figure, but the former is a very irregular building. The houses are indifferent, and the streets ill-paved; but there is a large handsome market-place, and several churches. Here is made excellent cheese, in which, as in corn and flax, a tolerable trade is carried on; there are, besides, manufactures of linen, and vines are partially cultivated in the surrounding country. In 1710 it sustained a siege of six weeks, and was taken by the allied army under the duke of Marlborough, but was restored to France at the peace of Utrecht. It is seated on a rock near the river Brette, and is traversed by the Lave, which falls into the Lys. Twenty miles north-west of Arras, and 134 north of Paris.

BETHUNE (Maximilian de), duke of Sully. See SULLY.

BETHZUR, in ancient geography, a city on the south of Judah, and borders of Edom, near Hebron. It was fortified by Rehoboam, and was very strong during the Machabean war.

Lysias, the Syro-Grecian general, besieged it with an army of 65,000 men; but Judas Maccabæus forced him to raise the siege. The Syrians, however, took it the following year, and kept it till Jonathan retook it.

BETIDE'. Be and tide, *pret.* It betided, or betid; *part. pass.* betid. From Sax. *betan*. See *TIDE*. To happen to; to befall; to bechance, whether good or bad; to come to pass; to be the fate.

— of true frendes there be too fewe

But sothfast frendes, what so *betide*,

In every fortune wollen abide.

Chaucer.

And leaveing there this ladie all dismayed,

Went forth streightway, into the forest wyde,

To seek if he perchance asleep were layed,

Or whatso else were unto him *betide*:

He sought him farre and neare, yet him no where
he spyde.

Spenser.

She, when her turn was come her tale to tell,

Told of a strange adventure that *betided*,

Betwixt the fox and the' ape by him misguided. *Id.*

In winter's tedious nights, sit by the fire

With good old folks, and let them tell thee tales

Of woeful ages long ago *betid*.

Shakspeare.

If he were dead what would *betide* of thee? *Id.*

But say, if our deliverer up to heaven

Must reascend, what will *betide* the few,

His faithful, left among the' unfaithful herd,

The enemies of truth.

Milton.

What should then *betide*

But that our charity be not too nice?

Come, let us those we can to real bliss entice.

Thomson.

Through many a clime 'tis mine to go,

With many a retrospection curst;

And all my solace is to know

What'er *betides* I've known the worst.

Byron.

BETIME', } Ang.-Sax. *tima*, by time; good

BETIMES'. } time; early time. See *TIME*.

Seasonably; before it is late; soon; before long time has passed; early in the day.

Whiles they are weak, *betimes* with them contend;
For when they once to perfect strength do grow,

Strong wars they make.

Spenser.

There be some have an over early ripeness in their years, which fadeth *betimes*: these are first such as have brittle wits, the edge whereof is soon turned.

Bacon.

He tires *betimes*, that spurs too fast *betimes*.

Shakspeare.

He that drinks all night, and is hanged *betimes* in the morning, may sleep the sounder next day. *Id.*

To measure life learn thou *betimes*, and know

Toward solid good what leads the nearest way.

Milton.

Remember thy Creator in the days of thy youth; that is, enter upon a religious course *betimes*. *Tillotson.*

Short is the date, alas! of modern rhymes;

And 'tis but just to let them live *betimes*.

Pope.

BETIS, governor of Gaza, under Darius, was famous for his valor and loyalty. He defended a place of consequence with a few men against Alexander, who was there shot through the shoulder. Betis thinking him slain, returned triumphantly to the city; but in a second assault, he was wounded and brought to Alexander, who basely ordered him to be put to death.

BETLEY, a market town of Staffordshire, seated on the confines of that county, next to Cheshire, in a sandy but not unfruitful soil. It

is about eight miles from Newcastle-under-Line, sixteen N. N. W. of Stafford, and 157 from London. It supplies Newcastle with almost all its vegetables; and there is a large cattle fair held here in July.

BETLIS, a strong town of Armenia or Turcomania, belonging to a kind of independent bey or prince. It lies on the road from Tauris to Aleppo, and the passage between the mountains is so narrow, that ten men can defend it against 1000. There is a castle on an eminence exactly in the middle. This eminence is so steep on all sides, that it is impossible to get up but circuitously. The people in and about the town are shepherds, but are ready to take up arms at the command of their prince. It is 150 miles east of Diarbek. Betlis is an ancient city, founded, according to the Armenians, by Alexander the Great. The Persians obtained a signal victory over the army of Soliman here in 1534. The population of the town and neighbouring villages is computed at 26,000 Kurds, Turks, Armenians, and Syrians. The country around, denominated Kurdistan, is a fine and highly cultivated valley, producing fruit, grain, and honey. The Armenians have four churches here, and as many monasteries, and enjoy great liberty. Long. 42° 50' E., lat. 37° 30' N.

BETO'KEN, } Be and token. See **TOKEN**.

BETO'KENING. } To signify; to mark; to represent; to foreshow; to presignify.

We know not wherefore churches should be the worse, if, at this time, when they are delivered into God's own possession, ceremonies fit to *betoken* such interest, and to accompany such actions, be usual.

Hooker.

A dewy cloud, and in the cloud a bow,
Conspicuous, with three listed colours gay,
Betokening peace from God.

Milton.

The kindling azure, and the mountain's brow,
Illumed with fluid gold, his near approach
Betoken glad.

Thomson.

This, I say, being a current opinion, the wise men would be apt enough to conclude, that the present star *betokened* the birth of that Prince of whom (as they might easily have heard) it had been so very long foretold,—‘There shall come a star out of Jacob, and a sceptre shall rise out of Israel.’

Porteus.

If bursting heart, and maddening brain—

And daring deed, and vengeful steel—

And all that I have felt—and feel—

Betoken love—that love was mine;—

And shewn by many a bitter sign. *Byron's Giaour.*

BETONICA, **BETONY**, in botany, a genus of the gymnospermia order, and didynamia class of plants; ranking in the natural method under the forty-second order, verticillate. **CAL.** awned; the upper lip of the cor. ascending and flattish; and the tube cylindric. There are five principal species, viz. 1. *B. Alpina*, the least Alpine betony. 2. *B. Danica*, the greater Danish betony. 3. *B. Incana*, the hoary Italian betony, has a flesh-colored flower. 4. *B. officinalis*, is the species chiefly worth notice. It is a low plant growing in woods and shady places in several parts both of England and Scotland. 5. *B. orientalis*, the eastern betony, has very long narrow leaves, and a thick spike of flowers.

BETONICA AQUATICA. See **SCROPHULARIA**.

BETONICA PAULI. See **VERONICA**.

VOL. IV.

BETORN'. The past participle of the verb to tear; to pull or rend asunder.

BETOSS'. Be and toss. See **Toss**. To throw; to heave; to agitate; to put into violent motion.

What said my man, when my *betossed* soul

Did not attend him as we rode? *Shakspeare.*

BETRAY', } Junius derives this word
BETRAY'ER, } from the French *trahir*; Latin
BETRAY'ING. } *tradere*. To give into the hands of enemies by treachery, or breach of trust: with to before the person, otherwise *into*. To discover that which has been entrusted to secrecy; to expose to evil by revealing something entrusted; to make known something that were better concealed; to make liable to fall into something inconvenient; to show; to discover; to delude; and deceive.

If ye be come to *betray* me to mine enemies, seeing there is no wrong in my hands, the God of our fathers look thereon, and rebuke it. *1 Chronicles.*

Jesus said unto them, The Son of man shall be *betrayed* into the hands of men. *Matthew.*

The wise man doth say of fear, that it is a *betray*er of the forces of reasonable understanding.

Hooker.

But when of him no answer she received,
But saw him senseless by the squire up-staide,
She weened well that then she was *betraide*. *Spenser.*

His abilities created him great confidence; and this was like enough to *betray* him to great errors.

King Charles.

How, would'st thou again betray me,
Bearing my words and doings to the Lord! *Milton.*

Ire, envy, and despair,
Which marred his borrowed visage, and *betrayed*
Him counterfeit, if any eye beheld. *Id.*

'Tis in return James does our fleet *betray*
(That fleet whose thunder made the world obey.)

Marvell.

There are only a few *betrayers* of their country; they are to purchase coin, perhaps at half price, and vend it among us, to the ruin of the publick. *Swift.*

For it is the opinion of goodness which creates easiness of trust: and by trust we are *betrayed* to power.

Shaftesbury.

He was not to be won, either by promise or reward, to *betray* the city.

Knolles.

The bright genius is ready to be so forward, as often *betrays* itself into great errors in judgement.

Watts.

To stifle passion, is no easy thing;
A heart in love is always on the wing;

The bold *betray*er flutters still,

And fans the breath prepar'd to tell. *Parnell.*

Ah, why this ruin so attractive made,

Or why, fond man, so easily *betrayed*?

Why heed we not, while mad we haste along,

The gentle voice of peace, or pleasure's song.

Cullins' Eclogues.

Escaped from shot—unharm'd by steel,

Or scarcely grazed its force to feel—

Had Selim won—*betrayed*—beset—

To where the strand and billows met.

Byron.

BETRIM', *v. a.*, from trim. See **TRIM**. To deck; to dress; to grace; to adorn; to embellish; to beautify; to decorate.

Thy banks with pioned and twilled brims,

Which spongy April at thy hest *betrim*s,

To make cold nymphs chaste crowns. *Shakspeare.*

G

BETROTH'. } Be and troth, i. e. truth;
BETROTHMENT. } Goth. *trawan*; Ang.-Sax. *tre-*
owan; Gerin. *trawen, betrawen*; to trow; to
 affiance; to pledge the truth; to promise or
 vow; to keep the truth; or to be true and faith-
 ful; to pledge or bind to the true and faithful
 performance of; particularly applied to the pro-
 mise to enter into the marriage contract.

Ency. Met.

And what man is there that hath *betrothed* a wife,
 and hath not taken her? let him go and return into
 his house.

Deuteronomy.

There might I see how Ver had every blossom lent,
 And eke the new *betrothed* birds, y-coupled how they
 went.

Earl of Surrey.

He, in the first flower of my freshest age,

Betrothed me unto the only heir

Of a most mighty king, most rich and sage. *Spenser.*

You have been contracted to a maid;

Nor are you therein, by my life, deceived;

You are *betrothed* both to a maid and man. *Shakspeare.*

To her, my lord,

Was I *betrothed*, ere I *Hermia* saw.

Id.

By soul's public promise she

Was sold then, and *betrothed* to Victory. *Cowley.*

If any person be consecrated a bishop to that
 church, whereunto he was not before *betrothed*, he
 shall not receive the habit of consecration, as not
 being canonically promoted.

Ayliffe.

BETROTHMENT is either solemn, made in
 the face of the church, or private, before wit-
 nesses out of the church. To betroth by giving
 arrhæ, or earnest, is called by middle age writers
 subarrare. In Russia the betrothing is always
 performed in the church, and is indissoluble;
 formerly it was eight days previous to the mar-
 riage. During this interval, the bride was only
 visited by the bridegroom, and the girls of her
 acquaintance, who amused her with singing. On
 the last evening the young women brought the
 bride into the hot bath, and plaited and tied up
 her hair, singing at the same time ballads
 descriptive of her future happiness. 'Now,' says
 Mr. Pinkerton, 'it is one of the three offices of
 marriage, and is accompanied with the exchange
 of rings. Then follows the matrimonial cor-
 onation, which is properly the marriage rite; and
 thirdly, the dissolving of the crowns. See MAR-
 RIAGE. Among the ancient Jews, the betrothing
 was performed, either by a writing, or by a piece
 of silver given to the bride, or by cohabitation
 and consummation. This latter engagement,
 according to the Rabbins, was allowed by the
 law (Deut. xxiv. 1.), but was afterwards forbid-
 den by the ancients, on account of the abuses
 that might happen, and for preventing clandes-
 tine marriages. After the marriage was con-
 tracted, the young people had the liberty of
 seeing each other. If during this time the bride
 should trespass against that fidelity she owed to
 her bridegroom, she was treated as an adulteress.
 (Seld. Uxor. Heb. l. ii. c. 1., and Matt. i. 19).
 The nuns of the Annuciada hold an annual
 feast in honor of the desponsation, or betroth-
 ment of the Virgin Mary to Joseph. Buxtorf
 Synag. Judaic. cxxxix. preserves the form of a
 written betrothment still in use among the Jews.
 Dr. A. Clarke says, 'This custom has been im-
 memorably observed among the inhabitants of
 Ireland, who have not only this but many other

Asiatic customs, which added to various authen-
 tic historic proofs, are collateral evidence that
 they received the Christian religion, not from the
 popes of Rome, but through the means of Asiatic
 missionaries.' But this argument is not conclu-
 sive; our Anglo-Saxon ancestors had the same
 custom. See Mr. Turner's able History, vol. ii.
 p. 83.

BETRUST'. Be and trust. See TRUST. To
 entrust; to put into the power of another, in
 confidence of fidelity.

Betrust him with all the good which our own ca-
 pacity will allow us, or his sufficiency encourage us,
 to hope for, either in this life, or that to come. *Grew.*

Whatsoever you would *betrust* to your memory, let
 it be disposed in a proper method. *Watts.*

BETSEY'S ISLE, or ISLE WILLAUMEZ, a
 small, high, and fertile island on the east coast
 of Van Diemen's Land, lying at the entrance
 of Derwent river.

BETTER, *v. n. adj. & adv.* The adjective is
 used as the irregular comparative of good, from
 Ang.-Sax. *beteran* and *betrian*, from *betan*, to
 beat; to correct; amend; improve; hence it
 has grown to mean superiority; advantage;
 having good qualities in a greater degree than
 something else; to surpass; to exceed; to ad-
 vance; to support; a higher rank.

Then it was *better* with me than now. *Hosea.*

Having a desire to depart and be with Christ;
 which is far *better*. *Philippians.*

A *better* preest, I trowe, that no wher none is,

He waited after no pompe ne reverence,

Ne maked him no spiced conscience:

But Cristes lore, and his apostles twelve,

He taught—but first he folwed it himselfe.

Chaucer. Cant. Tales. Prologue.

The Corinthians that morning, as the days before,
 had the *better*. *Sidney.*

He hath borne himself beyond the promise of his
 age; he hath, indeed, *better* *bettered* expectation,
 than you must expect of me to tell you. *Shakspeare.*

What you do

Still *better*s what is done; when you speak sweet,

I'd have you do it ever. *Id.*

He has a horse *better* than the Neapolitan's; a
better bad habit of frowning than the count Palatine.

Id. Merchant of Venice.

Their *bettors* would be hardly found, if they did
 not live among men, but in a wilderness by them-
 selves. *Hooker.*

The cause of his taking upon him our nature, was
 to *better* the quality, and to advance the condition
 thereof. *Id.*

The voyage of Drake and Hawkins was unfortu-
 nate; yet, in such sort, as does not break our pre-
 scription, to have had the *better* of the Spaniards.

Bacon.

You think fit

To get the *better* of me, and you shall;

Since you will have it so—I will be yours. *Southern.*

A fairer person lost not heaven; he seemed

For dignity composed and high exploit:

But all was false and hollow; though his tongue

Dropt manna, and could make the worse appear

The *better* reason, to perplex and dash

Matuarest counsel.

Milton.

But Jonathan, to whom both hearts were known,

With well-timed zeal, and with an artful care,

Restored and *bettered* soon the nice affair. *Cowley.*

Here, you shall see a noble title worn,
(That had not mis-beseemed one *better* borne)
By him, whose virtues are of little price,
And whose estate, was gotten by his vice.

Geo. Wither.

That ye thus hospitably live,
Is mighty grateful to your *bettors*,
And makes e'en gods themselves your debtors.

Prior.

The Romans took pains to hew out a passage for
these larks to discharge themselves, for the *bettering*
of the air.

Addison.

He that would know the idea of infinity, cannot do
better, than by considering to what infinity is attributed.

Locke.

Better for us, perhaps it might appear,
Were there all harmony, all virtue, here.

Pope.

When vice o'er all mankind prevails,
And weighty interest turns the scales,
Must I be *better* than the rest,
And harbour Justice in my breast?
On one side only take the fee,
Content with poverty and thee?

Moore.

He asked no question—all were answered new
By the first glance on that still—marble brow!
It was enough—she died—what recked it how?

The love of youth, the hope of *better* years,
The source of softest joy and tenderest fears,
The only living thing he could not hate,
Was reft at once—and he deserved his fate.

Byron.

BETTERTON (Thomas), a celebrated actor in the reign of Charles II. was born in Westminster in 1635, and excelled in Shakspeare's characters of Hamlet, Othello, Brutus, and Hotspur. In 1695 he opened a new playhouse in Lincoln's-inn-fields, but the scheme did not succeed. He died in 1710, and was buried in Westminster Abbey. He wrote *The Woman made a Justice*, a comedy; *the Unjust Judge*, or *Appius and Virginia*, a tragedy, written originally by Mr. John Webster, and altered by Betterton; *The Amorous Widow*, or *the Wanton Wife*; *Dioclesian*, a dramatic opera, &c.

BETTIAH, a district of the province of Bahar, Hindostan, situated between the twenty-seventh and twenty-eighth degrees of north latitude. On the west it is bounded by the river Gunduck, and on the east by Tyrhoot. It retained its independence till the year 1765, when it was subdued and annexed to Champaran by the British government. In the fifteenth century the Hindoo prince of this country was of so much consequence, that the Afghan emperor Sekunder demanded his daughter in marriage. In cultivation and manufactures it is at present inferior to other parts of Bahar, but its woods yield abundance of fine ship-building timber.

BETTIAN, the capital of the above district, and formerly a strong fortress, was taken and destroyed by the Afghans in 1498, and is now a middling-sized town. It is situated in lat. 26° 47' N., long. 84° 40' E.

BETTINELLI (Saverio or Xavier), in biography, a distinguished poet of Mantua, was born in 1718, and died in 1808. He published a new edition of his works in twenty-four volumes, 12mo. Venice, 1799-1801, which contain, 1. *Ragionamento filosofico, con Annotazioni.* 2. *Dell' Entusiasmo delle Belle Arti.* 3. *Dialoghi d' Amore*, two volumes. 4. *Risorgi-*

mento negli Studj, nelle Arti e nè Costume dopo il Mille, three volumes. 5. *Delle Lettere e delle Arti Mantovane; Lettere ed Arti Modenesi*, one volume. 6. *Lettere dieci di Virgilio agli Arcadi*, one volume. 7. *Italian Letters from a Lady to her Friend on the Fine Arts, and Letters from a Friend, copied from the Originals*, three volumes. 8. *Poetry*, three volumes. 9. *Tragedies*, two volumes. 10. *Lettere a Lesbia Cidonia sopra gli Epigrammi*, two volumes. 11. *An Essay on Eloquence.* He was a Jesuit, and one of the most celebrated of that order: in 1751 was entrusted to him the superintendence of the college of nobles at Parma, where he remained eight years. In 1755 he travelled in Germany, Italy, and France, with the sons of the prince of Hohenlohe. Voltaire, whom he visited, wrote the following in an edition of his own works, which he sent to Bettinelli's inn:—

Compatriote de Virgile,
Et son secretaire aujourd'hui,
C'est a vous d'ecrire sous lui;
Vous avez son ame et son style.

'Fellow-countryman of Virgil, and at present his secretary, it is for you to write in his name: you possess his soul and his style.' After settling at Verona for some time, he returned to his own country.

BETTOOR, a flourishing town on the banks of the Ganges, containing several handsome Hindoo temples. Long. 80° 5' E., lat. 26° 52' N.

BETTOORIAH, a district of Bengal, 100 miles long by about twenty broad, on the north-east bank of the Ganges; now included in the collectorship of Rajshy. The Ganges is said to have formerly run through this district, which is still much intersected by small rivers, and subject to inundations. It is consequently well adapted for the cultivation of rice, and produces immense quantities. It lies principally between the twenty-fourth and twenty-fifth degrees of north latitude.

BETTS (John), M. D. physician in ordinary to Charles II. was educated at Oxford; when he died is uncertain. He wrote, 1. *Of the Origin and Nature of the Blood*; and, 2. *The Anatomy of Thomas Parr*, who died in the 152d year and ninth month of his age; with the Observations of the celebrated Dr. William Harvey, and others of the king's physicians, who were present.

BETULA, in botany, the birch-tree: a genus of the tetrandria order, and monœcia class of plants; ranking in the natural method under the fiftieth order, amentaceæ. CAL. of the male monophyllous, trifid, and triflorous: cor. parted into four segments; the female calyx is monophyllous, trifid, and biflorous; the seeds have a membranaceous wing on both sides. There are six species, viz. 1. *B. alba*, the common birch-tree, is so well known as to need no description. It is generally of a humble growth, but in a proper soil and situation will grow to a great height, and considerable size. 2. *B. alnus*, the alder-tree, will grow to large timber. Wherever the soil is or can be made pasturable, the alder should by no means be permitted to gain a footing. Its suckers and seedlings poison the herb-

age; and it is a fact well known to the observant husbandman, that the roots of the alder have a peculiar property, of rendering the soil they grow in moist and rotten. Of the native species, Hanbury enumerates five, viz. 1. The long-leaved. 2. The white. 3. The black. 4. The hoary-leaved, and 5. The dwarf-alder.—3. *B. lenta*, the Canada birch, grows to sixty or more feet in height. The leaves are heart-shaped, oblong, smooth, of a thin consistence, pointed, and very sharply serrated. They differ in color; and the varieties of this species go by the names of 1. Dusky Canada birch; 2. White paper-birch; 3. Poplar-leaved Canada birch; 4. Low-growing Canada Birch, &c.—4. *B. nana*, the dwarf birch, with roundish leaves, grows naturally in the northern parts of Scotland, and Europe generally, and on the Alps. It seldom rises above two or three feet high. It has slender branches garnished with round leaves, but seldom produces flowers here. The catkins and seeds are the principal food of grouse, ptarmigans, &c. The Laplander turns this humble shrub to account, for fuel, and driving away the gnats; when covered with the reindeer's skin, it serves him for a bed. 5. *B. nigra*, the black Virginia birch-tree, will grow to upwards of sixty feet in height. The branches are spotted, and more sparingly set in the trees than the common sorts. There are several varieties of this species, differing in the color, size of the leaves, and shoots; such as, 1. the broad-leaved Virginian birch; 2. the poplar-leaved birch; 3. the paper birch; 4. the brown birch.—6. *B. pumila*, American, or hairy dwarf birch. Linn. Syst. 849. Reich. iv. 127. *B. nana*. Kalm. ii. 263. Leaves obovate, crenate; resembling the *nana*; a native of North America, and introduced into Kew garden in 1762, by Mr. James Gordon. The *alba* is easily propagated: it may be raised either from seeds or layering; and it will flourish in almost any soil and situation. The method of propagating the foreign sorts of birch is, 1. from seeds sown in beds of fine mould, covering them over about a quarter of an inch deep. During the time they are in the seminary, they must be constantly weeded, watered in dry weather, and, when about one or two years old, according to their strength, they should be planted in the nursery in rows. Weeding must always be observed in summer, and digging between the rows in winter; and when the plants are about three or four feet high, they will be of a good size to be planted out for the shrubby quarters. A part may be then taken up for such purposes; whilst the remainder may be left for standards, to answer other purposes; 2. these trees may also be propagated by layers; and this is the way to continue the peculiarities in the varieties. A sufficient number of plants should be procured, and set upon a spot of double dug ground, three yards distant from each other. The year following, if they have made no young shoots, they should be headed to within half a foot of the ground, to form the stools, which will then shoot vigorously the summer following; and in autumn the young shoots should be plashed near the stools, and the tender twigs layered near their

ends: they will then strike root, and become good plants by the autumn following; whilst fresh twigs will have sprung up from the stools, to be ready for the same operation. The layers, therefore, should be taken up, and the operation performed afresh. If the plants designed for stools have made good shoots the first year, they need not be headed down, but plashed near the ground, and all the young twigs layered. Thus may an immediate crop be raised, whilst young shoots will spring out in great plenty below the plashed part, for layering the succeeding year. This work may be repeated every autumn or winter; when some of the strongest layers may be planted out, if wanted; whilst the others may be removed into the nursery, to grow stronger before they are removed; 3. cuttings also, if set in a moist shady border in the beginning of October, will frequently grow: but as this is not a sure method, and as these trees are so easily propagated by layers, it hardly deserves to be put in practice. The alder, like the other aquatic natives, may be raised either from suckers, from cuttings, or by layering; and no doubt from seed, though this mode of propagation is seldom practised in this country.

The bark of the birch seems in a manner incorruptible. In Sweden the houses are often covered with it. It frequently happens that the wood is entirely rotten, when the bark is perfectly sound. In Kamtschatka it is used for making drinking cups. It abounds with a resinous matter, to which its durability is owing: in consequence, it is highly inflammable; and in the northern countries torches are made of this bark sliced and twisted together. The bark itself consists of two different substances; a thick brittle brownish red one; and several very thin smooth white transparent membranes, in which the inflammable property resides. The thick part is less resinous, and has a roughish taste. It has been thought to possess some medicinal virtues, but concerning these, experience has as yet determined nothing certain. Upon deeply wounding or boring the trunk of the tree, in the beginning of spring, a sweetish juice issues, sometimes in so large a quantity as to equal the weight of the whole tree and root; one branch will bleed a gallon or more in a day. Horses, cows, goats, and sheep, eat the leaves of all the species of *betula*; but swine refuse them. When eaten by cows, they are said greatly to increase the quantity of the milk. With the addition of sugar, and properly fermented, its juice makes a pleasant wine. Mr. Loudon says, 'birch wine has been made from an open grove of about 100 birch trees, near Overton Hall, for sixty or seventy years past. Thirty trees or more are tapped in a season, about six or eight inches above the ground, in March. A piece of bark about three quarters of an inch in diameter, is cut out with a gouge, and the wood penetrated an inch or more; an iron spout is then driven into the bark below the hole, which conducts the sap to a bottle. In warm weather the holes soon grow up, and will cease to run in four or five days; but in windy weather they will run for a month. Some trees will run twenty-four gallons in twenty-four hours, others not half a pint. The

water is sold at sixpence a gallon to those who take small wine as a substitute for small beer. If the water is scalded (not boiled) it may be kept a month before it is made into wine; if not, it will not keep above a day or two. For making the wine, two pounds of coarse sugar, and a quarter of a pound of Malaga raisins, are added to every gallon of birch water, when cold: it is then boiled about an hour, until it is observed to grow clearer, when it is set to cool, and when about at the same heat that beer is set to work, a toast of bread spread with yeast is put into it, and for four days suffered to work freely, when it is barrelled, and the same quantity of raisins as before, and about an ounce of isinglass to every twenty gallons, are added: it seldom works out of the barrel, and in two or three weeks is ready for close bunging down, to remain for three months, when it should be bottled off, and in two or three weeks after it is fit for drinking, but is the better for keeping longer.

BETULÆ, in entomology, a species of curculio, of a golden green color in one sex, and blue in the other, with a spine on each side of the anterior part of the thorax; a native of Europe.—Also a species of cryptocephalus; color black; thorax orbicular and hairy; wing-cases brown, with obscure streaks: a native of Prussia. Also a species of attelabus, the curculio exco-riato-niger of Degeer; color black, with legs formed for leaping.—Also a species of cimex found on the white alder in the north of Europe. The head is mucicated; thorax denticulated; anterior part of the wing-cases dilated.—Also a species of papilio, with brown wings, yellowish beneath; with two white streaks on the posterior ones: the larva is green, with pale oblique lines, and white on the sides; pupa glossy and ferruginous. The male is distinguished by a fulvous spot on the upper wings.—Also a species of tenthredo, tenthredo ferruginea of Degeer, body red; thorax, vent, and eyes black; wings brown behind: inhabits Europe.—Also a species of coccus, found on the white alder. It is round, and of a bay color.

BETULEIUS (Sixtus), an able grammarian, Latin poet, and philosopher, was born at Memmingen, in 1500; his true name was Birk. He taught the belles lettres and philosophy with reputation; and became principal of the college of Augsburg, where he died, June 16th, 1554. He wrote, 1. Notes on Lactantius, printed with the works of that father, fol. Bas. 1563; 2. Commentaries on Cicero de Natura Deorum, 8vo. Bas. 1550; 3. Three Dramatic Pieces inserted in the Dramata Sacra, 2 vols. 8vo. Bas. 1547; 4. Novi Testamenti Concordia Græca, Bas. 1546; 5. Oracula Sybillina Gr. cum Castigationibus, 8vo. Bas. 1545.

BETUWE, **BETUE**, or **BETAW**, a fertile island of Guelderland, forty miles long and ten broad, formed by the bifurcation of the Rhine above Nimeguen, and by the union of its streams near Worcum. It is the ancient Batavia, and formerly gave the name Batavians to the inhabitants of the Dutch Netherlands.

BETWEEN, & The Anglo-Saxon impera-
BETWIXT. } five be, and twegen or twain.
—*Enc. Met.* Betwixt is the imperative be, and

the Gothic *tuos*, or two.—*Tooke*. Between was formerly written *twene*, *atwene*, *bytwene*. These words are variously used, but always implying their primary sense. In the intermediate space which divides. From one to another; noting intercourse, belonging to two; bearing a relation to two; difference; a distinction of one from another. *Between* is properly used of two; and *among* of more; but perhaps this accuracy is not always observed.

The cercles of his eyen in his hed
They gloweden *betwixen* yelve and red;
And like a griffon loked he about;
With kemped heres on his browes stout.

Chaucer. Canterbury Tales.

Welcome, my sweet; alas! the stay of my welfare;
Thy presence bringeth forth a truce *betwixt* me and
my care.

Earl of Surrey.

Five years since there was some speech of mar-
riage

Betwixt myself and her.

Shakspeare.

He should think himself unhappy if things should
go so *between* them, as he should not be able to
acquit himself of ingratitude towards them both.

Bacon.

If there be any discord or suits *between* them and
any of the family, they are compounded and appeased.

Id.

Nor would I, for the world, my heart should bee
Inthrall'd by one that might not marry me;
Or such like passions bee perplexed in,
As hang *betwixt* a virtue and a sinne.
Or such as whether way soe're I went,
Occasioned guilt or shame or discontent;
For, howsoe're wee manage such like things,
Wee handle winding vipers that have stings.

Geo. Wither.

Friendship requires that it be *between* two at least;
and there can be no friendship where there are not
two friends.

South.

Their natural constitutions put so wide a difference
between some men, that art would never master.

Locke.

BEVECUM, a town in Brabant, in the
kingdom of the Netherlands; memorable for
being the place where the Duke of Marlborough
encamped, after forcing the French lines, in 1705;
and where he rested after the victory of Ramillies,
in 1706. It lies seven miles south of Lou-
vain.

BEVEL, *n.* & *v.* In masonry and joinery, a
kind of square, one leg of which is frequently
crooked, according to the sweep of an arch or
vault. It is movable on a point or centre, and
so may be set to any angle. An angle that is
not square is called a *bevel* angle, whether it be
more obtuse or more acute than a right angle.
To *bevel* is to cut to a *bevel* angle. From Germ.
bugel, diminutive of *bug*, from *bugen*, to bow.

The **BEVEL**, of carpenters, is made with a
movable tongue, to strike angles. It differs from
the square and the mitre in being movable,
whereas they are fixed; the first at 90°, the
second at 45°. Hence a bevel angle is any angle
not a right angle.

BEVEL, in heraldry, is a chief broken or open-
ing like a carpenter's rule.

2 **BEVELAND**, North and South, two islands
of the Netherlands, in the province of Zealand,
formed by two branches of the Scheldt. The
former, on the east side of the island of Walche-

ren. is about six miles long and four broad, and is formed by what the Dutch call the Easter Scheldt. It was destroyed by a dreadful inundation in 1532, so that nothing but the tops of the church steeple and the highest buildings could be seen; but the ground being raised by the alluvial depositions, it was afterwards drained and brought into cultivation. South Beveland is separated from North Beveland by the island of Wolfersdyke, and is about twenty-four miles in length, and from five to eight miles in breadth. It is said to be one of the most agreeable of those belonging to Zealand, and contains the town of Goes, with some villages and forts; and has a trade in corn. Both these islands were occupied by the British, in 1309, during the expedition to Walcheren.

BEVELLING, in ship-building, the art of hewing a timber with a proper and regular curve, according to a mould which is laid on one side of its surface. See **SHIP-BUILDING**.

BEVER, *v. & n.* } From the Lat. *libere*, to
 BEVERAGE. } drink. The afternoon and evening potations at colleges were called bevers; beverage is applied to any wholesome or pleasant liquid that is used for drink.

I am his cupbearer;

If from me he have wholesome *beverage*,

Account me not your servant. *Shakspeare.*

Grains, pulses, and all sorts of fruits, either bread or *beverage* may be made almost of all.

Brown's Vulgar Errors.

A pleasant *beverage* he prepared before

Of wine and honey mixed. *Dryden.*

Thine Pomona's choicest gift,

The tasteful apple rich with rosy juice:

Theme of thy envied song, Silarian bard,

According to the swains, in sparkling cups,

Delicious *beverage*. *Dodsley.*

BEVERCHES, in old records, customary services done by tenants to their lords, under the feudal system.

BEVERIDGE (William), a learned English prelate in the beginning of the eighteenth century, was born in 1638, and educated in St. John's college, Cambridge; where he distinguished himself so early by his knowledge of the oriental languages, that he published in his twentieth year a Latin treatise on the Excellency and Use of Oriental Languages, in which he reviews the several merits of the Hebrew, Chaldee, Syriac, Arabic, and Samaritan tongues. About the same time, also, he produced a Syriac grammar. Upon the deprivation of Dr. Ken, bishop of Bath and Wells, for not taking the oaths to the government, in 1691, he refused the offer of that see, though he was then chaplain to king William and queen Mary. In 1704 he was consecrated bishop of St. Asaph; in which high function he approved himself a truly primitive bishop. He died at Westminster Abbey, in 1707, aged seventy-one. As his whole life was spent in acts of piety and charity, so at his death, he left the bulk of his estate for the propagation of the gospel, and promoting Christian knowledge at home and abroad. His *Private Thoughts upon a Christian Life* has always been a very popular book. Among his other works are, 1. *De Linguarum Orientalium*, &c. *Prestantia et Usu*, &c.

8vo. Lond. 1658; 2. *Institutionum Chronologicorum Libri Duo*, &c. 4to. Lond. 1669; 3. *Συνοδικον*, sive *Pandectæ Canonum*, &c. 2 vols. folio, Oxon. 1672; 4. *Codex Canonum Ecclesiæ*, &c. 4to. Lond. 1679; 5. *The Church Catechism Explained*, 4to. Lond. 1704. His executors, after his decease, printed *Thesaurus Theologicus*, 4 vols. 8vo.; *The Necessity of frequent Communion*; *An Exposition of the Thirty-nine Articles*, folio; *A Defence of the Old Version of the Psalms*; and above 150 sermons, in twelve 8vo. and two folio volumes.

BEVERLACIUS (Joannes), or John of Beverley. See **JOHN**, St.

BEVERLEY, an ancient borough and market town of Yorkshire, governed by a mayor, a recorder, and twelve aldermen. It sends two members to parliament, elected by the freemen, who are about 400 in number. The minster here is a neat structure, and the roof is an arch of stone. Dr. Stukely says it was founded by king Athelstan, and is inferior to York minster in nothing but its size. In it are several monuments of the Percies, earls of Northumberland. In 1664 the grave of St. John of Beverley, archbishop of York, was discovered here, with many bones and relics. From an inscription on a plate, it appeared that the church was consumed by fire in 1183, and that, upon the rebuilding, the bones which were collected were deposited in the vault of John of Beverley. There are two other parish churches; a free school, with two fellowships, six scholarships, and three exhibitions, to St. John's College, Cambridge; and nine almshouses. The Liberties are said to contain above 100 towns, and parts of towns, in Holderness and other parts of the East Riding. The town is a mile in length, and the market-place contains four acres of land. It is adorned with a beautiful cross, supported by eight free-stone columns, each of an entire stone; the whole erected at the expense of some of the former borough members. The town, altogether, is well built; the streets are well paved, broad, neat, and clean. The principal trade is in malt, oat-meal, and tanned leather; and the poor people support themselves by making bone lace. Markets, Wednesdays and Saturdays. Inhabitants about 7500. It is nine miles north from Hull, twenty-eight from York, and 133 from London.

BEVERLEY, a post town of Massachusetts, in Essex county, situated on the north side of Salem Bay, and connected with the town of Salem by a bridge of 1500 feet in length. The inhabitants are devoted partly to navigation and the fisheries, and partly to agriculture; there is a bank, and, lately, a manufacture of cotton has been established here. It is twenty miles north-east of Boston. Long. 70° 50' W., lat. 42° 31' N.

BEVERLEY (John of). See **JOHN**, St.

BEVERUNGEN, a town of Germany, in the diocese of Paderborn, seated on the confluence of the rivers Bever and Weser. Long. 9° 30' E., lat. 51° 40' N.

BEVIN (Elway), an eminent musician and composer in the reign of queen Elizabeth. Dr. Child was his pupil. He composed sundry services and anthems. Before Bevin's time the precepts for the composition of canons are said

to have been known to few; and the resolution of a canon into its elements, and reducing it into score, was deemed a work of almost as great difficulty as the original composition. He wrote A brief and short Instruction of the Art of Music, &c. published in 4to. 1631, and much esteemed.

BEULAH, a figurative name given to the Jewish nation and church, in Isaiah lxii. 4.

BEURT-SCHEEPEN, or BEURT SCHUYTEN, turn-boats; vessels at Amsterdam which have the exclusive privilege of taking in goods in the provinces; so called because they sail in turn, according to specific regulations.

BEUTHEN, a lordship and circle of Upper Silesia, created a free barony by the emperor Leopold, in 1796. It has for boundaries Oppeln on the west and north, and Poland on the east. The inhabitants speak the Polish language, and are mostly Catholics.

BEUTHEN, the chief town of the above district, frequently called Upper Beuthen, contains several churches and religious houses, and about 1700 inhabitants, among whom are between 100 and 200 Jews. Here are manufactures of cloth, earthenware, and calamine, besides some considerable breweries. About 9600 cwt. of calamine are made in the course of a year. It is likewise the residence of the governor of the circle. Thirty miles north-east of Ratisbon, lat. 50° 18' N., long. 18° 53' E.

BEUTHEN, LOWER, is a considerable town on the Oder, containing a population of about 3000 individuals. It stands in a fertile country, and has fifty vessels engaged in the trade of the river; it is also noted for its breweries.

BEVY, *n.* *Beva*, Italian; etymology unknown—applied to birds that go in company. Skinner says, to drink, and derives it from *bi-hera*, *bevere*. We read of a *bevie* of ladies, a *bevy* of jacks. By sportsmen the term is now confined, says the Ency. Met. to quails.

And in the midst thereof, upon the floor,
A lovely *bevy* of fair ladies sat,
Courtied of many a jolly paramour.

Faerie Queene.

And wither rennes this *bevie* of ladies bright,
Raunged in a rowe.

Spenser.

None here, he hopes,
In all this noble *bevy*, has brought with her
One care abroad.

Shakspeare.

From the tents behold

A *bevy* of fair women richly gay
In gems and wanton dress, to the harp they sung
Soft amorous ditties, and in dance came on.

Milton.

BEWAIL', } Be and wail, Serenius says,
BEWAIL'ING. } from the Isl. *vela*; Goth.
wail, planctus, plaint; *waila*, to cry out as in
anguish; to deplore, to lament, to bemoan, to
express sorrow.

In this city he
Hath widowed and unchilded many a one,
Which to this hour *bewail* the injury.

Shakspeare.

Thy ambition,
Thou scarlet sin, robbed this *bewailing* land
Of noble Buckingham, my father-in-law.

Id.

Yet wiser Ennius gave command to all
His friends, not to *bewail* his funeral.

Sir John Denham.

And if I must *bewail* the blessing lost,
For which our Hampdens and our Sidneys bled,
I would at least *bewail* it under skies
Milder, among a people less austere,
In scenes which, having never known me free,
Would not reproach me with the loss I felt. *Couper.*

BEWARE', from be and ware, or wary; that is, cautious: thus, in an old treatise, I have found be ye ware. See WARY. *Lebanian*, Saxon; *warer*, Danish. To regard with caution; to be suspicious of danger from: generally the particle *of* goes before the thing which excites caution. It is observable, that it is only used in such forms of speech as admit the word *be*: thus we say, he may beware, let him beware, he will beware; but not, he did beware, or he has been ware.

Thither came Uriel, gliding through the even
On a sun-beam, swift as a shooting star
In autumn thwarts the night, when vapours fired
Impress the air, and shows the mariner
From what point of his compass to *beware*
Impetuous winds.

Milton.

You must *beware* of drawing or painting clouds,
winds, and thunder, towards the bottom of your piece.

Dryden.

Every one ought to be very careful to *beware* what he admits for a principle.

Locke.

Warn'd by the sylph, oh, pious maid *beware*!

This to disclose is all thy guardian can;

Beware of all, but most beware of man.

Pope.

BEWDLEY, or BEAULIEU, a borough and market town of Worcestershire, seated on the Severn; three miles from Kidderminster, and 128 north-west from London. It has its name Bewdley, Beawley, or Beaulieu, from its pleasant situation on the declivity of a hill overlooking the river, and commanding a most beautiful prospect. It was formerly accounted so delightful a place, that Henry VII. built a house in it for prince Arthur, which he called Tiken-hall, and here that prince was married to the proxy of Catherine of Spain, afterwards the wife of his brother, Henry VIII. Bewdley sent burgesses to parliament very early, and great privileges were bestowed upon it by Edward IV. and Henry VII. Its present charter, by which it sends one member to parliament, and is governed by a bailiff and burgesses, recorder, steward, town-clerk, &c. was settled in the reign of Queen Anne. It is neat and well built, and carries on a considerable trade, by the Severn, in malt, salt, glass, iron ware, leather, and Manchester goods. Market on Saturday. Population about 4000.

BEWEEP'. Be and weep, Ang.-Sax. *wepan*, bewepan. To weep over or upon; to bedew with tears.

Old fond eyes,
Beweep this cause again; I'll pluck ye out,
And cast you, with the waters that you lose,
To temper clay.

Shakspeare.

Larded all with sweet flowers,
Which *bewept* to the grave did go
With true love showers.

Id.

BEWET', *v. a.*, from wet. To wet; to moisten; to bedew; to water.

His napkin, with his true tears all *bewet*,
Can do no service on his sorrowful cheeks.

Shakspeare. Tit. And.

BEWICK (John), an artist, who, in conjunction with his brother Thomas Bewick, carried the art of engraving on wood to great perfection. They were settled at Newcastle-on-Tyne, where they printed in 1790 a History of Quadrupeds, an 8vo volume, which still maintains its credit, and were engaged in making engravings for a History of British Birds (published in 1797, 8vo.) when John Bewick died of a consumptive disease, December 5th, 1795. The author of the Pursuits of Literature has bestowed a merited eulogium on him.

BEWIL'DER. Be and wild. Wild is opposed to what is tamed or subdued; a wild or wilderness is applied to a place unsubdued or uncultivated, or unrestrained by man.—*Ency. Met.* To bewilder is to lose in pathless places; to confound for want of a plain road; to perplex; to entangle; to puzzle.

We parted thus; I homeward sped my way,
Bewildered in the wood till dawn of day. *Dryden.*

We no solution of our question find;
Your words *bewilder*, not direct the mind. *Blackmore.*

Our understanding traces them in vain,
Lost and *bewildered* in the fruitless search. *Addison.*

First Fear, his hand, its skill to try,
Amid the chords *bewildered* laid,
And back recoiled, he knew not why;
Even at the sound himself had made. *Collins.*

BEWITCH',	} Be and witch. Ang.-Sax. wiccian. To enchant; to use sorcery; to injure by witchcraft or charms; to charm; to please to such a degree as to take away the power of resistance; fascination; power of charming.
BEWITCH'ER,	
BEWITCH'ERY,	
BEWITCH'ING,	
BEWITCH'FUL,	
BEWITCH'INGLY.	
BEWITCH'MENT.	

And honour, glory, praise, renown, and fame,
That men's proud hearts *bewitch* with tickling pleasure,

An echo is, a shade, a dream, a flower,
With each wind blasted, spoiled with every shower. *Fairfax.*

Come, come away, frail, silly, fleshy wight,
Ne let vaine words *bewitch* thy manly hart,
Ne diuclish thoughts dismay thy constant spright
In heavenly mercies hast thou not a part? *Spenser.*

Look how I am *bewitch'd*; behold, mine arm
Is like a blasted sapling withered up. *Shakespeare.*

Doth even beauty beautify,
And most *bewitch* the wretched eye. *Sidney.*
I will counterfeit the *bewitchment* of some popular
man, and give it bountifully to the desirers. *Shakespeare.*

My flocks are free from love, yet loom so thin;
What magic has *bewitched* the woolly dams,
And what ill eyes beheld the tender lambs? *Dryden.*

There is a certain *bewitchery*, or fascination, in words, which makes them operate with a force beyond what we can give an account of. *South.*

Let me observe, that oblique vision, when natural, was anciently the mark of *bewitchery* and magical fascination, and to this day 'tis a malignant ill-look. *Spectator.*

The wanton beauty whose *bewitching* arts
Have drawn ten thousand wretched souls to hell, *Mrs. Rowe.*

BEWRAY', or? Probably from the Ang.-BERAY. } Sax. *wrgan*, to cover; that is with dirt, with filth, and thus to signify to be foul, to bespatter with dirt.—*Ency. Met.*

Let them that do so, understand, that they *beray*, sile their hands more, when they lay them on any other man than their owne husbandes, than though they blacked them in soote.

Vices. Instruction of Christian Women.
Being, as it were, in a small puddle of mire, she (the moon) is but a little sullied or *berayed* therewith, and so quickly getteth forth of it.

Holland. Phutarch.

BEWRAY', } Ang.-Sax. *wrgan*, *wreian*;
BEWRAY'ER, } to accuse; to inform; to be
BEWRAY'ING, } an informer; to betray; to discover perfidiously. Formerly it was used to signify simply to discover or make visible.

How shalt thou to thy lady freshe May,
Tellen thy wo? she wol alway say nay;
Eke if thou speke she wol thy no *bewrein*;
God be thin help I can no better sein.

Chaucer. Canterbury Tales.

O messenger fulfilled of drunkenesse!
Strong is thy breath; thy limmes faltren ay;
And thou *bewreiest* alle sekenesse;
Thy mind is lorn, thou janglest as a jay,
Thy face is turned in a new array. *Id.*

She saw a pretty blush in Philoclea's cheeks *bewray*
a modest discontent. *Sidney.*

Men do sometimes *bewray* that by deeds, which
to confess they are hardly drawn. *Hooker.*

But Blandamour, whenas he did espie
His chaunge of cheere that anguish did *bewray*;
He woxe full blithe, as he had got thereby,
And gan thereat to triumph without victorie. *Spenser.*

Fair feeling words he wisely 'gan display,
And, for her humour fitting purpose, fain
To tempt the cause itself for to *bewray*. *Facrie Qucene.*

When a friend is turned into an enemy, and a *bewrayer* of secrets, the world is just enough to accuse the perfidiousness of the friend. *Addison.*

BEX, a small town of Switzerland in the canton of Bern, remarkable for its salt works; which are entered by a subterraneous passage cut through the solid rock.

BEXUQUILLO, in the materia medica, a name given to the white ipecacuanha in Peru.

BEY, among the Turks, signifies a governor of a county or town. The Turks write it beg or beg, but pronounce it bey. The word is particularly applied to a lord of a banner, whom they call sangiac beg or bey. The provinces of Turkey are divided into sangiacs, each of which qualifies a bey: and these are all commanded by the governor of the province, whom they call begler-beg, that is, lord of all the begs or beys of the province. The title properly belongs to the chiefs who hold grants of land on military tenure, according to the ancient feudal system of Europe. These beys are similar to our ancient bannerets.

The **BEY** OF TUNIS is the prince of that place, has a despotic power within his jurisdiction; at the season for collecting the tribute from the Arabs, he is sometimes assisted by a body of troops from Algiers; and is, with the dey of Algiers, nominally subject to the Porte.

BEYLERBEG. See BEG, sect. 2, and BIG-
LER-BEG.

BEYOND'. Sax. *begeond*, *begeondan*. The imperative *be*, compounded with the past participle *geond*, *geoned*, or *goned*, of the verb *gan*, *gangan*, or *gongan*, to go, to pass; so that, 'beyond any place,' 'be passed that place,' or 'be that place passed.'—*Tooke*. It is however used in a variety of senses: for instance—Before, at a distance not yet reached; on the farther side of; farther onward than some given spot; past, out of the reach of; above, to a greater degree than above in excellence; remote from; not within the sphere of. *To go beyond* is to deceive, to circumvent, see 1 Thess. iv. ver. 6, That no man go *beyond*, and defraud his brother in any matter.

Neither is it *beyond* the sea, that thou shouldst say, Who shall go over the sea for us, and bring it unto us? *Deut. xxx. 13.*

Now we are on the land, we are but between death and life; for we are *beyond* the old world and the new. *Bacon.*

Beyond the infinite and boundless reach

Of mercy, if thou didst this deed of death,

Art thou damned, Hubert. *Shakspeare.*

She made earnest benefit of his jest, forcing him to do her such services as were both cumbersome and costly; while he still thought he went *beyond* her, because his heart did not commit the idolatry. *Sidney.*

He that sees a dark and shady grove,
Stays not, but looks *beyond* it on the sky. *Herbert.*

—— the universal host upsent
A shout that tore Hell's concave, and *beyond*

Frighted the reign of Chaos and old Night. *Milton.*

Yet these declare

Thy goodness *beyond* thought, and power divine. *Id.*

The just, wise, and good God neither does nor can require of man any thing that is impossible, or naturally *beyond* his power to do. *South.*

His satires are incomparably *beyond* Juvenal's, if to laugh and rally is to be preferred to railing and declaiming. *Dryden.*

With equal mind, what happens let us bear;
Nor joy, nor grieve, too much for things *beyond* our care. *Id. Fables.*

What's fame? a fancied life in others breath,
A thing *beyond* us, even before our death:
Just what you hear, you have. *Pope.*

Old wives there are, of judgment most acute,
Who solve these questions *beyond* all dispute;
Consult with those and be of better cheer,
Marry, do penance, and dismiss your fear. *Id.*
We cannot think men *beyond* the sea will part with their money for nothing. *Locke.*

All, all on earth is shadow, all *beyond*
Is substance; the reverse is folly's creed;
How solid all, where change shall be no more. *Young.*

It is that settled, ceaseless gloom,
The fabled Hebrew wanderer bore;
That will not look *beyond* the tomb,
But cannot hope for rest before. *Byron.*

Apart he stalked in joyless reverie,
And from his native land resolved to go,
And visit scorching climes *beyond* the sea.
With pleasure drugged he almost longed for woe,
And e'en for change of scene would seek the shades below. *Id. Child Harold.*

BEYRAMITCH, a large city of Asia Minor, in the district of Troas, and pachalic of the Dardanelles, distant from the straits about fifty miles. It is a well built place, abounding with antiquities, particularly some sarcophagi, consisting of large single blocks of granite. The ruins of a temple, dedicated to Jupiter, have been recently discovered here.

BEYS (Giles), a celebrated printer at Paris, in the sixteenth century; the first introducer of the consonants J. and V.

BEZA (Theodore), an eminent reformer, was born at Vezelay, in Burgundy, June 24th 1519. He was brought up by his uncle Nicholas de Beza, counsellor of the parliament of Paris, till the month of December, 1528, when he sent him to study at Orleans, and afterwards at Bourges, where he was under the care of Melchior Wolmar, under whom he made extraordinary progress, and from whom he imbibed the principles of Calvinism. His uncle intended him for the bar; but the law not suiting his disposition, he spent most of his time in reading the Greek and Latin authors, and in composing verses. In 1539 he took up his licentiate's degree, and went to Paris. He fell into the usual snares of youth, and wrote some licentious pieces. Sickness alarmed him; and on recovering he fulfilled a vow he made, of declaring for the reformed religion. This he did by going to Geneva, and making public profession of it. In 1549 he accepted of the Greek professorship at Lausanne, where he also read lectures in French, on the New Testament. Having settled at Geneva, he became the colleague of Calvin in the church and university. Being sent to Nerac with a view to the conversion of the king of Navarre, and to confer with him upon affairs of importance, the king expressed, both by letters and deputies, his desire, that Beza might assist at the conference of Poissy. The assembly hearkened attentively to his harangue, till, speaking of the real presence, he said, 'that the body of Jesus Christ was as distant from the bread and wine, as the highest heaven is from the earth.' Upon this, some cried out, Blasphemavit! others hastened away. Cardinal de Tournon desired the king and queen either to silence Beza, or permit him and his company to withdraw. Beza, throughout the conference, behaved with great ability. He often preached before the queen, the prince of Condé, and in the suburbs of Paris. After the massacre of Vassy, he was deputed to the king to complain of this violence. The civil war followed soon after, during which the prince of Condé kept him with him; and while the prince was imprisoned, he lived with admiral de Coligni, and did not return to Geneva, till after the peace of 1563. In 1571 he was chosen moderator at the national synod of Rochelle; and the year after assisted at that of Nismes; after this, he assisted at the conference of Montbeliard and of Bern. The infirmities of age beginning to afflict him in 1596, he could seldom speak in public; and he left it off entirely in the beginning of 1600. However, in 1597, he wrote some animated verses against the Jesuits, on occasion of the report that was made of his recantation and death. He died 13th of

October, 1605. His chief works are, 1. *Confessio Christianæ fidei*, 8vo. 2. *De Hæreticis a civili Magistratu puniendis*, 8vo. 3. *Comedie du Pape Malade*, 8vo. 4. *Traduction en vers François des Pseumes omis par Marot*. 5. *Histoire de la Mappemonde Papistique*, 4to. 6. *Le Reveilment des François et de leurs voisins*, 8vo. 7. *De Peste Questiones duæ Explicatæ; una, sit ne Contagiosa? altera, an et Quatenus sit Christianis per Secessionem Vitanda?* 8. *Histoire Ecclesiastique des Eglises Reformées au Royaume de France*, 3 vols. 8vo. 9. *Icones Virorum Illustrium*, 4to. 10. *Tractatio de Repudiis et Divitiis; Accedit Tractatus de Polygamia*, 8vo. 11. *Epistola Magistri Passavantii ad Petrum Lysetum*. 12. *The New Testament translated into Latin, with notes, folio*. Beza gave a Greek MS. of the third or fourth century, of the gospels and acts of the apostles, to the University of Cambridge, where a fac-simile of it was published in 1793, in 2 vols. folio.

BEZALEEL, the son of Uri, of the tribe of Judah, an artificer, employed by Moses in erecting the tabernacle, and supposed to have been in some degree inspired for that purpose.

BEZANS, in commerce, cotton cloths which come from Bengal; some are white and others striped with several colors.

BEZANT, round flat pieces of bullion without any impression, supposed to have been the current coin of Byzantium.

This coin was probably introduced into coat armour by those who went to the Holy Wars, as in the annexed figure. Ermine on a fess, gules, three bezants. The bezant was of pure gold, but whether it was the same as the Persian bizant, worth about two dinars, each dinar being equal to twenty or twenty-five drachms, is uncertain, as writers are not agreed respecting its value. It had, perhaps, as general a currency as any coin. It was current from the rise of the eastern empire to its fall, in all its provinces; and likewise in those countries which had been provinces of the western empire; and among others in Britain, where they were received in payments. Dr. Henry (*History of England*, vol. iv. 275,) estimates its value at 9s. 4½d. of our present money. The gold offered by the king of England on the altar at the feast of the Epiphany and the Purification, is called besant.

BEZANTLER, the branch of a deer's horns, next below the brow-antler.

BEZEK, 1. A city of Judah, about two miles from Beth-zur, and west of Bethlehem; the capital of Adoni-Bezek's kingdom. 2. A city south of Bethshan west of Jordan.

BEZEL, *z* n. s. That part of a ring in which **BEZIL**. *s* the stone is fixed.

BEZIER, or **BESIER**, an ancient and well-built town of France, in Lower Languedoc, near a canal of that name. It was formerly a bishop's see, and gave birth to the learned Barbeyrac. The neighbourhood is fertile and the site highly salubrious. The valley of the Orbe is bounded by hills, which are covered with vines and olives to the summit of a natural amphitheatre.

The beauty of it, as seen from the town, is increased by the eight sluices of the grand canal, which form as many fine water-falls. There is a cathedral and collegiate church here, several religious houses, and two hospitals; a good trade in wine, oil brandy, almonds, corn, wool, and silk; and manufactures of cotton, fustian, and other stuffs, stockings, earthenware, brandy, and leather. An Academy of Sciences was founded in 1723, and has survived the revolution. It stands thirty-eight miles south-west of Montpellier, in lat. 43° 20' N., and long. 3° 17' E.

BEZOAR. This name, which is derived from a Persian word, implying an antidote to poison, was given to a concretion found in the stomach of an animal of the goat kind. It was, of course, highly valued for this imaginary quality, and the name was thence extended to all concretions found in animals.

According to Fourcroy, Vauquelin, and Berthollet, these are of eight kinds. 1. Superphosphate of lime, which forms concretions in the intestines of many mammalia. 2. Phosphate of magnesia, semitransparent and yellowish, and of spec. grav. 2.160. 3. Phosphate of ammonia and magnesia. A concretion of a gray or brown color, composed of radiations from a centre. It is found in the intestines of herbivorous animals, the elephant, horse, &c. 4. Biliary, color reddish-brown, found frequently in the intestines and gall-bladder of oxen, and used by painters for an orange-yellow pigment. It is inspissated bile. 5. Resinous. The oriental bezoars, procured from unknown animals, belong to this class of concretions. They consist of concentric layers, are fusible, combustible, smooth, soft, and finely polished. They are composed of bile and resin. 6. Fungous, consisting of pieces of the *boletus ignarius*, swallowed by the animal. 7. Hairy. 8. Ligniform. Bezoars were formerly considered so highly alexipharmic, that other medicines of that kind received the name bezoardics, and so efficacious were they once thought, that they were eagerly bought at immense prices. They were sometimes taken internally, and in other cases worn around the neck, as preservatives: it is said that in Portugal it has been customary to hire them at the price of 10s. per day. This great value of the bezoar gave birth to many fabrications under the name, and various tests were proposed to detect artificial stones. Three bezoars sent to Buonaparte by the king of Persia, were found by Berthollet to be nothing but woody fibre agglomerated.

BEZOARDIC acid, a name given to the acid extracted from the urinary calculi formed in the kidneys or gall-bladder.

BEZOARDICA TERRA, a name used by some authors for a medical earth dug in the pope's territories, and more frequently called *terra noceriana*.

BEZOARDICK, *adj.* From bezoar. Medicines compounded with bezoar.

The *bezoardicks* are necessary to promote sweat, and drive forth the putrid particles. *Floyer.*

BEZOLA, in ichthyology, a truttaceous fish of the albula kind, called by Gesner the *albula carula*. It resembles the herring in shape, is of a

dusky bluish color, and does not essentially differ from the lavaretus.

B FA, B MI, in solmisation (music), according to the hexachord of Guido Aretinus, this expression denotes, that, when in modulation the interval B-natural is required, the syllable *mi* should be sung, and the key designated by B-mi, because the half tone falls between the B-natural, and C, and belongs to the hexachord of G, the fourth space bass clef: as,

G	A	B-natural	C	D	E
ut	re	mi	fa	sol	la

if, on the contrary, the modulation requires the interval B-flat, then the syllable *fa* should be sung, and the key designated by B-fa: as,

F	G	A	B-flat	C	D
ut	re	mi	fa	sol	la

As the gamut of Aretin was composed only of six notes, namely, ut re mi fa sol la, there was no leading note to the octave, and as they sung by the system of mutation, the name of mi was given to all notes separated only from the one above, by a semi-tone; and the name of fa to every note which was separated from the one below, by a semi-tone; thus the leading note to ut, called mi in solmisation, was designated by the name of B-mi, and the same note descending by one semi-tone, called fa in solmisation, was designated B-fa.

BHADRINATH, VADARINATHA, a town and temple in the province of Serinagur, Northern Hindostan, on the west bank of the Alacananda River, in the centre of a valley. It is built on the sloping bank of the river, and contains only twenty or thirty small houses, for the accommodation of the Brahmins and other attendants on the temple. This is in the form of a cone, with a small cupola, surmounted by a square shelving roof of copper, over which is a golden ball (gilt) and spire. The height of the building is forty or fifty feet, and the era of its foundation is very remote. A warm bath, supplied by a spring of hot water that issues from the mountain, is strongly tainted with a sulphureous smell. and close to it is a cold spring. There are also several other springs in the neighbourhood.

The idol, Bhadrinath (the lord of purity), is a human figure, about three feet high, cut in black stone or marble, dressed in a suit of gold and silver brocade, the head and hands being uncovered. His temple has more beneficed lands attached to it than any sacred Hindoo establishment in this part of India, and is said to possess 700 villages, in different parts of Gurwal or Kemaon, all under the jurisdiction of the high-priest, who holds an authority nominally independent. The number of pilgrims who visit this place annually is estimated at 50,000, who come from the remotest quarters of India. They generally assemble at Hurdwar.

BHATGAN, or BHATGONG, a town in Northern Hindostan, situated in the valley of Nepaul, eight miles east by south of Catmandoo. Its ancient name was Dhurmaputten, and it is called by the Newars Khopodaise. This town is the favorite residence of the Brahmins of Nepaul, containing many more families of that order than

Catmandoo and Patan together, though in size it is the least considerable of the three; yet its palace and the buildings in general are of a more striking appearance, owing to the excellent quality of the bricks. The former sovereigns of this state possessed but a small share of the valley; but their dominions extended eastward to the banks of the Coosey. Bhatgong is the Benares of the Ghoorkhali dominions, and is said to contain many valuable ancient Sanserit manuscripts.

BHATTIA, a town in the western extremity of the Gujrat Peninsula, situated a few miles to the east of Oaka. It contains about 500 houses, chiefly inhabited by Aheers, an industrious class of the peasantry, originally herdsmen, but who of late years have applied themselves to the cultivation of land. The country to the north of Bhattia exhibits an appearance of cultivation and prosperity superior in general to the rest of the peninsula. The grain chiefly raised is bajaree.

BHIURTPORE, a strongly fortified town of Hindostan, in the province of Agra; the capital of the Jauts. It was erected by a Jaut chief, in the reign of Aurungzebe, who gained considerable power during the civil wars between that prince and his brothers. In the year 1768 his successors had extended their territory within a few miles of Delhi, westward, and their alliance was much courted. On the breaking out of the last Mahratta war, the Jaut rajah, Runjeet Sing, promised to assist the British, but afterwards formed an alliance with Scindea and Holkar, in consequence of which this territory was invaded by Lord Lake; the fortress of Deeg, and several places were taken, but Bhiurtpore endured a memorable siege. The British are said to have lost in it more men than by any three pitched battles they ever fought in India. It submitted at last, worn out by our perseverance. At the moment when we write this, despatches from India announce that it has been again besieged by the British, under lord Combermere, and was taken by storm in January, 1826. This tribe is said to be remarkably brave and handsome; and less bigotted to their superstitions than many other of the Hindoos. It stands in long. 77° 28' E., lat. 27° 13' N.

BIA, in commerce, a name given by the Siamese to those small shells which are called cowries throughout almost all the other parts of the East Indies. See COWRIES.

BIABACERKIF, a town of Russia, in the government of Kiow.

BIACULEATUS, in ichthyology, a species of balistes, having two ventral spines. This is the *piscis cornutus* of Willoughby. It is of an elongated form, white, cinereous above, rough to the touch, being covered with very short bristly hairs. It is a native of the East Indies, and is a voracious kind, feeding probably on marine worms and crabs. The Dutch call it *hoornvisch*; and the French, *baliste à deux piquans*.

BIÆUM, βιαιον, in rhetoric, a kind of counter argument, whereby something alleged for the adversary is retorted against him, and made to conclude a different way: for instance, *Occidisti, quia adstitisti interfecto.*—βιαιον, Immo quia adstiti interfecto, non occidi; nam si id esset, in fugam me conjecissem. 'You killed the person,

because you were found standing by his body.' Biæum, 'Rather I did not kill him, because I was found standing by his body; since, if I had, I should have fled away.'

BIÆUM, in medicine, a kind of saline or seawine, used by the ancient Greeks in various disorders. It was made of grapes gathered a little before ripe, and dried in the sun; then pressed, the juice put up in casks, and mixed with a large proportion of sea-water. Dioscorides seems to describe it as made of grapes steeped in seawater, and then pressed.

BIAFARA, or BIAFRA, a district of Lower Africa, south-east of Benin, with a capital of the same name, said to be situated about sixty miles up the river Camarones. This river, though broad, is extremely shallow, and the country has been very partially explored.

BIAFARAS, a people who inhabit part of the archipelago of the Bissagos. See BISSAGOS.

BIAFORA, in the customs of the middle age, a form of alarm to arms; on the hearing whereof, the inhabitants of towns or villages were to issue forth, and attend their prince. The word seems originally from Gascony; and the Italians even now, on a sudden insurrection of the people, commonly cry, *Via-fora*, changing the B into V.

BIALOGOROD, or AKERMAN, a strong town of Bessarabia, in European Turkey, seated on the lake Vidono, near the sea-side.

BIALYSTOCK, or BIALLISTOK, a town of European Russia, in the government of Grodno, and formerly included in the Polish palatinate of Podlachia. It was formerly the capital of this part of the country, and contains a noble castle with extensive gardens. The whole population is about 5000; the greater part of whom are Roman Catholics. Lat. 53° 2' N., long. 22° 30' E.

BIANA, an ancient city of Hindostan, formerly the capital of Agra; but now belonging to the Jauts. The remains of an extensive fort are to be traced here, and the city contains a number of stone houses. The vicinity produces fine indigo; and there were formerly mines of copper worked here. At the close of the fourteenth century it was the residence of an independent Afghan chief, who assumed the title of king. Lord Lake took it the last Mahratta war. Long. 77° 16' E., lat. 26° 56' N.

BIANCHI (Francis), called Il Frari, a painter, born at Modena; master of one of the most esteemed painters that ever appeared, Antonio Corregio. His coloring was delicately fine; his attitudes full of grace; and his invention extremely grand. His works have an astonishing beauty, and are prized almost as highly as those of Corregio. He died in 1520.

BIANCHI (Antonio), a Venetian gondolier and porter of the last century, who raised himself from obscurity by his genius. His most admired work is, *Il Davide Re d' Israele*, published in folio in 1751. He also wrote a poem, entitled *Il Tempio ovvero il Salomone*, 4to, 1753; a Treatise on Italian Comedy; and an Oratorio, called *Elia sur Carmelo*.—*Bug. Univ.*

BIANCHI (John), generally known by the name of James Plancus, was a native of Rimini, and born in 1653. He practised medicine with considerable reputation, and wrote—*Lettere In-*

torno all Cataratta, 4to; *Observazioni intorno una Sezione Anatomica*, 4to; *De Monstris*, 4to; *Storia Medica d'un Apostema nel lobo destro del Cerebello*, 8vo; *Discorso sopra il vitto Pitagorico*, 8vo; a Treatise on the Baths of Pisa; another respecting a giant; a third on scarce shells; an account of a girl named Cattarina Vizani, &c.; *Epistola Anatomica ad Jos. Puteum Bononiensem*, 4to; *Dissertazione de Vesicatori*, 8vo; and *Fabii Columnæ Phytobasanos*. He was considered very skilful in his profession, and died in 1775.

BIANCHINI (Francis), one of the most learned men of his time, was born at Verona in 1662, of an ancient family. His taste for natural philosophy and mathematics induced him to establish the academy of Altofili, at Verona. He went to Rome in 1684; and was made librarian to cardinal Ottobini, afterwards pope Alexander VIII. He also became canon of St. Mary de la Rotonda, and at length of St. Lawrence in Damasco. He was esteemed by the learned; and was a member of many academies. He published, 1. Three Memoirs on the Comet of 1684. 2. Another on the Comet of 1702. 3. *Relazione della linea meridiana orizzontale e della ellissi polare fabricata in Roma*. 4. *Epistola de Eclipsi Solis*, 1724. 5. *Hesperii et Phosphori nova Phenomena, sive Observationes circa Planetam Veneris*, fol. 6. *F. Bianchini Astronomiæ et Geographiæ Observationes*, fol. 7. *De Emblemate, nomine atque instituto Alethophilorum*, 4to. 8. *Istoria Universale Provata con Monumenti e Figurata con Simboli degli antichi*, 4to. 9. *De Calendario et cyclo Cæsaris ac de Paschali canone S. Hippolyti*, fol. 10. *Camera et Inscrizioni Sepolcrali*, fol. 11. *Del palazzo de' Cæsari*. 12. An edition of Anastasius Bibliothecarius' history of the Popes, fol. 13. *Opuscula Variorum*, 2 vols. 4to. He died in 1729, aged sixty-seven.

BIANGULATED, *adj.* From Lat. *binus* *BIANGULOUS*, *s* and *angulus*. Having two corners or angles.

BIANOR, in entomology, a species of papilio, a native of the East Indies. The wings are black, with five rufous lunules on the posterior pair. It is doubtful whether this is a distinct species from *P. Paris*; perhaps only a sexual difference.

BIARCHIUS, an officer in the court of the emperors of Constantinople, who was intrusted with the care and inspection of the provisions of the soldiers.

BIARUM, in botany, a name by which the people of Egypt at this time call the root of nilufar, or saba Ægyptica, growing on the Nile.

BIAS, *v. n. s. adj. & adv.* *?* *Biais*, Fr. said *BIAS DRAWING*, *s* to come from *bi-hay*, an old Gaulish word, signifying cross or thwart. It is used metaphorically for to turn away from a right, fair, impartial judgment; to prejudice; any thing which turns a man to a particular course, or gives the direction to his measures; propension; inclination; any thing which turns, or is turned, aside.

Every action that hath gone before,
Whereof we have record, trial did draw
Bias and thwart, not answering the aim.

Shakspeare. Troilus and Cressida.

Blow till thy *bias* check
Outswell the cholic of puffed Aquilon.

Id.

Madam, we'll play at bowls—

'Twill make me think the world is full of rubs,
And that my fortune runs against the *bias*.

Shakspeare.

You have been mistook :

But nature to her *bias* drew in that.

Id.

As for the religion of our poet, he seems to have
some little *bias* towards the opinions of Wickliff.

Dryden.

Were I in no more danger to be misled by ignorance,
than I am to be *biased* by interest, I might
give a very perfect account.

Locke.

A desire leaning to either side *biasses* the judgment
strangely ; by indifference for every thing but
truth, you will be excited to examine.

Watts.

Thus nature gives us, let it check our pride,

The virtue nearest to our vice allied ;

Reason the *bias* turns to good or ill.

Pope

BIAS, a celebrated philosopher, and one of
the seven sages of Greece, flourished about
A.A.C. 606. He was accustomed to say, 'It
is a sickness of mind to wish for impossible
things.' During the siege of Priene, his native
city, being asked why he was the only one
who returned from the place without carrying
any thing with him, he replied, That he
carried his all with him ; meaning, that his
knowledge and virtue were the only blessings
that were peculiarly his own, since they could
not be taken from him. He expired while
pleading for one of his friends.

BIAS, in entomology, a species of papilio
that inhabits Cayenne. The wings are black,
glossed with blue ; brown beneath, with a white
margin.

BIATHANATI, *βιαθανατοι*, from *βια*, violence,
and *θανατος*, death, the same with suicides.

BIATHANATOS, the title of a work of Dr.
Donne's, published at London in 1664, 4to.
wherein he undertook to prove this paradoxical
position, 'That suicide is not so naturally sin as
that it may never be otherwise.'

BIB, *n. s. & v.* } From the Lat. *bibere*, to drink.
BIB'BER, } 'A *bib*,' according to Skinner,
BIB'ING, } is a cloth stretched over the
BIB'ULOUS. } breast of an infant, that it may
imbibe the overflowing liquid' from its mouth ;
to *bib* is to tipple ; to *sip*, to drink frequently ;
to be a sot ; a wine-bibber is a person given to
wine, who drinks it to excess.

This miller hath so wisely *bibbed* ale,
That as a hors he snorteth in his slepe. *Chaucer*.
We'll have a *bib* for sporting of thy doublet ;
And a fringed mackender hang at thy girdle ;
I'll be thy nurse, and get a coral for thee,
And a fine ring of bells. *Beaumont and Fletcher*.
He playeth with *bibbing* mother Meroë, as though
so named because she would drink mere wine without
water. *Camden*.

To appease a froward child, they gave him drink
as often as he cried ; so that he was constantly *bibbing*,
and drank more in twenty-four hours than I did.

Locke.

I would fain know, why it should not be as nobile
a task to write upon a *bib* and hanging sleeves, as on
the bulla and pretexta.

Addison.

Strowed *bibulous* above, I see the sands,

The pebbly gravel next, the layers then,

Of mingled moulds, of more retentive earths.

Thomson.

BIB'BLE-BAB'BLE. *Babble-babble*, frivolous,
unmeaning talk.

Malvolio, Malvolio, thy wits the heavens restore ;
endeavour thyself to sleep, and leave thy vain *bibble-
babble*. *Shakspeare*.

BIBERACH, a city of Wirtemberg, the head
of an upper bailiwick, in the district of the Danube.
It was formerly free and imperial, subject to its
own magistrates. It is seated in a pleasant fertile
valley on the river Reuss, and has a large manufac-
ture of fustians. Here are also manufactures of
linen, woollen, and cotton goods, and leather ; and
a considerable trade in salt. It has also some hot
baths. In September, 1796, a victory was ob-
tained in its neighbourhood, by the French re-
publican army, over the Austrian general Latour,
and in 1802 this city and territory were ceded
to Baden, who transferred them in 1806 to the
king of Wirtemberg. Population about 4500,
of whom two-thirds are Lutherans, and the rest
Catholics. It lies eighteen miles S. S. E. of Ulm.
Long. 10°. 2' E., lat. 48° 10' N.

BIBERACH, is also the name of a neat market
town, castle, and lordship, of the Bavarian do-
minions, in the circle of the Upper Danube and
district of Wertingen. It is situated on the
river Schmutter, and belonged formerly to the
counts of Fugger. It contains about 1200 in-
habitants, and is much resorted to by Catholics
on account of a miraculous crucifix said to be
found in one of the churches. Nine miles from
Augsburg.

BIBIENA, a territory of Tuscany, situated
around a town of the same name, on the banks
of the Arno.

BIBIENA (Ferdinand Gall), an excellent
painter and architect, born at Bologna in 1657,
and surnamed Bibiena from the territory in which
his father was born. He acquired such reputa-
tion by his skill in architecture, the decorations
of the theatre, and perspective, that the duke of
Parma invited him to his court, and made him
his first painter and architect. Bibiena at length
went to Vienna, where he had the same honors
and advantages. He wrote two books of archi-
tecture ; and died at Bologna, at above eighty
years of age. His sons followed with success
the same professions.

BIBIENA (Bernardo da), a Roman cardinal,
born of obscure parentage, in 1470. Having
entered into the service of the family of Medici,
and being a man of considerable address, he
was very instrumental in securing the election of
Leo X. by whom he was made a cardinal, and
employed on several missions of importance.
His ambition, however, having excited the jeal-
ousy of Leo, it was suspected he was poisoned
in 1520 ; but there seems to be no good grounds
for this suspicion. Bibiena's comedy, entitled
Calandra, is still in esteem among the Italians.

BIBIO, the wine-fly, in entomology, a species
of the musca genus, a very small fly, found fre-
quently among empty wine-casks. It is pro-
duced from a small, oblong, red worm, very
common in the sediments of wine. Fabricius
defines the generical character of bibio from the
sucker, feelers, and antennæ. The sucker con-
sists of three bristles and a sheath of a single
valve ; feelers very short ; antennæ connected at
the base, and pointed at the tip.

B I B L E.

BIBLE, Literally, a book, probably from *βιβλος*, or *βιβλική*, an Egyptian plant, of which the ancient papyrus, or material for writing upon, was made. Rolls of these, written upon, were called books, *Bibles*. It is now pre-eminently, if not exclusively, applied to the Jewish and Christian Scriptures—the volume of Divine Revelation. *Biblical* is applied to any thing that relates to the Bible: thus a critic, who employs his studies in elucidating or explaining the Scriptures, is called a *biblical critic*. *Bible-bearing* is a very significant word to denote a hypocrite thus employing himself—to be seen of men.

A saint-seeming and bible-bearing hypocritical puritan. *Montagu's Appeal.*

Her studie was but litle on the Bible. *Chaucer. Cant. Tales.*

To tellen all would possen any Bible. *Id.*
That o wher is.

If we pass from the apostolick to the next ages of the church, the primitive Christians looked on their bibles as their most important treasure.

Government of the Tongue.

We must take heed how we accustom ourselves to a slight and irrelevant use of the name of God, and of the phrases and expressions of the holy bible, which ought not to be applied upon every slight occasion.

Tillotson.

In questions of natural religion we should confirm and improve, or connect our reasonings by the divine assistance of the bible. *Watts.*

To make a *biblical* version faithful and exact, so that it may represent the true text of the original in the best manner, is very different from giving it a shewy and modernised appearance. *Archbishop Newcome.*

Augustine and Jerome corresponded upon *biblical* subjects infinitely less important. *Porson to Travis.*

Biblicist was an 'appellation given to the schoolmen of the twelfth and thirteenth centuries, who made the Scriptures the chief subject of their studies, and the text of their lectures, without deriving any succours from reason or philosophy.'

BIBLE, Greek *βιβλος*, the book; a name applied by way of eminence to the collection of sacred writings, or the Holy Scriptures of the Old and New Testaments; known also by various other appellations, as, the Sacred Books, Holy Writ, Inspired Writings, &c. The Jews styled the Old Testament *מִקְרָה* (*Mikrah*), which signifies the lesson or lecture. Christians must of course regard the entire collection of canonical books, belonging to both of the Divine Covenants, as furnishing the basis of all true religion; 'so that,' as the church of England well expresses it, 'whatsoever is not read therein, nor may be proved thereby, is not to be required of any man, that it should be believed as an article of faith, or be thought requisite or necessary to salvation.' It is therefore a vulgar, though very common, error to apply the term Bible to the Old Testament exclusively. A writer of the New Testament (St. Peter) leads the way (2 Epist. iii. 16) in ranking its books with *τας λοιπας γραφας*, 'the other Scriptures'; and

as early as St Chrysostom's days it seems to have been used thus to designate the whole Inspired Volume. 'I therefore exhort all of you,' says that eminent father (Col. ii. 9, tom. xi. p. 391,) 'to procure to yourselves Bibles (*βιβλια*). If you have nothing else, take care to have the New Testament, particularly the Acts of the Apostles and the Gospels, for your constant instructors.' And Jerome says (In Is. c. 29, tom. ii. p. 246,) 'that the Scriptures, being all written by one Spirit, are one book.'

The Canon of Scripture, or Biblical Canon, is the accredited list of those books which Jews and Christians with regard to the Old Testament, and Christians almost unanimously with regard to the New, agree to hold as authentic and inspired: they are also called canonical in contradistinction from others called deuterocanonical, apocryphal, pseudo-apocryphal, &c. which either are not acknowledged as divine books, or rejected as heretical or spurious. See **APOCRYPHAL**.

The critical history of the Bible divides itself into 1. The history of the formation and arrangement of the Jewish canon; 2. The formation of the Christian canon. 3. The history of ancient and modern versions of the Scriptures as a whole, or in part, in various languages.

SECT. I. OF THE CANON OF THE HEBREW SCRIPTURES.

In endeavouring to arrive at a settled canon of the ancient or Hebrew Scriptures, we have the great advantage of corroborating our researches as Christians by the labors and decisions of eminent Jewish critics; so that whatever may be objected against the authority of the present canon of the Old Testament, either in behalf of any books which are not in it or against any that are, may be sufficiently answered, in most cases, by this single consideration, viz. that we receive the same and no other books than such as were received by the Jewish church in the time of our Saviour; for we can quote lists of them procured by the first Christians, and catalogues which they made of them soon after the destruction of Jerusalem.

It is clear that the Pentateuch, or five books of Moses, were collected shortly after the death of that legislator, for they were deposited together (Deut. xxxi. 24. 26) in the tabernacle, 'in the side of,' or near the ark. Here also were accumulated, according to the invariable tradition of the Jews, the other sacred books as they were produced; and Solomon transferred the whole extant in his time, from the tabernacle to the temple. To Ezra is assigned the honor of having collected together, and perfected, a complete copy of the ancient Scriptures. After having been concealed in the dangerous days of the idolatrous kings of Judah, and particularly in the reigns of Manasseh and Amon, it was found in the days of Josiah, the succeeding prince, by Hilkiah the priest, in the temple. Prideaux supposes, that during the preceding reigns, the book of the Law was so de-

stroyed and lost, that, besides this copy of it, there was then no other to be obtained, and refers to the surprise manifested by Hilkiah, on the discovery of it, and the grief expressed by Josiah when he heard it read, as plainly showing that neither of them had seen it before, 2 Kings, xxii. 8—13. 2 Chron. xxxiv. On the other hand, Dr. Kennicott contends, that long before this time there were several copies of the Law in Israel, during the separation of the ten tribes, and that there were some copies of it also in the possession, at least of the prophets and priests belonging to the two more faithful tribes of Judah and Benjamin. He thinks that the surprise expressed by Josiah and the people, at his reading the copy found by Hilkiah, may be accounted for by adverting to the history of the preceding reigns, and particularly recollecting what a very idolatrous king his grandfather Manasseh had been; wanting neither the will nor the power to destroy the copies of the Law, if they had not been carefully secreted. This solemn reading of it by Josiah would doubtless awaken his own and the peoples' earnest attention; more especially as the copy produced was possibly the autograph of Moses. From this time copies of the Law were extensively multiplied among the people; and though, within a few years, the original copy might be burnt with the city and temple, it is certain that Daniel had a copy of the Scriptures with him at Babylon; for he quotes the Law, and mentions the prophecies of Jeremiah. Dan. ix. 11. 13, ix. 2. It appears also, from the sixth chapter of Ezra, and from the ninth chapter of Nehemiah, that copies of the Law were dispersed among the people. It is unnecessary, therefore, to suppose, with some of the fathers, that Ezra restored the Scriptures by a divine revelation, after they had been lost and destroyed in the captivity; an opinion resting only on the authority of a fabulous relation, which occurs in the fourteenth chapter of the second apocryphal book of Esdras. What Ezra did may be comprised in the following particulars. He collected and collated as many copies of the sacred writings as he could find, and out of them all formed one complete copy, adjusted the various readings, corrected the errors of transcribers, and, as some say, annexed the 'Kerichetib,' which are found in the margins of the ancient MSS. He likewise made additions in several parts of the different books which appeared to be necessary for their illustration, correction, and completion. To this class of additions, we may refer the last chapter of Deuteronomy, which, as it gives an account of the death and burial of Moses, and of the succession of Joshua after him, could not have been written by Moses himself. Under the same head have also been included many other interpolations in the Bible, which create difficulties that cannot be solved without allowing them; as in Gen. xii. 6, xxii. 14, xxxvi. 3. Exod. xvi. 35. Deut. ii. 12, iii. 11. 14. Prov. xxv. 1. The interpolations in these passages are ascribed by Prideaux to Ezra; and others which were afterwards added, he attributes to Simon the Just. Ezra also changed the old names of several places that were become obsolete, putting instead of them the

new names by which they were at that time called; instances of which occur in Genesis xiv. 4, where Dan is substituted for Laish, and in several places in Genesis, and also in Numbers, where Hebron is put for Kirjath Arba, &c. He likewise wrote out the whole in the Chaldee character, changing for it the old Hebrew character, which has since that time been retained only by the Samaritans, and among whom it is preserved to this day.

Dupin contends that Nehemiah was principally concerned in compiling and collecting this canon; for proof of which he refers to the letter of the Jews of Jerusalem, written to the Jews of Egypt, mentioned in the beginning of the second book of Maccabees, in which it is said, that Nehemiah had collected the books of the Kings, of the Prophets, and of David. It is said that this canon was then approved by the grand Sanhedrim, the great synagogue or council of seventy, and published by its authority. It is, however, says Dupin, more apparent that about that time the number of the sacred books was fixed among the Jews by a canon, which the whole Jewish nation received and followed; so that they looked no longer upon such books as sacred and divinely inspired, which were not contained in it.

The canon of the whole Hebrew Bible seems, says Kennicott, to have been closed by Malachi, the latest of the Jewish prophets, about fifty years after Ezra had collected together all the sacred books which had been composed before and during his time. Prideaux supposes the canon was closed by Simon the Just, about 150 years after Malachi. Be this as it may, it seems well established, that Judas Maccabæus repaired the temple, and replaced in it every thing necessary for the performance of divine worship (1 Macc. iv. 36—59), which included a correct copy of the Hebrew Scriptures, if not that of Ezra himself. And that this copy remained in the temple until the destruction of Jerusalem and the subversion of the Jewish polity under Titus, when it was carried in triumph to Rome, among the other spoils which he had taken.

From the New Testament, as well as from the testimony of Josephus, it appears that this standard canon of Old Testament Scripture was divided into the three parts, of the Law, the Prophets, and the Hagiographa, or Psalms (Luke xxiv. 44). Josephus, *Contra Apion.* i. 8. tom. ii. p. 441., says the canonical books were distributed into three classes; the first containing the five books of Moses; the second, thirteen historical and prophetic books, written from the time of the death of Moses to Artaxerxes; and the third, four books of hymns and of morality; the whole number amounting to twenty-two. The first class therefore comprehended Genesis, Exodus, Leviticus, Numbers, and Deuteronomy; the second Joshua, Judges, with Ruth, Samuel, Kings, Chronicles, Ezra with Nehemiah, Esther, Isaiah, Jeremiah with Lamentations, Ezekiel, Daniel, and the twelve minor prophets; and the third Job, the Psalms, Proverbs, and Ecclesiastes, and the Song of Solomon. The whole passage is as follows:

'We have not an innumerable multitude of

books among us, disagreeing from and contradicting one another, but only twenty-two books, containing the records of all past times, which are justly believed to be divine. Five of them belong to Moses, which contain his laws, and the traditions concerning the origin of mankind, till his death. But as to the time from the death of Moses, till the reign of Artaxerxes king of Persia, who reigned after Xerxes, the prophets who were after Moses wrote down what was done in their times in thirteen books. The remaining four books contain hymns to God, and precepts for the conduct of human life. Our history, indeed, has been written, since Artaxerxes, very particularly; *but it has not been esteemed of equal authority with the former by our forefathers, because there had not been an exact succession of prophets since that time.* And how firmly we have given credit to these books of our own nation, is evident by what we do: for, during so many ages as have already passed, *no one has been so bold as either to add any thing to them, to take any thing from them, or to make any change in them;* but it is become natural to all Jews, immediately, and from their very birth, to esteem these books to contain divine doctrines, and to persist in them; and, if it be necessary, willingly to die for them.' *Josephus contra Apion*, lib. 1. sect. 8.

There is some variety of opinion, among the fathers, as to the classification of the books of Ruth, Job, the Song of Solomon, &c. at this time: but that all our present canon was contained in this ancient one is confirmed by the modern division of the sacred books among the Jews, who now enumerate twenty-four. The Law is still the first division, containing the five books of Moses: the Prophets are divided into the former and latter, with regard to the time when they flourished respectively. The former prophets containing the Books of Joshua, Judges, and 1 and 2 Samuel, and 1 and 2 Kings; and the two last being each considered as one book. The latter prophets comprise the writings of Isaiah, Jeremiah, Ezekiel, and the twelve minor prophets, whose books are reckoned as one. The *Cetulin*, or *Hagiographa*, consist of the Psalms, Proverbs, Job, Song of Solomon, Ruth, Lamentations of Jeremiah, Ecclesiastes, Esther, Daniel, Ezra and Nehemiah (reckoned as one), and 1 and 2 Chronicles, which also are reckoned as one. In the modern copies of the Hebrew Scriptures, the Song of Solomon, Ruth, Lamentations, Ecclesiastes, and Esther, are placed immediately after the Pentateuch, under the name of the five *Megilloth*, or volumes. This order, however, is not always observed.

We pass over minor divisions in this place, as well as the modern one, into chapters and verses, referring the reader for the latter to the word *CHAPTER*. The council of Trent having extracted from Luther's writings the position 'that no books should be reckoned a part of the Old Testament beside those received by the Jews,' (see Sarpi's History), have included, for no other reason that we can find, the Apocryphal books of Tobit, Judith, The Book of Wisdom, Ecclesiasticus, Baruch, 1 Maccabees, and 2 Maccabees, in the sacred canon. See our article *ΑΠΟΚΡΥΦΑ*.

A canon of the ancient Scriptures thus delivered

to us by those to whom were 'committed the oracles of God,' has been perpetuated by numerous MSS. preserved both by Jews and Christians with scrupulous care, and is happily distributed, in modern times, by the invention of printing, into every region of the globe. Hebrew MSS. of the Old Testament are extant in the form of rolls and square: the former being generally the shape of those found in the Jewish synagogues. To ensure their correctness, approved scribes have been from before our Saviour's time employed upon the task of transcribing them; and although superstition may have dictated a great portion of such rules as the following, the observance of them it is clear must have had an unquestionable tendency to preserve pure the sacred text. Carpzov and other critics tell us that the copies of the law must be transcribed according to the Jews (and these rules are said to be observed to the present day), from ancient MSS. of approved character only, with pure ink, on parchment prepared from the hide of a clean animal, for this express purpose, by a Jew, and fastened together by the strings of clean animals. Every skin must contain a certain number of columns of prescribed length and breadth, each column comprising a given number of lines and words. No word must be written by heart or with points, or without being first orally pronounced by the copyist: the name of God is not to be written but with the utmost devotion and attention; and previously to writing it, the pen must be washed. The want, or the redundancy of a single letter, the writing of prose as verse, or verse as prose, respectively, vitiates a MS. and when a copy has been completed, it must be examined and corrected within thirty days after the writing has been finished, in order to determine whether it is to be approved or rejected. The Hebrew text of these MSS., it should here be remarked, was originally transcribed without any breaks or divisions into chapters and verses, or even into words; so that a whole book, as anciently written, was in fact but one continued sentence, or rather word. When various readings therefore had arisen in the lapse of ages, the Jews had recourse to a canon or rule which they called *masora* or tradition, consisting of the most minute critical notices, which they placed in the margin of their copies of the text, and which tells us the different reading of the words which are redundant or defective; how often the same word is found at the beginning, middle, or end of a verse, the different significations of the same word; the agreement or conjunction of one word with another; what letters are pronounced, and what are inverted, together with such as hang perpendicular: they even took the number of each letter, for the Jews cherish their sacred books with such reverence, that they make scruple of changing the situation of a letter, which is evidently misplaced: supposing that some mystery has occasioned the alteration. They have likewise reckoned which is the middle letter of the Pentateuch, which is the middle clause of each book; and how many times each letter of the alphabet occurs in all the Hebrew Scriptures. See Walton's *Prolegomena*, c. viii.

Five exemplars have been more particularly celebrated among the Jews for their correctness, the Codex of Hillel, of Ben Asher, also called the Jerusalem, or Palestine Codex; of Ben Naphthali, or the Babylonian Codex; the Pentateuch of Jericho, and the Codex Sinai. But, in the seventeenth and eighteenth centuries, collections of Hebrew MSS. were made by Christian critics, which have placed a most minute acquaintance with every part of the sacred text within the power of almost every modern student. Rabbi Joseph Athias, in his celebrated edition of the Hebrew Bible, printed at Amsterdam 1661 and 1667, may be said indeed to have led the way to this good work. He was succeeded by Jablonski, in his Bible printed at Berlin 1699, by Vander Hooft in 1705, Opitz in 1709, J. H. Michaelis in 1720, and Houbigant in 1733.

In this last year Dr. Kennicott first announced to the public his important and extensive plan, for collating Hebrew MSS., in his First Dissertation on the state of the printed Hebrew text. Of his progress, and the circumstances that attended it, we have a detailed account in the *Dissertatio Generalis*, published with the second volume of his Bible. Having proposed ten years as the time which, he thought, would be necessary for collating the Hebrew and Samaritan MSS., he was enabled by his singular assiduity to fulfil his own expectations and those of the public. Patronised by his Majesty and a great number of liberal friends to the undertaking, both at home and in foreign countries, in the list of whom are no fewer than seven crowned heads, several princes, cardinals, archbishops and bishops, besides universities, public libraries, and many of the most eminent literati in various parts of Europe; and amongst whom a subscription of £10,000 was raised; Dr. Kennicott instituted various and extensive enquiries after MSS. at Constantinople, Warsaw, Venice, Bologna, Mantua, Pavia, Genoa, Lisbon, Geneva, Utrecht, Erfurt, Berlin, Stockholm, and Hamburgh. The numerous Hebrew MSS. of the latter place were collated by the celebrated Reimarus, who not only concurred in but applauded the undertaking. In the prosecution of this work, it was discovered, that the printed editions of the Hebrew Bible, which had been supposed to agree, and on the agreement of which the notion of the integrity of that text had been founded, very much differed from one another; and particularly, that the oldest editions agreed most with the oldest and best MSS., and the modern editions, with the latest and worst. As one proof of this, it is alleged, that the variations in the first edition (in 1488) from Van der Hooft (in 1705) amount to 12,000. In the year 1767 Dr. Kennicott derived great advantage from his own examination of the Paris MSS., both Hebrew and Samaritan, and from the labors of Dr. Gill, a celebrated Baptist minister, who collated for him all the passages quoted in the Talmud. An Hebrew MS., which once belonged to a synagogue at Jerusalem, was at this time purchased by his Britannic Majesty; and our author himself, hoping to obtain other treasures from the East, sent to Canton, and had nearly succeeded in procuring a MS. from the Jews at Cai-fong-fu, in the province of

Vol. IV.

Honan. But though he failed in China, he succeeded in America, and procured a complete Hebrew MS. from a Jew at New York. During the tenth and last year of this collation, eight Danish MSS. were sent to Oxford for the author's own examination, as were also six others from Toledo, by Dr. Bayer. Collations of other MSS. were furnished, at the same time, from Silesia, Cologne, Strasburg, Konigsburg, Upsal, Leyden, and Ireland. The indefatigable author, having thus collected materials for his noble undertaking, no less honorable to his country than to himself, proceeded to digest the variations, with which he was furnished, under their several books, chapters, and verses. During this operation, he formed a plan for a more complete scrutiny of the best MSS. through Europe, by sending some well qualified person to re-examine the MSS. already collated, and to examine the rest in passages of greater moment, and where success seemed at all probable. Mr. (afterwards Dr.) Bruns, a learned German, was selected for this embassy: and he was honored with letters from the secretaries of state here, to all our foreign ambassadors, as well as from the rulers of the two synagogues in London. The places in which he thus examined MSS. during a tour of three years, were Paris, Louvain, Cologne, Mentz, Worms, Mannheim, Nuremberg, Augsbourg, Stuttgart, Carlsruhe, Strasburgh, Basle, Zurich, Berne, Geneva, Turin, Casale, Veruli, Milan, Genoa, Leghorn, Sienna, Rome, Florence, Bologna, Cesena, Modena, Reggio, Parma, Mantua, Padua, Venice, Udina, Goritia, Gradisca, Trieste, Vienna, Dresden, Leipsic, Erfurt, Jena, Dessau, Berlin, Hamburgh, Helmstadt, Cassel, Amsterdam, Utrecht, Leyden, and the Hague. The variations contained in nearly 700 bundles of papers, being at last digested, including the collections made by Dr. Bruns; and the whole, when put together, being corrected by the original collations, and then fairly transcribed into thirty folio volumes, the work was put to press in 1773; and both volumes, with the general dissertation, were finished in July 1780.

The writer of this paper cannot here forget the admirable peroration of one of Bishop Marsli's lectures at Cambridge, on the subject of the immense mass of readings, many of them very insignificant, thus obtained. 'You will be ready,' he observed, 'perhaps, with me to say, How many learned lives and what a vast sum of money has thus been expended in comparatively fruitless labor; for no controversy of importance either between Jews and Christians, or any of the sects into which they are respectively divided, has been affected by them. No: *it was worth all their lives and labors to know there was nothing to do!*'

Of the different printed editions of the Hebrew Bible it is not necessary for us here to speak particularly. Best amongst the best, of course where it can be obtained and duly appreciated, is Dr. Kennicott's work; to which may be added De Rossi's important supplement, published at Parma between the years 1784 and 1799, in five 18mo. volumes. The Psalter, issued about the year 1477, was the first book printed in Hebrew. It had the complete commentary of Rabbi Kimchi annexed. The Pentateuch was printed at

II

Bologna in 1482; and the Greater and Lesser Prophets followed in 1484 and 1486: the Hagio-grapha was first printed at Naples in 1487, and a copy of this edition is in the library of Eton College. At length the whole Hebrew Bible appeared complete from the Socini press in 1488. In 1494 was published that edition of the Hebrew Scriptures, at Brescia, from which Luther made his German translation: thus early uniting the invention of printing with the reformation of religion. This was also the basis of Bomberg's celebrated edition of the Hebrew Bible, and of the Complutensian, Antwerp, and Paris Polyglott versions. Bomberg's second edition, printed at Venice in 1525-6, is the basis of all our modern Hebrew Bibles. For BIBLES, POLYGLOTT, see the close of this article.

SECT. II.—OF THE FORMATION OF THE CHRISTIAN OR NEW TESTAMENT CANON.

Jesus Christ and his apostles adverted constantly to the Scriptures of the Old Testament as testifying of him; it is also remarkable that they quote sometimes the Septuagint, if not other versions of the ancient Scriptures. Thus they, in fact, adopt the Jewish canon, and set the seal of a direct divine approval upon it at the close of a far greater period of time from its commencement than has elapsed since that important and unequivocal sanction was given. But Christianity in primitive times was not a national religion, and was long before it even received public toleration; this will, in part, perhaps, account for the comparatively late date at which we find any public body or council who furnish us with the accredited canon of early Christians. Le Clerc observes upon this (H. E. ann. 100. num. iii. iv. et ann. 29. num. xcii.), 'We nowhere read of a council of the apostles, or of any assembly of the governors of Christian churches, convened to determine by their authority, that such a number of gospels, neither more nor fewer, should be received. Nor was there any need of it, since it is well known to all, from the concurring testimony of contemporaries, that these four gospels are the genuine writings of those whose names they bear, and since it is also manifest that there is in them nothing unworthy of those to whom they are ascribed, nor any thing at all contrary to the revelation of the Old Testament, nor to right reason. There was no need of a synod of grammarians to declare magisterially what are the works of Cicero or Virgil. In like manner, the authority of the gospels has been established by general and perpetual consent, without any decree of the governors of the church. We may say the same of the apostolical epistles, which owe all their authority, not to the decisions of any ecclesiastical assembly, but to the concurring testimony of all Christians, and the things themselves which are contained therein.' From the decree of the council of Laodicea, held A. D. 363, it appears that there were writings at that time already known by the title of canonical. In its last canon that council declares 'that private psalms ought not to be read in the church, nor any books not canonical, but only the canonical books of the Old and New Testament;' after which follows a catalogue or

enumeration of such books, in which are omitted all the apocryphal books of the Old Testament, and the Revelation in the New. The forty-seventh canon of the council of Carthage, assembled A. D. 397, ordains, 'that nothing besides the canonical Scriptures be read in the church.' The council's canon of the New Testament is the same as that now received. From the manner in which the epistle to the Hebrews is mentioned, there is reason to suspect, that it was not so generally received as the other thirteen epistles of St. Paul was. The 'Revolution' seems rather omitted from the Laodicean, than as an inspired book.

If we now advert, therefore, to the authentic writings of ancient authors, we shall find, that they had the same canon of the New Testament with that which is generally received to this day. Accordingly, the catalogue of canonical books furnished by Origen about A. D. 230; Eusebius, A. D. 315; Athanasius, A. D. 326; Cyril, A. D. 348 (the book of Revelation excepted); Epiphanius, A. D. 368; Basil and Gregory Nazianzen, and Amphilochius, A. D. 370; Gregory Nyssen, A. D. 371; Jerome, A. D. 392; Augustine, A. D. 395; Rufinus, A. D. 397; Innocent I. bishop of Rome, A. D. 402; Isidore of Pelusium, and Cyril of Alexandria, A. D. 412; Cassian, A. D. 424; Prosper of Aquitaine, and Eusebius bishop of Lyons, and Sedulius, A. D. 434; Leo, bishop of Rome, and Salvan presbyter of Marseilles, A. D. 440; Dionysius, falsely called the Areopagite, A. D. 490; Gelasius, bishop of Rome A. D. 494; Andrew, bishop of Caesarea, A. D. 500; Facundus, an African bishop, and Arethas, A. D. 540; Cassiodorus, A. D. 556; Photius, patriarch of Constantinople, A. D. 858; Oecumenius, A. D. 950; Theophylact, A. D. 1070 (the Revelation excepted); and Nicephorus Callisti, A. D. 1325; agrees with that which is now received among both Catholics and Protestants, as well as in the Greek church.

It is worthy of notice here, that as Protestants we have thus the sanction of the entire Jewish church for our received canon of the Old Testament, and the rejection of the Apocrypha—and that of the Catholic as well as Greek church for all we hold to be the Christian Scriptures. A late futile attempt to bring forward an Apocryphal New Testament, is no further worth notice here than as giving us an occasion to refer to Mr. Horne's excellent examination of that performance, in his Introduction to the Critical Study of the Holy Scriptures, vol. ii. p. 687.

Very anciently, the New Testament consisted of two codes or collections, called gospels and epistles, or Evangelion and Apostolon. Tertullian distinguishes the gospels by the names of the writers, and calls them, our Digesta or digests, in allusion, as it seems, to some collection of the Roman laws digested into order. As to the order of the several gospels, it appears that, in Tertullian's time, they were disposed in the African churches according to the quality of the writers; those two occurring first which were written by apostles, and then the other two written by apostolical men. In some of the most ancient MSS. now extant, the order of the several evangelists is Matthew, John, Luke,

Mark. The order of the four gospels has been generally Matthew, Mark, Luke, John; then follow the Acts, St. Paul's Epistles, the Catholic epistles, and the Revelation. All the books of the New Testament were written in Greek, except the gospel of St. Matthew, who, according to St. Jerome, first wrote in Judea in the Hebrew language.

The MSS. of the New Testament still extant exceed in number those of any single classic whatever: more than 380 were collected by Griesbach alone. They have been dispersed over all parts of the globe; and several of them are upwards of 1200 years old. It is true that many of them are not entire; the most, in number, containing the Gospels; some the Gospel and Acts of the Apostles only; others the Gospel, Acts, and Epistles; and but a few the Revelation of St. John. Thirty thousand various readings were found in those collected by Dr. Mill, and 150,000 are said to be contained in the researches of Griesbach. Yet the most correct and accurate of the ancient classics are more depraved, mutilated and inaccurate. Not a hundredth part of these various readings makes any perceptible variation in the meaning of the sacred writers; evident verbal errors constitute by far the major part of them; substitutions of one word for another; or an immaterial transposition of words in a sentence. The most inferior of these manuscripts in the judgment of critics, does not pervert or resign a single article of the faith of Christians, or omit or alter one moral precept. The variations may indeed prove that God has not been pleased, by a standing miracle, to prevent those accidents affecting the sacred books which are never supposed to affect the credit or utility of other writings; but the general sense of the inspired penmen has been made more evident and unequivocal by these researches, and the flaws and imperfections thus discovered on the surface of the foundation stones, serve only to demonstrate the antiquity of our faith. The most important single MS. copies of the New Testament are, 1. The Codex Alexandrinus, see ALEXANDRINUS, where a specimen is furnished. 2. The Codex Vaticanus (these two contain also the Septuagint version of the Old Testament). 3. The Codex Cottonianus. 4. The Codex Bezae. 5. The Codex Ephreimi. 6. The Codex Claramontanus. 7. The Codex Argenteus. 8. The Codex Rescriptus of St. Matthew's Gospel, in Trinity College, Dublin. 9. The Codex Laudianus. 10. The Codex Boerneianus, &c. Michaelis has given a catalogue of 292, and bishop Marsh, his annotator, has added 197, to which they respectively refer; and to these celebrated works,—Wetstein's Proleg. N. T., bishop Marsh's Michaelis, and Mr. Horne's Introduction, already adverted to, we must refer the reader for further information on this topic.

The principal standard-text editions of the Greek New Testament are those of Erasmus, who gave the world the first printed edition of the entire New Testament in 1516; the Complutensian, forming the fifth volume of the Complutensian Polyglott, published in 1522; that of Robert Stephens, first published in 1546; and the Elzevir Greek Testament, published in 1624. The text in common use has been copied, with a

few exceptions, from that of Beza, who closely followed R. Stephens. Griesbach is the Kenicott of New Testament criticism; and the student who can possess himself of his and Wetstein's labors, is well furnished in this department of sacred literature; the best editions are Wetstein, 2 vols. folio, 1751; Griesbach, 2 vols. 8vo., 1796. Bishop Marsh says of the former 'He alone contributed more to advance the criticism of the Greek Testament than all who had gone before him: and this task he performed not only without support, either public or private, but during a series of severe trials, under which a mind of less energy would infallibly have sunk. In short, he gave a new turn to the criticism of the Greek Testament, and laid the foundation on which later editions have built.'

SECT. III.—OF THE PRINCIPAL VERSIONS OF THE BIBLE, ANCIENT AND MODERN.

Our observations, and the facts we have recorded thus far, principally relate to the original languages of the Bible. Long prior to the destruction of the Jewish polity, a most important version of the Old Testament in Greek, was executed among that ancient people of God. This is called the Septuagint, either because it was executed, as has been stated, by six approved scribes from each of the twelve tribes, at the request, as we are told, of Ptolemy Philadelphus; or because it was sanctioned by the Sanhedrim or Great Council of the Jews, who were seventy in number. Dr. Hody, 'De Bibliorum Textibus Originalibus,' &c., who seems accurately to have studied its origin, states that this version was made by the Jews living at Alexandria, for the use of themselves and many thousands of their brethren, who were then settled in Egypt, and who, living among the Greeks, generally used the Greek language: that the whole was not translated at once; but the Pentateuch, about 285 years before Christ; and that when Antiochus Epiphanes forbade them to recite any part of the law, the Jews translated into Greek Isaiah, the following prophets, &c., for the use of the temple at Heliopolis and the Alexandrian synagogues. It is clear, from the number of Coptic words in this version, and several peculiar modes of expression, that this was a work undertaken either in Egypt, or by Jews much connected with that country; and the most probable opinion is, that the Pentateuch was executed in the joint reigns of Ptolemy Lagus, and his son Philadelphus; Joshua, not less than twenty years after the death of the latter; and the other books at subsequent unknown periods. We have alluded to those quotations of this version in the New Testament which fully prove it to have been well accredited among the Jews in our Saviour's time. Of the Septuagint version, the Alexandrian and Vatican codices are the most ancient transcripts; and there are four principal printed editions, from one or more of which all subsequent editions have been copied, viz. the Complutensian, the Aldine, the Vatican, and the Oxford, or Dr. Grabe's edition. Various other ancient versions are of considerable importance to the criticism and interpretation of Scripture. The Greek version of the Old Testament by Aquila, a Jew of the second century; another by

Theodotion, contemporary with Aquila; and a third by Symmachus, in the early part of the third century of the Christian era, may here be noticed. Origen mentions three others, whose ages and authors are unknown.

A *Syriac* version of the Hebrew Bible was made as early as the close of the first century, and is called the *Peschito*, or *Literal* version, from its close adherence to the original. It is of great value to the biblical critic; and was printed both in the Paris and London polyglots.

A *Coptic* version was made from the Septuagint, probably in the second or third, and certainly before the seventh century. Of this version only the Pentateuch and book of Psalms are printed. A *Sahidic* version of the Old Testament, i. e. into the language of Upper Egypt, made at this time, does not appear to have been published.

An *Ethiopic* or *Abyssinian* version was made from the Septuagint, it is supposed, about the second or third century. Only a few books and fragments of which remain.

The *Armenian* version was executed towards the close of the fourth, or early in the fifth century: the Slavonic, or old Russian, in the ninth century. The former was first printed in 1666, and the latter in 1519 and 1570.

A *Gothic* version was executed about the middle of the fourth century by Ulphilas, a bishop of the Mæso-Goths. Signor Mai has recently discovered in the Ambrosian library at Milan, some fragments of the books of Kings in this version, which had been lost.

An *Arabic* version of the Old Testament appeared about the tenth century; having for its translator R. Fuadîa Gaon; but the Pentateuch and Isaiah are all that remain of it. Other Arabic translations are extant, but of little antiquity or authority.

Several early *Persian* versions of the Septuagint seem to have been made, but most of them remain in MS. The translation of the Pentateuch, printed in the London Polyglott, was executed by a Jew in the eleventh or twelfth century.

The *Italic* was an ancient Latin version of the Septuagint, in common use in St. Jerome's time; a revision of it was undertaken by him, and gradually introduced throughout the Western church, until at length Pope Gregory the Great gave it the sanction of the popedom. It is this revision of the *Italic* version that now forms the well-known *Vulgate*, and which the council of Trent has declared to be authentic, and commanded to be used in all sermons, expositions, &c. It alone, therefore, is used in the Romish church; but some passages of the ancient *Vulgate* are left in the *Missal*, and the *Psalms*. The two principal editions of the *Vulgate* are those of popes Sixtus V. and Clement VIII. The former was printed in 1590, after the most ancient MSS. and best printed copies had been collated, as it was said, and the most learned men assembled out of all the nations of the Christian world; the pope himself presiding over the whole, and correcting the proof sheets. This edition was then published with a tremendous excommunication of every person, who should presume ever afterwards to alter the least particle of it.

The other edition was published in 1592, by Clement VIII; but so different from that of Sixtus, as to contain two thousand variations, some of whole verses, and many others clearly contradictory in the sense; yet this edition is also pronounced authentic, and enforced by the same sentence of excommunication with the former.

Modern versions are so multiplied, and are increasing so rapidly in various quarters, that we can only attempt to present the reader with a list of the principal ones:—

I.—IN THE LANGUAGES OF MODERN EUROPE.

The New Testament was first printed in	The Old Testament in	In the Language or Dialect.
1522	1478	Spanish (Valencian.)
1526	1536	German (Luther's.)
1534	1534	English (Tindal's)
1534	1535	French.
1524	1541	Swedish.
1556	1550	Danish.
1519	1560	Dutch.
1525	1562	Italian.

1812 }		

The above have, of course, been in many instances made by missionaries, and, of the Asiatic Translations, the major part by the Baptist missionaries at Serampore. See BAPTIST MISSION.

BIBLES, POLYGLOTT.—Polyglott Bibles contain the sacred text and versions of the Scriptures in various languages. In 1501 Aldus Manutius the elder, a celebrated printer, first projected an undertaking of this kind, in collateral columns of Hebrew, Greek, and Latin; only one sheet however was printed. In 1516 appeared at Genoa the Pentaglott Psalter of Agostino Justiniani, bishop of Nebo: it was in Hebrew, Arabic, Chaldee, Greek, and Latin, accompanied with glosses and scholia. In 1518 John Potken published at Cologne the Psalter in Hebrew, Greek, Latin, and Ethiopic.

The *Complutensian Polyglott*, so called from the Latin name of Alcalá in Spain, where it was printed, was the first polyglott edition of the whole Bible. This celebrated work was begun in 1502, and though completed in fifteen years, costing cardinal Ximenes (see *ALCALÁ*) the sum of 50,000 ducats, it was not published until 1522. It is complete in six folio volumes. The first four contain the Old Testament in Hebrew, Greek, and Latin, with the Chaldee paraphrase at the bottom of each page: the fifth is occupied with the New Testament in Greek and Latin; and the sixth with critical apparatus.

The *Antwerp*, sometimes called the Spanish and Royal Polyglott, was published in 1572 by Christopher Plantin of Antwerp, under the patronage of Philip II. of Spain. The Old Testament is printed in Hebrew, Greek, Latin, and Chaldee; and contains, beside the Complutensian versions, a Chaldee paraphrase left by cardinal Ximenes, in the public library at Alcalá. The whole work forms eight vols. folio; and has a Syrian version of the New Testament, together with the Latin version of S. Pagninus, revised by Arius Montanus, the presiding editor. The first five contain the Old and New Testaments, and the three last are filled with lexicons, grammars,

&c. Only 500 copies were printed; the greater part of which being lost in a voyage to Spain, complete sets are very rare.

The *Paris Polyglott* of 1645, printed by Antoine Vitre, is in ten folio volumes, and is a magnificent work. It was executed at a ruinous expense by a M. Le Jay, and contains all that is inserted in the Complutensian and Antwerp Polyglotts, with the addition of the Samaritan Pentateuch and its version. It has no critical apparatus.

The *London Polyglott* of bishop Walton was published in 1657 in six folio volumes. The first volume contains a very extensive critical apparatus (the Prolegomena itself, written by Bishop Walton, being a treasure of sacred criticism), and also the Pentateuch. The second and third volumes comprise the remaining books of the Old Testament; the fourth the Apocrypha, and a threefold Targum on the Pentateuch, viz. two in Chaldee, and one in Persic. The fifth the New Testament. The sixth contains various readings, and critical elucidations of the whole. The Pentateuch of this most noble work is in Hebrew, Greek, Syriac, with the Chaldee paraphrase, Hebræo-Samaritan, Samaritan, and Arabic, accompanied with the Latin Vulgate, and six other Latin versions of the various oriental ones. The Samaritan Pentateuch is the only part of the Old Testament in that language. The other volumes of the Old Testament are nearly similar, only that there is an Ethiopic version of the Psalms. The New Testament exhibits the Greek, Syriac, Persic, Vulgate, Arabic and Ethiopic versions, at least as far as the end of the Gospels, for here the Persic closes, and separate Latin versions accompany all the oriental ones. This work is not considered complete without the *Lexicon Heptaglotton*, published by Dr. Edmund Castell at London, in 1669, in two volumes folio. It contains a joint lexicon of the Hebrew, Chaldee, Syriac, Samaritan, Ethiopic, and Arabic languages, together with a separate lexicon of the Persic, and brief grammars of the several tongues.

The *Leipsic Polyglott* of 1750 is in three vols. folio, edited by C. Reineccius. The Old Testament is in Greek, Latin, and German: the New, in ancient and modern Greek, Syriac, and German.

Our account of these important works must

not close without noticing the spirited attempt of a respectable bookseller of this metropolis to add a second London Polyglott to the foregoing list. In 1816 Mr. S. Bagster commenced his 4to. and 8vo. Polyglott, comprising the Hebrew text of the Old Testament, from Van der Hooght's edition, the Samaritan Pentateuch from Dr. Kennicott's edition of the Hebrew Scriptures, the Septuagint Greek version of the Old Testament from Bos's edition of the Roman or Vatican text, the Latin Vulgate, and the authorised English version. The New Testament is given in Greek from Dr. Mill's edition, with the whole of the important various readings from Dr. Griesbach's edition, printed at Leipsic in 1805; and is accompanied by the Peschito, or old Syriac version, the Latin Vulgate, and the authorised English version. The Apocalypse, and such of the Epistles as are not found in the old Syriac, are given from the Philoxenian or new Syriac version. The text of the Latin Vulgate version is taken from the edition of Pope Clement VII. The authorised English version is accompanied with the marginal renderings, references, &c. The Hebrew of the 4to. copies is pointed; the 8vo. copies may be procured both with and without points. Price of the 4to. copies £5. 5s.

After a most calamitous fire which happened in 1822, destroying an entire impression of a Polyglott Bible in the modern languages, Mr. Bagster was induced to project a small folio Polyglott Bible to be completed in one volume, which he says will comprise the original Hebrew text, and the Greek Septuagint version of the Old Testament; the original Greek Text, and the venerable Peschito or old Syriac version of the New Testament, the Samaritan Pentateuch, the Vulgate Latin, the authorised English version, Luther's German version, Ostervald's French version, Diodati's Italian version, and P. Scio's Spanish version. The types from which this Polyglott is printed are entirely new, and together with the paper of singular beauty. Mr. B. has lately added the modern languages with his 8vo. Polyglott; which, complete, is sold at £7. 3s.

For a more particular account of the several translations of the Bible into the languages of the British isles, see ENGLISH, IRISH, and WELSH BIBLES.

BIBLE SOCIETIES.

BIBLE SOCIETIES.—The most striking characteristics of the times in which we live, are the voluntary religious associations to which they have given birth. Among these it will be readily admitted that Bible Societies are the first in magnitude and importance. How they arose? what has been their progress? and what will be their probable results? are questions which the patriot, the philanthropist, and the Christian, must frequently revolve. Indeed they have been discussed by men of all parties in politics and religion; and every variety of talent has been brought to their elucidation. In tracing their origin, the philosophical enquirer cannot fail to

be struck with the felicitous combination of matured protestantism, and the unrestrained enjoyment of religious freedom, to which these institutions are mainly indebted for their existence. When the schism was first made, which broke the unity of the Catholic Church, and dissolved the charm of its infallibility, it was predicted that endless divisions among the reformed would be the disastrous consequence—and that thus the new religion would be exterminated by its own violence; or that the refractory sovereigns and kingdoms, which had thrown off their allegiance to the holy pontiff, would be driven, of necessity, to take refuge once more in his paternal bosom.

And, it must be confessed, that the religious distractions and civil commotions which marked the early progress of the Reformation, and which, like heterogeneous elements, frequently threatened an explosion fatal to the existence of society, contributed not a little to encourage a belief that the prediction would be realised. It was the interest of the Papal See to extend and to strengthen this conviction; while protestant rulers, in church and state, unwittingly lent themselves to support this political manœuvre of their arch adversary. Hence division, discord, and anarchy, became the hereditary reproach of Protestants—while it was bruited throughout the earth that the internal peace which universally prevailed, where the pope's authority was acknowledged, arose from that unity of faith which, in all Catholic states, was the bond of perfectness. It was reserved for later generations to discover that this loudly-boasted tranquillity was but the crouching of ignorant and besotted slaves at the feet of civil and ecclesiastical despotism; and that the convulsions which so long and so fearfully distracted the repose of protestant Europe, were the natural consequences of a mighty struggle between light and darkness—between freedom and tyranny. The ecclesiastical Revolution, so suddenly effected by Luther, was the first dawn of liberty to Europe. It was, however, but a spark, feeble and vacillating, and sometimes on the point of extinction. It was long before it shone forth with a lustre, which bespoke the divinity of its origin, and the indestructibility of its nature. The demons and the darkness united to smother it in its birth, and retired with that reluctance with which conquerors, in a thousand battles, at last yield up victory and life together. It was not till the principles of protestantism began to be well understood by the Protestants of England, and till they had worked out a good degree of civil liberty for their country, that its blessings could be very largely distributed, or extensively enjoyed. Its first introduction among us was very inauspicious. It came merely as the engine of state policy, and was forced into an unnatural alliance with the lust and wilfulness of the most detestable tyrant that ever outraged the decencies of life, and insulted the patience of mankind. 'The defender of the faith,' not contented with the flattering distinction of being a royal and favored son of the church, resolved to usurp the authority of its infallible head, and to subordinate to himself a hierarchy of his own, surrounded with the mists and darkness of popery. The nation was at the first scarcely conscious of any change—they retained almost every thing of popery but the name—the monarch was as absolute as the pope, but not quite so crafty. The twilight of knowledge awakened the thrill of gladness in the hearts of a distinguished few who had been waiting for the morning, and who thought they saw, notwithstanding the gloom which yet prevailed, the indication of its approach. Still, protestantism had but an incipient existence. It was during the next reign that it seemed to emerge into conscious being; and then it was that freedom to think and judge in matters of religion, produced extravagancies and diver-

sities of opinion—for this, Protestants as they were, the ecclesiastical rulers were not prepared; and they fell upon the expedient, so constantly resorted to by the church which they had recently abandoned, namely, to extinguish heresy by the massacre of heretics. There was no civil freedom then to throw its ægis over the virtuous beings who had violated no law, and who, therefore, deserved no punishment: and they were committed to the flames. Popery returned with vengeance, and executed with fiendish satisfaction the *lex talionis* on the protestant murderers. For more than half a century, the protestant faith triumphed; but it was confined within the limits of the hierarchy, and under the absolute control of the sovereign. It had no toleration, and therefore could exercise no charity. The clergy condemned, and the queen executed, all who dared to question the infallibility of either. In the subsequent reigns of James and the first Charles, the spirit of protestantism began to work. The translation and circulation of the Scriptures induced multitudes to read them; and the natural consequence was a diversity of opinions, and at length a variety of sects. Unhappily, the notion of an exclusive church, and of absolute uniformity in matters of faith, which some of the early reformers imported from Rome, was the reigning dogma of them all; and hence the idea of mutual extermination commended itself to each of them as a sacred duty. Of course, the party that could wield the sword of power, and second its anathemas with the vengeance of the state, had the greatest facilities for the performance of their duty, and enjoyed, in the highest degree, the pious luxury of persecuting, even unto death, their unoffending fellow-subjects. It was not possible that such a state of things could long continue. Either ecclesiastical despotism must triumph in the annihilation of every sect but its own, or civil freedom must result from the struggles of the contending parties. The balance was long held in doubtful vacillation; but the religious spirit proved at last too mighty for the policy and the power that aimed to destroy it. The conflicts which mutual persecution provoked and inflamed, ended, happily for the protestant cause in Europe, in laying the foundation of a civil constitution, which, in its progress to perfection, will not fail to secure equal rights to all good subjects, whatever be their religious creed or ecclesiastical discipline. The throne, while the 'baby Charles' (the endearing terms in which the Royal Solomon used to speak of the heir apparent—the martyr of blessed memory) sat upon it, was placed as a barrier against the tide of religious freedom, then mightily setting in, and which would have moved on in its majestic course, a confluence of undisturbed and tributary streams, enriching and beautifying all around it, but for this unnatural and most impolitic obstruction. What was the consequence? pent up and confined, it became an impetuous and boiling torrent, bearing away, with irresistible fury, the monarch, and every vestige of his proud regalia. The Protectorate was a season of light, and to whatever desperate expedients the head of the commonwealth was impelled, by the necessity of circumstances, the

principles of general freedom were industriously sown. Like the dragon's teeth of Cadmus, they came up armed men, at the period of the glorious Revolution, and drove into merited exile the last of the Stuarts. Then it was that the rights of conscience were expressly recognised by the law of the land; and freedom of worship was granted to all, without exception, on condition, however, that the seceders from the dominant church should submit to certain civil privations and disabilities. This change, though not in all respects what a liberal and just policy ought to have devised, and though it left something of the wormwood and the gall of a persecuting spirit to embitter religious differences, was yet fraught with the happiest consequences; which, during the lapse of nearly two centuries, have been accumulating the richest benefits upon the nation. Proscriptions, fines, and imprisonments, have given place to controversy, rivalry, and charity. The bigots of all parties content themselves with exuding harmless venom: the state has extracted their teeth, and they cannot bite. Too many of the clergy of different churches are still 'good haters;' but they can now only imprecate the vengeance they were formerly accustomed to inflict: and it is the prayer of the righteous only that availeth much. The haughty and exclusive assumption of the church is consistently abandoned by Protestants, and is claimed only by the mother of barlets. The Church of England, in her article on this subject, speaks the language of every Christian community. She claims indeed pre-eminence, and this is cheerfully conceded to her learning, her wealth, and her numbers; but the churches of dissent have also 'a local habitation, and a name.' The spirit of emulation which has long prevailed among both the established and the protected churches, is of the right kind, and has, among them all, promoted, in a very eminent degree, the interests of true religion. Every extension of toleration, every step in advance towards perfect freedom, has allayed the animosities of party, and in proportion as Christians of various denominations have been brought upon equal terms into civil contact with each other, mutual good will, brotherhood, and charity, have been the happy consequences. The most perfect state of society is where the right of private judgment, in matters of religion, is equally claimed and conceded through all the extent of its probable and practical results; and where the civil government extends equal protection to all who exercise that right, whether they conform to the creed of their rulers or dissent from it. To this state public opinion at least was rapidly approximating at the period when the British and Foreign Bible Society began its splendid and marvellous career; nor could it have obtained existence among us under different circumstances. If there had been less of liberal feeling and sentiment in the British churches, or less of tolerance in the government, or less of freedom in the spirit of our laws, the plan of such an institution could never have been conceived; or, if conceived, it must have appeared altogether absurd and impracticable.

But the more proximate and immediate causes

which led to its formation, may be traced to the moral wants of the people, created by that system of universal instruction, which had, for several years, been in active operation. To which we may likewise add the zealous efforts of the clergy, both in and out of the establishment, to diffuse throughout the land the spirit and the principles of religion. A reading population, and a population awakened to a powerful conviction of the truth and value of the Holy Scriptures, must, of necessity, produce an unusual demand for the sacred volume; and, at least, multitudes would be thus prepared to give it a prompt and cordial welcome. At this period, too, the spirit of active and inquisitive benevolence was abroad—the moral wants of the British empire were not contemplated with a partial or an exclusive eye: but commercial energy and missionary zeal had laid bare the forlorn and wretched condition of the greatest part of Christendom, and of the whole pagan world; while facilities of communication were opened by these means with every quarter of the globe. All these circumstances will account for the rapid growth of the Bible Society, and for the grand principle on which it is founded, and on which its usefulness, its permanency, and prosperity depend. The object, namely, the circulation of the Scriptures, was pressed upon the attention of the original founders of the institution by an occurrence of a very trivial nature; then the magnitude of that object, as embracing the whole habitable world, impressed them with the conviction that it could not be achieved on ordinary principles, nor by ordinary means. The principles and the means required they found in the catholicism which prevailed among British Protestants; and in the divine inspiration and sufficiency of the Scriptures themselves, on which that catholicism might erect its noble superstructure of spiritual benevolence.

At the time the project of this great society was contemplated, the sources in existence, from which a distribution of the Scriptures might be expected, were few, and certainly, from their constitution, inadequate to supply the biblical necessities of the world. The principal societies which made the dispersion of the Scriptures a collateral or an exclusive object, are the following. The figures subjoined denote the year in which each was founded:—

The Society for Promoting Christian Knowledge	1696
The Society for the Propagation of the Gospel in Foreign parts	1701
The Society in Scotland for Propagating Christian Knowledge	1709
The Society for Promoting Religious Knowledge among the Poor	1750
The Bible (now the Naval and Military Bible) Society	1780
The Society for the Support and Encouragement of Sunday Schools	1785
The French Bible Society	1792

For an account of the principal operations of these associations, see CHRISTIAN KNOWLEDGE, SOCIETY FOR PROMOTING,—GOSPEL, SOCIETY FOR PROMOTING THE,—NAVAL AND MILITARY BIBLE SOCIETY, &c. &c.

That these institutions existed, was an evidence to every reflecting mind, that something similar, but of far greater magnitude, would soon be required; and that the Holy Scriptures, flowing in these comparatively narrow and confined channels, would never satisfy the desires which would thus be excited for their universal diffusion; and it was, in fact, a serious dearth of this kind in the principality of Wales, which none of the existing Societies could supply, that was the direct cause of originating that which by way of eminence we very justly denominate THE BIBLE SOCIETY. From the year 1787 to the year 1793, the most affecting and earnest appeals were made in behalf of the poor of the Principality to obtain for them a supply of Welsh Bibles. The Society for promoting Christian knowledge, the only source whence the necessary supply could be obtained, turned a deaf ear to every complaint and remonstrance; and negociation, however kept open and on whatever terms maintained, altogether failing, was at length abandoned in despair. In 1796, however, this venerable Society, impressed with a sense of the necessity for some further exertions, and believing at last the reasonableness of the pleas urged in favor of a new edition of the Scriptures in the Welsh language, passed an order at its board for the printing of 10,000 of the Welsh Bible, Common Prayer, and singing Psalms, with 2000 extra Testaments; and in 1798 this order was executed.

It was long hoped by the friends of humanity and religion, that the facts disclosed by the correspondence of the Society for Promoting Christian Knowledge with the clergy and gentry of the Principality, and the certainty of their funds being increased to any amount which the exigency of the case would require, of which they could not entertain a reasonable doubt, would have induced that Society, to make another effort. But the inhabitants of Wales having looked in vain to this quarter, in the month of December, 1802, the Rev. T. Charles, B. A. of Bala, a minister of the Established Church, a man of zealous piety, and indefatigable exertion, and whose habits and connexions rendered him intimately familiar with the spiritual wants of his countrymen, being in London; proposed a contribution in aid of a plan for printing and distributing the Scriptures among them. On the seventh of that month, the subject having been introduced by Mr. Joseph Tarn, the present assistant secretary and accountant of the British and Foreign Bible Society, in a circle of friends who had met to transact a different business, Mr. Charles proposed his suit in behalf of his countrymen: describing the want of Welsh Bibles, and the failure of all attempts to obtain them in the usual channel, and urging with importunate earnestness, the necessity of resorting in this painful extremity to new and extraordinary means.

This proposition gave rise to a conversation of some length. In the course of which it was suggested, that as Wales was not the only part of the kingdom in which such a want as had been described might be supposed to prevail, it would be desirable to take such steps as might be likely to stir up the public mind to a general disper-

sion of the Scriptures. This suggestion proceeded from a dissenting clergyman, the Rev. J. Hughes, one of the Society's present Secretaries, and was warmly encouraged by the rest of the company, who, with the proposer, were members of the Religious Tract Society, and who had met to transact the business of that institution. To this casual conversation we are to trace the dawn of those measures, which, expanding with time and progressive discretion, issued at length in the proposal and establishment of the British and Foreign Bible Society.

Mr. Hughes was desired to prepare in writing such an address as might contain, in a more digested form, the substance of his unpremeditated observations. In the mean time, the subject was introduced to the notice of various individuals of distinguished reputation for piety and benevolence. Among these was William Wilberforce, Esq. who, at a private interview, conferred with the parties who had solicited his advice; and furnished such hints as his enlightened mind and liberal heart would be likely to suggest. A similar communication was made to Charles Grant, Esq. and attended with a similar result.

The Rev. C. F. A. Steinkopff, minister of the German Lutheran church in the Savoy, and one of the Society's present secretaries, voluntarily tendered his services to promote the design, in the course of a journey which he was about to make to the continent of Europe. His offer was thankfully accepted, and he was accordingly requested to enquire particularly into the want of the Scriptures in such places as he should have occasion to visit. Similar enquiries were directed to be promoted in Ireland, and in other parts of the United Kingdom.

In the course of May 1803, Mr. Hughes presented an impression of his Essay. The conclusion is in a spirit which has from the commencement to the present time so truly characterised the society, and is in itself so complete a refutation of all those calumnies heaped upon the motives of its patrons and supporters, that the most brief notice of the institution would be defective, if it were not introduced to adorn and to hallow the page. 'God puts honor upon mortals by employing their agency in the fulfilment of his promises, and in the promotion of his glory; and if those of his designs may be considered as indicating an approach towards maturity, which most unite and engage his servants; is it not probable that knowledge and salvation will follow close in the train of those labors, to which, with respectful deference, we now call the attention of the Christian world. May we not therefore look forward to a large meeting of our fellow-Christians, whose unanimous and loud voice shall encourage us to go on and do all that is in our hearts? But should we in this respect be disappointed, our labor will not be regretted, if it serve in a few instances to draw more attention to the Bible; if it contribute to the strength of societies already established; and especially if it promote the spirit of distribution among those, who, having long regarded the truth as it is in Jesus, have yet done little toward enriching the world with its

treasures. Conscious, however, of having discharged a duty, and encouraged to expect some favorable result, we here conclude, leaving our exhortations with the consciences of men, and our prayers in the bosom of God.'

Copies of this Essay were industriously circulated, and it cannot be doubted but that the public mind was thus prepared to entertain the project so clearly stated, and so powerfully supported. It was not, however, till the month of January, 1804, that the measures for carrying it into effect had attained a sufficient degree of ripeness in the estimation of its conductors. to justify the consideration of steps for carrying them into actual execution. A plan which had been sketched in the preceding year now underwent revision, and the title was altered at the suggestion of the late Reverend and benevolent John Townsend (the founder of the Deaf and Dumb Asylum), from 'A Society for promoting a more extensive circulation of the Holy Scriptures, both at home and abroad,' the form in which it originally stood, to the definite and more comprehensive designation of THE BRITISH AND FOREIGN BIBLE SOCIETY. Things being thus far advanced, it was determined to convene a public meeting: a circular address was accordingly drawn up, which unfolded the plan, so far as it was at that time matured, and announced a public meeting to be held at the London Tavern, on Wednesday the 7th of March, 1804. It was subscribed by the following names:

Granville Sharp	Richard Lea
William Alers	Alexander Maitland
Joseph Benwell	Samuel Mills
Henry Boase	Joseph Reyner
Robert Cowie	Herman Schroeder
Samuel Foyster	Christopher Sundius
Joseph Smith Gosse	George Wolff.

The future secretary and historian of the Society, Mr. Owen, received from Mr. Hughes two copies of the Essay on the Excellence of the Holy Scriptures, one for his own use, and the other he was requested to present to the bishop of London (Porteus), to whom he was chaplain, and to solicit his lordship's patronage to such an institution as that Essay was designed to recommend. With part only of this request did he comply—he merely presented the pamphlet; and beyond that, as he candidly observes, 'he neither felt himself authorised nor inclined to proceed.' So completely, indeed, had the presumption of its impracticability taken possession of his mind, that he is not aware of having given the plan any further consideration, till the receipt of the circular revived the recollection of it; and the name of his intimate and valued friend, Granville Sharp, at the head of the signatures, determined him to attend the meeting, at which its merits were to be publicly and solemnly discussed.

By the provisional committee Mr. Owen was requested to move the series of resolutions which were designed to form the basis of the proposed society. 'He rose,' he says, 'by an impulse which he had neither the inclination nor the power to disobey. Surrounded by a multi-

tude of Christians, whose doctrinal and ritual differences had for ages kept them asunder, and who had been taught to regard each other with a sort of pious estrangement, or rather of consecrated hostility; and reflecting on the object and the end which had brought them so harmoniously together; he felt an impression which the lapse of more than ten years had scarcely diminished, and which no length of time will entirely remove. The scene was new: to him it appeared to indicate the dawn of a new era in Christendom; and to portend something like the return of those auspicious days, when 'the multitude of them that believed were of one heart and of one soul;' and when as a consequence of that union, to a certain degree at least, 'the word of God mightily grew and prevailed.' After giving utterance to these feelings, in the best way he could, Mr. Owen moved the resolutions which had been consigned to his care, which were unanimously and enthusiastically adopted. The institution was considered as established, and more than £700 were immediately subscribed.

THE BRITISH AND FOREIGN BIBLE SOCIETY having been thus established, Mr. Owen felt it important to make an early communication of the fact to his diocesan and patron, the amiable and pious bishop Porteus. In this communication he availed himself of the confidence with which he knew the bishop honored him, and entered into a minute detail of all the circumstances which at the recent meeting had deeply impressed his own heart; he particularly described the comprehensive principle on which the society was constituted, and the spirit of candour and liberality in which it had been formed, submitted to his lordship that the challenge so liberally given on the part of the dissenters, ought on the part of the church to be as liberally accepted; and expressed his conviction that it was equally expedient for the honor of the church, and for the accomplishment of the society's object, that the ministers and members of the establishment should give it their decided countenance and support. After a reasonable delay, the bishop replied to this communication in very satisfactory and encouraging terms. In the course of his reply, his lordship distinctly stated that he very much approved the design of the Bible Society; and that he had mentioned it to several of his friends who also approved of it.

'The Committee,' says Mr. Owen, 'which was nominated at the formation of the society, and on which the executive measures had devolved, consisted of individuals highly respectable, and conscientiously devoted to the service of the institution. But the diversity of religious sentiment, connexion, and denomination, by which they were characterised, may naturally be supposed to have thrown serious obstacles in the way of that mutual understanding which is the only sure basis of a sincere and steady co-operation. Never, perhaps, before, were thirty-six persons brought together for the prosecution and attainment of a common purpose, whose views and habits and prejudices exhibited a greater and more unpromising variety. Strangers in many

instances to each other's persons, and not a little disaffected to each other's religious systems, they had to struggle against feelings, to which time and mutual alienation had given in a manner the authority of principles; and to balance the value of the object itself against that of the minor considerations which must be sacrificed in order to attain it. It is not therefore to be wondered at, that, in the outset of their proceedings, a committee thus composed should experience no ordinary embarrassment. A sense of propriety dictated that parties so strangely diversified should mutually advance towards each other with wariness and reserve: and it is natural to conclude, that in the exercise of this caution they should occasionally betray those emotions of jealousy which served to demonstrate how much they were indebted to the influence of the Bible for effecting their approximation to a common standard.'

In this important stage of its progress, when the committee, previously to a general and public meeting, were called upon to make their final arrangements, not only as to elementary principles, but as to detail, and every part of the practical machinery of the infant institution entrusted to their hands, the great questions which demanded their most serious attention and ultimate determination, related

First, To the simple consideration of what they were to distribute.

Second, As the society consisted of a union of all denominations of Christians, to the proportion in which each should be represented in the committee.

Third, To the secretariat, involving the same delicate question with that of the constituent principle of the committee; and

Fourth, To the presidency and patronage.

1. As to the first, namely, what they were to distribute, the founders of the society, without discussion, or even distinct recognition, had assumed certain principles which they took for granted were universally maintained by Protestants, and on which they were universally agreed, however diversified their sentiments on other subjects: these were the divine and exclusive authority of the Scriptures in matters of religion; the capacity and consequent obligation of all men to search the Scriptures for themselves, as the only inspired media through which to obtain the knowledge of salvation; that all men who have derived their religion from the Holy Scriptures, however they may differ in their religious opinions, may with equal confidence appeal to the divine volume as the only standard of their faith and practice; that it is the duty of all men who profess religion themselves, and who derive that religion from the Scriptures, to circulate those Scriptures as the only authoritative and infallible means of conveying religion to others. These principles are all included in the establishment of a Bible Society: but they are instantly violated, if the integrity, purity, and completeness of the Scriptures be in any measure sacrificed; they apply to the Bible, and the Bible alone; to the Bible in all its parts,—to the entire volume, without the smallest deduction or addition. The great question then to be determined

by the new society which assumed such principles as their basis, was, whether any version of the Scriptures existed, in the truth and fairness of which all the various denominations of Christians, who were to unite in the circulation, perfectly agreed. Happily the authorised version of the English Bible, which was in the hands of all, and which all equally esteemed, presented itself; and to guard against the possibility of its deterioration, or of its ever becoming the engine of party, it was suggested by the bishop of London, that the authorised version, without note or comment, should be the only book in the languages of the United Kingdom, to be circulated by the Society. This proposal allayed all existing fears, and threw an effectual barrier in the way of all future jealousies. It equally interested the churchman and the dissenter; the definition was too precise and clear to admit of controversy or disagreement, and to this simple principle is to be traced the harmony, the zeal, and the energy which, from the moment of its adoption, for so many years, distinguished the British and Foreign Bible Society.

2. The constituents of the Committee presented more formidable difficulties than were at first anticipated. This question was peculiarly calculated to excite party feeling, and to awaken prejudice and distrust even in the most upright and liberal minds. Are all denominations of Christians to be represented in the committee by members of their respective bodies? and, if they are, in what proportion? What is to decide their proportion; piety, wisdom, wealth, or numbers? and must every one take his seat in the committee, as a stickler for the honor and pre-eminence of his own party? All these enquiries seemed to open a wide field for discussion and angry controversy. But here, too, divine principles triumphed over human pride, and a happy suggestion, the fruit of wisdom, candour, and forbearance, soon terminated a discussion which might have led to the most disastrous consequences. Attending to the suggestion, it was determined the committee should consist exclusively of laymen; that of the thirty-six members, to which number it was limited, six should be foreigners resident in or near the metropolis; and of the remaining thirty, one-half should be members of the established church, and the other half members of other Christian denominations. In order, however, to secure the services of the clergy, and of ministers generally, provision was made for their admission to a seat and a vote in the committee, on the terms which made them members of the society; a provision which, while it concealed their names, recognised their privileges and retained their co-operation.

3. The business of appointing secretaries was one of equal difficulty with that of the formation of the committee. This, however, yielded to the spirit of wisdom and liberality which so eminently distinguished the individuals with whom the institution itself originated. The secretariat was divided into three distinct branches of office, and each had a representative. The reverend Josiah Pratt was appointed secretary to represent the established church; the

Rev. Joseph Hughes as the organ of the dissenters; and the Rev. Mr. Steinkopff, as the foreign secretary, to maintain the interests of the foreign churches. The resignation of Mr. Pratt, soon after his acceptance of his office, a measure dictated perhaps by his prudent solicitude for the general acceptance of the Society among the higher clergy, to which he felt that the name of a marked and well-known evangelical clergyman might be objectionable, prepared the way for his able, ardent, and eloquent successor, the Rev. John Owen. Thus was everything regarding the executive of the institution amicably arranged, and it only remained, that a name of sufficient weight and distinction in the country should grace its list of patronage, and give sanction to an object which conferred infinitely more honor than it could ever receive. It was deemed highly important, if not indispensable, to gain the concurrence and support of the most influential body in the kingdom, the clergy of the established church, as well as the co-operation of its most zealous and efficient laymembers. In accomplishing this object, to a degree which far exceeded the most sanguine expectations of the Committee, they were greatly assisted by the lord bishop of London. It was his lordship's suggestion that induced their application to Lord Teignmouth to become the president of the society; and on the day after Lord Teignmouth's nomination to the presidency, the 15th of May, the bishops of London and Durham sent in their names as subscribers of five guineas annually to the funds of the society; and before the close of the ensuing June, both these prelates, together with the bishops of Exeter (afterwards of Salisbury) and St. David's (now of Salisbury) accepted respectively the office of vice-president. Sir William Pepperell, Bart. Vice-admiral (now Lord Gambier), Charles Grant, Esq. William Wilberforce, Esq. and Henry Stratton, Esq. were other names that were quickly enrolled.

We subjoin the entire code of principle and management, as it was completed a little before the first anniversary.

LAWS AND REGULATIONS OF THE BRITISH AND FOREIGN BIBLE SOCIETY.

1. The designation of this Society shall be The British and Foreign Bible Society, of which the sole object shall be to encourage a wider circulation of the Holy Scriptures, without note or comment. The only copies in the languages of the United Kingdom to be circulated by the society, shall be the authorised version.

2. This Society shall add its endeavours to those employed by other societies, for circulating the Scriptures through the British dominions; and shall also, according to its ability, extend its influence to other countries, whether Christian, Mahomedan, or Pagan.

3. Each subscriber of one guinea annually shall be a member.

4. Each subscriber of ten guineas at one time, shall be a member for life.

5. Each subscriber of five guineas annually shall be a governor.

6. Each subscriber of fifty pounds at one time, or who shall, by one additional payment, increase

his original subscription to fifty pounds, shall be a governor for life.

7. Governors shall be entitled to attend and vote at all meetings of the committee.

8. An executor paying a bequest of fifty pounds, shall be a member for life; or of one hundred pounds, a governor for life.

9. A committee shall be appointed to conduct the business of the society, consisting of thirty-six laymen, six of whom shall be foreigners, resident in London or its vicinity, half the remainder shall be members of the church of England, and the other half members of other denominations of Christians. Twenty-seven of the above number, who shall have most frequently attended, shall be eligible for re-election for the ensuing year. The Committee shall appoint all officers, except the treasurer, and call special general meetings; and shall be charged with procuring for the Society suitable patronage, both British and Foreign.

10. Each member of the society shall be entitled, under the direction of the Committee to purchase Bibles and Testaments at the Society's prices, which shall be as low as possible.

11. The annual meeting of the Society shall be held on the first Wednesday in May, when the treasurer and committee shall be chosen, the accounts presented, and the proceedings of the foregoing year reported.

12. The president, vice-presidents, and treasurer, shall be considered, ex officio, members of the Committee.

13. Every clergyman or dissenting minister who is a member of the Society, shall be entitled to vote at all meetings of the committee.

14. The secretaries for the time being, shall be considered as members of the Committee; but no person deriving any emolument from the Society shall have that privilege.

15. At the general meeting, and meetings of the Committee, the president, or in his absence, the vice-president first upon the list, then present; and, in the absence of all the vice-presidents, the treasurer; and, in his absence, such member as shall be voted for that purpose; shall preside at the meeting.

16. The Committee shall meet on the first Monday in every month, or oftener if necessary.

17. The Committee shall have the power of nominating such persons as have rendered essential services to this institution, either members for life, or governors for life.

18. The Committee shall also have the power of nominating honorary members from among foreigners who have promoted the objects of this society.

19. The whole of the minutes of every general meeting shall be signed by the chairman.

Such was the origin of the British and Foreign Bible Society; and such were the principal steps by which it was trained from its elementary existence, in a crude suggestion and in unpromising obscurity, to the ripeness of its plan in a well-digested system, an organised establishment, and a regular and dignified patronage.

While a spirit of mutual forbearance and kindness reigned in the Committee, on whom devolved the important charge of the executive of the

institution ; it prepared them for the most vigorous measures in promoting and carrying forward its great and characteristic object. The word of God united them, and they felt a concentration of energies, wholly devoted to the design of its circulation. The chairman and the secretaries possessed, in a peculiar manner, all those qualities of adaptation which fitted them for their respective departments in the great scheme of philanthropic operation. Perhaps, says Mr. Owen, it would not have been possible to find throughout the British dominions a man in whom the qualities requisite for the first chairman of the British and Foreign Bible Society were so completely united, as they were in this venerable philanthropist. A churchman in faith, in charity a universalist, he stamped upon the institution, while it was yet tender, those characters which suited its constitution and its end ; and, while he made it respected by the sanction of his name, he improved it by the influence of his example.

Lord Teignmouth, from character, extensive knowledge of the world, and influence in society, from his christian benevolence, and tempered zeal, his prudent sagacity, and ready promptitude, his skill to devise, and his ability to execute, was admirably fitted to sustain the duties of that high office, to which the concurring suffrages of all who felt interested in the success of the institution, had spontaneously called him.

In Hughes, Owen, and Steinkopf, were happily blended and contrasted those points of union and of difference which secured the combination of all their powers and influence to the great object they respectively had in view.

‘ Calm-eyed ethereal Faith, and ardent Hope,
And seraph Love.’

Such were the men ; a threefold cord which only death could sever ; and which continued firm and unbroken till their more ardent spirit had outstripped its fellows in zeal, in labor, and success, and obtained therefore an earlier haven.

The Society having been nominally formed on the 7th of May 1804, from that period its Committee held periodical meetings, for the most part weekly, till the Society was completely organised, and its business brought into a regular train ; afterwards they adhered to a general resolution which convened them on the first Monday of every month ; though on every occasion of exigency or importance they met more frequently.

The first proceeding resorted to, with a view to the execution of the Society's design, was the appointment of different sub-committees, for the several departments of its practical business. These subordinate committees began their operations with great spirit in the month of March.

Three considerations appear in this early stage of their existence to have occupied the principal solicitude and attention of the Committee ; the care of the Society's funds, the improvement of its general interest, and the prosecution of enquiries directed to the accomplishment of its object—the circulation of the Scriptures. Of the two former it is not necessary that we should say more than that they were prosecuted with great earnestness, and with most encouraging success.

The Committee, whose proper business it was to ascertain the dearth of the Scriptures both at home and abroad, and to supply the means of removing it, directed their first efforts to the Principality and to Ireland ; they were anxious that copies of the sacred volume, in the Welsh and Irish languages, should be put into immediate circulation. Mr. Steinkopf was also deputed to open a foreign correspondence, in order to the promotion of the Society's object abroad. While these measures were in a train, the Committee was occupied for several months in enquiries and negotiations respecting the Chinese MS. of the New Testament in the British Museum. Dr Antonio Montucci had published in October and November 1801, in the Gentleman's Magazine, an account of this MS., and when he heard of the formation of the Bible Society, this gentleman addressed a letter to Mr. Hughes, offering his services as editor, should it be thought expedient to print the MS. A correspondence was now therefore opened with persons of distinction, and supposed to be well acquainted with Chinese literature. Sir George Staunton rendered the Committee all the assistance in his power, and imparted to them a great deal of knowledge from his own former intercourse with China. The object of the correspondence was, however, at length deemed either inexpedient or impracticable at this time ; and, though it was not totally abandoned, it was indefinitely deferred. While the Committee were anxiously looking around to facilitate the printing new editions of the Scriptures in Welsh and Irish, Mr. Andrew Wilson commenced a negotiation with the university of Cambridge, for the introduction of his improved mode of printing Bibles and Testaments by the employment of stereotype plates ; this negotiation was brought to a favorable issue ; and the syndics of the press had concluded to adopt his process for printing Bibles and Testaments at the very period in which enquiries were making into the best mode of obtaining supplies of both in the languages of the united kingdom. To the Committee of the British and Foreign Bible Society the plan of printing the Scriptures by stereotype offered so many and important advantages, that, after mature deliberation, a resolution was passed that a number of Bibles and Testaments in stereotype should be immediately ordered, and, among that number, 20,000 Welsh Bibles in 12mo., and 5000 additional Testaments in a larger type. This measure was determined upon at a meeting on the 3d of September 1804, and the determination was notified to the University of Cambridge without delay.

On the 23d of July in this year, with a view to extend the foundation of the institution, and to associate with it whatever would be likely to consolidate its strength, facilitate its proceedings, and augment its respectability, it was determined by the Committee to address the two great Religious Societies in London and Dublin, denominated respectively, ‘ the Society for Promoting Christian Knowledge,’ and ‘ the Association for Discourteasing Vice, and Promoting the Knowledge and Practice of the Christian Religion.’ The object was to assist these societies

in that part of their plan and constitution which related to the circulation of the Scriptures only. From the Dublin Association a respectful and friendly acknowledgment was transmitted in return *by order of the Board*. Dr. Gaskin, and the Society of which he was an accredited organ, made no acknowledgment. Another measure, directed to the enlargement of the Society's connexions, and its more complete introduction to notoriety and usefulness, was that of addressing the parochial clergy, dissenting ministers, and other respectable persons, individually, as far as might be practicable throughout the united kingdom. For this purpose a circular, containing a plan of the institution, extracts of correspondence, and a list of subscribers, was prepared; and very extensively distributed, free of expense to the receiver, through the medium of the post.

The correspondence abroad produced the most gratifying assurances of approbation, and of a cordial disposition to co-operate in promoting the design of the institution as it regarded foreign countries. To the imperial city of Nuremberg a donation of £100 was granted in the event of a Bible Society being formed in that place; the result of this proposition was the establishment of the first FOREIGN BIBLE SOCIETY. The foundation of it was laid on the 10th of May 1804. From Stuttgard, Professor Druck, librarian to the elector (now king) of Wirtemberg, in reply to the letter in which he had been addressed, transmitted important intelligence relative to the versions of the Scriptures in the Wirtemberg library, amounting in all to more than 4000 different editions of the whole Bible, or of distinct parts of the same, and accompanied his account with expressions of the highest gratification and surprise at the motive and object of those enquiries to which his answer was requested. Communications were opened with Sweden, with Holland, and with Berlin; at the latter place it was the wish of several distinguished persons to form a Society for the purpose of printing an edition of the Bohemian Bible, and £100 was voted from the British and Foreign Society on this condition, in aid of this most desirable and necessary object. The most remarkable circumstance elicited by this general correspondence by the Society's agents through different parts of the continent of Europe, was an address from a Roman Catholic clergyman in Suabia, indicative of an improved temper in the members of that church, and the harbinger of a better understanding than had hitherto subsisted between them and their brethren of other denominations. The concluding paragraph in the letter of this excellent Roman Catholic divine to the Committee of the Protestant Bible Society, is so unique that it deserves an introduction into our pages.

'Now, I beg you, my dear brother in Christ, to receive these few lines in love. I wrote them, trusting it might be acceptable to your venerable Society. I cannot express in terms sufficiently strong, the fervency of my joy and of my love towards all who, throughout England, heartily believe in Jesus Christ as their only Saviour, and zealously endeavour to extend the Redeemer's kingdom. I embrace them all as the beloved and elect of God, as friends and brethren in Christ,

let them be of whatever name, or belong to whatever church or denomination. The more distant the countries, and the more different the outward forms and establishments are, the more I rejoice, if I am privileged to hear that an ever faithful Lord and Saviour is gathering from among them a flock of believing people. Truly God has a numerous *army of reserve* in England, who do not bow before the Baal of the age, nor sacrifice to the god of the times. Let all who know his name, glorify him for his mercy! May the peace of God, and the all-sufficient grace of our Lord Jesus Christ, be with you all.' This letter the Committee regarded as an invitation to occupy a field from which they had considered themselves as altogether excluded, and they resolved to place 1000 copies of the Protestant New Testament, then printing at Nuremberg, at the disposal of this zealous correspondent, for distribution by sale or gift among the Roman Catholics of Suabia and Bavaria; and directed him to be assured of their sincere disposition to afford the members of his communion every degree of aid consistent with the principles and means of the institution. These transactions comprehend every thing which it is material to record, in the history of the Society's attempt to establish a system of foreign relations, from its commencement to the month of December 1804.

In the meantime, the measures adopted for supplying the inhabitants of the united kingdom with the Scriptures in the English and Welsh languages, continued to be prosecuted with unabated vigor; and advanced as rapidly as, from the more tardy process of casting the stereotype plates, and other impediments inseparable from the execution of great and important concerns, could be reasonably expected.

Things had attained this state, when an incident occurred which afforded the Society an opportunity of making the first application of its funds to the printing of a portion of the Scriptures in a foreign language, under its own immediate direction. Captain John Norton, chief of the Mohawk Indians, who inhabit Upper Canada, was then in England, and, having become a decided convert to Christianity, he undertook the translation of the Evangelist John into their tongue. After due investigation of the claims of his translation, it was accepted by the Committee, and forthwith printed. By this act a very important portion of the sacred book was put into the hands of more than 8000 souls, who were allies of the British government.

About this period also the foundation was laid for that biblical library, which, by gradual accumulation, is now become considerable and important. It was determined that of every edition or translation of the Holy Scriptures, or of parts thereof, printed under the auspices of the British and Foreign Bible Society, six or more copies should be transmitted to be lodged in its depository; and that an appeal should be made to the community at large, through the medium of certain daily newspapers, and periodical publications of character, soliciting donations of Bibles, Testaments, or portions of the Scriptures, in the ancient and modern languages. The first fruits of this determination were a munificent

present from Granville Sharp, Esq., of thirty-nine copies of the Holy Scriptures, or certain portions of them, in various languages, together with the Irish and Italian versions of the English liturgy.

The commencement of the year 1805 was rendered memorable in the annals of the Society by a serious and protracted discussion, relative to the text at that time preparing for the purposed edition of the Welsh Bible. This discussion was begun by imputations thrown upon the integrity of the agents on whom the Society devolved the task of carrying this valuable undertaking through the press. The accuser was a Rev. J. Roberts, described by the Rev. Dr. Gaskin, as 'a very respectable clergyman and eminent Welsh scholar, who had been employed by the Society for Promoting Christian Knowledge, in correcting the press of the last Oxford edition of the Welsh Bible.' The charge of this Rev. censor, which, through the medium of Dr. Gaskin, as Secretary of the Society for Promoting Christian Knowledge, was transmitted to all the Bishops whose names appeared as Vice-Presidents of the British and Foreign Bible Society, amounted to this, 'That improper alterations had been made in the present orthography of the Welsh version of the Bible.' Trifling and vexatious as the imputation on the face of it must have appeared, especially considering the quarter in which it originated, it was nevertheless very patiently and impartially examined. The result is before the public in the Rev. Mr. Dealtry's 'Vindication of the British and Foreign Bible Society.' It is highly honorable in all respects to the Rev. Mr. Charles of Bala, who had kindly proffered his services to the Society, to prepare a copy of the Welsh Scriptures for the press. And now that the fact is ascertained, that the new Society are engaged in vigorous operations to meet this emergency, the tardy Bartlett's Buildings Society, jealous of its upstart rival, announces a resolution of 'the Board,' passed on March 12th 1805, to print 20,000 Welsh Bibles from its former edition of 1746, which they subsequently altered to that of 1752. Accusing at the same time the British and Foreign Bible Society of rivalry and opposition to the Society for Promoting Christian Knowledge, because they had directed their first efforts to relieve that specific moral necessity which had been the principal reason for the formation of their Society. The Bible Society, however, in this as well as in all its subsequent conflicts, was triumphant. Mr. Charles was exonerated from the suspicion of attempting or intending any change in the translation, and the Committee expressed their real satisfaction in having been able to show that the confidence reposed in him had been amply justified. The charge of rivalry fell pointlessly to the ground, when it was clearly shown, that the first order for printing an edition of the Welsh Scriptures on account of the Bible Society was dated on the 3d of September, 1804; and that the first information which the Committee of that Society received, that the Society for Promoting Christian Knowledge had come to a resolution at their last meeting to print an edition of 20,000 Welsh Bibles, was made, in the words of the quotation, by a member of both

Societies, on the 18th of March, 1805. 'The spirit of rivalry in this case' says Lord Teignmouth, 'must have been prophetic.' But, to end all dispute, and to prove to the venerable Society, that the more recent institution, which she regarded with such unreasonable jealousy, had no sinister interest to serve, no envy to indulge, no vanity to gratify, the Bible Society resolved to supersede their own revised copy, and to adopt the text of their opponent as the foundation of their projected edition.

About this time intelligence was received from Bale, in answer to the communication addressed to that place, inviting its inhabitants to co-operate with the British and Foreign Bible Society in the advancement of its foreign objects. The parties who had been addressed, announced their willingness to adopt the proposal of forming a Bible Society for their town and vicinity; but added, that from local difficulties, they were not yet in a condition to proceed to such an establishment; they had therefore determined, under present circumstances, to unite their exertions with those of their brethren at Nuremberg. An interesting letter was also transmitted from the Rev. Mr. Oberlin, minister of a parish in Alsace, containing five villages, and embracing a mixed religious population of Roman Catholics, Lutherans, Reformed, and Baptists. Mr. Oberlin had been supplied with funds from England for the purchase of French and German Bibles, intended for distribution, and this was the occasion of his writing to the Society, through the medium of its foreign secretary.

Coincident with the receipt of these communications from Germany was that of the first regular information relative to the design entertained by the Baptist missionaries at Serampore, to engage in an extensive system of Oriental translations: it was a letter from Mr., now Dr. Carey at Calcutta, to the secretary of the mission, the late Rev. Andrew Fuller; and it represented the missionaries as already employed on four languages, and as possessing considerable advantages, should they be adequately supported, for translating the Bible into all the languages of the East.

Such was the state to which things had arrived, in both the domestic and foreign department, when a publication appeared, which opened upon the Society the first of those many attacks by which it was destined to be assaulted. The title of this publication, was, An Address to Lord Teignmouth, President of the British and Foreign Bible Society, occasioned by his Address to the Clergy of the Church of England; by a Country Clergyman. At this distance of time, and when so much of the effervescence of irritated feeling has passed off, we cannot but wonder at the mighty stir which this most puerile and insignificant pamphlet was the means of exciting. It was hailed by the ultra-orthodox among the clergy as a composition of great 'pith and moment.' It was circulated with matchless industry, and the following postulates of this modern ecclesiastical Locke, were repeated with a solemnity, and a confidence, which rendered dissent something worse than heresy.

'Christian charity no where recommends asso-

ciations of discordant principles, combinations of men professedly at variance, and in hostility, with each other; but Christian charity enjoins that which renders all these elaborate societies useless; it teaches and obliges Christians to be like-minded, to have one faith, one baptism, one speech, and one hope of their calling.'—*Address*, p. 11.

'It is to be expected that each member of your heterogeneous society will raise his portion of books for the promotion of his particular opinions; for it is easily seen, that a Bible given away by a Papist, will be productive of popery, the Socinian will make his Bible speak and spread Socinianism, while the Calvinist, the Baptist, and the Quaker will teach the opinions peculiar to their sects. *Supply these men with Bibles (I SPEAK AS A TRUE CHURCHMAN), and you supply them with arms against yourself.*'—*Ibid* p. 13.

A meeting was convened at London House, which was composed of lord Teignmouth, the bishops of London, Durham, and Exeter, and the Rev. John Owen, the clerical secretary of the institution. The formidable bill of indictment was produced, and poor Lord Teignmouth and Mr. Owen put upon their defence. The latter allayed the apprehensions of the venerable conservators of the church's safety, and, with a meekness and earnestness which did them honor, they requested Mr. Owen to undertake the defence of the Bible Society, against its weak, yet evidently malignant opponent. Thus urged, Mr. Owen yielded a ready compliance, and in the course of three weeks brought before the public a pamphlet entitled 'A Letter to a Country Clergyman, occasioned by his address to lord Teignmouth, &c. by a Suburban Clergyman.' In this production Mr. Owen appears to the greatest advantage as a controversialist, a gentleman, and above all as a christian.

The first anniversary of the Society was celebrated on Wednesday the 1st of May, 1805, at the New London Tavern, Cheapside. 'The scene presented on this interesting occasion,' says Mr. Owen, 'was distinguished by features which gave it an irresistible influence over the kindest and most elevated affections of the heart.'

The society now became more extensively known, the subject of more general enquiry and discussion; and its patrons and friends multiplied in full proportion. In Wales the spirit diffused itself with great rapidity. In Scotland the co-operation became more extended and organised; and during the year 1806 The Society incorporated by royal charter, for Propagating Christian Knowledge, being invited to patronise and co-operate with the British and Foreign Bible Society, cordially assented to the proposal. Ireland was not neglected; though she required more to interest and excite her into action, on account of her ignorance and spiritual degradation; yet intelligence was conveyed across the channel, correspondence with many influential persons was carried on, and thus a foundation was laid for that superstructure which shortly after indicated so rapid a progress.

Every month added something to the increase

of its strength on the continent; a Roman Catholic Bible Society, roused by the example of the Protestants at Nuremberg, was established at Ratisbon under the superintendence of the Rev. Mr. Wittman, director of the ecclesiastical seminary in that place. The address of this truly pious divine to Christians of the Roman Catholic persuasion throughout Germany, is peculiarly simple, liberal, and devout. We must refer however to Mr. Owen's History, for a perusal of this invaluable document, vol. i. page 174.

At Halle in Saxony, the Society's application about this time began also to take effect. And the Rev. John Janicke, stimulated by the example of Nuremberg, and encouraged by the generous proposal of the British and Foreign Bible Society, exerted himself with so much judgment and perseverance, that the foundation of a Bible Society was laid in Berlin in the commencement of 1806, under the direction of some noblemen and other persons of great distinction and exemplary character.

In the meantime, the wants of Great Britain were neither forgotten, nor lightly considered. Much exertion was made to accelerate the production of some fruits from the stereotype press, in order that the desirable business of distribution might commence among the necessitous part of the British population. This object was obtained in September, 1805, when an impression of an octavo English Testament was announced as ready for delivery, and the work of distribution commenced without delay.

The Dublin Association was also assisted, as were subsequently the Naval and Military Bible Society in London, and certain other religious institutions; by being permitted to share with the British and Foreign Bible Society in its advantageous arrangements with the University of Cambridge: and every opportunity was eagerly embraced of supplying, both directly and indirectly, the scriptural wants of the country, and of exciting attention to the importance of reading and dispersing the lively oracles of God. One of the earliest and most beneficial results from the distribution in Ireland, combined with other exertions of a similar description in that country, was the establishment of a Bible Society at Dublin.

The attention of the Society was about this time excited to the consideration of the Gaelic Scriptures. Representations were transmitted from persons of credibility, stating that in the Highlands of Scotland very few persons were in possession of a complete Bible; that among those who possessed a single volume of the four in which the Scriptures had been published, the proportion did not exceed one in forty; that the price of a complete copy was beyond the ability of the poor to purchase it; and that, in fact, it was not easily procurable at any price. It was added, that, in the island of Sky, containing about 15,000 persons, scarcely one Gaelic Bible was to be found.

It further appeared, on the authority of an Address, delivered in May, 1803, by the Secretary to the Society in Scotland for Propagating Christian Knowledge, that out of 335,000 persons in the Highlands, 300,000 were considered

not to understand any other language than the Gaelic, so far at least as to comprehend a book written, or a continued discourse.

After due enquiry, and deliberate discussion, the Society resolved upon the measure of furnishing the Highlanders with an impression of the Gaelic Bible from an universally accredited text.

Shortly after the business of the Gaelic Bible had been taken up, the case of the numerous prisoners of war was brought under the Society's consideration, and excited a very lively sympathy in their favor, and a strong disposition to administer to their relief; and now was a beginning made in that department of beneficence, which afterwards occupied so greatly the labors of the Society, and by means of which its spiritual bounty was conveyed to so many receptacles of ignorance, misery, and vice.

This, perhaps, is the most appropriate place in which to explain the nature and operation of the Auxiliary Societies and Associations, which, commencing in London in 1805, have done more to secure the prosperity of the British and Foreign Bible Society, than all the other means put together, which wise and enlightened benevolence has yet been able to devise.

AUXILIARY SOCIETIES were the first in order; these, it was proposed, should unite the energies of a county, or a large district. Each Auxiliary to possess its own patrons, president, treasurer, and secretaries, and to transact its own business upon the fundamental principles of the Parent Institution; securing to all its members the same privileges. These auxiliaries were to receive subscriptions, and to distribute copies of the Scriptures at cost, or reduced, prices, or gratuitously, as they might deem necessary; and after deducting from the aggregate contributions of the year the sums they expended, to transmit the remainder, through the treasurer, to the general fund in London. When it was found that the extent of a county was too great, or its towns and villages too numerous to be easily managed by the Auxiliary, Branch Societies originated, connecting themselves with their respective auxiliaries, just as these were connected with the Parent Society. But the grand instrument was yet wanting, that which should combine the greatest moral good with the most astonishing augmentation of pecuniary support. This was the principal of Local Associations, which was no sooner applied, than the happiest results immediately followed. The association was designed to embrace the pence of the poor, in the form either of weekly deposits, for the purchase of Bibles, which they received from the Committee, as soon as these deposits amounted to the stipulated price; or of free subscriptions, which, it was believed, the pious poor would take the greatest delight in contributing, and thus advancing the cause, according to their ability, in the success of which they were equally interested with their more opulent brethren; but from the promotion of which, they had hitherto been excluded by their poverty. Where there existed Branch Societies, the associations were to transmit their funds to that in their immediate vicinity; if not, to their county or district auxiliary.

VOL. IV.

deriving from them their required supplies of the Scriptures. By this admirable system, the moral benefits and the pecuniary resources of the British and Foreign Bible Society, were happily united. The benevolence of all classes of the community was laid under requisition; while the worst abuses likely to arise from indiscriminate and gratuitous distribution of the Scriptures were effectually guarded against. It was not, however, matured at once; during the first six years of its history, the society received comparatively but little support from its auxiliaries, and it was not till a much later period that local associations for the poor were organised.

Early in the year 1806 an attempt was made, as it afterwards appeared, by the same individual, who, under the title of a country clergyman, had before violently assailed the society, to detach from it the countenance and support of its episcopal patrons. The attack was in the form of a letter to the bishop of London. The writer, no doubt, presumed upon the natural timidity of his lordship's character, and it is really distressing to perceive how such a mind as that of Porteus could be affected by the insolent abuse of an anonymous calumniator; affected to such a degree as to vacillate between supporting and abandoning an object, which he had deliberately espoused upon principle, merely because it was united with the additional merit of having provoked the blind and bigotted hostility of a Papist in disguise. Mr. Owen too was all apprehension and terror; and we are not to wonder at his trepidation, when we consider how well he was acquainted with the difficulties which had been surmounted, in attaching to the society its episcopal patronage, and the conviction which he felt that the loss of that patronage would have involved 'the institution in certain and irremediable destruction.' But thousands now felt the delightful assurance, that the success of the Bible Society depended neither upon the smiles of episcopacy or presbyterianism. It was the badge and the glory of the catholic church, and was identified with the churches of England, Scotland, Rome, or any other churches upon the face of the earth, only so far as they cherished a catholic spirit.

We must pass on rather hastily over the subsequent years of the Society's labors and successes, referring our readers, for more detailed and minute statements, to the very full, though somewhat tedious, volumes of Mr. Owen, and to the annual reports of the institution itself. From 1806 to 1809 the Society gradually advanced in public favor, and in more extended usefulness. Under these auspices, and patronised by the king of Prussia, an edition of the Bohemian Bible, amounting to 3000 copies, was put to press. To Königsberg, the capital of Prussia, and to the province of Jethuania, containing a population exceeding a million of souls, the Society devoted much of its attention, and prepared the way for active operation. The case and circumstances of the inhabitants of Iceland passed also under their review, and measures were adopted to furnish this interesting and destitute people with the sacred Scriptures; the Society offering to defray half the expense of an edition

of 5000 Icelandic Testaments. It was at this time, and arising out of circumstances connected with this last measure, that the Society became acquainted with two of their most zealous and indefatigable agents, who for several years effectually promoted their interests in the northern parts of Europe. The Rev. Messrs. Pater-son and Henderson, during the year 1806 penetrated into Russia, in connexion with Karass, a missionary settlement to the north of the Caspian Sea. The missionaries occupying that station were the Rev. Henry Brunton and the Rev. Robert Pinkerton: these gentlemen, with their associates, having been induced to undertake the translation of the New Testament into the Turkish and Tartar dialects, applied to the British and Foreign Bible Society, in order to obtain encouragement and aid towards the performance of so desirable an undertaking. The Committee, regarding the proposed work as pregnant with great and extensive advantages, determined to supply the translators with a new font of Arabic types, and a sufficient quantity of paper and ink, to enable them to execute an impression of 5000 copies. About this time the Committee opened a correspondence with archbishop Plato, the metropolitan of the Greek church in Russia, with a view to interest that eminent and learned prelate in measures for promoting the circulation of the Scriptures in Russia. The application was successful, and the most promising field that was ever opened to the labors of any benevolent institution, presented itself, on this occasion, to the Bible Society. It was occupied for several years, and with the most encouraging tokens of success. The Society's exertions were likewise directed to the French at St. Domingo, the Spaniards at Buenos Ayres; to the British settlers, soldiers, and colonists, in North America; to the Cape of Good Hope, New South Wales, and Van Diemen's Land; to the felons and other prisoners in Newgate; to the case of Mahomedans and heathens whose spiritual instruction, too long overlooked by the bulk of European Christians, had begun to awaken in the breasts of a few the emotions of sympathy and anxious consideration.

Dr. Carey having introduced to the Society the scheme of Oriental Translations, so nobly projected by the Baptist missionaries at Serampore, and Dr. Buchanan's Memoir on The Expediency of an Ecclesiastical Establishment for British India, having furnished the additional, and very important information, that, 'under the auspices of the College of Fort William, the Scriptures were in a course of translation into almost all the languages of Oriental India,' it was determined to appropriate £1000 to an object, in all respects so deserving of encouragement and aid; and a grant to that amount was accordingly made. A regular intercourse now commenced between the conductors of the British and Foreign Bible Society, and the leading friends of Christianity in the heart of British India; and it appeared to the former in a high degree desirable to take all practicable steps in order to cherish and improve the connexion. With this view, a second grant of £1000 was made on the 4th of May, 1807; and on the 15th

of June, it was further determined to send 500 English Bibles and 1000 Testaments, from the London Depository, and 250 German Bibles and 500 Testaments, from the institution at Halle, for the use of the army and navy, and other Europeans in India.

It was about this time that the British and Foreign Bible Society conceived the design, of promoting a correct and acceptable impression of the Arabic Scriptures. The subject underwent very serious and repeated examination; and extended correspondence was carried on with the bishops of London and Durham, the professors of Arabic in both our Universities, and other persons of competent information, with a view to the ascertainment of a standard text, and such other points as required to be accurately known previously to a formal and conclusive determination. So many difficulties, however, combined to retard the execution of the purpose, that the Committee, finding their own plans altogether immature, and unwilling to sacrifice any further delay, determined to subscribe for 300 copies, as a temporary expedient.

In 1807 Mr. Twining published his attack upon the British and Foreign Bible Society, so far as their views were directed to India. This gentleman accused the Society of meditating an interference in the religious opinions of the native inhabitants of India; and denounced that interference as fraught with the most disastrous consequences to our possessions in the East. This brought forth an able refutation from the pen of Mr. Owen, who in his address to the chairman of the East India Company, occasioned by Mr. Twining's letter to that gentleman, undertook to prove, that neither in the *object*, the *patronage*, nor the *proceedings*, of the Society, was there any thing to justify the charge of culpable interference with the religious systems of India, or to authorise the apprehension of these alarming consequences to our sovereignty in the East, which had been so confidently predicted. Mr. Twining and his coadjutors were not satisfied either with this, or the various other replies which were written in defence of the missionaries, as well as of the Bible Society. They continued to fulminate an alarm, and were encouraged in their pagan and idolatrous zeal, by those gentlemanly Christians, the redoubted critics of the North. But though reason could not silence, time has rendered them false prophets; and they now stand corrected before the world, either as fanatics or impostors. A man should never pretend to prophecy unless he can work miracles. Mr. Twining was no conjurer, and hence the Edinburgh Review for once ceased to be oracular. The noble president of the Bible Society followed on the same side of the question, by publishing his *Considerations on the Practicability, Policy, and Obligation of Communicating to the Natives of India the Knowledge of Christianity*; with *Observations on the Prefatory Remarks to a Pamphlet*, published by Major Scott Waring, by a late resident in Bengal. Of this production, Mr. Owen justly says, 'It would be difficult to speak in terms proportioned to its merits, without incurring the suspicion of a design to write its panegyric.' Controversy neither suspended the exertions of

the Committee, or weakened the favorable impressions which the Bible Society had already produced on the public mind. Both at home and abroad, the great cause gradually and silently extended its influence, so that in April 1810, that is six years after its establishment, thirteen auxiliary societies were formed in various parts of the kingdom, while at Basle, Berlin, and Stockholm, the Scriptures were widely circulated in different languages; beyond the Atlantic, fields of useful exertion presented themselves. Philadelphia took the lead, and an efficient Bible Society soon obtained an establishment in that city. The example thus set was soon followed, and in the course of the first year from the commencement of the Philadelphian Institution, six kindred establishments were formed: the Connecticut Bible Society at Hartford; the Massachusetts, at Boston; the New Jersey, at Princeton; and three at New York, under the respective designations of The New York Bible Society; and The New York Bible and Common Prayer-book Society.

Now commenced the Wordsworthian controversy, designed by the assailant of the Bible Society, the Rev. Dr. Wordsworth, dean of Borking and chaplain to the archbishop of Canterbury, to withdraw the patronage of the established clergy from the institution. The ground of objection assumed by this dignified person, was singular enough, and, but for various reasons unconnected with the literary controversy, an uninformed reader might very innocently have hailed Dr. Wordsworth as a friend of the Bible Society, supporting its claims, and covering its enemies with ridicule by a severe ironical attack.

This learned adversary of the Bible Society assumed, that the great cause of Christian knowledge, the inestimable interests of piety, and peace, and true religion, would be injured and retarded by the Bible Society; because the support which the clergy and others might be disposed to render to that institution, would withdraw from the Society for Promoting Christian Knowledge, funds which would otherwise be appropriated to its support. We can only refer our readers to the answers which this weak and puerile work elicited from Lord Teignmouth and the Rev. Mr. Dealtry. Unfortunately for Dr. Wordsworth, he had assumed, what he was not prepared to prove, and which was instantly refuted by the facts of the case. The greatest benefactor the Society for Promoting Christian Knowledge ever had, both as it regards the augmentation of its receipts and the increase of its zeal, is unquestionably the Bible Society. Mr. Dealtry, by a comparison of the average receipts of the Society for Promoting Christian Knowledge, for four years preceding, with those of the five years immediately succeeding the establishment of the British and Foreign Bible Society, draws this general conclusion:—

‘Not only have the receipts and subscriptions increased, but the rate of increase has been greatly accelerated since the establishment of the Bible Society; and it should be particularly observed that the funds and subscriptions of *both Societies* received their greatest augmentation in the same

year; viz. in the year ending March 1809.’ We are constrained, with great reluctance, to abandon the form of narrative in our account of the further progress of this wonderful moral engine, the British and Foreign Bible Society, and to refer to the dry figures, and statements of its own reports, for what it has received and what it has achieved, in extending its influence and in circulating the Scriptures in the different languages of the world, from the year 1810 to the present period. It is incumbent upon us, however, very briefly to notice the controversies which have marked this portion of its history.

In the summer of 1810, the Rev. Dr. Wordsworth made his second appearance as an opponent of the Society, in a letter of 157 pages, addressed to Lord Teignmouth, president of the British and Foreign Bible Society, in vindication of reasons for not becoming a subscriber to that institution. To this elaborate and extended diatribe, written with some warmth of temper, and calculated by the station of its author, the massiveness of its bulk, and the pomp and circumstances of its subscription—implying that it was composed within the walls of ‘Lambeth palace,’ and finished on ‘St. Peter’s day,’—to produce no inconsiderable impression. The Rev. Mr. Dealtry replied, in a volume replete with sound information, solid argument, and acute and eloquent retort. ‘If, says Mr. Dealtry, addressing Dr. Wordsworth, ‘from the 157 pages of your pamphlet, I were to subtract the observations which are merely personal,—the discussions which are utterly irrelevant,—the multiplicity of bodings, which it is not difficult to make on all subjects,—the mistakes in fact, and the fallacies in reasoning,—the conclusions without proof, and the conjectures without probability,—I cannot but remark, that the argument would be shortened, and its effect diminished, in a degree hardly calculable.’ This description of Dr. Wordsworth’s Letter, a description by no means exaggerated, will account for the length into which Mr. Dealtry felt himself compelled to go in his ‘Vindication of the British and Foreign Bible Society.’ The discussion having been, for the most part, controversial, both in matter and in tone, it would answer no good purpose to exhibit it, either in detail or analysis. Of Mr. Dealtry’s ‘Vindication,’ however, it must be said, that it was a seasonable and masterly publication: it took in the whole scope of the question, and sifted to the bottom all the objections relevant and irrelevant which Dr. Wordsworth and others had advanced; and while it raised the character of the writer, it contributed very greatly to establish the growing reputation of the British and Foreign Bible Society.

On the 12th of December, 1811, the important name of Cambridge was added to the list of Auxiliary Bible Societies; but the accomplishment of this object, so honorable to the parties with whom it originated, as well as to those by whom it was conducted to its issue, was not, however, effected without experiencing a very formidable and decided opposition.

This opposition proceeded from the Rev. Dr. Marsh, Margaret Professor of Divinity; a person

of considerable learning, dexterous abilities, and profoundly versed in the tactics of controversy. In an Address to the Senate, the professor contrasted the British and Foreign Bible Society with the Society for Promoting Christian Knowledge, and contended that the latter was entitled to exclusive encouragement and support. The opening of the professor's address, though sufficiently ingenious, and adapted to ensnare the unwary, was certainly constructed too much on the model of a recruiting advertisement, to be worthy of a cause wherein accuracy of statement and dignity of manner were peculiarly required.

'We have at present,' says the professor, 'two very extensive Bible Societies, the one founded in 1699, the other in 1804. Both of our archbishops, and all our bishops, with the prince regent at their head, are members of the former: neither of the two archbishops, and only a small proportion of the bishops, are members of the latter.'

From the constitution of the two Societies, and their respective objects, the professor contends, that 'our encouragement of the ancient Bible Society must contribute to the welfare of the established church;' while, 'our encouragement of the modern Society, not only contributes nothing to it in preference to other churches, but may contribute even to its dissolution.'

To this Address, which formed the text-work for much of what was said on the 12th of December, a reply was produced by the right honorable N. Vansittart, then chancellor of His Majesty's exchequer; and 1000 copies of it were printed, and on the recommendation of his royal highness the duke of Gloucester, were distributed among the persons assembled at the formation of the Cambridge Auxiliary Society.

For this reply from a member of the University of Oxford, the cause was indebted to the somewhat indiscreet zeal of the author of the Address; the occasion of it is thus explained by Mr. Vansittart, in the introduction of his Letter.

'Dear Sir,

'I beg to return you my best acknowledgments for the communication of your Address to the Senate of Cambridge; which I the more strongly feel as a mark of your kind attention, as I have not the honor of belonging to that university, and as it is a considerable time since I have been so fortunate as to have had an opportunity of meeting you, you were perhaps not aware that you were sending your Address to a member of the British and Foreign Bible Society; but I accept as a proof of kindness your candid and friendly admonition, which affords me an opportunity of justifying myself to you as a church of England man, for contributing my assistance to that institution. I never, indeed, before thought it necessary to offer any apology for so doing; for though I was aware, before I engaged in the Society, that it had been represented as dangerous to the church, it appeared to me that this charge had been so completely refuted, that it is with no less surprise than regret that I now learn that you still think it well founded.'

Of the reply itself, it may be affirmed, in general, that it contains, within a small compass, a clear and satisfactory refutation of the charges

advanced by the learned professor against the principle and tendency of the institution. The style is chaste, the sentiments pious and liberal; and the Letter is characterised throughout by such a tone of candor and urbanity, as either to make the reader forget that he is perusing a controversial pamphlet, or to induce him almost to be in love with controversy. But it will be necessary to advert to a few particulars.

The professor had described the Society as deficient in patronage. On this topic Mr. Vansittart thus observes:—'Among the vice-presidents are already numbered one of the archbishops of Ireland, and five English, and two Irish bishops. I doubt whether the Society for Promoting Christian Knowledge, which now, as you observe, enjoys the countenance of the whole episcopal bench, was, at so short a period from its formation, honored with the support of so large a body of the prelates; and I should hope the time might not be far distant, when the two Societies may equally flourish under the general patronage of them all.' To the objection against the principle of associating with Dissenters, and its probable injuriousness to the interests of the Church, the right honorable author thus judiciously replies:—'The co-operation of Churchmen and Dissenters in religious matters, so far as they can conscientiously co-operate, seems to me one of the most efficacious means of lessening both the political and religious evils of dissent. It dispels prejudices, promotes candor and good-will, and must prepare the mind for the reception of that truth which every one perceives to be no less the object of those who differ from him than his own: from such a communication the church of England has nothing to fear, and every thing to hope: as holding (in our judgment at least) that middle line of truth in which all opposite opinions have a tendency to coincide.' 'And is that truth,' Mr. Vansittart asks, 'more likely to be acknowledged and embraced, by minds embittered by mutual jealousy and aversion, or by such as have been previously softened by conciliation?' With regard to the measure recommended by the professor,—that all Churchmen should withdraw from the Society, and leave it wholly in the hands of the Dissenters—Mr. Vansittart shows, that it is fraught with inevitable mischief. 'If anything can make the Society dangerous, this must do it; because there can be no check to any sectarian spirit which might introduce itself, and which must be unavoidably irritated by so harsh, and, I think, so unjust an indication of jealousy.' One of two consequences, Mr. Vansittart contends, must result from such a proceeding; either the reduction of the Society to utter insignificance, an evil sorely to be deprecated, or the future administration of it in nearly the same manner as before, by augmented zeal, activity, and exertion on the part of the Dissenting interest. 'This latter alternative,' he observes, 'is to transfer to Dissenters all the honor and influence of whatever has been done, and whatever may be done, by an institution the dawn of which is so glorious, but which is visibly rising into brighter day. Shall it be said,' asks Mr. Vansittart, 'that the Dissenters alone

have carried the word of God to every nation under heaven? Or shall the church of England continue to claim the leading part in this important work? And can the church of England stand so secure upon a narrow and exclusive policy, as by deserving the blessing and uniting the prayers of all people, nations, and languages?

To the general tendency of the professor's advice Mr. Vansittart opposes the following admirable statement and most salutary counsel. 'The existence of dissent will perhaps be inseparable from religious freedom, so long as the mind of man is liable to error; but it is not unreasonable to hope, that hostility may cease where perfect agreement cannot be established. If we cannot reconcile all opinions, let us endeavour to unite all hearts.'

These arguments, Mr. Vansittart observes, had induced him to consider his taking a part in the concerns of the Bible Society, not only consistent with, but a proof of, the sincerity and warmth of his attachment to the church of England; and 'far from repenting,' he adds, 'of what I have done, I feel convinced I shall least of all repent of it as I approach that state in which the distinction of Churchman and Dissenter shall be no more.'

In the following year, the Margaret Professor, author of the Address which we have thus summarily dismissed, produced his threatened Strictures on the Principles of the British and Foreign Bible Society, in an elaborate pamphlet, entitled, 'An Enquiry into the Consequences of neglecting to give the Prayer Book with the Bible, interspersed with Remarks on some late Speeches at Cambridge, and other important matters relative to the British and Foreign Bible Society.'

The appearance of this publication was greeted with numerous replies; and its fallacies were exposed, among others, by the caustic pleasantry of Dr. Clarke, the vigorous animadversion of Mr. Dealtry, the conclusive reasoning of Mr. Otter, and the luminous refutation of Mr. Vansittart. To these advocates, was added the Rev. C. Simeon, who, in the preface to Four Sermons on the Liturgy, very ably defended both himself, and the clerical members of the British and Foreign Bible Society, against the accusation conveyed through the assumption upon which the hypothesis of the professor was built.

The amount of what was stated in these several replies sufficiently evinced that the Society for Promoting Christian Knowledge had greatly augmented the number of its subscribing members; that the issue of Prayer-Books, both from that Society and other sources, had largely increased; and that there was every encouragement to conclude, as well from experience as from the reason of the thing, that, by a steady co-operation on the part of the church members of the Society, both the honor and the interest of the church would keep pace with the reputation and prosperity of the institution.

In connexion with those writers, who met the Professor's 'Enquiry' with direct replies, may be mentioned the Rev. Robert Hall, who, in a

speech of extraordinary ability at the Second Anniversary of the Leicester Auxiliary Bible Society, on the 13th of April, 1812, gave to every thing that was deserving of notice in that attack, a most acute and masterly confutation.

The Professor's subsequent attacks required little refutation; and the friends of the Society left them unanswered to their fate.

Now started up Dr. Edward Maltby, a clergyman of the protestant church of England, whose objection to the Bible Society was of a very different character to that of his predecessors; these had contended, that in giving the Bible, the Society gave too little; the object of this assailant was to prove, that in so doing the Society gave too much. 'The whole Bible ought not, in his opinion, to be given to the bulk of the people.' According to this Protestant-papist, 'out of sixty-six books, which form the contents of the Old and New Testament, not above seven in the Old, nor above eleven in the New, appear to be calculated for the study or comprehension of the unlearned.'

Against this attack, which threatened to reduce the Bible, in the hands of the common people, to less than one-third of its former dimensions, the British and Foreign Bible Society, or rather Christianity itself, was very ably defended by the Rev. J. W. Cunningham, Vicar of Harrow.

To the Observations of Mr. Cunningham, the author who had provoked them made no reply. He was not, perhaps, aware of the mischievous consequence of his theory, till he saw them so acutely exposed; and he very judiciously abandoned his pamphlet to the fate it deserved, and which, in the hands of Mr. Cunningham, it could not be expected to escape. If Dr. Maltby had not shown his respect for Christianity by a work of no ordinary merit, in its illustration and defence, he would have laid himself open to the suspicion of no very friendly designs towards our holy religion, and the institutions by which it is promoted. But, in fact, the cause of the Society is that on the side of which the Scriptures, and every church which professes to be founded upon them, are decidedly ranged; and they who will oppose it, can find no other weapons to employ against it than such as 'have been undeniably forged in the camp of the Philistines.'

We do the next opponent too much honor, by introducing him into our pages, and notice him not on his own account, but simply for the purpose of inserting the comments of the Bishop of St. David's, now of Salisbury, on a very contemptible performance, which bears upon its title-page the name of the Rev. Henry Norris, curate of St. John's, Hackney; and purporting to be a Practical Exposition of the Tendency and Proceedings of the British and Foreign Bible Society;—of this wretched Exposition the learned prelate remarks, that he 'holds it to be a most unjustifiable attack on the Bible Society;' adding, that 'it is so destitute of the demonstration which it professes to give, so defective in its premises, so inconclusive in its inferences, and so reprehensible in its calumnies respecting the church members of the Society, that it might be left to its own refutation.' A few skirmishes

in the public journals, and a warfare of a somewhat graver character, employed the champions of the Bible Society, at distant intervals, till the death of the Rev. John Owen, which sad event took place at Ramsgate, September 26th, 1822, in the fifty-seventh year of his age. It was obvious to the friends of the institution, as it was undoubtedly felt with deep chagrin by its enemies, that it gained ground with every past assault upon its character, while the opposition to it, increasingly divested of its pretensions to reason, truth and piety, became more and more enfeebled; strong only in prejudice and malignity. Mr. Owen lived to effect one of the greatest works ever achieved by man; and he was permitted to see that work triumph over the most formidable hostility. He died in the hour of victory; nothing can better illustrate his character, than the just tribute of respect which was paid to his memory by the Rev. Joseph Hughes, one of his surviving colleagues. See 'Attachment to Life,' a Sermon on the Death of the late Rev. J. Owen, M.A.

Hitherto amidst unrivalled prosperity, the British and Foreign Bible Society, through evil report, and through good report, had maintained its undeviating majestic course. If a storm occasionally raged without, peace and harmony prevailed within. The numerous and diversified energies which it attracted, it also combined; and when a world rose up in arms against it, it was irresistible in its might. Having survived opposition, and humbled and silenced its most powerful adversaries, it was everywhere greeted with applause. It had nothing to do but to concentrate all its wonderful resources upon its direct and legitimate objects. The field was won, and now all that was required was its occupation. Under circumstances thus auspicious, how deeply is it to be regretted, that conflicting interests and opinions should have arisen to distract its operations, and almost to threaten its extinction. We trust that the day of extreme peril is past, and that the cause which has brought so many differing parties to coalesce, will at length allay the ferment which has been excited; and once more unite hearts, if it cannot reconcile opinions. We refer, and we do it with sincere pain, to the controversy in the Bible Society, respecting the Apocrypha: we think that there ought never to have been a question as to the simple and legitimate principle on which the Society was constituted. If the Bible was to be the band of union, and if, jealously to guard against the possibility of breaking it, the condition was subjoined that it should, in every case, be without note or comment; it surely never could have been in the contemplation of its original founders to circulate any thing but what was inspired, or, at least, accredited by all the parties united, as the word of God. The simple principle of diffusing the Scriptures alone was adopted, among other reasons, chiefly because it would for ever close the door of controversy, by leaving nothing to be discussed; because the Scriptures offered common ground which Christians of all denominations could occupy, without compromising their peculiar and respective tenets.

Now, we are of opinion, that a society thus constituted, has as much right to circulate Protestant prayer books, popish legends, and Hindoo shasters, as Jewish legends and apocryphal fables. That is, they have no right to do either; for when they circulate with the Scriptures, which all consider of equal authority, writings which one of the parties associated on the common principle deny to be sacred; they break faith with the public, and violate the solemn pledge which was laid down as the only foundation of their union. In this view the proceedings of the Committee of the British and Foreign Bible Society, in conniving at the circulation of the apocryphal books, or aiding that circulation with their funds, appears to us decidedly inconsistent. Still we think that men may be inconsistent, without being so far criminal as to justify the withdrawal from them of public confidence. The circumstances of the case would perhaps have betrayed their most violent censors into the same inconsistency; and from the implacable spirit which some of them have discovered, we fear they would not have retraced their steps with the same humility. We believe that the Committee have abandoned the Apocrypha altogether; and are well satisfied with the following resolution, dated November 21, 1825: 'That the funds of the Society be applied to the printing and circulation of the canonical books of Scripture, to the exclusion of those books, and parts of books, which are usually termed Apocryphal; and that all copies printed, either entirely or in part, at the expense of this Society, and whether such copies consist of the whole, or of one or more of such books, be invariably issued bound, no other book whatever being bound with them; and further, that all money grants to societies or individuals, be made only in conformity with the principle of this regulation.' We only wish they had never adopted any other. But we acquit them of all sinister intentions; we have still confidence in their principles and management; and we are happy to believe that the connexion of the Society with the circulation of the apocrypha, has chiefly been incidental, indirect, or owing to circumstances which the Committee believed they could not prevent or control. While therefore we applaud the vigilance which detected the evil, and still more the magnanimous zeal which first remonstrated with the offenders, and afterwards brought the whole under the review of the public; we must deeply regret the extreme intemperance of language and spirit, and the illiberal acrimony, amounting to uncivilised rudeness and anti-christian intolerance with which some of the best men upon earth have been treated by their brethren on the other side of the Tweed. We willingly turn from this unhallowed conflict, which we would gladly terminate by bringing the parties under the influence of that divine benevolence which first brought them to love each other. While it was one and undivided this institution was truly great; but must dwindle into useless insignificance the moment it ceases to be girt with that charity which is the bond of perfectness.

BIBLIA, or **BIBLIA PETRARIA**, in a military sense, a machine used by the ancients for throwing stones or darts.

BIBLIANDER (Theodore), professor of divinity at Zurich, in the sixteenth century. He attempted a new edition of the Koran; the text of which he corrected, by collating the Arabic and Latin copies. To this edition he subjoined the life of Mahomet and his successors; and prefixed an apology, by way of preface, which has been much exclaimed against.

BIBLICI. See **BIBLISTÆ**.

BIBLIOGRAPHY, from *βιβλος*, a book, and *γραφω*, to write, a name which has been recently employed both in Great Britain and on the continent, to comprehend every thing that relates to books; and as every branch of knowledge is contained in them, by a strange kind of reasoning, **Bibliography** is made to denote a science which comprehends all the other sciences. One modern writer on the subject prefers the more general term **Bibliology**, which he divides into seven different heads, viz. 1. Glossology or the knowledge of languages. 2. Diplomacy, or the knowledge of writings. 3. *Biblioepia*, or the composition of books. 4. *Typography*, or the knowledge of printing. 5. *Bibliopoly*, or the knowledge of bookselling. 6. *Bibliography*, or the knowledge of books. 7. *Universal Literary History*. These various heads are branched out into innumerable subdivisions, embracing every subject to which the human mind has ever been directed.

Bibliography, in fact, to have any intelligible sense, should be confined to the bare description and arrangement of books, or the duty of an intelligent librarian. In such an arrangement it is certainly necessary to follow some general division of knowledge; but, for divers reasons, it cannot be proper to adopt that classification which results from a perfect acquaintance with the sciences. To consult the books of such a library it would then be requisite first to have read them. In the article **LIBRARY** we shall suggest some of the best practical considerations on this subject.

BIBLIOMANCY, divination performed by means of the Bible; otherwise called *sortes biblicæ*, or *sortes sanctorum*. It consisted in taking passages at hazard, and drawing indications thence concerning things future. It was much used at the consecration of bishops. It was a practice adopted from the heathens, who drew the same kind of prognostication from the works of Homer and Virgil. In 465 the council of Vannes condemned whoever practiced this art to be cast out of the communion of the church; as did the councils of Agde and Auxerre. But in the twelfth century we find it employed as a mode of detecting heretics.

In the Gallican church it was long practised in the election of bishops; children being employed, on behalf of each candidate, to draw slips of paper with texts on them, and that which was thought most favorable decided the choice. A similar mode was pursued at the installation of abbots, and the reception of canons: and this custom is said to have continued in the cathedrals of Ypres, St. Omcr and Boulogne, so late as the year 1744. In the

Greek church we read of the prevalence of this custom so early as the consecration of Athanasius, on whose behalf the presiding prelate, Caracalla, archbishop of Nicomedia, opened the gospels upon the words, 'For the devil and his angels.' Matt. xxv. 41. The bishop of Nice first saw them, and adroitly turned over the leaf to another verse, with was instantly read aloud: 'The birds of the air came and lodged in the branches thereof.' Matt. xiii. 32. But this passage appearing irrelevant to the ceremony, the first became gradually known; and the historian who has recorded the fact, remarks, that the church of Constantinople was violently agitated by the most fatal divisions during the patriarchate! Mr. Southey tells us, that both the celebrated founders of Methodism, Mr. Wesley and Mr. Whitfield, occasionally practised this method of deciding upon some of their earlier religious plans. For another kind of Bibliomancy, not very dissimilar, the כול Bath-Kol, or daughter of the voice, in use among the Jews, See **BATH-KOL**.

F. J. Davidius, a Jesuit, has published a Bibliomancy under the borrowed name of Veridicus Christianus.

BIBLIOMANIA, an extravagant passion for books, and particularly those called curious or rare, from whatever cause; or a desire for accumulating them beyond all reason and necessity; a passion at once well satirised and stimulated in the productions of the author of a modern work under this title.

BIBLIOTHECA, from *βιβλος*, a book, and *θηκη*, repository, properly signifies a library, or repository of books.

BIBLIOTHECA, in literature, denotes a collection of the treatises of various writers on a certain subject: thus, we have historical *bibliothecæ*, as that of Diodorus Siculus; mythological *bibliothecæ*, as that of Apollodorus; theological and sacred *bibliothecæ*, as those of Ravenellus; the *Bibliotheca Veterum Patrum*, or collection of the works of the early Fathers of the Christian church, published by Duport and others at Lyons, in 1677, in thirty folio volumes, &c. It is also used for a catalogue of the books in a library: such are the *Bibliotheca Thuanæa*, *Bibliotheca Du-Boisiana*, &c.

BIBLIOTHECA, in sacred literature, is applied to the books of the Old and New Testament, in respect to their excellency, and sufficiency for the uses of the Christian life.

BIBLIOTHECARIAN, or **BIBLIOTHECARY**, a librarian, or keeper of a library. The word is also used for the author of a *bibliotheca*, or a catalogue of books. In this sense P. L'Abbe, Gesner, Lipenius, Struvius, Fabricius &c. are celebrated *bibliothecarians*.

BIBLIOTHECARY, *βιβλιον*, a book, and *θηκη*, a repository; a place where books are deposited. The library *bibliothecary* is a librarian; *bibliolatory* is book idolatry.

What I said in my epistle to my reverend friend and master, Doctor James, the incomparably industrious and learned *bibliothecary* of Oxford, I profess still; but I hold those canons of the apostles uncanonical. Hall.

This invention of erecting libraries, especially here at Rome, came from Asinius Pollio, who, by dedicating his *bibliothèque*, containing all the books that ever were written, was the first that made the wits and workes of learned men a publicke matter, and a benefit to a commonweale. *Holland. Plinie.*

If to adore an image be idolatry,

To deify a book is *bibliolatry*.

Byron.

BIBLISTÆ, or **BIBLISTS**, an appellation given by Romish writers to those who profess to adhere to Scripture alone as the sole rule of faith, exclusive of all tradition, and the supposed authority of the church. In this sense, all Protestants are, or ought to be, biblists. The word among Christians, answers nearly to caraites or textuaries among the Jews. But it arose more particularly from the doctors being divided, towards the close of the twelfth century, into two classes, viz. the biblici, and the scholastici; the former were called doctors of the sacred page, because they explained the doctrines of Christianity in their manner by the sacred writings; their reputation, however, declined, and the scholastic theology prevailed in all the European universities till the time of Luther.

BIBLUS, βιβλος, in botany, an aquatic plant in Egypt, called also papyrus, of whose skin the ancient Egyptians made paper. Hence the Greeks gave the denomination of βιβλος to books.

BIBRACTE, in ancient geography, a citadel of the Ædii, according to Strabo; but Cæsar describes it as a town well fortified, large and populous, and of the greatest authority among that nation. Some consider it to be Autun, others, Beurect, or Bevray, four miles north-west of Autun, in the department of the Saone and Loire.

BIBROCI, an ancient people of Britain, who inhabited that part of Berkshire, now called the Hundred of Bray.

BICANERE, a principality in the north-west of Hindostan, the precise dimensions and limits of which are scarcely ascertained. It extends from about 27° 46' N. lat. to 29° 45', and from 72° 10' to 74° 15' E. long.; and its superficial area probably amounts to about 17,000 square miles. It is bounded on the north by the country of the Batties; on the east by the territories of Hurrianah and Shekhawuttee, in the province of Delhi; on the south-east by Jeypour; on the south-west by Jesselmere; and on the west by Bahawalpoor. This country is, in general, a sandy plain, and water extremely scarce; but, as this circumstance constitutes a means of defence against invaders, it is tolerably well cultivated, and produces camels and sheep. The rajah is of the Rajpoot tribe, tributary to the Jondpore rajah, though his subjects are principally Jauts. Vast tracts are occupied with hills and valleys of loose heavy sand; the former from twenty feet to 100 in height, shifting their position and altering their shape according to the influence of the wind; and, during summer, the moving sand frequently exhibits the phenomenon of the mirage, or threatens to overwhelm the exhausted traveller. But in the midst of arid tracts, the water-melon, a juicy fruit, grows in profusion, attaining the remarkable size of three or four feet in circum-

ference. The seeds are sown by the natives, and also grow wild. Water seems to be obtained only at immense depths.

The wild ass, famous for its speed and shyness, is often found here in herds. Antelopes and foxes are also seen in some parts. Of domesticated animals, horses, bullocks, and camels, are in great abundance; especially the last. The population is very scattered and uncertain. The rajah's military force amounts to about 10,000 men.

BICANERE, the capital of the above district, is spacious and well built. It is surrounded by a wall and encompassed by a broad and deep ditch. Long. 73° 30' E., lat. 28° 55' N.; from 270 to 280 miles north-west of Delhi.

BICALCARATUS, in zoology, a species of pavo; color, brown; the head slightly crested, and two spurs on each leg. This is pavo Chinnensis of Brisson; l'eperonnier of Buffon; petit paon de Malacca of Sonnerat; and iris peacock of Latham.

BICARINATA, in zoology, a species of lacerta, with a tail compressed, and carinated above; and four rows of carinated scales on the back, of a gray color, and is found in South America and India.

BICAUDA, from bis, double, and cauda, tail, in ichthyology, the name of a well tasted fish of the genus of xiphias. It is five feet long, or more, and a foot and a half broad at the breast, tapering gradually towards the tail: covered with a thick and rough skin, brown on the back and sides; and has three short bony prickles. Its belly is white; its fins of a brownish gray, and the back one has several beautiful black spots.

BICAUDALIS, in anatomy, an appellation given by some to a muscle of the external ear, on account of its having two tails; but which is subject to great variety, having sometimes only one, and sometimes three tails; in which cases it is called intricalis and tricaudalis.

BICAUDALIS, in ichthyology, a species of ostracion, of a triangular shape, with two subcaudal spines and ten rays in the dorsal fin.

BICE', *n. s.* The name of a color used in painting. It is either green or blue.

Take green *bice*, and order it as you do your blue *bice*; you may diaper upon it with the water of deep green. *Peacham.*

BICE, or **BISE**, in painting, is a color prepared from the lapis armenus. It bears the best body of all bright blues used in common work, as house-painting, &c. but it is the palest in color. It inclines to be a little too sandy, and therefore requires good grinding. Next to ultramarine, which is too dear to be commonly used, it lies best near the eye of all other blues.

BICEPS, the name of several muscles; as the biceps humeri or cubiti, biceps tibiæ, &c. See **ANATOMY**.

BICESTER, **BISSETER**, or **BURCHESTER**, a well built and ancient town of Oxfordshire, on the road between Oxford and Buckingham, about twelve miles from each, and fifty-five from London. It is noted for its good malt-liquor, and its lace. It has a market on Friday, and several sheep fairs. Inhabitants about 2600.

BICHAT (Maria Francis Xavier), a French

physician of considerable eminence, who was born in 1771, and died, much regretted, in 1802. He was a pupil of the celebrated Desault, and wrote, 1. *Recherches Physiologiques sur la Vie et la Mort*, 8vo. 1801. 2. *Anatomie Generale appliqué à la Physiologie*, &c. 4 vols. 8vo. Paris, 1801.

BICHET, a quantity or measure of corn, which differs according to the places where it is used. The bichet is not a wooden measure, as the minot at Paris, or the bushel at London, but is compounded of several certain measures. It was used in many parts of France, &c.

BICHET denotes, also, a certain quantity of land, as much as may be sown by a bichet of corn.

BICINCTA, in entomology, a small species of vespa; color black, thorax spotted, with two yellow bands on the abdomen: found at the Cape of Good Hope. Also a species of *tenthredo*: body black, two belts on the abdomen: mouth and shanks yellow: a native of Europe.

BICINUM, from *bis*, and *cano*, to sing, in church music, the singing of two, either together or alternately.

BICIPITAL, *adj.* } *Biceps, bicipitis*, Lat.

BICIPITOUS, *adj.* } Having two heads. It is applied to one of the muscles of the arm.

A piece of flesh if exchanged from the *bicipital* muscle of either party's arm. *Broun's Vulgar Errors*.

While men believe *bicipitons* conformation in any species, they admit a gemination of principal parts.

BICKER, } Probably of Ang.-Sax. ori-
BICKERER, } gin, *pycar*, to peck at, to be
BICKERING, } always attacking, skirmishing,
BICKERMENT, } or quarrelling. Skinner sug-
gests the verb *pickear* as the etymon; to fight with pikes or spears, and from the brandishing and glimmering flashing of these, perhaps is derived the application of the word to any thing that quivers, and is fitful, unsteady, giving a wavering light.

When that thine husbonde is to bed ygo,
While that he slepeth cut his throte atwo;
For in my dreame it is ywarned me,
How that my newewe shall my bane ybe;
But which In'tot; wherefore I woll be siker:
If thou say naie, we two shall have a *biker*.

Chaucer. Legend of Hypermnestra.

When Artegall arriving happily,
Did stay awhile their greedy *bickermēt*,
Till he had questioned the cause of their dissent.

They fell to such a *bickering*, that he got a halting,
and lost his picture. *Sidney.*

And from about him fierce effusion rowled
Of smoke, and *bickering* flame, and sparkles dire.

Milton.

The *bickering* sabre's shivering jar—
And pealing wide—or ringing near
Its echoes on the throbbing ear;
The death-shot hissing from afar—
The shock—the shout—the groan of war—
Reverberate along that vale,
More suited to the shepherd's tale.

Byron. Giaour.

BICKERTON (Sir Richard), a brave English naval officer, was promoted to the rank of lieutenant on the 8th of February 1745. After several removals, he was appointed captain of the Glas-

gow of twenty guns, and ordered to the West Indies, where he greatly distinguished himself. In June 1773, when the king reviewed the fleet at Portsmouth, captain Bickerton steered his Majesty's barge, and on the 24th of the same month received the honor of knighthood on board the *Barfleur*. In 1777 he was appointed to the *Terrible* of seventy-four guns, one of the ships attached to the Channel fleet, and was present at the engagement with the count d'Orville, off Ushant, on the 27th of July. In May next year, he was ordered on a cruise in the bay, and had the good fortune to fall in with thirty French merchant-ships, richly laden, under convoy of three frigates. Eight of the trading vessels were taken; but the war ships and the remainder escaped. In 1782 Sir Richard sailed with a convoy to India, and arrived in time to join Sir Edward Hughes, and share in the encounter which took place with Suffrein, in June 1783; when the French, after an engagement of three hours, thought proper to haul off. Soon after this action, intelligence of peace arriving in India, hostilities ceased, and Sir Richard returned to England in 1784. In 1786 he was appointed commodore on the Leeward Island Station; from whence he returned as a passenger in September, 1787, and was promoted to the rank of rear-admiral of the blue. In 1790 he was made vice-admiral of the white, and appointed to command as port-admiral at Plymouth. He died on the 25th of February 1792; leaving his son, Sir Richard, a baronet, at that period rear-admiral of the blue; and in 1806, vice-admiral of the white.

BICKERTON'S ISLAND, an island of the South Pacific, in the nineteenth degree of south latitude, and 175th of west longitude. It was discovered by the Spanish captain Morello in 1781, and is called Lattai by the natives. It consists principally of a conical volcano, having its base covered with a fertile soil, and its sides clothed with forests. Its products are bananas and cocoa nuts. This is also a name given to a small island in the gulf of Carpenteria, about four miles from the shore of New Holland.

BICLINIUM, in Roman antiquity, a chamber with two beds in it; or a table with only two couches.

BICOLOR, in entomology (of two colors), the name of several different species of insects, according to Fabricius, Gmelin, and other writers, but which are too numerous to enumerate.

BICOLOR, in conchology, a species of *donax*, marked with elevated striae, which decussate a few transverse ones; rufous, with a white ray on one side. Also a species of *pinna* found in the Red Sea. This is thin and inflexed at the lateral margin; yellow, with dark brown rays, and a few longitudinal striae.

BICOLOR, in ornithology, a species of *alcedo*; color green, and golden rufous beneath; a black and white waved band on the breast; the wings and tail spotted with white. A native of Cayenne. Also a species of *fringilla*; the Bahama sparrow of English writers; color, head and breast, black; back, wings, and tail, greenish; length four inches. Also a species of *lanius*, color blue; white beneath. This is *lanius Madagascariensis caruleus* of Brisson; *pie-griesche*

bleu de Madagascar of Buffon : and blue shrike of Latham. Also a species of loxia found in the East Indies only ; the brunor of Buffon. Also a species of muscicapa, a native of Guiana ; the black and white flycatcher of Latham.

BICOLORATA, in entomology, a species of phalena geometra ; wings blue and striated ; anterior pair black, spotted with white ; inhabiting Surinam. Also a species of scarabæus melolontha ; color green ; testaceous beneath ; legs tipped with gold.

BICORDATA, a species of cicada, ranatra ; wing-cases black on both sides ; a line in the middle ; the legs yellow. Inhabiting Carniola.

BICORNE, *adj.* ? Lat. *bicornis*, having two Bicornous, *adj.* 3 horns.

We should be too critical, to question the letter Y, or *bicornous* element of Pythagoras ; that is, the making of the horns equal. *Brown's Vulgar Errors.*

BICORNE Os, or two horned bone ; in anatomy, the same with the os hyoides.

BICORNES, an order of plants in the fragmenta methodi naturalis of Linnæus, so termed from the antheræ having in appearance two horns.

BICORNIS, in anatomy, an extensor muscle of the arm, otherwise denominated radius externus, and extensor carpi radialis.

BICORNIS, in natural history, a species of planaria, with an ovate-lanceolate obtuse body, of a grayish ash-color, dotted with black ; and two very short divergent tubes on the fore part. This is the fasciola punctata of Pallas. Also a species of actinia found in the North sea. This kind is hemispherical-oval, and glabrous with two horns.

BICORNIS, in entomology, a species of scarabæus, with two horns on the thorax ; a curved horn on the head, and rufous wing-cases. Inhabiting South America. Also the name of a species of hispa, curculio, cassida, mantis, apis, and aranea.

BICORNIS POLLICIS MANUS, the proper extensor muscle of the thumb ; also called tricornis ; and abductor pollicis longus.

BICORPORAL SIGNS, or **BICORPOREA SIGNA**, from bis, and corpus body ; in astronomy, those signs of the zodiac which have two bodies, or consist of two figures ; such as gemini, pisces, and sagittarius.

BICOSTELLA, in entomology, a species of phalena linea, found in Europe. Color cinereous, with a brown stripe on the anterior wings ; feelers advanced ; antennæ downy.

BID', } Sax. *biddan*. To desire ; to ask ;
BID'DER, } to call ; to invite ; to command ; to
BID'DING, } order ; before things or persons ;
to offer ; to propose ; as to *bid* a price ; to proclaim ; to offer ; or to make known by some public voice ; to pronounce ; to declare ; to denounce ; to pray. See **BLAD**.

Wondring upon this thing, quaking for drede,
She saide : Lord ! indigne and unworthy
Am I to thilke honour, that ye me bede.

Chaucer. Canterbury Tales.

Go ye into the highways, and, as many as you shall find, *bid* to the marriage. *Matt. xxix. 9.*

You are retired,
As if you were a feasted one, and not
The hostess of the meeting ; pray you *bid*
These unknown friends to 's welcome.

Shakspeare.

Saint Withold footed thrice the wold,
He met the nightmarc, and her nine fold,
Bid her alight, and her troth plight. *Id.*

I am *bid* forth to supper, Jessica ;
There are my keys. *Id. Merchant of Venice.*
Thyself and Oxford, with five thousand men,
Shall cross the seas, and *bid* false Edward battle.

Id. Henry VI.

Come, and be true.—

—Thou *bidst* me to my loss ; for true to thee
Were to prove false. *Id. Cymbeline.*

Or if the star of evening and the moon
Haste to thy audience, Night with her will bring
Silence, and deep listening to thee will watch,
Or we can *bid* his absence, till thy song
End, and dismiss thee ere the morning shine.

Milton.

If patiently thy *bidding* they obey,
Dismiss them not disconsolate ; reveal
To Adam what shall come in future days,
As I shall thee enlighten ; internix
My covenant in the woman's seed renewed ;
So send them forth, though sorrowing, yet in peace.

Id.

She *bid* war to all that durst supply
The place of those her cruelty made die.

Waller.

To give interest a share in friendship, is to sell it
by inch of candle ; he that *bids* most shall have it :
and when it is mercenary, there is no depending on it.
Collier on Friendship.

When a man is resolute to keep his sins while he
lives, and yet unwilling to relinquish all hope, he
will embrace that profession which *bids* fairest to the
reconciling those so distant interests. *Decay of Piety.*

'Tis these that early taint the female soul,
Instruct the eyes of young etiquettes to roll,
Teach infants' cheeks a *bidden* blush to know,
And little hearts to flutter at a beau.

Pope's Rape of the Lock.

Our bans thrice *bid* ! and for our wedding day
My kerchief bought ! then pressed, then forced away.

Gay.

He looked upon several dresses which hung there,
exposed to the purchase of the best *bidd*er. *Addison.*
She [*Fancy*] *bids* the flattering mirror, formed to
please,

Now blast my hope, now vindicate despair ;
Bids my fond verse the love-sick parody cease,
Accuse my rigid fate, acquit my fair.

Shenstone's Elegies.

BIDALDI, or **BIDARIT**, an ancient kind of
foot soldiers mentioned by the French histori-
ans, armed with two darts. Hence the original
of the word, which seems to be a corruption of
bidardi, or *à binis dardis*. They are also called
bidaus, *bideaux*, *bidauts*, and *pitauts*.

BIDASSOA, or **VIDASSO**, a considerable river
of Spain, which rises in the Pyrenees, and falls
into the Bay of Biscay, between Andaye and Fon-
tarabia. This river was long a subject of con-
tention between France and Spain, but is now
common to both nations. The duties paid by
those passing from France to Spain belong to the
latter, and by those who pass the contrary way
to the former. At the mouth is the Isle of Phea-
sants, on which the peace of the Pyrenees was
signed in 1659.

BIDDERMAN (John Gottlieb), was born at
Naumberg in Germany, in 1705, and became
rector of the college there. This he resigned for
the more lucrative situation of rector of the pub-
lic school at Friedburg in 1747, and continued

in its duties until his death in 1772. He was the author of several learned treatises, among which are, *De Latinitate Maccaronicâ*; *Acta Scholastica*, in eight volumes; and *Selecta Scholastica*, in two; *De arte Obliviscendi*; *De Insolentiâ Titulorum Librariorum*; *De Religione Eruditorum*, &c.

BIDDEFORD, a port of entry, and post town, of the district of Maine, North America, situated in York county, at the mouth of Saco river. It is 105 miles from Boston, and 452 from Philadelphia.

BIDDEFORD, a sea-port and post town of the United States of America, in the province of Maine, containing above 1000 inhabitants, and 105 miles from Boston.

BIDDEFORD, or **BIDEFORD**, a market and sea-port town of Devonshire, seated on the river Torridge, near its junction with the Taw, over which there is a good stone bridge of twenty-four arches. It is a large and populous place, and carries on a considerable trade, principally to the West Indies and America; it is also engaged in the Newfoundland fisheries. The custom-house is a good building, opposite a noble quay, where ships of large burden may unload. Oak bark is exported here in considerable quantities. Carpet, woollen, and earthenware manufactures are established in the town, and the neighbourhood abounds with fine timber. The church was twice enlarged during the last century, and here are two respectable dissenting chapels. It is governed by a mayor, recorder, seven aldermen, and ten capital burgesses, who, in the reign of Edward I. and II., sent two members to parliament; but the poverty of the place shortly after induced the inhabitants to decline this burden. The market is on Tuesday, and well supplied with corn, cattle, and provisions. It is thirty miles north of Exeter, and 201 west from London.

BIDDING is also used for proclaiming or notifying. In this sense we meet with bidding of the bands, the same with what is otherwise called asking.

BIDDING, or **OFFERING**, denotes the rising price of a thing at a sale or auction. The French call it *encherir*. It answers to what the Romans call *licitari*; they used to bid by holding up the hand or finger.

BIDDING OF THE BEADS. See **BEADS**.

BIDDING PRAYER. It was a part of the office of the deacons in the primitive Christian church, to be monitors and directors of the people in their public devotions. To this end they used certain forms of words, to give notice when each part of the service began. This was called by the Greeks *κηρυττεν*, and by the Latins *prædicare*: which therefore do not ordinarily signify to preach, as some suppose, but to perform the office of a crier (*κηρὸς*, or *præco*) in the assembly: whence Synesius and others call the deacons *ιεροκηρυκεις*, the holy criers of the church, appointed to bid or exhort the congregation to pray and join in the several parts of the service of the church. Agreeably to this ancient practice is the form, Let us pray, repeated before several of the prayers in the English liturgy.

BIDDLE (John), one of the most eminent writers among the English Socinians, was born

at Wotton-under-Edge in Gloucestershire, and educated in the free school of that place. He was here particularly noticed by George Lord Berkeley, who allowed him an exhibition of £10 a year. While at school he made a translation of Virgil's *Bucolics*, and of the first two *Satires* of Juvenal. At thirteen he was sent to Oxford, and entered a student in Magdalen-hall. In 1641 the magistrates of Gloucester chose him master of the free school there, and where he was much esteemed; but contracting some opinions concerning the Trinity different from those commonly received, and expressing his thoughts with freedom, he suffered various persecutions and imprisonments in the time of the Commonwealth. During one of these confinements, which lasted for several years, being reduced to great indigence, he was employed by Roger Daniel of London, to correct the impression of the Greek Septuagint Bible, which that printer was about to publish. In 1651 the parliament published a general act of oblivion, which restored him to liberty. He was however afterwards imprisoned on account of his tenets; and the Protector, in October, 1655, seems to have doomed him to be confined for life in St. Mary's castle, in the Isle of Scilly. Soon after, he was allowed 100 crowns a year for subsistence. But in 1658 he was again at liberty. After the Restoration, he was fined £100 for preaching, and each of his hearers £20, or to lie in prison till the fines were paid; which being put in execution, Biddle contracted a jail distemper, of which he died 22d Sept. 1662, in the forty-seventh year of his age. His life was published in Latin in 1692, by Mr. Farrington, who represents him as possessed of extraordinary piety, charity, and humility. He would not discourse, we are told, of those points, in which he differed from others, with those that did not appear religious according to their knowledge; and was a strict observer himself, and a severe exacter in others, of reverence in speaking of God and Christ. He had so happy a memory, that he retained word for word nearly the whole New Testament, not only in English, but in Greek.

BIDE, } Sax. *bisan*. To endure; to suffer.
BID'ING, } fer: commonly to *abide*; to dwell; to live; to inhabit; to remain in a place; to continue in a state. It has probably all the significations of the word *abide*.

Certes your strife were easie to accord,
Would ye remit it to some righteous man,
Unto yourselfe, said they! We give our word
To *bide* what judgment ye shall us afford. *Spenser*.
And they also, if they *bide* not still in unbelief,
shall be grafted in. *Romans*, xi. 23.

Safe in a ditch he *bides*,
With twenty trenched gashes on his head,
The least a death to nature.

Shakspeare. Macbeth.

Who of all ages to succeed, but feeling
The evil on him brought by me, will curse
My head? Ill fare our ancestor impure,
For this we may thank Adam; but his thanks
Shall be the execration; so besides
Mine own that *bide* upon me, all from me
Shall with a fearful flux on me redound;
On me as on their natural centre light,
Heavy though in their place. *Milton*.

The wary Dutch this gathering storm foresaw,
And durst not *bide* it on the English coast. *Dryden*.

BIDENS, in botany, water hemp-agrimony : a genus of the polygamia æqualis order, and syngenesia class of plants ; ranking in the natural method under the forty-ninth order, compositæ oppositifoliæ. The receptacle is paleaceous ; the pappus with erect scabrous awns ; and the calyx imbricated. Of this genus Linnæus enumerates thirteen species, none of which appear to merit much notice, except the tripartita, found by the sides of rivulets, ditches, and lakes, both in Scotland and England. It grows to the height of two feet, and has its leaves divided into three or often five, lanceolate serrated lobes, with yellow flowers. A decoction of it with alum, dyes yarn of a yellow color. The seeds have been known sometimes to destroy the cyprinus auratus, or gold fish, by adhering to their gills and jaws.

BIDENS, in conchology, a species of mytilus, dentated and slightly curved, having the posterior margin inflected, and the hinge bidentated. A native of the Mediterranean and Atlantic. Also a species of nerita, smooth, and inner lip bidentated. This shell is black, reddish, or sometimes yellow, clouded with whitish, with three black bands.

BIDENS, in entomology, a species of scarabæus, found in America. The head and thorax are brassy-green and downy : wing-cases testaceous, glossed with green. Also the name of a species of formica, vespa, cimex, sphex, mantis, curculio, and cassida.

BIDENTAL, } *Bis*, two, and *dens* a tooth,
BIDENTALE. } Latin, having two teeth.

Ill management of forks is not to be helped, when they are only *bidental*. *Swift*.

BIDENTAL, in Roman antiquity, a place blasted with lightning ; which was immediately consecrated with the sacrifice of a bidens. The place was afterwards accounted sacred, and it was unlawful to enter it or to tread upon it ; for which reason it was commonly surrounded with a ditch, wall, hedge, ropes, &c. See next article.

BIDENTALES, in Roman antiquity, priests instituted to perform certain ceremonies when thunder fell on any place. Their office was the sacrificing a sheep of two years old, which in Latin is called bidens ; whence the place struck with thunder obtained its name of bidental.

BIDENTATA, in entomology, a species of apis inhabiting America. The abdomen is brown, with five whitish belts ; vent bidentated. Also a species of phalæna noctua. A native of Europe ; wings brown ; a bidentated streak in the middle. Also a species of chrysis, a native of Europe. Color shining blue ; thorax armed with two teeth, and at the vent also are three short teeth.

BIDENTATUS, a species of hystrix ; color black and testaceous, and armed at the extremity with two hooked spines. Also a species of cryptocephalus crioceris. A native of Africa. Also a species of cerambyx found in South America. The thorax spinous ; wing-cases bidentated and brown. Also a species of ich-

neumon that inhabits Europe. Color black, and on the thorax are two teeth. Also a species of cimex spinosus, found only in France. Color brown ; thorax armed with two teeth on the anterior part beneath.

BIDENTES, in middle age writers, denotes two-yearlings, or sheep of the second year. The wool of these bidentes, or two-years-old sheep, being the first shearing, was sometimes claimed as a heriot to the king, on the death of an abbot. Among the ancient Romans, the word was extended further to any sorts of beasts used for victims, especially those of that age ; whence we meet with *sues bidentes*.

BIDET, a nag or little horse, formerly allowed each trooper and dragoon, for his baggage, &c. It has lately been applied to a convenient washing basin, across which the operator sits.

BIDEL, an order of magistrates at Sparta, five in number, whose business was to superintend the ephebi, and be present at their exercises, wrestlings, &c.

BIDI-BIDI, in zoology, a name of the rallus Jamaicensis of Latham.

BIDIS, in ancient geography, a small city of Sicily, near Syracuse, whose ruins are still seen about fifteen miles to the south-west, with a church called S. Giovanni di Bidini.

BIDLAKE (Dr. John), was born in 1755 at Plymouth, and brought up at the grammar-school there, of which, having completed his education at Christ Church, Oxford, he was afterwards the high master. Three years before his death, he was seized with an epileptic fit in the pulpit, while delivering the Bampton lecture at St. Mary's, which terminated in the total loss of sight. In addition to the lecture above mentioned, he published an Introduction to Geography, 12mo. ; The Sea ; The Country Parson ; The Summer Eve ; The Year ; and Youth ; poems, separately printed in octavo, &c.

BIDLOO (Godfrey), author of several treatises in anatomy, was born at Amsterdam, March 12th, 1649. In 1688 he was professor of anatomy at the Hague, and in 1694 at Leyden, when king William III. of England appointed him his physician ; which he held with his professorship. He published in Latin, 1. The Anatomy of the Human Body, demonstrated in 105 cuts, explained by the Discoveries of the Ancient and Modern Writers. 2. An Oration upon the Antiquity of Anatomy. 3. A Letter to Anthony Leuwenhoeck on the Animals sometimes found in the Livers of Sheep, &c. 4. Two Decades of Dissertations in Anatomy and Chirurgery ; and other pieces. He died at Leyden in April, 1713.

BIDON, a liquid measure, containing about five pints of Paris, that is, about five quarts English wine measure. It is seldom used but among ships' crews.

BIDREAP, an old feudal service, by which a tenant was obliged to reap his landlord's corn.

BIE (Adrian de), an eminent painter, was born at Liere in 1594. After learning the rudiments of the art from different masters, he travelled to Rome, where he spent six years in studying the best masters. His industry was then rewarded with proportionable success ; for he found encouragement among the most honorable

persons at Rome, and in every part of Italy. His penciling was so exceedingly neat, and his touch and coloring so very delicate, that he was frequently employed to paint on jasper, agate, porphyry, &c.

BIŁEZ, a town of Poland, in the palatinate of Cracovia, remarkable for its vitriol mines.

BIELAU, a considerable town of Silesia, in the circle of Reichenbach, containing between 6000 and 7000 inhabitants, who are chiefly employed in weaving serge, fustian, and muslin, and export great quantities. It contains several good houses, with four Catholic and Lutheran churches, and castle.

BIELEFELD, a town of the Prussian states, the capital of the county of Ravensberg, in the grand duchy of the Lower Rhine. There are 5500 inhabitants, who conduct flourishing manufactures of leather, soap, woollen stuffs, linen, and thread, along with excellent bleaching grounds. The trade in linen is large, and at one time brought yearly into circulation half a million dollars of foreign money. Twenty-two miles north of Lippstadt, and twenty-five east of Munster.

BIELGOROD, an old town of European Russia, near the southern borders of the government of Kursk. It was built by the grand duke Wladimir in 990; is an archbishop's see, and contains 9000 or 10,000 inhabitants, who carry on a good trade in honey, wax, tallow, leather, and soap. This town submitted to the arms of Potemkin in 1790, and is sixty-eight miles south-west of Kursk.

BIELLA, **BIELA**, or **BIOGLIO**, a small populous town of Piedmont, the capital of a small district, called from it the Biellese. It is partly on the summit, and partly on the declivity of a hill near the Cervo and Opora, and divided into Upper and Lower town, containing four churches and four monasteries. Population 8250. Twenty-four miles north-west of Vercelli, and thirty-five N. N. E. of Turin.

BIELO-OZERO, or **BIELOSERSK**, i. e. White Lake, a lake in the government of Novogorod, European Russia, so called from its bottom being of white clay. It is about thirty miles long, and eighteen broad, and receives a number of small streams; the Scheksna flows from it southward to the Volga. This lake abounds in fish; and on its south bank stands the town of Bielosersk.

BIELOPOLJE, a town of European Russia, in the government of Charkov, with 9050 inhabitants, who are engaged in agriculture and the distillation of brandy. Eighty-eight miles N. N. W. of Charkov, and 555 S. S. E. of St. Petersburg.

BIELOSERSK, a town in the government of Novogorod, European Russia, on the south bank of the lake of Bielo-Ozero. It is the capital of a circle, and consists of the fortress and the suburb; having 2800 inhabitants, who support themselves principally by fishing. Sixty-four miles north-east of Vologda, and 220 E. N. E. of Novogorod.

BIENNE, a district of Switzerland, between the lake of that name, and a branch of the Jura range of mountains. It was annexed to the canton of Bern by the congress of Vienna in 1815, and is in extent about 150 square miles; the

population nearly 6000. The bishop of Basle was the former sovereign, under whom it presented the phenomenon of a Protestant state, having a Catholic ruler; but his power was materially limited by the privileges of the people. Forming an important pass into Switzerland, it was early taken possession of by the French in 1798, and when annexed for awhile to their empire, was included in the department of the Upper Rhine.

BIENNE, or **BIEL**, the capital of the foregoing district, is situated on the Suss, at the northern extremity of the Biemme lake. It has about 2700 inhabitants, who carry on various manufactures of iron, wire, leather, and chintz. The town is about fifteen miles north-west of Bern.

BIENNE, LAKE OF, in the above district, is about nine miles long and four broad, lying north-east of that of Neufchatel, with which it is connected by the river Thielle. The scenery on both sides is highly picturesque, interspersed with vineyards, country houses, &c. The town of Nidau is a pleasing object on its eastern shore. Near the southern extremity is the island of St. Peter, sometimes called Rousseau's Island, from its having been the place of that philosopher's residence; who was so partial to this spot, that he deemed the two months he spent there, 'so happy,' he says, 'that he could have passed his whole existence there, without even a momentary wish for another situation.'

BIENNIAL, lasting or continuing two years; from *bis* two, and *annus* a year.

Then why should some be very long lived, others only annual or biennial? *Ray on the Creation.*

BIENNIAL PLANTS, plants that last only two years. Numerous plants are of this tribe, which, being raised one year from seed, generally attain perfection either the same, or in about the period of a twelvemonth (a little less or more), and the following spring or summer they flower, and perfect seeds; soon after which they commonly perish: or if any survive another year, they dwindle, and gradually die off; so that biennials are always in their prime the first or second summer. Biennials consist both of esculents and flower plants. Of the esculent kinds, the cabbage, savoy, carrot, parsnip, beet, onion, leek, &c. are biennials. Of the flowery tribe, the Canterbury bell, French honeysuckle, wall-flower, stock, July flower, sweet-william, China pink, common pink, matted pink, carnation, scabious, holly-hock, tree mallow, vervain mallow, tree primrose, honesty, or moonwort, &c. are all of this tribe; all of which being sown in March, April, or May, rise the same year, and in spring following shoot up into stalks, flower, and perfect seeds in autumn; after which most of them dwindle: though sometimes the wall-flowers, holly-hocks, carnations, and pinks will survive and flower the following year; but the plants become straggling, the flowers small and badly colored; it is therefore eligible to raise a supply annually from seed; although wall-flowers, carnations, and pinks may be continued by slips and layers.

BIER, Ang.-Sax. *bæran*, to bear; from to bear, as *feretrum*, in Latin, from *fero*. A car-

riage, or frame of wood, on which the dead are carried to the grave.

And now the prey of fowls he lies,
Nor wailed of friends, nor laid on groaning *bier*.
Spenser.

They bore him bare-faced on the *bier*,
And on his grave rained many a tear. *Shakspeare.*

He must not float upon his watery *bier*
Unwept. *Milton.*

No friend's complaint, no kind domestic tear
Pleased thy pale ghost, or graced thy mournful *bier*.
Pope.

But the white shroud, and each extended tress,
Long—fair—but spread in utter lifelessness,
Which late the sport of every summer wind,
Escaped the baffled wreath that strove to bind;
These—and the pale pure cheek, became the *bier*—
But she is nothing—wherefore is he here.
Byron's Corsair.

BIER, was in former times, more particularly used for that whereon the bodies of saints were placed in the church, and exposed to the veneration of the devout. This is also called, in middle-age writers, *lectus*, *feretrum*, *lectica*, and *loculus*; and was usually enriched with gold, silver, and precious stones.

BIERS, among the ancient Romans, were different according to the rank of the deceased. That whereon the poorer sort were carried was called *sandapila*; that used for richer persons, *lectica*, *lectica funebris*, sometimes *lectus*. The former was only a wooden chest, *vilis arca*, which was burnt with the body; the latter was enriched and gilded. It was carried bare, or uncovered, when the person died a natural and easy death; when he was much disfigured or distorted, it was veiled or covered over.

BIERON, or **BIHERON** (Mademoiselle), an ingenious Parisian lady, was born in 1719 and died in 1795. She studied most of the fine arts with success; but is chiefly deserving of notice for her knowledge of anatomy, and the curious models in wax of various parts of the animal structure, which, together with her paintings on vellum of subjects belonging to natural history, are preserved in the Museum of Natural History at Paris. The empress of Russia bought several for her cabinet, now in the Museum of Natural History at Petersburg.

BIESBOSCH, a lake or arm of the sea, between Dort and Gertruydenburg, in South Holland. It was formed by the bursting of the dykes in the year 1421, when seventy-two villages with their inhabitants (which, including the peasantry, are said to have been 100,000 in number,) were suddenly overwhelmed and destroyed. The only remains of this once fruitful tract are a few islands. It is supplied with water from the Maese, and gives rise to the broad water of Holland's-diep, or Haringsvliet.

BIESTING, *n. s.*, *byrting*, Saxon. The first milk given by a cow after calving, which is very thick.

And twice besides, her *biestings* never fail
To store the dairy with a brimming gail. *Dryden.*

BIETIGHEIM, a town and upper bailiwick of Wirtemberg, at the confluence of the Metter and the Enz. It is the seat of an ecclesiastical

superintendent, and contains 2200 inhabitants. Here is a handsome stone bridge across the Enz. The territory is fertile in wine and fruit: fifteen miles north of Stuttgart, and thirty S. S. E. of Heidelberg.

BIFA'RIOUS, *adj.*, Lat. *bifarius*; twofold; what may be understood two ways.

BIFASCIANA, in entomology, a species of *phalæna tortrix*. The anterior wings, testaceous; two oblique bands, and mark at the apex, brown. Inhabiting Europe.

BIFASCIATA, in conchology, a species of *bulia*, somewhat tapering and white, with two broad reddish bands at the aperture. Also a species of *cyprea*, of an oblong form; color, purplish, with a straw-colored and narrow white band. Also a species of *nerita*: color, black; with two hoary bands and white tip. A native of India.

BIFASCIATUS, in entomology, a species of *scarabæus* that inhabits Coromandel: on the thorax is a triple protuberance, with an erect horn on the head; wing-cases, black; with two rufous bands. Also a species of *dermestes*, of a black color: a native of the Cape of Good Hope. Also a species of *bostrichus*, found in Siberia; color, black; wing-cases, yellow; with two bluish-black denticulated bands. Also a species of *cryptocephalus*, inhabiting Africa.

BIFASCIELLA, a species of *phalæna*, *teinea*; wings, glossy; with two bands of white, the hinder one interrupted; head, rufous: a native of Denmark.

BIFERÆ, plants that flower twice a year, in spring and autumn, as is common between the tropics.

BIFEROUS, *adj.* Lat. *biferens*; bearing fruit twice a year.

BIFFA, in middle-age writers, a machine for casting stones and darts, having a movable counterpoise, which turned round its yard.

BIFID, *adj.* } Lat. *bifidus*, a botanical term;
BIFIDATED, } divided into two; split in two;
opening with a cleft.

BIFIDUS, in entomology, a species of *cimex redivivus*: color, black; with a rufous band on the wing-cases, and an erect bifid spine on the scutellum. Inhabiting China.

BIFOLD, *adj.* Lat. from *binus* and *fold*; twofold; double.

If beauty have a soul, this is not she;
If souls guide vows, if vows are sanctimony,
If sanctimony be the gods' delight,
If there be rule in unity itself,
This is not she: O madness of discourse!
That cause sets up with and against itself!
Bifold authority. *Shakspeare. Troilus and Cressida.*

BIFORIS, in natural history, a species of *echinus*, having at the base five furrows, and ten flexuous radiated lines; and two oblong perforations near the vent.

BIFORM, } *Bis* and *forma*; double formed;
BIFORMITY, } having two shapes.

And from whose monster-teeming womb, the earth
Received what much it mourned, a *biform* birth.
Crowall. Ovid. Met.

Strange things he spoke of the *biformity*
Of the Dizonians. *More. Song of the Soul.*

BIFRONS, in entomology, a species of *brenatus*, inhabiting Cayenne: color, black; wing-cases, striated; with glabrous yellow spots. Also a species of ichneumon: color, black; the front, white, with a black spot beneath the antennæ. Also, in natural history, a species of nereis, a native of the North Sea. It is depressed: peduncles, with a simple setigerous papilla, ciliated above. This creature is continually in motion; about an inch long, of a brownish color; head, white; eyes, four; cirri, seven; body, attenuated at both ends, and consisting of fifty-six joints.

BIFRONS, in ancient mythology, an appellation of Janus, who was represented with two faces, as being supposed to look both backwards and forwards, to time past and future; though other reasons for it are recited by Plutarch. Sometimes he was painted with four faces, and styled quadrifrons, as governing the four seasons.

BIFRONTED. Bis and frons. Having two fronts; double fronted.

Lictors, gag him: doe;
And put a case of vizards o'er his head,
That he may look *bifronted* as he speaks. *Ben Jonson.*

BIFURCATED, } Lat. from *binus* two, and
BIFURCATION. } *furca* a fork. Shooting
out by a division into two heads; divisions into
two; opening into two parts.

The first catachrestical and far derived similitude, it holds with man; that is, in a *bifurcation*, or division of the root into two parts. *Brown's Vulgar Errors.*

A small white piece, *bifurcated*, or branching into two, and finely reticulated all over. *Woodward.*

BIFURCATUS, in entomology, a species of *cimex oblongus*, inhabiting Germany: color, blackish; abdomen, pale yellow, and bifurcated.

BIG' v & adj. } *Big* may be a prefix to
BIG'GER, or } almost any thing. Its ety-
BIG'LY, } mology is uncertain; but its
BIG'NESS, } meaning, from usage, is ob-
BIG'BELLIED, } vious enough. Skinner
BIG'BONED, } gives it from *peg*, Danish,
BIG'NAMED, } which signifies the belly.
BIG-SONDING, } Perhaps, says the etymolo-
BIG'SWOLN, } gist in the Ency. Met. it is
BIG'UDDERED. } from the Ang-Sax. *bycgan*,

byggan, to *big*, to build. Jamieson and Ritson both agree as to this usage of the word. However, it cannot be restricted to enlargement by building. It takes an infinitely wider range; thus it signifies comparative bulk, greater or less; teeming, pregnant, great with young, tumid, full of something, and desirous or about to give it vent; distended, ready to burst; used often to express the effects of any passion; great in air and mien; proud; swelling; consequential, not the ox which is great, but the frog that apes the ox; that would be great, but is only big; yet is it sometimes used in a better sense, as great in spirit; lofty; brave.

How else, said he, but with a good bold face,
And with *big* words, and with a stately pace?

Spenser.

If you had look'd *big*, and spit at him, he'd have
run. *Shakspeare. Winters' Tale.*

His gentle lady,
Big of this gentleman, our theme, deceased
As he was born. *Id. Cymbeline.*

What art thou? have not I
An arm as *big* as thine? a heart as *big*?
Thy words, I grant, are *bigger*: for I wear not
My dagger in my mouth. *Id.*
Thy heart is *big*; get thee apart, and weep.

Id. Julius Cæsar.

When we have laugh'd to see the sails conceive,
And grow *bigbellied* with the wanton wind.

Shakspeare.

If panicm be laid below, and about the bottom of
a root, it will cause the root to grow to an excessive
bigness. *Bacon.*

A bear *big* with young hath seldom been seen.

Id.

Lately on yonder swelling bush,
Big with many a common rose,
This early bud began to blush. *Waller.*

Behold a wonder! they but now who seemed
In *bigness* to surpass earth's giant sons,
Now less than smallest dwarfs in narrow room
Throng numberless, like that pygmean race
Beyond the Indian mount. *Milton.*

The *big-boned* ox, in pace is very slow,
And in his *travaile* step by step doth goe.

Geo. Wither.

In his prosperous season, he fell under the reproach
of being a man of *big* looks, and of a mean and ab-
ject spirit. *Clarendon.*

To grant *big* Thraso valour, Phormio scuse,
Should indignation give, at least offence. *Garth.*

Would'st thou not rather choose a small renown,
To be the mayor of some poor paltry town;
Bigly to look, and barbarously to speak;
To pound false weights, and scanty measures break?

Dryden.

We pursued our march, to the terror of the market
people, and the miscarriage of half a dozen *higbellied*
women. *Addison.*

The great, the important day,
Big with the fate of Cato and of Rome. *Id.*
Might my *bigswoln* heart

Vent all its griefs, and give a loose to sorrow. *Id.*

A troubled ocean, to a man who sails in it, is, I
think, the *biggest* object that he can see in motion.

Spectator.

Several sorts of rays make vibrations of several
bignesses, which, according to their *bignesses*, excite
sensations of several colours; and the air, according
to their *bignesses*, excites sensations of several sounds.

Newton's Opticks.

———— her bosom heaved
Unwonted sighs, and stealing oft a look
Towards the *big* gloom, on Celadon her eye
Fell tearful, wetting her disordered cheek.

Thomson.

BIG, Scotch barley, a species of *Hordeum*,
which see.

BIG SANDY RIVER, a river of North America,
which separates the state of Virginia from that of
Kentucky, and falls into the Ohio, in lat. 38° 30'
N. It is about sixty yards wide, and navigable
for sixty miles. Little Sandy River falls into the
Ohio, about twenty miles west of Big Sandy
River.

BIGA, in antiquity, a chariot drawn by two
horses abreast. Chambers observes it ought rather
to be written *Bigæ*, in the plural; being
derived from *bijuga*, two horses joined by a
jugum, or yoke. Chariot-races, with two horses,
were introduced into the Olympic games in the
ninety-third Olympiad: but the invention was
much more ancient, as we find that the heroes in

the Iliad fight from chariots of this kind. The moon, the night, and the morning, are by mythologists supposed to be carried in bigæ, the sun in a quadriga. Statues in bigæ were at first only allowed to the gods, then to conquerors in the Grecian games; under the Roman emperors, similar statues, with bigæ, were decreed to great and well-deserving men, as a kind of half triumph, being erected in most public places of the city. Figures of bigæ were also struck on their coins.

BIGÆ, BIGATA, or BIROTA, in writers of the middle age, a cart with two wheels.

BIGAM, } Δις and γαμεω, twice and to
BIGAMOUS, } unite in marriage. A bigame,
BIGAMIST, } is either a man or woman
BIGAMY. } who has been twice married,
whether the first spouse be living or not. This is the precise meaning of the word; but it is now applied only to those who have contracted matrimony twice, and where all the parties are alive. This is both a civil and canonical offence.

A beauty-waning and distressed widow
Seduced the pitch and height of all his thoughts
To base declension, and loathed bigamy.

Shakspeare.

Randal determined to commence a suit against Martin, for bigamy and incest. *Arbutnot and Pope.*

By the papal canons, a clergyman that has a wife, cannot have an ecclesiastical benefice; much less can a bigamist have such a benefice according to that law.

Ayliffe.

Bigamy, according to the canonists, consisted in marrying two virgins successively, one after the other, or once marrying a widow.

Blackstone's Commentaries.

BIGAMY properly signifies being twice married, but with us is used as synonymous to polygamy, or having a plurality of wives at once. Such second marriage, the former husband or wife being alive, is simply void, and a mere nullity, by the ecclesiastical law of England; and yet the legislature has thought it just to make it felony, by reason of its being so great a violation of the public economy and decency. Whatever specious reasons may be urged for it in eastern nations, it never obtained in this part of the world, even from the time of our German ancestors, who, as Tacitus informs us, 'prope soli barbarorum singulis uxoribus contenti sunt.' It is therefore punished by the laws both of ancient and modern Sweden with death. And in Britain it is enacted by stat. 1 Jac. 1. c. 11, that if any person being married, do afterwards marry again, the former husband or wife being alive, it is felony, not within the benefit of clergy. The first wife in this case shall not be admitted as an evidence against her husband, because she is the true wife; but the second may, for she indeed is no wife at all: and so vice versa, of a second husband. The 18 Eliz. c. 7, s. 2 and 3 (a statute not noticed by Blackstone), inflicts the punishment of branding in the hand, and imprisonment for any term not exceeding one year; and by 35 Geo. III. c. 67, s. 1. bigamy is subjected to the same punishments with grand or petit larceny, the effect of which is, that the burning in the hand may be commuted for seven years' transportation, and the limit to the duration of the

imprisonment is wholly taken away. The statutes, however, against second marriages, excepts persons whose first husband or wife has been absent for seven years, without the knowledge of the party remarrying, though that absence be within the king's dominions; or has been absent out of the kingdom, whether with or without the knowledge of the party remaining in England. It is also no offence to marry during the life of a first husband or wife, where there has been a divorce of a former marriage; or where that marriage has been declared void by sentence of an ecclesiastical court.

BIGARII, in antiquity, the drivers of Bigæ, which see.

BIGATI, in antiquity, a kind of ancient Roman silver coins, on one side whereof was represented a biga, or chariot drawn by two horses. The bigatus was properly the Roman denarius, whose impression, during the times of the Commonwealth, was a chariot driven by Victory, and drawn either by two horses or four; according to which it was either denominated bigatus or quadrigatus.

BIG-BONE CREEK, a river of Kentucky, which falls into the Ohio, so named from the large bones found near it.

BIGGA, a small island of Scotland, in Yell Sound, among the Northern Shetland Isles: one half of it belongs to the parish of Delting, and the other to that of Yell.

BIGGAR, a parish of Scotland, in the county of Lanark, about six miles long from east to west, and three and a half broad from south to north, forming a kind of irregular oval. The tradition is, that a battle was fought near it between the Scots under Sir William Wallace, and an English army of 60,000 men, wherein great slaughter was made on both sides.

BIGGIN. Fr. *beguin*. A child's cap, says Dr. Johnson. Beguins, from whence it is derived, were an order of nuns, who wore the peculiar kind of cap, which has obtained this designation.

Sleep now!

Yet not so sound, and half so deeply sweet
As he, whose brow with homely *biggin* bound,
Snores out the watch of night. *Shakspeare.*

You that have sucked the milk of the court, and from thence have been brought up to the very strong meats and wine of it; been a courtier from the *biggin* to the nightcap (as we may say); and you, to offend in such a high point of ceremony as this? and let your nuptials want all marks of solemnity.

Ben Jonson.

Mr. Gifford interprets the phrase from 'the *biggin* to the nightcap,' from infancy to age.

BIGGLESWADE, a market town of Bedfordshire, on the river Ivel, over which there is a handsome bridge. It was almost destroyed by fire in 1785, when property to the amount of £24,000 was consumed. The town, however, has been much improved since. It is one of the greatest barley markets in England. It is five miles south-east of Bedford, and forty-five north of London. Inhabitants, about 3000.

BIGHORN RIVER, one of the North American rivers, which rises in the Rocky Mountains, near the sources of the Plate and the Yellowstone, and having passed through the eastern

range of these mountains, joins the latter in the forty-seventh degree of latitude. It is navigable for canoes to a great distance, and flows through a fine open timber country.

BIGHT, *n. s.* It is explained by Skinner, the circumference of a coil of rope.

BIGLAND (Ralph), an English herald and topographer, was a native of Kendal in Westmoreland, and appointed garter king at arms in 1780. He died in 1784, having employed himself in making collections for a history of the county of Gloucester. His son Richard published from his MSS. in one volume folio, the first part of the *Antiquities of Gloucestershire*. 1792.

BIGNON (Jerome), a French writer, born at Paris in 1590. He made great progress under the care of his father, in philosophy, mathematics, history, civil law, and divinity. At ten years of age he gave the public a specimen of his learning, in a *Description of the Holy Land*; two years after he published a Discourse concerning the Principal Antiquities and Curiosities of Rome, and a summary Treatise concerning the Election of Popes. Henry IV. now desired to see him, and appointed him page to the dauphin, afterwards Louis XIII. He wrote at this time a Treatise of the Precedency of the Kings of France, which he dedicated to Henry IV. who ordered him to continue his researches, but the death of that prince interrupted them. In 1613 he published the *Formulae of Marculphus*. He was, in 1620, made advocate general in the grand council, then counsellor of state, and at last advocate general in the parliament. In 1641 he resigned his offices in favor of his son, and was appointed chief keeper of the king's library. At last this great man, who had always made religion the basis of his virtues, died with the most exemplary devotion, in 1656, aged sixty-six.

BIGNONIA, in botany, trumpet flower, or scarlet jessamine: a genus of the angiospermia order and didynamia class of plants; ranking, in the natural method, in the fortieth order, personate: *cal.* quinquefid and cup-form: *cor.* bell-shaped at the throat, quinquefid, and bellied underneath. The silique, bilocular; and the seeds with membranous wings. Of this genus Linnæus enumerates seventeen species; of which the following are the most remarkable: 1. *B. catalpa*, a native of Carolina, Virginia, and the Bahama islands. It has a strong woody stem and branches, rising twenty feet high, ornamented with large heart-shaped leaves, five or six inches long. 2. *B. capreolata*, or tendril bignonia, a native of North America, a fine climber, which rises by the assistance of tendrils or claspers. 3. *B. radicans*, the climbing ash-leaved bignonia, is a native of Virginia and Canada. It rises thirty or forty feet high, having pinnated opposite leaves of four pair of serrated lobes, and an odd one. 4. *B. sempervirens*, or evergreen climbing Virginian bignonia, is a native of Virginia, Carolina, and the Bahama islands. 5. *B. unguis*, the claw-bignonia, a deciduous climber, is a native of Barbadoes and the other West India islands. It rises by the help of claw-like tendrils, the branches being very slender and weak; and by these it will overtop bushes, trees, &c. twenty or thirty feet high.

VOL. IV.

BIGOIS, a nymph who is said to have written a book in the Tuscan language, concerning the Art of Interpreting Lightnings. This was kept at Rome, in the temple of Apollo, with others of a similar nature.

BIGORNEAU, in natural history, a name given by Bellonius to that genus of cochleæ, called the semi-circular mouthed, or semi-lunar kind, including the nerita.

BIGORRE, a former county of France, which now forms the department of the Upper Pyrenees.

BIGOT, } This word cannot be traced.
BIGOTED, } It is supposed by Camden and
BIGOTTICK, } others, to take its rise from some
BIGOTTICAL, } occasional phrase. The French
BIGOTRY, } apply it to one superstitiously religious, and to a hypocrite. A man devoted unreasonably to a certain party; prejudiced in favor of certain opinions; a blind zealot. It is used often with *to* before the object of zeal; as a *bigot to* the Cartesian tenets.

Presbyterian merit, during the reign of that weak, *bigotted*, and ill-advised prince, will easily be computed. *Swift.*

Bigoted to this idol, we disclaim Rest, health, and ease, for nothing but a name.

Garth.

In philosophy and religion, the *bigots* of all parties are generally the most positive. *Watts.*

Were it not for a *bigotry* to our own tenets, we could hardly imagine that so many absurd, wicked, and bloody principles should pretend to support themselves by the Gospel. *Id.*

I shall only, in one word, mention the horrid effects of *bigotry* and avarice in the conquest of Spanish America—a conquest, on a low estimation, effected by the murder of ten millions of the species.

Burke.

BIGOR, in Italian bignonia, is used to denote a Venetian liquid measure, containing the fourth part of an amphora, or half the boot.

BIGOT (Emeric), the son of John Bigot, Sieur de Sommeuil, one of the most learned and most honest men of the seventeenth century, was born at Rouen, in 1626. His love of learning diverted him from public employments. He applied himself solely to the sciences, and greatly increased the magnificent library left by his father. He had a weekly assembly of literati at his house, besides much correspondence with those abroad. M. Menage and Nic. Heinsius were his most intimate friends. He translated Palladius's *Life of St. Chrysostom* from the Greek; concerning which a curious anecdote is recorded in the *Hist. des Ouvrages des Scavans*, for Feb. 1690, p. 267. 'Mr. Bigot's design was to add the Epistle' from St. Chrysostom to 'Cesarius, which he had found in a library at Florence, to the *Life*—but it appeared so express against transubstantiation, that the examiners obliged him to suppress it'. He was very modest, and an enemy to controversy. He died at Rouen, December 28th 1689, aged sixty.

BIGOT (William), a learned French physician and philosopher, under Francis I., was born at Laval, in Maine, in 1502. He was unfortunate almost from his birth: fourteen of his family died of the plague, of whom his nurse was the last. The neighbours being afraid to take care of him,

K

he was exposed by the side of a road under a hedge, and his father found him in this situation. As he grew up his education was neglected, and he early plunged into debauchery. He retired however into the country, where he acquired a relish for study; and without the assistance of instructors, made himself master of Greek, medicine, astronomy, and astrology, &c. He afterwards went to Germany, and was admitted professor of philosophy at Tubingen. Differing with the other professors, he returned to France, and was patronised by Mess. Du Bellai. He would have been promoted at the court of France, had he not incurred the displeasure of some person in the confidence of Francis I. The story as told by Melancthon, is, that Castellan represented him to that monarch, as an Aristotelian philosopher, and being asked by the king, what that was, replied he is one who prefers commonwealths before monarchies. Bayle, however, is at great pains to refute this story. Be that as it may, Bigot accepted an invitation to the university of Nismes, where his zeal for its privileges raised him many new enemies, and while he went to Paris to get the dispute settled, new misfortunes occurred in his domestic affairs. In particular, his wife already the mother of two daughters, was detected in an amour with a musician, on whom our author inflicted the punishment of Abelard. For this his enemies attempted to bring him to capital punishment; but though long confined, he escaped; as did his wife during his imprisonment. He was the author of 1. *Christianæ Philosophiæ præludium*; 2. *Somnium ad Gul. Belaium, Mæcenatem suum*; 3. *Carmen ad Jesum Christum*; &c. &c.

BIGOTRY is always to be distinguished from an honest zeal, which is an ardor of mind arising from the love of truth, and exciting the possessor to defend and propagate what he considers its principles. Bigotry is prejudice combined with a degree of malignity, and mostly prevalent amongst the ignorant, and those who are naturally of a morose and contracted mind. It is generally manifested more in unimportant sentiments, or the circumstantialities of religion than the essentials of it. Simple bigotry is the spirit of persecution without the power; persecution is bigotry armed with power, and carrying its will into act. As it is the effect of ignorance, so it is the nurse of it, because it precludes free enquiry: it overlooks the liberty that all man have of thinking for themselves, cuts the very sinews of that charity which hopeth all things, and destroys moderation and good will.

BIG-ROCK BRANCH, the Ness-head branch of the river Allegany. The branch called Big-hole Town joins it, and forms the Allegany, eight miles north-east from and above Venango Foot.

BIGUBA, a small state and town of western Africa, situated on the northern bank of the Rio Grande, about fifty or sixty miles from its mouth.

BIGUTTATA, in entomology, a species of cantharis, found in Europe. The thorax black, wing-cases black, and yellow at the tip. This is *telephorus niger*, *femoribus flavis*, *elytris apice luteis* of Degeer. Also the name of a species of cicada and also sylpha.

BIGUTTATOR, a species of ichneumon; color black, with two dots on the scutell, native of Sweden.

BIGUTTATUS, a species of curculio, that is found in Germany. Also a species of *cryptoccephalus*, native of Austria. Also a species of *carabus*, that lives under the bark of trees in Sweden.

BIGUTTULUS, a species of *gryllus locusta*; thorax cruciate, wing-cases clouded, and marked with a white spot near the tip. This is *acrydium biguttulum* of Degeer.

BIHACZ, a strong town of Hungary, in Croatia, seated in an isle formed by the river Unna.

BIHAMATA, in entomology, a species of *hispa*, of an oblong, depressed shape, unarmed, black, spotted with red, shells truncated and hooked, native of India.

BIHAR, a town and district of the eastern part of Hungary, bordering on Transylvania. It is partly a mountainous district, the plains are chiefly inhabited by Hungarians, and the hilly parts by Walachians. The former are esteemed superior both in purity of language and morals to the rest of their countrymen. The whole population is about 230,000.

BIJANAGUR, a city in the Balaghaut ceded territories, in the south of India, once the capital of a great Hindoo empire, but now in ruins. Its modern name is *ANNAGOONDY*, which see.

BJORE, an Afghan district of the province of Cabul, lying on the shores of the Indus. It contains eight extensive valleys, of which Rod is the largest. It is only partially possessed by the Yusefey tribe, many portions being occupied by the Mohmand, Sahi, Shinwari, and Turcalani tribes.

BJORE, the capital of the above district, is situated fifty-five miles from the river Indus. There is a tradition that the descendants of the Greeks, who accompanied Alexander to India, kept possession of this district for a considerable period. Long. 70° 43' E., lat. 34° 8' N.

BIJORKO, an island of Sweden, in the lake of Malar, on which there stood formerly a royal palace, and a small town. It is fifteen miles west of Stockholm.

BIJUGUM FOLIUM, in botany, denotes a winged leaf, bearing two pair of foliolæ.

BIL, in ichthyography, a name given in some parts of England to a peculiar species of cod-fish, called by Willoughby *assellus luseus*. It is distinguished from the cod by its smallness, by its being shorter and broader in its shape, by the paleness of its color, and largeness of its scales, though it agrees with it in having a beard under the chin.

BILANCHI DEFERENDIS, a writ anciently directed to a corporation, for the carrying of weights to a haven, and there to weigh wool.

BILANDER, *n. s. Fr. belandre*; a small vessel of about eighty tons burden, used for the carriage of goods. It is a kind of hoy, manageable by four or five men, and has masts and sails after the manner of a hoy. They are used chiefly in Holland, as being particularly fit for the canals. *Savary, Trevour.*

Like *bilanders* to creep
Along the coast, and land in view to keep. *Dryden.*

BILANDER in navigation, a small merchant ship with two masts, distinguished from other vessels of the same kind by the form of the main-sail. Few vessels are now rigged in the manner of bilanders: the name has been variously applied in different countries.

BILARIUS PORUS, the biliary pore, or hepatic duct, a considerable appendage of the liver, formed from the concurrence of a multitude of small ramifications springing from its glands, which unite into several trunks equal in magnitude to the branches of the hepatic arteries; and accompany them branch for branch through the whole substance of the liver; being wrapped up in the same capsula with the porta.

BILATERAL COGNATION, denotes kindred, on both sides, that of the father as well as mother.

BIL'BERRY, *n. s.*, from Sax. *bilg*, a bladder and berry, according to Skinner; *vitis idæa*. A small shrub; and a sweet berry of that shrub; whortleberry

Cricket, to Windsor's chimneys shalt thou leap;
There pinch the maids as blue as *bilberries*. *Shakspeare*.

BILBILIS, in ancient geography, a town of Hispania Citerior, the birth place of Martial, now supposed to be Calataiud in Arragon.

BILBO, } A sword, or rapier; and
BIL'BOES, } also stocks for the feet;
BIL'BOESMITH. } used for punishing offenders
at sea, they derive their name from bilboa where they were manufactured; and bilbo is a corruption of bilboa.

To be compassed like a good *bilbo*, in the circumference of a peck, hilt to point, heel to head.

Shakspeare.

Methought I lay
Worse than the mutines in the *bilboes*. *Id.*

BILBOA, formerly *BELVÃO*, the good ford, a town of Spain, the capital of Biscay Proper, having an excellent harbour at a short distance from the Bay of Biscay. It was built in 1300, on the margin of a navigable stream, by Diego Lopez de Haro, and soon became flourishing. The houses are well built, generally with projecting roofs, the streets paved and clean. Several canals pass through them, and convey water from the river. The population is about 15,000, who carry or an extensive commerce. Spanish wool of between 50,000 and 60,000 sacks, of two hundred weight each, have been sent out here in a year. Its other exports are iron, chestnuts, oil, and wine. Bilboa also imports salt, hemp, fish, materials for ship-building, colonial produce, British and French manufactures, drugs, &c. The number of vessels which annually enter the harbour is between 500 and 600. It stands fifty miles south of St. Sebastian, in lat. 43° 14' N, and long. 2° 42' W.

BILCOCK, in zoology, a synonyme of the *rallus aquaticus*, or water rail.

BILDAD, one of Job's four friends, is supposed to have been a descendant of Shuah, one of Abraham's sons by Keturah; as he is expressly styled a Shuhite. In his reasoning with Job, he proceeds upon the mistaken idea, that misfortune is always the attendant of criminality.

BILDGE, for *BILGE*, of a ship, the bottom of

her floor, or the breadth of the place the ship rests on when she is a-ground.

BILDGE-PUMPS, or burr-pumps, are those that carry off the bidge water.

BILDGE WATER, that which lies on the ships' floor, and cannot go to the well of the pump,

BILE'. See **BOIL**.

BILE'.

From *bilis*, Lat., and which
BIL'IARY, } Vossius has no doubt is from
BIL'IOUS. } the Greek *χολη*.

The liver minds his own affair;
Kindly suppuces our publick uses;
And parts and strains the vital juices;
Still lays some useful *bile* aside,
To tinge the chyle's insipid tide:
Else we should want both gibe and satire;
And all be burst with pure good nature. *Prior*.

Why *bilious* juice a golden light puts on,
And floods of chyle in silver currents run.

Garth. Dispensary.

Voracious animals, and such as do not chew, have a great quantity of gall; and some of them have the *biliary* duct inserted into the pylorus. *Arbuthnot*.

The gall-bladder is a very remarkable contrivance. It is the reservoir of a canal. It does not form the channel itself, i. e. the direct communication between the liver and the intestine, which is by another passage, viz. the ductus hepaticus, continued under the name of the ductus communis, but it lies adjacent to this channel, joining it by a duct of its own, the ductus cysticus; by which structure it is enabled, as occasion may require, to add its contents to, and increase the flow of *bile* into the duodenum. *Paley's Theology*.

BILE, The fluid secreted by the liver. It varies in color and consistence in different animals, and in the same animals under different circumstances. Its appearance, however, for the most part is of a yellowish green, the shades on one side or the other predominating with irregularity; sometimes, indeed, it is nearly brown, and at other times almost colorless. Its taste is more or less bitter; the bile from the ox, which has been the principal subject of experiment, being exceedingly so, while human bile has much less of bitterness.

When, says Mr. Brande, the bile of the ox is distilled, it affords about 90 per cent. of insipid water; the residuum is brown, bitter, and may be redissolved in water: it affords traces of uncombined alkali, which appears to be soda. The acids render bile turbid, and separate from it a substance, which possesses many of the properties of albumen. It is likewise coagulated by alcohol; and upon filtering off the clear liquor, and evaporating it, an inflammable fusible substance is obtained, of an intensely bitter flavor, combined with a portion of soda and common salt: this has been termed the resin of bile, and appears to be the principle which confers upon it its chief peculiarities. We should, therefore, conclude, as the result of these observations, that bile consists of water, albumen, soda, a bitter resin, and some minute portions of saline matter.

Thenard has determined the composition of ox-bile, as follows; but the substance denominated picromel among the following items, is thought by Mr. Brande to be an educt rather than a product, since the process by which it was procured by Thenard is very complex:

Water . . .	700 or a little more
Resin . . .	24
Picromel . . .	60·5
Yellow matter . .	variable in this case 4
Soda . . .	4
Phosphate of soda .	2
Muriate of soda .	3·2
Sulphate of soda .	0·8
Phosphate of lime .	1·2
Oxide of iron . .	a trace.

Berzelius, in remarking upon this analysis, questions its accuracy altogether, and denies even the presence of resin in bile. This last chemist states the composition of the fluid in question to be as follows :—

Water . . .	907·4
Biliary matter . .	80·0
Mucus of the gall-bladder .	3·0
Alkalies and salts, common to all animal fluids	9·6
	<hr/> 1000

It ought to be recollected, in all experiments upon this fluid, that it is, as above intimated, very different even from the same subject at different times. Dr. Monro, jun. describes a very interesting case, showing that bile after a meal, is secreted in larger quantities than at ordinary times. ‘I attended,’ says he, ‘a case in which there was an abscess in the liver, and a preternatural communication between that organ and the lungs, through which the bile was secreted, and discharged by coughing. The quantity thus discharged was very different at different times. It was always greater after meals, and especially for an hour or two after dinner.’ Bichat, too, proved the same fact by experiment. This last physiologist says, ‘that the bile which is secreted during abstinence, is divided between the duodenum and gall-bladder, and that the portion of it which goes into the latter, receives a more active character (un caractère d’âcreté, une teinte foncée): it should be recollected too, that the secretion itself is much regulated and modified by varied conditions of the nervous power, and organic energies. This last particular is of course more applicable to bile from the human subject than to that from animals, whose existence is less complicated, and not so much under the influence of external circumstances.

Thenard states, that no picromel is traceable in human bile, and that no other ingredient can be found in it than yellow matter, albumen, resin, and saline substances; the extract from human bile, affords, however, precisely the same salts as are discoverable in that from the ox, viz., uncombined soda, muriate, sulphate, and phosphate of soda, phosphate of lime, and oxide of iron.

The bile of the dog, the sheep, the cat, and the calf, was found precisely like that from the ox. In the pig’s bile, no picromel nor albumen, nor even yellow matter, was discovered. The bile of birds has a larger quantity of aluminous matter, and the picromel which it yields, is said to be not sensibly sweet, but possessed of a sharp and bitter taste.

The yellow matter appears to be that by which, with slight exception, the fluid under notice is principally characterised; and this matter seems

to be the same, from whatever species of animal the bile may have been taken. This is insoluble by itself, but becomes capable of solution, when combined with the other principles and ingredients of which the bile is composed. All acids decompose human bile.

How is bile formed? The liver is generally known to be the organ which secretes this fluid, although there are many among the lower tribes of animals that are furnished with a secretion answerable in its apparent qualities and purposes to bile, but in which no organ corresponding in structure and appearance with the liver has hitherto been detected; and in cases where, as in man, and the higher order of animals, this organ (the liver) is manifestly the organ by which the bile is formed, it does not seem to be ascertained with precision what is the actual portion of the organ that is destined for the purpose. The liver is remarkable for being furnished with a vessel (the vena portarum) by which venous blood is conveyed into its substance; while other organs of secretion are supplied only with arterious blood: it has hence been supposed that this venous blood is for the formation of bile, while that which is transmitted besides from the large artery of the liver (the hepatic artery) is intended for the nourishment merely of the viscus; and, to say the least, there seems to be some foundation for this hypothesis, although the inference from structure and apparent office is modifiable by circumstances, to which we shall advert in the articles *PHYSIOLOGY* and *MEDICINE*. It would seem to be pretty certain, that the actual secretion of the fluid takes place in that part of the liver’s substance which is termed granular; but, as we have above intimated, the bile is different when it is poured out into the intestines from what it is when first formed; and the rationale of these changes will fall to be considered in other places, especially in those parts of our work to which we have just referred the reader.

Uses of the bile. The direct and obvious office, says a modern writer, of the liver is the secretion of bile, which in most animals is suffered to accumulate in a pear-shaped reservoir adhering to its concave surface, and denominated a gall-bladder. Yet in many animals, even of different classes, we perceive no such reservoir, as the elephant, rhinoceros, stag, camel, goat, horse, tricheus, porpoise, rat, ostrich, and parrot; while we do not know of a reptile that is destitute of it. In the human subject, it has also been wanting, of which Dr. Cholmely gives a singular example in the sixth volume of the *Medical Transactions*; but such a deficiency has only occurred in infants who have fallen victims to it soon after birth, before which period as there is no transit of fæces through the intestinal canal, and perhaps no peristaltic action, it does not appear to be necessary.

Perhaps, indeed, antecedently to birth, there is no bile secreted. In the case related by Dr. Cholmely, although the whole of the bile, as fast as it was secreted, seems to have been carried back into the system, the sallowness of the skin is not noticed to have occurred till the day after birth, from which time the child exhibited a deeper and deeper hue, till it died of convulsions at the end of five weeks.

It has reasonably, therefore, been supposed that one chief use of the bile is to stimulate the lacteal vessels, and maintain the peristaltic action of the alvine canal. Yet in jaundice the lacteals perform their office, and in lenter the peristaltic action is peculiarly brisk, though the intestines are without this fluid. Hence, Dr. Fordyce regarded the bile as of no service whatever in the digestive process; and Sir E. Home has given an example of a child that fed heartily, seemed to digest the food well, and had regular stools, and was nevertheless without a gall-bladder, or even a duct of any kind leading from the liver to the duodenum; and however stimulant the bile may be to the coats and emunctories of the intestines, it has a sedative rather than a stimulant power upon the blood, and instead of rousing to additional energy, produces weariness and inactivity.

But recent experiments of Mr. Brodie have proved, that, whatever force there may be in some of the above objections, the main office of the bile is clearly to change the nutritious part of the chyme into chyle, and to separate from it the excrementitious matter. Mr. B. tied a ligature around the duct which leads from the liver into the intestines, and, in all the cases in which the experiment was made, it was found that the conversion of chyme into chyle (see CHYLE) was invariably and completely prevented; so that we are furnished with evidence of demonstrative force to show, that for the due nutrition of the system, as well as for the proper actions of the intestinal canal, the presence of the bile is absolutely necessary.

Mr. Brodie meets such objections as have been advanced above, and others, in the following way: 'If the bile be so essential, how is it that persons occasionally live a considerable time in whom the flow of the bile into the duodenum is interrupted? On this point it may be remarked, 1st. It seldom happens that the obstruction of the duct is so complete as to prevent the passage of the bile altogether; and the circumstance of the evacuation being of a white color in jaundice and other diseases, may prove the deficiency, but does not prove the total absence of bile. 2dly. That in the very few authenticated cases which have occurred of total obliteration of the duct in the human subject, there has been always, I believe, extreme emaciation, showing that the function of nutrition was not properly performed. 3dly. That the fact of individuals having occasionally lived for a few weeks or months under these circumstances, only proves that nutrition may take place to some extent without chyle being formed. In my experiments,' he adds, 'I found that the more fluid parts of the chyme had been absorbed, and probably this would have been sufficient to maintain life during a limited portion of time.'

For an account of Biliary calculi, see CALCULUS.

BILEDULGERID, or **BLAD AL JERID**, the country of dates, a district of Africa, south of Algiers. It is almost square, extending more than eighty leagues every way, from lat. 28° 30' to 32° 50' N., and from long. 6° to 12° W. It is bounded on the north by Tunis, on the east

by a ridge of lofty mountains which divide it from Tripoli and part of Gudamis, on the west by the countries of Zeb and Mezzeb, and on the south by the province of Verghela. This country is barren and mountainous, producing little beside dates, which grow here in such profusion, that the face of half the country is covered over with the trees. The climate is unhealthy, and the people lean, swarthy, and shrivelled; with their eyes inflamed, from the reflection of the sun-beams. The showers of dust and sand, driven by the high winds, frequently bury men and cattle in whole caravans. The inhabitants are also much afflicted with scurvy in the gums, &c. but they are remarkably free from other diseases. The plague is said not to be known in Biledulgerid. The tribes of this region are a mixture of Africans and wild Arabs: the latter, who pride themselves in their superiority of birth and talents, being quite independent, pursue scarcely any other occupation besides hunting ostriches and plundering. The Africans live with considerable regularity in small villages. Besides dates, and ostriches, the common food here is the flesh of goats and camels; drinking either the broth in which the flesh is boiled, or the milk of their camels; for they seldom taste water. There is scarcely a town in the whole country, or a stream of water that deserves notice.

BILFINGER (George Bernard), was born 23d January, 1693, at Canstadt, in Wirtemberg; and by a singularity of constitution, hereditary in his family, came into the world with twelve fingers and twelve toes, which an early amputation happily corrected. His father was a Lutheran minister, and from his earliest years discovered his great inclination to learning. He studied in the schools of Blaubeuern and Bobenhausen, and afterwards entered into the theological seminary of Tubingen. Here the works of Wolf inspired him with a taste for the Wolfian philosophy, and that of Leibnitz. He wished, at least, to try to connect theology with his favorite science of philosophy, and in this spirit composed a tract, entitled *De Deo, Anima, et Mundo*, a work which met with great applause, and contributed to the advancement of the author to the office of preacher at the castle of Tubingen. In 1719 he obtained from his friends a supply of money, which enabled him to spend some time at Halle, to pursue the lessons of Wolf, and after two years returned to Tubingen, only to find his lectures deserted, and himself shunned for his new notions. After this had lasted almost four years, he received an invitation to go to Petersburg, as professor of logic and metaphysics, and member of the new academy of Peter I. He was received in this city, where he arrived in 1725, with great consideration. The Academy of Sciences at Paris having proposed about this time the famous problem, on the cause of gravity, Bifinger gained the prize of a thousand crowns. This success drew the attention of all the learned of Europe to his name; and Charles Edward, Duke of Wirtemberg, finding that the author was one of his subjects, hastened to recal him. The czar, after having made some useless attempts to detain

nim, granted him a pension of four hundred florins, and a present of two thousand. He quitted Petersburg in 1731. Returning to Tübingen, the university greatly prospered under his care; and is said to be conducted to this day according to the excellent regulations he established. The duke appointed him in 1735 privy-counsellor, a nomination not simply honorary, for Bilfinger saw himself raised at once to considerable power. He now employed almost two years in laboring to understand the statistics of his country, its political situation, &c. and ultimately became one of the most enlightened ministers it ever produced. He was the author of that strict union which has long united Wirtemberg and Prussia, and of the importance to which the hereditary Prince of Wirtemberg was raised at Berlin. In 1737 the duke nominated him president of his consistory, and secretary of the grand order of the chase. He was also curator of the university of Tübingen, and member of the Royal Academy of Berlin. He was never married, and died at Stuttgart, the 18th of February, 1750. His works, besides papers published in the Memoirs of the St. Petersburg and Paris Academies of Science, are: 1. *Disputatio de Harmoniâ præstabilitâ*, Tübingen, 1721, in 4to. 2. *De Harmoniâ Animi et Corporis Humani maximè præstabilitâ Commentatio Hypothetica*, Frankfort on the Maine, 1723, in 8vo. This work was inserted in the Expurgatory Index at Rome in 1734. 3. *De Origine et Permissione Mali, præcipuè Moralis, Commentatio Philosophica*, ib. 1724, in 8vo. 4. *Specimen Doctrinæ Veterum Sinarum Moralis et Politicæ*, Frankf. 1724, in 4to. 5. *Dissertatio Historico catoptrica de Speculo Archimedis*, Tübingen, 1725, in 4to. 6. *Dilucidationes Philosophicæ de Deo, Animâ Humanâ, Mundo, et Generalibus Rerum Affectionibus*, ib. 1725, in 4to. 7. *Bilfingeri et Holmanii Epistolæ de Harmoniâ Præstabilitâ*, 1728, in 4to. 8. *Disputatio de Naturâ et Legibus Studii in Theologiâ Thetici*, ib. 1731, in 4to. 9. *Disputatio de Cultu Dei Rationali*, ib. 1731. 10. *Notæ Breves in Ben. Spinosæ Methodum Explicandi Scripturas*, Tub. 1732, in 4to. 11. *De Mysteriis Christianæ Fidei Generatim Spectatis Sermo, Recitatus* 1732, Tub. 1732, in 4to. 12. *Elementa Physicæ*, Leipzig, 1742, in 8vo. 13. *La Citadelle Coupée*, Leipzig, 1756, in 4to.

BIL'GEN, *n.* } Gothic, *bulgia*, to swell;
BILGE', *v.* } that which bulges or bellies out; the bilge, according to Skinner, is the compass or breadth of a ship's bottom—her belly; to bilge, therefore, is when by any violence, such as striking on a rock, she opens her bulge or belly so as to let in the water; it is another term for springing a leak.

The next morning, at day-break, she (the *Wager*) struck on a sunken rock, and soon after *bilged*, and grounded between two small islands, at about a musquet shot from the shore.

Anson's Voyage round the World.

BILHAH, a city of the Simeonites, in Judea.

BILIMBI, in botany, a tree celebrated in the East Indies for its uses in medicine. European botanists call it *malus Indica*, fructu pentagona, or the Indian apple tree, with the five-cornered

fruit. It seldom grows to above twelve feet high, and is not commonly wild, but carefully cultivated in gardens, where it flowers all the year round. The juice of the root is drank as a cure for fevers. The leaves boiled, and made into a cataplasm with rice, are famed in tumors, and the juice of the fruit is used in almost all external heats. The fruit is pleasant to the taste when ripe, and is commonly eaten.

BIL'INGSGATE, *n. s.*, a cant word, borrowed from Bilingsgate in London, a place where there is always a crowd of low people, and frequent brawls and foul language; ribaldry; foul language. See **BILLINGS**GATE.

There stript, fair rhetorick languished on the ground,
 And shameful *bilingsgate* her robes adorn. *Pope.*

BILINGUIS, properly denotes, 1. A person who has two tongues in his mouth; an instance of which is given by Dolaus. 2. A person who speaks two languages. It is in law applied to a jury impanelled between an Englishman and a foreigner, which should consist half of foreigners and half of Englishmen.

BILIN, a town of Bohemia, in the circle of Leitmeritz, near a mountain of the same name, remarkable for the variety of herbs found on it, as well as for stones and metals. Here is also a mineral spring. It is seventeen miles west of Leitmeritz.

BILINEATA, in entomology, a species of leptura; color blackish-brown, with two lines on the thorax, and scattered dots on the yellow wing-cases; inhabiting Carniola. Also a species of cantharis; thorax yellow, with four brown dots: wing-cases yellow, with a fuscous line. A native of the Cape of Good Hope. Also a species of chrysomela, found in Scandinavia; color green, glossed with gold; anterior of the thorax excavated; and a double blue line on the wing-cases. Also a species of phalæna geometra; wings testaceous yellow, with a broad stripe across, and a brown and a white margin.

BILINEATUS, in entomology, a species of ichneumon; color black, with two yellow lines in front; abdomen depressed; legs red.

BILINEATUS, in ichthyology, a Chinese species of pleuronectes. It is thin, long, yellow above, with a brown margin; reddish-white beneath; covered with small scales.

BILINEATUS, in zoology, a species of coluber; color rufous, with two yellow stripes. This is la double-raie of count le Cepede, and bilineated snake of Dr. Shaw.

BILITZ, or **BIELITZ**, a principality of Austrian Silesia, enclosed by the lordship of Plesse, the principality of Teschen, and the kingdom of Poland. The town of Bilitz lies on the river Biala, and has a castle. The inhabitants, who amount to 3360, are chiefly cloth-weavers. This place stands opposite to the Polish town of Biala, with which it has communication by a bridge across the river. It is fifteen miles E.N.E. of Teschen. Long. 18° 59' E., lat. 49° 48' N.

BILK', *v. a.*, derived by Mr. Lye from the Gothic *biliacum*. To cheat; to defraud, by running in debt, and avoiding payment.

Bilked stationers for yeomen stood prepared.

Dryden.

What comedy, what farce can more delight,
Than grinning hunger, and the pleasing sight
Of your *bilked* hopes.

Id.

BILL, *v. & n.*, Ang.-Sax. *bile*; the beak of a bird; the snout of a beast; the nose of a fish; the beak of a ship; 'biling and cooing,' the courtship of birds; now a common phrase for those little tendernesses which love employs to express the ardor of its affection: a very amiable weakness.

Their *bills* were thwarted crossways at the end, and with these they would cut an apple in two at one snap.

Carew.

In his *bill*

An olive leaf he brings, pacifick sign!

Milton.

Still amorous, and fond, and *billing*,

Like Philip and Mary on a shilling.

Butler.

On the other side, Tom Faddle and his pretty spouse, wherever they come, are *billing* at such a rate, as they think must do our hearts good who behold them.

Spectator.

O let them ne'er with artificial note,
To please a tyrant, strain their little *bill*,
But sing what heaven inspires, and wander where
they will.

Beattie.

In the curlew, woodcock, and snipe, there are three pair of nerves, equal almost to the optic nerve in thickness, which pass first along the roof of the mouth, and then along the upper chap down to the point of the *bill*, long as the *bill* is. *Paley's Theology.*

BILL' } Sax. *bille*, *tribille*; a two-
BILL'ETS, } edged axe. A kind of hatchet
BILL'MAN. } with a hooked point, used in country work, as a hedging *bill*; so called from its resemblance in form to the beak of a bird of prey; a kind of weapon anciently carried by the foot; a battle-axe. Junius thinks *billets* are pieces of wood cut with a *bill*.

And drove at him with all his might and mayne
A forest-*bill*, which both his hands did strayne.

Spenser.

Yea, distaff women manage rusty *bills*;
Against thy seat both young and old rebel.

Shakspeare.

Standing troops are servants armed, who use the lance and sword, as other servants do the sickle or the *bil*, at the command of those who entertain them.

Temple.

Preserve this groaning branch, O hear my prayer,
Spare ne this one, this one poor *billet* spare;
That having many fires and flames withstood,
Its ancient testimonial may last good,
In future times to prove, I once had wood.

King. The last Billet.

The ranks of *bill-men* in order to battle are always environed with pikemen, for the *bill-men* serve specially for execution if the enemy be overthrown.

Old's Life of Raleigh.

BILL', *v. & n.* } Ang.-Sax. *bille*, unde
BILL'ET, *v. & n.* } Græco Barb. *βιλλος*; Gallic
BILL'MAKER. } and Belgic *billet*. To enlist; to enroll; to put or write upon the muster-roll. In whatever different applications the word is employed it retains the original meaning of writing. 'To *billet* a soldier or other person is to note, *bill*, or particular in writing, to appoint his quarters or lodgings. A *bill* seems to be applied to a statement in writing of

certain particular things, as a *bill* of indictment, a *bill* of costs,' &c.

He does receive

Particular addition from the *bill*

That writes them all alike.

Shakspeare.

Retire thee; go where thou art *billeted*:

Away, I say.

Id.

How now, for mitigation of this *bill*,

Urged by the commons? doth his majesty

Incline to it, or no?

Id.

Ordinary expence ought to be limited by a man's estate, and ordered to the best, that the *bills* may be less than the estimation abroad.

Bacon.

No new laws can be made, nor old laws abrogated or altered, but by parliament; where *bills* are prepared and presented to the two houses.

Id.

His masterpiece was a composition that he *billed* about under the name of a sovereign antidote.

L'Estrange.

When he found this little *billet*, in which was only written 'Remember Cæsar,' he was exceedingly confounded.

Clarendon.

Like him that took the doctor's *bill*,

And swallowed it instead o' the pill.

Hudibras.

Let them, but under your superiours, kill,

When doctors first have signed the bloody *bill*.

Dryden.

And in despair, their empty pit to fill,

Set up some foreign monster in a *bill*.

Id.

The fourth thing very maturely to be consulted by the jury, is, what influence their finding the *bill* may have upon the kingdom.

Swift.

It may seem somewhat difficult to make out the *bills* of fare for some of the forementioned suppers.

Arbutnot.

There will be no way left for me to tell you that I remember you, and that I love you, but that one, which needs no open warrant, or secret conveyance; which no *bills* can preclude, nor so kings prevent.

Pope to Atterbury.

All that a *bill* of exchange can do, is to direct to whom money due, or taken up upon credit, in a foreign country, shall be paid.

Locke.

Let us then calculate, when the bulk of a fagot or *billet* is dilated and rarified to the degree of fire, how vast a place it must take up.

Digby on Bodies.

'Twas then, Belinda! if report say true,

Thy eyes first opened on a *billet-doux*.

Pope.

Most who took in the weekly *bills* of mortality, made little other use of them, than to look at the foot, how the burials increased or decreased.

Grant.

As he never said—No—to any request in his life, he has given them a *bill*, drawn by a friend of his upon a merchant in the city, which I am to get changed.

Goldsmith.

We'll add a title —

Count Arnold; it hath no ungracious sound,
And will look well upon a *billet-doux*.

Byron. Deformed Transformed.

BILL is a word of various legal uses. The best definition is that of the learned and laborious author of the Law Dictionary. 'It is a declaration in writing, expressing either the wrong the party complaining hath suffered by the party complained of, or else some fault committed against some law or statute of the realm; and this bill is sometimes addressed to the Lord Chancellor of England, especially for unconscionable wrongs done to the complainant, and sometimes to others having jurisdiction, according as the law directs.'

The BILL IN EQUITY, 'addressed to the Lord Chancellor,' is a formal statement, in the style of a petition, wherewith a complainant or orator, as he is termed in the bill, commences his suit; here he sets forth at length the circumstances of fraud, breach of trust, hardship, or the like, under which he suffers, without remedy by common law; humbly praying that he may be relieved at the hands of the court, and that the defendant may be compelled to answer, upon oath, the matters charged against him. The answer is ordinarily the second stage in all pleadings in courts of equity.

Actions in the courts of law are either by 'Original' or by 'Bill;' that is, by an original writ issuing out of the Court of Chancery (or at least, by process, supposing in legal fiction such a writ to have issued), and returnable to the particular court of law; or by bill filed in the first instance in that particular court.

A *BILL OF MIDDLESEX* is a process of the Court of King's Bench, forming a part of the scheme whereby it obtains its jurisdiction in civil actions.

A *BILL OF EXCEPTIONS* is a formal statement drawn up on the trial of a cause, and sealed by the judge, wherein an objection is stated to some decision of his, either in admitting or refusing evidence, in a challenge of a juror, in mis-stating the legal effects of facts, &c. Its intent is, to enable the party against whom judgment is given, should he appeal by writ of error to a superior tribunal, to have this alleged judicial mistake taken into consideration. This by the common law he could not do, as objections of this nature would not appear on the face of the record, or written pleadings; and, to remedy this defect, the right of tendering to the judge a bill of exceptions was provided by the statute of Westminster the second, 13 Edw. I. ch. 31, and it is made compulsory on the judge to affix his seal to it.

A *BILL OF EXCHANGE* is in modern times a request in writing, addressed by one person to another, desiring him to pay a sum of money to some third person, or to any person to whom either that third person, or the first person himself, who makes the request, may afterwards order it to be paid, and that, either immediately, or at any specified distance of time. This is presented to the person to whom it is addressed, for his assent or acceptance. If he gives his assent to it, he notifies it by signing his name on the bill, with the word 'accepted,' and, from that time, he becomes liable to pay it, according to its tenor. The party, in whose favor it is drawn, indicates to what person it shall be paid by indorsing it—that is, by writing on the back of it to that effect, and authenticating it by his signature. The person who makes the bill is the drawer; he to whom it is addressed the drawee; and, when he has accepted it, the acceptor; he in whose favor it is drawn, the payee; and any other person whom he appoints, by indorsement, to receive the money, the indorsee; and all parties into whose hands it may come, by subsequent circulation, holders. When the payee writes nothing but his name on the back, he is said to indorse it in blank, and it is thenceforth payable to any holder. The law of bills of exchange has become in this country a

very important and extensive branch of study. Mr. Chitty and Mr. Justice Bayley have both published valuable treatises on it.

A *BILL OF INDICTMENT* is the written statement of an offence imputed to a prisoner, which is, in the first instance, laid before the grand jury; and if, upon examination of ex parte evidence, they declare it to be 'a true bill,' the prisoner is arraigned and takes his trial; the evidence, in order to convict him, being expected to correspond with the bill or indictment. See *Starkie's Treatise on Criminal Pleading*, 2 vols. 8vo. London, 1822.

A *BILL OF SALE* is a contract, which must be by deed under seal, whereby the proprietor of goods and chattels passes his right and property in them to another: being made solemnly, and with the seller's seal affixed, he is bound by it, and not allowed to show, as he might in the case of a mere parol contract, that it was made without good or valuable consideration, and that, therefore, in law the property did not pass, and no action can be maintained to recover it. See *ASSUMPSIT*.

The BILL OF RIGHTS was an important statute, the second of the first year of William and Mary, so called as being declaratory of the rights of British subjects. See *Blackstone's Comment.* vol. i. p. 128.

BILL, in mechanics, an instrument made of iron, edged in the form of a crescent, and adapted to a handle. It is used by basket-makers, plumbers, and gardeners. When short, it is called a hand-bill, and when long, a hedge-bill.

BILL, in physiology, a cartilaginous substance covered with skin, forming the beak of a bird. The bill performs the office of teeth in some birds, and serves as a weapon. In the parrot kind it is hooked, and serves to climb, and catch hold of boughs. The upper bill of this bird is filled with rows of cross bars; and the under bill, which is much shorter, shuts within the upper, and draws against the roof of the mouth; by which a kind of mastication is affected, before the meat passes into the craw. The phoenixpter bill is a true hyperbola, pointed at the end like a sword; and the upper bill moves in eating, the lower being fixed contrary to those of all other kinds. The woodpecker's bill is strong, and sharp enough to dig holes in the heart of the hardest timber. In the island of Ferro, a fixed reward is given for the bills of ravenous birds: all watermen are obliged to bring a certain number yearly to the country courts, at the feast of St. Olaus; when they are thrown into a heap, and burnt in triumph. Plott gives divers instances of monstrous irregularities in the bills of birds, particularly of a raven, whose mandible crossed each other, the lower chap turning upwards and the upper downwards. *Nat. Hist. Stafford.* ch. vii. sect. 4.

BILL, in trade, both wholesale and retail, as also among workmen, signifies an account of goods delivered to a person, or of work done.

BILL, BANK, is a note of obligation signed on behalf of the company of the bank by one of the partners or their cashiers. Or it is an obligation to pay on demand either to the bearer or to order; in Scotland, it is understood to be to order.

BILL BROUGHT INTO PARLIAMENT, a paper containing propositions, offered to both houses to be passed by them, and then presented to the king to pass into a law. To bring a bill into the house, if the relief, sought by it, is of a private nature, it is first necessary to prefer a petition; which must be presented by a member, and usually sets forth the grievance to be remedied. This petition when founded on facts that may be disputed is referred to a committee, who examine the matter, and accordingly report to the house; and then, or otherwise upon the mere petition, leave is given to bring in the bill. In public matters, the bill is brought in upon motion made to the house, without any petition. Formerly bills were drawn in the form of petitions, and entered upon the parliament rolls with the king's answer subjoined; not in any settled form of words, but as the circumstances required; and, at the end of each parliament, the judges drew them into the form of a statute, which was entered on the statute rolls. In the reign of Henry V., to prevent mistakes and abuses, the statutes were drawn up by the judges before the end of the parliament; and in the reign of Henry VI. bills in the form of acts, according to the modern custom, were first introduced. The persons directed to bring in the bill, present it in a competent time to the house, drawn out on paper, with a multitude of blanks, or void spaces, where any thing occurs that is dubious, or necessary to be settled by parliament itself, such especially as the precise date of times, the nature and quantity of penalties, or of any sums of money to be raised, being indeed only the skeleton of the bill. In the house of lords, if the bill begins there, it is when of a private nature referred to two judges, who examine and report the state of the facts alleged, to see that all necessary parties consent, and to settle all points of technical propriety.—This is read a first time, and at a convenient distance a second time: and, after each reading, the speaker opens to the house the substance of the bill and puts the question, Whether it shall proceed any farther? The introduction of the bill may be originally opposed, as the bill itself may on either of the readings; and if the opposition succeed, the bill must be dropped for that session; as it must, also, if opposed with success in any subsequent stage. After the second reading, the bill is committed; that is referred to a committee: which is either selected by the house, in matters of small importance; or else, upon a bill of consequence, the house resolves itself into a committee of the whole house, which is composed of every member; to form it, the speaker quits the chair, another member being appointed chairman, and may sit and debate as a private member. In these committees the bill is debated clause by clause, amendments made, the blanks filled, and sometimes the bill entirely new modelled. After it has gone through the committee, the chairman reports it to the house, with such amendments as the committee have made: the house then reconsiders the whole again, and the question is repeatedly put upon every clause and amendment. When the house has agreed or disagreed to the amendments of the committee, and sometimes added new amendments of its

own, the bill is then ordered to be engrossed, or written in a strong gross hand, on one or more long rolls of parchment sewed together. When this is finished, it is read a third time, and amendments are sometimes then made to it; and if a new clause be added, it is done by tacking a separate piece of parchment on the bill, which is called a rider. The speaker then again opens the contents; and holding it up in his hands, puts the question, whether the bill shall pass? If this be agreed to, the title to it is then settled: which used to be a general one for all the acts passed in the session, till in the fifth year of Henry VIII. distinct titles were introduced for each. After this, one of the members is directed to carry it to the lords, and desire their concurrence; who, attended by several more, carries it to the bar of the house of peers, and there delivers it to their speaker, who comes down from his woosack to receive it. It there passes through the same forms as in the other house, except engrossing, which is already done; and if rejected, no more notice is taken, but it passes sub silentio, to prevent unbecoming altercations. But if it is agreed to, the lords send a message by two masters in chancery, or sometimes two of the judges, that they have agreed: and the bill remains with the lords, if they have made no amendment to it.—But if any amendments are made, such amendments are sent down with the bill to receive the concurrence of the commons. If the commons disagree to the amendments, a conference usually follows between members deputed from each house; who for the most part settle and adjust the difference: but if both houses remain inflexible the bill is dropped. If the commons agree to the amendments, the bill is sent back to the lords by one of the members with a message to acquaint them therewith. The same forms are observed, *mutatis mutandis*, when the bill begins in the house of lords. But when an act of grace or pardon is passed, it is first signed by his majesty, and then read once only in each of the houses, without any new engrossing or amendment. And when both houses have done with any bill, it is deposited in the house of peers, to wait the royal assent; except in the case of a bill of supply, which, after receiving the concurrence of the lords, is sent back to the house of commons. For the manner of giving the royal assent, See ASSENT.

Before the invention of printing, acts of parliament were usually published by the sheriff of every county; the king's writ being sent to him at the end of every session, together with a transcript of all the acts made at that session, commanding him, *ut statuta illa, et omnes articulos in eisdem contentos, in singulis locis ubi expidire viderit, publicè proclamari, et firmiter teneri et observari faciat.* And the custom was to proclaim them in his county court, and there to keep them, that whoever would, might read or take copies thereof; which custom continued till the reign of Henry VII. An act of parliament thus made is the exercise of the highest authority that this kingdom acknowledges. It has power to bind every subject in the land, and the dominions thereunto belonging; nay, even the king himself, if particu-

larly named therein. And it cannot be altered, amended, dispensed with, suspended, or repealed, but in the same forms and by the same authority of parliament: for it is a maxim in law, that it requires the same strength to dissolve as to create an obligation. It was formerly held, that the king might in many cases dispense with penal statutes; but now by statute, 1 William and Mary, stat. 2, cap. 2, it is declared that the suspending or dispensing with laws, by royal authority, without consent of parliament, is illegal.

BILL OF APPEAL. See **APPEAL**.

BILL OF ATTAINDER. See **ATTAINDER**.

BILL OF ENTRY, an account of the goods entered at the custom-house, both inwards and outwards. In this bill must be expressed the merchant exporting or importing, the quantity of merchandise, and the divers species thereof; and whither transported, and from whence.

BILL OF LADING, or memorandum, is an acknowledgment signed by the master of a ship, and given to a merchant, &c. containing an account of the goods which the master has received on board from him, with a promise to deliver them at an intended place, for a certain salary. Each bill of lading must be treble; one for the merchant who loads the goods, another to be sent to the person to whom they are consigned, and the third to remain in the hands of the master of the ship. It must be observed, however, that a bill of lading is used only when the goods sent on board a ship are but part of the cargo: for when a merchant loads a whole vessel on his own personal account, the deed passed between him and the master of the ship is called charter-party. See **CHARTER-PARTY**.

BILLS OF MORTALITY. These are summed up every week, month, quarter, or year, according to the population of the place; hence called weekly bills, monthly, quarterly, or yearly bills. The London bills of mortality, which were the first in Britain, are composed by the company of parish-clerks, and express the number of christenings of each sex, and the number of deaths from each disease. These bills were first computed after the Plague in 1592, at which time they included 109 parishes. This number has since been increased to 146.

BILL OF STORE, a license granted at the custom-house to merchants, by which they have liberty to carry, custom free, all stores and necessary provisions for their voyage.

BILL OF SUFFERANCE, a license granted to a merchant, at the custom house, suffering him to trade from one English port to another without paying custom.

BILLERICAY, a market-town in the hundred of Barnstable, Essex, four miles east from Brentwood, and twenty-three east from London. At Blunts'-Walls, near this place, are traces of a Roman fortification and ditch. The market, on Tuesday, is well supplied with corn.

BILLERICAY, a township in Middlesex county, Massachusetts, twenty miles north of Boston.

BILLES, in traffic, a name given by the French, and afterwards by other nations, to the masses of raw steel which has been tempered for sale, and is ready to be wrought into tools,

&c. This in working loses its temper, but recovers it again by plunging it into cold water.

BILLET, in military affairs, a well-known ticket for quartering soldiers, which entitles each soldier, by act of parliament, to candles, vinegar, and salt, with the use of fire, and the necessary utensils for dressing and eating their meat. Publicans, and other persons obliged to furnish quarters, have been relieved by a further allowance of 6d. each man per diem for the cavalry, and 4d. each man per diem for the infantry; which makes the whole sum for each man's diet and small beer, 10d. per diem. They are also, by a subsequent act, entitled an Act for the Relief of Innkeepers, &c. allowed 4½d. for each horse's hay and straw, in addition to the former 6d. By a circular, dated War Office, 24th May, 1816, to general officers commanding districts, in conformity with an Act for fixing the Rates of Subsistence to be paid to Innkeepers and others on quartering Soldiers, the rate of allowance for the hot-meal, provided for non-commissioned officers or private soldiers on a march in South Britain, is fixed at the sum of 1s. per diem, until the 24th ultimo inclusive, and from and after that day at the sum of 10d. per diem; and that the sum to be paid to innholders, and others on whom any of the horses belonging to his majesty's forces shall be quartered, is fixed at 1s. 2d. per diem, until the 24th ultimo inclusive, and at 10d. per diem from and after that day.

BILLET, in heraldry, a bearing in form of a long square. They are supposed to represent pieces of cloth of gold and silver; but Guillem thinks they represent a letter sealed up, and other authors take them for bricks. Billets signifies that the escutcheon is all overstrewn with billets, the number not ascertained.

BILLETS, or **BILLET WOOD**, small wood for fuel; the assize of which was formerly to be enquired of by justices.

BILLETINS, or Brothers of Charity, a society of religious hospitaliers, founded about A. D. 1297. They took the third order of St. Francis, and the seapulary, making three usual vows, but without begging.

BILLETON, an island in the Indian Seas, of a circular form, about fifty miles in length, and forty-five in breadth, situated between Sumatra and Borneo. Long. 108° E., lat. 3° S.

BILLIARDS. This game is played on a rectangular table, with little ivory balls, which are driven into hazards or holes. It was invented by the French, but was played differently from what it now is; having a pass iron fixed on the table, through which the balls at particular periods of the game used to be played; but this method is quite laid aside. The French, Germans, Dutch, and Italians, brought this game into vogue throughout most parts of Europe, and it soon became a favorite diversion in England, particularly with persons of rank. It has, however, of late years been prostituted by the designing among the lower classes; but it will never be out of fashion, being very entertaining, and affording that moderate exercise which renders it the more agreeable. The table on which the game is played is generally about twelve feet long, and six wide; it is covered with fine green

cloth, and surrounded with cushions to prevent the balls rolling off, and to make them rebound. There are six holes, nets, or pockets, fixed at the four corners, and the middle, opposite to each other, to receive the balls, which when put into them are called hazards. The making of a hazard, that is, putting the adversary's ball in, at the usual game, reckons two in favor of the player. The game is played with sticks called maces, or with cues; the first consists of a long straight stick, with a head at the end, and is the most powerful instrument of the two: the cue is a thick stick diminishing gradually to a point of about half an inch in diameter; this instrument is played over the left hand, and supported by the fore-finger and thumb. It is the only instrument in vogue abroad, and is played with amazing address by the Italians and some of the Dutch; but in England the mace is the prevailing instrument, which the foreigners hold in contempt, as it requires not near so much address to play the game with it as with the cue; but the mace is preferred for its peculiar advantage, which some professed players have introduced under the name of trailing, that is following the ball with the mace to such a convenient distance as to make it an easy hazard. The degrees of trailing are various, and have different denominations, viz. the shove, the sweep, the long stroke, the trail, and the dead trail or turn up, all which secure an advantage to a good player according to their various gradations; even the butt end of the cue becomes very powerful when it is made use of by a good trailer.

The following are the rules observed in the common game of billiards: 1. For the lead, the balls must be put at one end, and the player must strike against the farthestmost cushion, in order to see what will be nearest the cushion that is next to them. 2. The nearest to the cushion is to lead, and choose the ball if he pleases. 3. The leader is to place his ball at the nail, and not to pass the middle pocket; and if he holes himself in leading, he loses the lead. 4. He who follows the leader must stand within the corner of the table, and not place his ball beyond the nail. 5. He who plays upon the running ball loses one. 6. He who touches the ball twice, and moves it, loses one. But these two rules are seldom if ever enforced, especially in England. 7. He who does not hit his adversary's ball loses one. 8. He who touches both balls at the same time, makes a foul stroke, in which case if he should hole his adversary, nothing is gained by the stroke; but if he should put himself in, he loses two. 9. He who holes both balls loses two. 10. He who strikes upon his adversary's ball, and holes himself, loses two. 11. He who plays at the ball without striking it, and holes himself, loses three. 12. He who strikes both balls over the table, loses two. 13. He who strikes his ball over the table, and does not hit his adversary's ball, loses three. 14. He who retains the end of his adversary's stick when playing, or endeavours to baulk the stroke, loses one. 15. He who plays another's ball or stroke without leave, loses one. 16. He who takes up his ball, or his adversary's without leave, loses one. 17. He who stops either ball

when running, loses one, and being near the hole loses two. 18. He who blows upon the ball when running loses one, and if near the hole loses two. 19. He who shakes the table when the ball is running loses one. 20. He who strikes the table with the stick, or plays before his turn, loses one. 21. He who throws the stick upon the table, and hits the ball, loses one. 22. If the ball stands upon the edge of the hole, and after being challenged, it falls in, it is nothing, but must be put where it was before. 23. If any person, not being one of the players, stops a ball, the ball must stand in the place where it was stopped. 24. He who plays without a foot upon the floor, and holes his adversary's ball, gets nothing for it, but loses the lead. 25. He who leaves the game before it is ended, loses it. 26. Any person may change his stick in play. 27. If any difference arise between players, he who marks the game, or the majority of the company, must decide it. 28. Those who do not play must stand from the table, and make room for the players. 29. If any person lays any wager, and does not play, he shall not give advice to the players upon the game.

Besides the common winning game, which is twelve up, there are several other kinds, viz. the losing game, the winning and losing, choice of balls, bricole, carambole, Russian carambole, the bar hole, the one hole, the four game, and hazards. I. The losing game, is the common game nearly reversed; that is to say, except hitting the balls, which is absolutely necessary, the player gains by losing. By putting himself in, he wins two; by putting his adversary in, he loses two; but if he pockets both balls, he gets four. This game depends greatly upon particular strengths, and is therefore very necessary to be known to play the winning game well. II. The winning and losing game is a combination of both games; that is to say, all balls that are put in by striking first the adversary's ball, reckon towards game; and holing both balls reckons four. At this game, and the losing, knocking over, or forcing the balls over the cushion, goes for nothing, the striker only loses the lead. III. Choice of balls, is choosing each time which ball the player pleases, which is doubtless a great advantage, and is generally played against losing and winning. IV. Bricole is being obliged to hit a cushion, and make the ball rebound, or return to hit the adversary's ball, otherwise the player loses a point. This is a great disadvantage, and is reckoned between even players to be equal to receiving about eight or nine points. V. Carambole, is a game introduced from France. It is played with three balls, one being red, which is neutral, and is placed upon a spot on a line with the string nail (i.e. that part of the table whence the player strikes his ball at first setting off, and which is generally marked with two brass nails). Each antagonist, at the first stroke of a hazard, plays from a mark, which is upon a line with it, at the other end of the table. The chief object at this game is, for the player to hit with his own ball the two other balls, which is called a carambole, and by which the player wins two. If he puts in the red ball he gets two; so that seven may be made at one stroke, by caram-

holing and putting in both balls. This game resembles the losing, depending chiefly upon particularly strengths, and is generally played with the cue. The game is sixteen up; yet is reckoned sooner over than the common game. The next object of this game, after making what we have distinguished by the carambole, is the baulk; that is, making the white ball, and bringing the player's own ball and the red one below the stringing nail, whence the adversaries begin. By this means the opponent is obliged to play bricole from the opposite cushion, and it often happens that the game is determined by this situation. VI. The Russian carambole is a game introduced from abroad, and is played in the following manner: the red ball is placed as usual on the spot made for that purpose; but the player when he begins, or having been holed, never places his ball on any particular place or spot; he being at liberty to put it where he pleases. When he begins to play, instead of striking at the red ball, he leads his own gently behind it, and his antagonist is to play at which he thinks proper; if he plays at the red ball and holes it, he scores three as usual towards the game, which is twenty-four instead of sixteen points; and the red ball is put upon the spot again, at which he may strike again or take his choice which of the two balls to push at, always following his stroke till both balls are off the table. He is entitled to two points each time that he caramboles, the same as at the other game; but if he caramboles, and puts his own ball into any hole, he loses as many as he might have got had he not holed himself: for example, if he strikes at the red ball, which he holes, at the same time caramboles and holes himself, he loses five points; and if he holes both balls when he caramboles, and likewise his own, he loses seven, which he could have got if he had not holed his own ball. In other respects it is played like the common carambole game. VII. The bar hole, is so called from the hole being barred which the ball should be played for, and the player striking for another hole; when this game is played against the common game, the advantage for the latter, between equal players, is reckoned to be about six. VIII. The player at the one hole, though it seems to those who are not judges of the game to be a great disadvantage, has in fact the best of it; for, as all balls that go into the one hole reckon, the player endeavours to lay his ball constantly before that hole, and his antagonist frequently finds it very difficult to keep one or other ball out, particularly on the leads, when the one hole player lays his ball (which he does as often as he can) on the brink of the hole; leading for that purpose from the opposite end, which in reality he has no right to do; for the lead should be given from the end of the table at which the hazard is made: but this advantage is often taken of novices. IX. The four game, consists of two partners on each side, at the common winning game; who play by succession after each hazard, or two points lost. The game is fifteen up; so that the point or hazard is an odd number, which makes a miss at this game of more consequence than it is at another; being as much at four, six, or

eight, as it is at five, seven, or nine, at the single game. X. Hazards, are so called because they depend entirely upon the making of hazards, there being no account kept of any game. Any number of persons may play, by having balls that are numbered; but the number seldom exceeds six, to avoid confusion. The person whose ball is put in, pays so much to the player according to what is agreed to be played for each hazard; and the person who misses, pays half the price of a hazard to him whose ball he played at. The only general rule is not to lay any ball a hazard for the next player, which may be in a great measure avoided, by always playing upon the next player, and either bringing him close to the cushion, or putting him at a distance from the rest of the balls. The table, when hazards are played, is always paid for by the hour.

BILLINGSGATE, the principal market of London for fish, is said to be very ancient. Bailey derives its name from Belinus, one of the fabulous kings of Britain, long before the Roman invasion. But he gives two other more probable derivations, viz. from *bellan*, Teut. to roar; alluding to the noise of the waters (or the fishwives), and from *belte*, Sax. a purse. The tolls here are appointed by statute. All persons buying fish in this market may sell the same in any other market by retail, but none but fishmongers are allowed to sell it in shops; and if any person shall buy any quantity of fish at Billingsgate for others, or any fishmonger shall engross in the market, they incur a penalty of £20. Fish imported by foreigners shall be forfeited, and the vessel, &c. See BILINGS-GATE.

BILLINGSLEY (Sir Henry), an eminent magistrate and mathematician of the sixteenth century, was born at Canterbury, and educated at Oxford, after which he served an apprenticeship to a haberdasher in London. Having commenced business for himself, he was very successful, and became very wealthy. He was much respected among the citizens; and filled the offices of sheriff, alderman, and lord mayor; the last of which was in 1598, when he received the honor of knighthood. He entertained in his house one Whitehead, an expelled friar, who was deeply skilled in the mathematics; to whom he became a student, and soon acquired himself great reputation as a mathematician. The first edition of Euclid's Elements in English was published by him in 1570, with annotations drawn from the MSS. of his tutor, in folio. To this work Dr. Dee wrote a learned preface. Sir Henry died in 1606.

BILLINGS-SPORT, a town in Delaware, twelve miles below Philadelphia, fortified, for the defence of the channel, during the American war. Opposite this fort several large frames of timber, neaded with iron spikes, denominated *chevaux de frizes*, were sunk to prevent the British ships from passing. A curious machine was afterwards invented to raise them.

BILLINGTON (Elizabeth), a celebrated English singer, was born in England in 1770, her father, Mr. Weichsell, being a native of Saxony. At an early age she attained to an extraordinary proficiency on the piano-forte under Schröter. At fourteen she made her first appearance as a

singer at Oxford; and at sixteen years of age married Mr. Billington, a performer on the double-bass, whom she accompanied to Dublin. From Ireland she returned to London, where she appeared at Covent Garden for the first time, as Rosetta, in Arne's *Love in a Village*, and met with such unprecedented encouragement as to secure her an immediate engagement at the salary of £1000, and a benefit, for the remainder of the season. She continued to take lessons of Mortellari, a celebrated Italian master then in London, and, on the closing of the theatre, repaired to Paris, in order to profit by the instructions of Sacchini. She returned to England in 1785, and appeared at the concerts of ancient music. From this period no music meeting, opera, or concert, was considered complete without her. In 1793 she visited Italy, and performed at the theatre of St. Carlos at Naples; Bianchi composing expressly for her, his celebrated opera '*Inez de Castro*.' Her husband here died suddenly of apoplexy, just as she was preparing to set out for the theatre. In 1796 she appeared at Venice, and at Rome, being everywhere received with great applause. In 1801 she returned to the London stage, and delighted the whole musical world by her *Mandane*; a performance never since equalled in the English Opera; and continued incessantly the favorite of the public till her final retirement from public life in 1809. In 1817 she quitted England, and died after a short illness at St. Artien, an estate she had purchased in the Venetian territories. Though always known as Mrs. Billington, this lady married a second time, to a M. Felipent, in 1799.

BILLION. A million of millions.

BILLIONS, in arithmetic; contraction of billions, or twice millions, the word millions occurring twice in explaining the meaning of the word; millions of millions. Billions, in nomenclature, occupy from the thirteenth to the eighteenth column, to the left. See **ARITHMETIC**.

BILLON. Lat. *bullia*. Base metal of gold or silver alloyed with copper.—*Ency. Met.*

BILLON, or **BILLIO**; from *bullia*, bullion, Lat.; in coinage, a composition of precious and base metals, where there are most of the latter. Wherefore, billon of gold signifies gold under twelve carats fine; and billon of silver, silver under six penny-weights. So little attention was paid formerly to the purity of gold and silver, that the term billon of gold was applied only to that which was under twenty-one carats, and billon of silver to that which was lower than ten penny-weights.

BILLOX, or **BILLOM**, a town of France, the head of a canton, in Lower Auvergne, and in the department of the Puy de Dome. It lies in a fruitful country; but the manufactures have gone to decay. Population 5200. Twelve miles E. S. E. of Clermont-Ferrand, and seventeen north of Issoire.

BILLOUNJAH, a district of Hindostan, in the province of Gundwana, adjoining the British province of Bahar. It is occupied by chieftains who have been frequently compelled to pay tribute to the Moguls and Mahrattas; but who in the hills, with which it abounds, are nearly independent. It lies between 24° and 25° N. lat., and 84° and 85° E. long.

BILL'OW, *v. & n.* } Germ. *bilge*; Dan. *Bill'ow*. } *bolg*; probably of the same original with Sax. *bilg*, a bladder. A wave swollen, and hollow; to swell, or roll as a wave; swelling; turgid; wavy.

The waves come rolling, and the *billows* rore
Outrageously, as they outraged were,
Or wrathful Neptune did them drive before
His whirling chariot for exceeding feare. *Spenser*.

Wilt thou upon the high and giddy mast
Seal up the shipboy's eyes, and rock his brain
In cradle of the rude imperious surge;
And in the visitation of the winds,
Who take the ruffian *billows* by the top,
Curling their monstrous heads and hanging them
With deafening clamour in the slippery clouds
That with the hurly, Death itself awakes?
Shakspeare.

————— on each hand the flames
Driven backward slope their pointing spires, and
rolled

In *billows*, leave i' th' midst a horrid vale. *Milton*.

The *billowing* snow, and violence of the shower,
That from the hills disperse their dreadful store,
And o'er the vales collected ruin pour. *Prior*.

In this dire season, oft the whirlwind's wing
Sweeps up the burthen of whole wintry plains
At one wide waft, and o'er the hapless flocks,
Hid in the hollow of two neighbouring hills,
The *billowy* tempest whelms, till, upward urged,
The valley to a shining mountain swells,
Tipt with a wreath high-curling in the sky.
Thomson.

And as the stately vessel glided slow,
Beneath the shadow of that ancient mount,
He watched the *billows'* melancholy flow,
And, sunk albeit in thought as he was wont,
More placid seemed his eye, and smooth his pallid
front. *Byron's Child Harold*.

BILMA, a vast desert of Africa, south-east of Fezzan, and bordering on Bornou. It is a most inhospitable and burning tract of sand, which the caravans are ten days in passing: but contains the famous lakes of Dombou, which supply salt for the Cashna and Bornou markets, and as far as to the south of the Niger.

BILOBUS, in entomology, a species of scarabæus, with two lobes on the thorax; a simple horn on the head, and the wing-cases striated. Found in the south of Europe. Also a species of dytiscus, color black; except the mouth, vertical two-lobed spot, thorax, sutural line, base, and margin of the wing-cases, which are yellowish-white. Also a species of cimex spinosus; thorax obtusely dentated; wing-cases grayish-red; vent with two lobes. A native of Europe.

BILOBUS, in ornithology, a species of charadrius, the wattled plover of Latham. It is a native of the Malabar coast. The bill and legs are yellow; frontal skin naked, and pendulous in two lobes; body yellowish-gray above; white beneath. Gmelin, &c. This is pluvier à lambeaux of Buffon.

BILOCULAR, in botany, a term applied to a capsule that has two cells.

BILSAH, a town belonging to Dowlet Row Sindia, in the province of Malwah, Hindostan; situated on the Betwah River, in lat. 23° 33' N., long. 77° 50' E. It is enclosed with a stone wall, defended by square towers, and a ditch. The

streets are spacious, and contain several good houses. This place is situated nearly on the south-west extremity of the district, where it is contiguous to that of Bopal. The country is celebrated all over India for the excellent quality of the tobacco. It is open, and well cultivated. To the east, on a high and steep rock, is a durgah, consecrated to the memory of a Mahomedan saint, named Jelal ud Deen Bokhari. Distant from Oojain 140 miles, from Nagpoor 249, from Benares 416, from Calcutta, by Mundlah, 867 miles.

BILSEN, or **BILSON**, a town of Germany, in the ci-devant bishopric of Liege. It was the rendezvous of the duke of Marlborough in 1706, previous to the battle of Ramillies. It lies six miles west of Maestricht, and fourteen north of Liege.

BILSON (Thomas), bishop of Winchester, the place of his birth and education. In 1565 he was admitted perpetual fellow of New College; in 1570 M.A.; in 1579 B.D.; and in 1580 D.D. His first preferment was that of master of Winchester school; he was next made prebendary, and afterwards warden, of Winchester college. In 1596 he was consecrated bishop of Worcester; and, about a year after, translated to the see of Winchester, and sworn of queen Elizabeth's privy council. He was one of the principal managers of the Hampton-court conference in 1604; and the English translation of the Bible, in the reign of king James I., was finally corrected by this prelate, and Dr. Miles Smith, bishop of Gloucester. He died in 1616. Authors agree in giving him the character of a learned divine, an able civilian, and an upright man. His style is in general much more easy and harmonious than that of his contemporaries. His works are: 1. Several Latin poems and orations; MSS. in Ant. Wood's library. 2. The true Difference between Christian Subjection and Unchristian Rebellion, Oxford, 1585, 4to.; London, 1586, 8vo. 3. The Perpetual Government of Christ's Church, London, 1593, 4to., black letter, &c.

BIMA, a town and district in the north-east extremity of the island of Sumbava, governed by an independent sultan, whose dominion extends over part of the neighbouring islands. The town stands on a commodious harbour, encompassed by lofty mountains, and is gained by a channel of great depth. The language spoken here is esteemed one of the radical dialects of the east, and extends over the greater part of the island of Ende, or Floris. The sultan having invited the Dutch at one period to form a settlement here, Bima became dependent on Macassar; but was taken by the British, and they appointed a resident here.

BIMACULARIS, in entomology, a species of phalæna, found in Europe. The anterior wings are brown, with two brown spots.

BIMACULATA, in conchology, a species of tellina, found in the European and American seas; of a somewhat rotundated triangular shape, rather broad, whitish, with two sanguineous spots within.

BIMACULATA, in entomology, a species of silpha, found in Barbary: color black; head of the antennæ globose; legs ferruginous.

BIMACULATUS, in ichthyology, a species of Salmo: body compressed, and marked with two spots; anal fin with thirty-two rays. This is a native of South America.

BIMATICAL, of two years continuance.

BIMEDIAL, in mathematics. If two medial lines, as AB and BC, commensurable only in power, containing a rational rectangle, are compounded, the whole line AC will be irrational, and is called a first bimedral line.

B
A ————— C

See *Euclid*, lib. x. prop. 38.

BIMINI, one of the Bahama islands, inhabited by the native tribes, near the north-west extremity of the Great Bahama bank, and the east point of Florida. It is about eight miles long, and difficult of access from the numerous shoals with which it is surrounded. It is covered with beautiful groves.

BIMUCRONATUS, in entomology, a species of scarabæus, inhabiting Amboyna. It is testaceous; shanks of the anterior legs large, and bearded; shield of the head mucronated on both sides, and bordered with fine hairs.

BINACLE or **BINNACLE**. See **BINNACLE**.

BINAROS, a walled sea-port of Valencia, Spain, near the mouth of a river which falls into the Mediterranean. It has a harbour at a short distance from the town, with from six to nine fathoms water. The adjacent country produces excellent wine.

BINARY, *bis*, *binus*; two, twofold, double.

THOR. I have 'em already, Somerton.

SOMERTON. *Binal* revenge all this.

Ford. Witch of Edmonton.

So that this matter was rightly called heaven; and the union of the passive and active principle in the creation of this material heaven is the second day's work, and the *binarie* denotes the nature thereof.

More. The Philosophick Cabbala.

BINARY, **ARITHMETIC**, that wherein unity, or 1 and 0, are only used. Mr. Leibnitz shows it to be very expeditious in discovering the properties of numbers, and in constructing tables: and Dangeourt, in the History of the Royal Academy of Sciences, gives a specimen of it in arithmetical progression, where he shows that because in binary arithmetic only two characters are used, therefore the laws of progression may be more easily discovered by it than by common arithmetic. All the characters used in binary arithmetic are 0 and 1; and the cypher multiplies every thing by 2, as in the common arithmetic by 10. Thus 1 is one; 10, two; 11, three; 100, four; 101, five; 110, six; 111, seven; 1000, eight; 1001, nine; 1010, ten; which is built on the same principles with common arithmetic. Hence appears the reason of the celebrated property of the duplicate geometrical proportion in whole numbers; viz. that one number of each degree being had, we may thence compose all the other whole numbers above the double of the highest degree.

BINARY LOGARITHMS, are a species of logarithms contrived and calculated by M. Euler (*Tentamen Novæ Theoriæ Musicæ*, chap. vii.) for facilitating musical calculations; wherein 2 is made the unit, or modulus, instead of 10, as in

the common logarithms, or 1 in the hyperoolic logarithms.

In these logarithms, the powers of 2 have successively 1, 2, 3, 4, &c. for their logarithms, as in the following table, for the first 10 numbers, viz.

Numbers.	Binary Logarithms.
1	0.000000
2	1.000000
3	1.584963
4	2.000000
5	2.321928
6	2.584963
7	2.807356
8	3.000000
9	3.169925
10	3.321928

Musical calculations are performed with great ease by the binary logarithms, owing to their representing the decimal values of the intervals, in terms of the octave as unity.

BINARY MEASURE, in music, a measure which is beaten equally, or where the time of rising is equal to that of falling. This is usually called common time.

BINARY NUMBER, that composed of two units.

BINCHE, or **BINCK**, a town of the Netherlands, of Hainault, on a stream that joins the Haisne at a short distance. From 1554, when it was burnt by Henry II. of France, it has undergone frequent sieges and change of masters. In May 1794 several engagements took place near this town between the French and Austrians. Population 3800. Twelve miles E. S. E. of Mons.

BIND, *v.* & *n.* } Ang.-Sax. bindan. To
BINDER, } confine; to enchain; to fix
BINDING, } by circumvolution; to fasten; to connect; to put under constraint; to contract; in hinder; to stop; to compel; to oblige.
Binding is a bandage, a cover, a ligament: a *bind*er is either the agent, or the instrument employed in binding.

Wilt thou play with him, as with a bird? or wilt thou *bind* him for thy maidens? *Job.*

Who hath *bound* the waters in a garment? *Proverbs.*

Keep my commandments, and live; and my law, as the apple of thine eye. *Bind* them upon thy fingers, write them upon the table of thine heart. *Id.*

When he saw him, he had compassion on him, and went to him, and *bound* up his wounds. *Luke.*
 And now perforce they have him prisoner taken;
 And now they doe with captive bands him *bind*;
 And now they lead him thence of all forsaken,
 Unless some succour had in time him overtaken. *Spenser.*

All which accepting, and with faithful oth
Bynding himselfe most firmly to obey,
 He up arose, however lief or loth,
 And swore to him true fealtie for aye. *Id.*

Though I am *bound* to every act of duty,
 I am not *bound* to all that slaves are free to. *Shakespeare.*

Now I am cabined, cribbed, confined, *bound* in
 To saucy doubts and fears. *Id.*

Was ever book, containing such vile matter,
 So fairly *bound*? *Id.*

Rhubarb hath manifestly in it parts of contrary operations; parts that purge, and parts that *bind* the body. *Bacon.*

The more we are *bound* up to an exact narration, we want more life, and fire, to animate and inform the story. *Felton.*

Unjust, thou sayst,
 Flatly unjust, to *bind* with laws the free,
 And equal over equals to let reign,
 One over all with unsucceeded power. *Milton.*

Adown her shoulders fell her length of hair:
 A ribband did the braided tresses *bind*,
 The rest was loose, and wantoned in the wind. *Dryden.*

Sir Roger was staggered with the reports concerning this woman, and would have *bound* her over to the county sessions. *Addison.*

As one of these, in days of yore,
 Rummaged a shop of learning o'er—
 Not like our modern dealers, minding
 Only the margin breadth, and *binding*. *Gay.*

The law, by which all creatures else are *bound*,
Binds man, the lord of all. *Couper.*

BIND, *n. s.*, a species of hops.

The two best sorts are the white and the grey *bind*; the latter is a large square hop, and more hardy. *Mortimer.*

BINDING, in falconry, implies tiring, or when a hawk seizes.

BINDING, in fencing, a method of securing or crossing the adversary's sword with a pressure, accompanied with a spring from the wrist. Unless a man, by some kind of cross, render his adversary's sword incapable to offend him during the time of his performing a lesson upon him; he may receive from his adversary, either a fortuitous contretemps, or an exchanged thrust, before the recovery of his body after a thrust. The great objection made against the frequent use of binding, is, that when a man, in performing it, cleaves too much to his adversary's sword, he is liable to his adversary's slipping of him, and consequently of receiving either a plain thrust, or one from a feint.

BINDING JOISTS, in architecture, are those joists in a floor, into which the trimmers of staircases, or well-holes of the stairs, and chimney-ways, are framed; they ought to be stronger than common joists.

BINDWEED, *n. s.*, *Lat. convolvulus*, the name of a plant.

Bindweed is the larger and the smaller; the first sort flowers in September, and the last in June and July. *Mortimer.*

BINGAZI, a sea-port of Barca, in Africa, defended by a wall and castle, once a large and beautiful city, but now reduced. It contains, however, 5000 inhabitants, and has an excellent harbour for ships of 200 tons burden. But there are some quicksands in the vicinity. It carries on also a considerable trade in corn and flocks of sheep.

BINGEN, a fortified town on the left bank of the Rhine, in the duchy of Hesse, near the borders of the Prussian dominions. It is famous for the culture of a particular kind of wine called scharlach. The population is about 3000. The waters of the Rhine, near this place, being

confined by shelving rocks, form the dangerous whirlpool called Bingerloch. Bingen was taken and retaken by the French almost every year, between 1792 and 1796. Its fortifications were destroyed by Louis XIV., but were ordered to be renewed by Buonaparte when first consul. Bingen is about twenty miles west of Mentz. Lat. 49° 55' N., long. 7° 48' E. See BINGIUM.

BINGHAM (Joseph), an antiquarian of Wakefield, was born in 1660, educated at Oxford, and ejected from a fellowship thrice, on account of his supposed heterodoxy; he died in 1723. His *Origines Ecclesiasticæ* was the most important of his works, which were published altogether in 2 vols. folio. 1725, and translated into Latin by Grichow, in 11 vols. 4to. Hall. 1724—1738, and 1751—1761. The first volume of his laborious work appeared in 1708, and the whole was eventually completed in 10 vols. 8vo.; an edition being also printed in 2 vols. folio. It was shortly after translated into Latin, and acquired a great circulation on the continent, being still esteemed a standard work. Trelawney, bishop of Winchester, collated him, in 1712, to the living of Havant, near Portsmouth; the failure, however, of the South Sea scheme, in 1720, in which he had embarked the whole of his savings, reduced him to comparative indigence; and his death taking place within three years after, he was not able to retrieve himself. Six of his children survived him; the eldest of whom collected and published his father's works, in 2 vols. folio, 1725. Among them are a Scholastic History of Lay Baptism, originally printed in 8vo. 1712; and a Discourse on the Mercy of God to Penitent Sinners.

BINGIUM, in ancient geography, a village or town of the Vangiones in Gallia Belgica, now called Bingen.

BINNACLE, or BITTACLE, in navigation, is used to denote the box in which the compass is placed for steering a ship. In all ships steered by a wheel, it is common to have two binnacles, or a double binnacle, for the convenience of the steersman, on either side of the wheel; but in this case the compasses are necessarily so near together as to affect each others direction, and thereby to render doubtful the course of the ship. To avoid this, sliding binnacles are sometimes employed. But those now in general use in the navy are Sir Home Popham's binnacles, being formed agreeably to the instructions of that distinguished officer. They consist of a square box, about two feet high, and eighteen inches on the side, with a top in the form of the frustum of a square pyramid, the bottom of which fits accurately upon the top of the box. The four sides of the frustum are of plate glass, whereby the compass card, which is about level with the upper part of the square box, may be distinctly seen in the day time; and for the night, there are provided thin copper screens, which shut up those sides not necessary for the steersman's immediate purpose, and which at the same time assist to reflect the light of the lamp on the other side, strongly upon the card. The lamp itself is attached to one of these screens, a hole being cut in it just sufficient to admit what light is necessary. As there would be great

liability of breaking these glass faces, the four edges of the frustum are defended by strong wooden frames with projecting edges; and at top with a flat piece of wood that also projects considerably beyond the glass, which latter, by this means, is pretty well protected from injury. See one of these in our plate BINNACLES, fig. 1, and the lamp, fig. 2.

In vol. xxxi. of the Transactions of the Society of Arts, an improved ship's binnacle is described by Mr. G. Preston of Wapping. It has a cylindrical top, which encloses the lamp, and which gives a powerful light vertically on the compass, but is seen by no one except the man at the wheel. Fig. 3 is a representation of this binnacle in perspective, as it stands on the deck of a vessel opposite the steering wheel. Fig. 4 is a section of the box, containing the lamp and reflectors; AA, fig. 3 is a square box closed by a door in front, which is omitted in the drawing, to show the interior. This box is fixed down in a proper situation on the deck, and supported at a convenient height to view the compass card which it contains, the two sides being exactly parallel to the ship's keel. B is a shelf in the box, to support a board C, which exactly fits the box, but having its angles taken off to permit it to slide in and out more freely; it has a stem *a* of brass wire standing up from the centre of it, and terminating in a sharp point, on which the compass card is freely suspended; being then included within a circular hole made in the top of the box, and its divisions reading against a line called by seamen the lubber line, drawn on a piece of white paper seen plainly in the figure. The opening on the top of the box is surrounded by an octangular lantern, which has glass panes in all its sides half way up from the bottom, to admit light in the day time; but at night these are closed by sliding shutters *aaa*. The compass is seen through the glass *b*, which is placed at a proper inclination to command the view of the card: the lamp is situated in a circular box fitted into a ring F, at the top of the lantern frame; and has a dome G with a chimney *d*, to take off the smoke. The section, fig. 4. will explain the interior parts; II H are the sides of a cylindrical box which fits into the ring F. fig. 3.: *ee* and *ff* are the sections of the two brass circles called the gimbals. I I K K is a brass box which fits into the ring F, and has at its bottom a large plane convex lens, K K, which concentrates the light of the lamp above, and throws it down on the card beneath. The lamp LL is just within the box; it consists of a deep copper hoop, forming the external surface, with a lid at the top, and at bottom half way down, which have each a hole through their centres, and may therefore be considered as rings; another hoop being soldered within these, forms a complete hollow ring in which the oil is contained, as shown at L L fig. 4. this being filled at the tubes *gh*. The wick *i* is situated in a kind of spout which proceeds from the interior of the ring to its centre; and being very narrow, diminishes the light very little; for, as shown in the figure, the frame is made to project over the end of it, and then comes in the centre of the hole, that the lens K K may throw the light down with the greatest

*Binnacle,
used in the Royal Navy.*

Fig. 1.

Fig. 2.

Fig. 3.

Fig. 4.

Fig. 5.

effect; and to increase this a reflector is added. M is a kind of conical chimney, which stands over the lamp and includes the light: the conical part *ll* of this is turned within, and well polished to reflect the light downwards. By this means the card is well illuminated, and if the shutters *a a a* are put down, no light is shown which would be perceived by an enemy at sea; for the only aperture *b* directs the light upwards, and that in a direction where it will not fall on any part of the ship. The lamp is trimmed or lighted by taking out the box from the ring at the top of the lantern; the lamp of course comes with it, and there is a hole on one side to give access to it: if it is to be filled with oil, the box is turned upside down, and the gimbal *e f* keeping the lamp horizontal, it may be filled or taken out, to clean the conical reflector, and the lens also if they require it.

Gilbert's double binnacle lamp, is exhibited in fig. 5. DEFG in the lantern and L the lamp; AA are two condensing lenses, and BB two others, so adjusted to these as to throw the light, after being brought to a focus, upon the two mirrors MM, from which it is reflected strongly upon the two cards NS, NS; by a proper adjustment of the two lenses, the light is made to converge and diverge in any degree, and thereby to illuminate the card only. The contrast of this intense light with every thing else dark, renders the card so exceedingly bright, that in the darkest night the steersman sees it more distinctly than in the brightest day; at the same time not a single ray of light escapes that can be seen by an enemy. Messrs. Gilbert have also a single binnacle lamp upon the same principles.

BINNOCH, a Scots patriot, in the days of Robert Bruce, who, during the usurpation of Edward I., assisted Bruce in recovering the castle of Linlithgow from the English. Having been employed to supply the castle with hay, he introduced armed men in his cart without suspicion, who soon made themselves masters of it, and opened the gates to their countrymen. He was rewarded with some lands, which descended to his posterity, the Binnings of Wallyford, who bore for their arms a hay wain, with this motto *Virtute doloque*.

BINOCLE, *n. s.*, from *binus* and *oculus*, a kind of dioptric telescope, fitted so with two tubes joining together in one, as that a distant object may be seen with both eyes together.

Harris.

BINOCULAR, *adj.* Lat., from *binus* and *oculus*, having two eyes.

Most animals are *binocular*, spiders for the most part *octonocular*, and some *senocular*. Derham.

BINOCULAR TELESCOPE, a kind of dioptric telescope fitted with two tubes, joined in such a manner that one may see a distant object with both eyes at the same time. See **OPTICS**.

BINODIS, in entomology, a species of formica, a native of Egypt: color black; head rufous; with two tubercles on the petiole.

BINOMIAL, a quantity consisting of two terms or members, connected by the sign + or -, viz. plus or minus; as $a + b$, or $3a - 2c$, or $a^2 + b$, or $x^2 - 2\sqrt{c}$, &c.; denoting the

sum or the difference of the two terms. But the difference is also sometimes named a residual, and by Euclid an apotome. The term binomial was first introduced by Robert Recorde; see his *Algebra*, p. 462.

BINOMIAL CURVE, is a curve whose ordinate is expressed by a binomial quantity; as the curve whose ordinate is $x^2 \times \sqrt{b + dx^{ce}}$. *Stirling, Method. Diff.* p. 58.

BINOMIAL, IMAGINARY, OR BINOMIAL, IMPOSSIBLE, is a binomial which has one of its terms an impossible or imaginary quantity; as $a + \sqrt{-b}$. Dr. Maskelyne has given a method of finding any power of an impossible binomial, by another like binomial, in his introduction prefixed to Taylor's Tables of Logarithms; which is as follows: The quantities a and b being given, it is required to find the power of the impossible binomial $a \pm \sqrt{-b^2}$

whose index is $\frac{m}{n}$, that is, to find $(a \pm \sqrt{-b^2})^{\frac{m}{n}}$

by another impossible binomial, and thence the

value of $(a + \sqrt{-b^2})^{\frac{m}{n}} + (a - \sqrt{-b^2})^{\frac{m}{n}}$ which is always possible, whether a or b be the greater of the two.

Solution. Put $\frac{b}{a} = \text{tang. } z$, then

$$(a \pm \sqrt{-b^2})^{\frac{m}{n}} = (a^2 + b^2)^{\frac{m}{n}} \times (\cos \frac{m}{n} z \pm \sqrt{-\sin^2 \frac{m}{n} z}).$$

$$\text{Hence } a + \sqrt{-b^2}^{\frac{m}{n}} + (a - \sqrt{-b^2})^{\frac{m}{n}} = (a^2 + b^2)^{\frac{m}{n}} \times 2 \cos \frac{m}{n} z = (a \times \sec z)^{\frac{m}{n}} \times 2 \cos \frac{m}{n} z = (b \times \csc z)^{\frac{m}{n}} \times 2 \cos \frac{m}{n} z,$$

where the first or second of these two last expressions is to be used according as z is an extreme or mean arc; or rather because $\frac{b}{a}$ is not only the tangent of z but also the tangent of $z + 360^\circ$, $z + 720^\circ$, &c.; therefore the factor in the answer will have several values, viz.—

$$2 \cos \frac{m}{n} z; 2 \cos \frac{m}{n} (z + 360^\circ); 2 \cos \frac{m}{n} (z + 720^\circ), \&c. \text{ the number of which, if } m \text{ and } n \text{ be whole numbers, and the fraction } \frac{m}{n} \text{ in its least}$$

terms, will be equal to the denominator n ; otherwise, infinite. These computations, it is obvious, may be much facilitated by taking the logarithms of the quantities concerned.

BINOMIAL LINE, OR SURD, is that in which at least one of the parts is a surd. Euclid enumerates six kinds of binomial lines or surds, 1.

in the tenth book of his elements, which are exactly similar to the six residuals or apotomes there treated of also, and of which mention is made under the article APOTOME. These apotomes, however, become binomials by only changing the sign of the latter term from minus to plus, which therefore are as below.

BINOMIAL LINES, EUCLID'S SIX.

First $3 + \sqrt{5}$, 4th $4 + \sqrt{3}$,
2d $\sqrt{18} + 4$, 5th $\sqrt{6} + 2$,
3d $\sqrt{24} + \sqrt{18}$, 6th $\sqrt{6} + \sqrt{2}$.

BINOMIAL ROOT, in algebra, a root composed of only two parts connected with the signs plus or minus.—*Harris*.

BINOMIALS, RULES FOR EXTRACTING THE SQUARE ROOTS OF; such as of $a + \sqrt{b}$ or $\sqrt{c} + \sqrt{b}$. Various rules have been given for this purpose. The first is that of Lucas De Burgo, in his *Summa de Arith. &c.* which is this: When one part, as a , is rational, divide it into two such parts, that their product may be equal to $\frac{1}{4}$ th of the number under the radical b ; then shall the sum of the roots of those parts be the root of the binomial sought: or their difference is the root when the quantity is residual. That is, if $c + e = a$, and $ce = \frac{1}{4}b$; then is $\sqrt{c} + \sqrt{e} = \sqrt{a + \sqrt{b}}$ the root sought. As if the binomial be $23 + \sqrt{448}$; then the parts of 23 are 16 and 7, and their product is 112, which is $\frac{1}{4}$ th of 448; therefore the sum of their roots $4 + \sqrt{7}$ is the root sought of $23 + \sqrt{448}$. De Burgo gives also another rule for the same extractions, which is this. The given binomial being, for example, $\sqrt{c} + \sqrt{b}$, its root will be

$\sqrt{\frac{1}{2}\sqrt{c} + \frac{1}{2}\sqrt{c-b} + \frac{1}{2}\sqrt{c} - \frac{1}{2}\sqrt{c-b}}$ —So in the foregoing example, $23 + \sqrt{448}$, here $\sqrt{c} = 23$, and $\sqrt{b} = \sqrt{448}$; hence $\frac{1}{2}\sqrt{c} = 11\frac{1}{2}$, and $\frac{1}{2}\sqrt{c-b} = \frac{1}{2}\sqrt{23^2 - 448} = \frac{1}{2}\sqrt{81} = 4\frac{1}{2}$;

therefore $\sqrt{\frac{1}{2}\sqrt{c} + \frac{1}{2}\sqrt{c-b}} = \sqrt{11\frac{1}{2} + 4\frac{1}{2}} = \sqrt{16} = 4$,

and $\sqrt{\frac{1}{2}\sqrt{c} - \frac{1}{2}\sqrt{c-b}} = \sqrt{11\frac{1}{2} - 4\frac{1}{2}} = \sqrt{7}$;

consequently $4 + \sqrt{7}$ is the root sought, as before. Again, if the binomial be $\sqrt{18} + \sqrt{10}$; here $c = 18$, and $b = 10$; therefore $\frac{1}{2}\sqrt{c} = \frac{1}{2}\sqrt{18} = \frac{3}{2}\sqrt{2}$, and $\frac{1}{2}\sqrt{c-b} = \frac{1}{2}\sqrt{8} = \sqrt{2}$; hence, $\sqrt{\frac{1}{2}\sqrt{c} + \frac{1}{2}\sqrt{c-b}} = \sqrt{\frac{3}{2}\sqrt{2} + \sqrt{2}} = \sqrt{\frac{5}{2}\sqrt{2}} = \sqrt{\frac{5}{2}}\sqrt{2} = \sqrt{\frac{5}{2}}$, and $\sqrt{\frac{1}{2}\sqrt{c} - \frac{1}{2}\sqrt{c-b}} = \sqrt{\frac{3}{2}\sqrt{2} - \sqrt{2}} = \sqrt{\frac{1}{2}\sqrt{2}} = \sqrt{\frac{1}{2}}$; consequently $\sqrt{\frac{5}{2}} + \sqrt{\frac{1}{2}}$ or $\frac{\sqrt{5} + 1}{\sqrt{2}}$ is the

root of $\sqrt{18} + \sqrt{10}$ sought. And this latter rule has been used by all other authors, down to the present time.

BINOMIALS, RULES TO EXTRACT THE CUBIC AND OTHER HIGHER ROOTS OF. This is useful in resolving cubic and higher equations, and was introduced with the resolution of those equations by Tartalea and Cardan. The rules for such extractions are in a great measure tentative. Tartalea, Bombelli, Gerard, Den. oivre, and Dr. Wallis, have given rules for extracting the cube roots, &c. of binomials: for which we shall refer to the works of these authors, as the following rule

of Sir Isaac Newton's applies to all roots of binomials whatsoever.

BINOMIALS, SIR ISAAC NEWTON'S RULE FOR ANY ROOT OF. Of the given quantity $a \pm b$, let a be the greater term, and c the index of the root to be extracted. Seek the least number n whose power n^c . can be divided by $a^c - b^c$ without a remainder. and let the quotient be q ;

Compute $\sqrt[c]{a + b} \cdot \sqrt[c]{q}$ in the nearest integer number, which call r ; divide $a \sqrt[c]{q}$ by its greatest rational divisor, calling the quotient s ;

and let the nearest integer number above $\frac{r + \frac{n}{1}}{2s}$ be t : so shall $\frac{ts \pm \sqrt{t^2 s^2 - n}}{2c \sqrt[c]{q}}$ be the root

sought, if the root can be extracted. And this rule is demonstrated by s'Gravesande in his *Commentary on Newton's Arithmetic*. And many numeral examples, illustrating this rule, are given in s'Gravesande's *Algebra*, above-mentioned, p. 100; as also in Newton's *Univers. Arith.* p. 53, 2d edit. and in Maclaurin's *Algebra*, p. 118. Other rules may be found in Schooten's *Commentary on the Geometry of Des Cartes*, and elsewhere.

BINOMIAL SURD. See BINOMIAL LINE.

BINOMIAL THEOREM, in algebra, is used to denote the celebrated theorem invented by Sir Isaac Newton for raising a binomial to any power, or for extracting any root of it by an approximating infinite series. Stifelius and others, about the beginning of the sixteenth century, knew how to raise the integral powers, not barely by a continued multiplication of the given binomial, but by means of a table of numbers formed by continual addition, which showed by inspection the co-efficients of the terms of any power of the binomial contained within its limits; but still they could not, independent of a table, and of any of the lower powers, raise any power of a binomial at once by determining its powers from one another only, viz. the second term from the first, the third from the second, and so on as far as we please, by a general rule, and much less could they extract general algebraic roots in infinite series by any rule whatever. Dr. Hutton has shown, in the *Historical Introduction to his Mathematical Tables*, p. 75, that Mr. Henry Briggs, about the year 1600, was the first who taught the rule for generating the terms successively one from another of any power of a binomial, independent of those of any other power, for he gives the binomial theorem in words, wanting only the algebraic notation in symbols, as it stands at this day, and as it was extended by Newton to roots or fractional exponents long after Briggs had given it in the case of integral powers. 'The theorem being thus plainly taught by Briggs, about the year 1600, (says Dr. Hutton,) I am surprised, that a man of such general reading, as Dr. Wallis was, could possibly be ignorant of it, as he plainly appears to have been, from the eighty-fifth chapter of his *Algebra*, where he fully ascribes the invention to Newton; and adds, that 'he himself had formerly sought for such a rule, but without success; or how Mr.

John Bernoulli, not half a century since, could himself first dispute the invention of this theorem with Newton, and then give the discovery of it to Pascal, who was not born till long after it had been taught by Briggs, (see Bernoulli's Works, vol. iv. p. 173). But I do not wonder that Briggs's remark was unknown to Newton, who owed almost every thing to genius, and very little to reading; and I have no doubt that he made the discovery without any light from Briggs, and that he thought it was new for all powers in general, as it was indeed for roots, and quantities with fractional and irrational exponents.' Thus it appears that Briggs discovered in part what Newton afterwards rendered more complete and universal, for he found about the year 1666 that if m were put for any whole number whatsoever, the co-efficients of the terms of

the m th power of $1 + x$ would be $1, \frac{m}{1}, \frac{m}{1},$

$\frac{m-1}{2}, \frac{m}{1}, \frac{m-1}{2}, \frac{m-2}{3},$ &c. till we come

to the term $\frac{m-(m-1)}{m}$, which will be the last

term. But how he discovered this proposition, he has not told us; nor has he even attempted to give a demonstration of it. Sir Isaac Newton, after he had discovered this rule for generating the co-efficients of the powers of $1 + x$, when the indexes of those powers were whole numbers, conjectured that it might be possibly true likewise when they were fractions. He therefore resolved to try whether it was or not, by applying it to such indexes in a few easy instances, and particularly to the indexes $\frac{1}{2}$ and $\frac{1}{3}$, which, if the rule held good in the case of fractional indexes, would enable him to find series equal

to the values $\sqrt{1+x}$ and $\sqrt[3]{1+x}$, or the square root and cube root of the binomial $1 + x$, and when he had in this manner obtained a series for $\sqrt{1+x}$ or the square root of $1 + x$, he multiplied the said series into itself, and found that the product was $1 + x$; in like manner he obtained a series which he suspected to be equal to $\sqrt[3]{1+x}$, and by multiplying the said series twice into itself, the product he found to be $1 + x$, hence he concluded that the former series was really equal to the square root of $1 + x$, and the latter to its cube root, and from these and a few more such trials he concluded universally, that the rule was true in all cases, whether the index m stood for a whole number, or a fraction of any

kind as $\frac{1}{2}, \frac{1}{3}, \frac{2}{3},$ or, in general, $\frac{p}{q}$. This discovery of Newton's appears first to have been given to the world, but without a demonstration, by Dr. Wallis in his Algebra, chap. 85, in the year 1685, though it was inserted in Sir Isaac's first letter to Mr. Oldenburgh, the secretary to the Royal Society, dated July 13th, 1676; and the said letter was shown to Mr. Leibnitz, and probably to other mathematicians of that time, yet it remained for some years without a demonstration, either in the case of integral powers or roots. At last it was demonstrated, in the case of integral powers, by means of the properties of

figurate numbers, by Mr. James Bernoulli, in the third chapter of his Treatise de Arte Conjectandi, published in 1713, about eight years after his death, but probably written in the latter years of the preceding century. That part of his book relating to the properties of figurate numbers, from which the binomial theorem may be deduced, was published at his native place Basil or Basle in Switzerland, in 1692. Various other demonstrations have been given of this very important theorem by more modern mathematicians, some of which are by means of the doctrine of Fluxions (which see), and others more legally from the pure principles of algebra only; among the best of that kind is that given by Dr. Hutton in his Mathematical Tracts, vol. i. where a full account is given of what others have done upon this subject. A demonstration of it is also given from algebraical principles, by Mr. Abram Robertson of Oxford, in the London Philosophical Transactions for 1795, part ii. The binomial theorem is engraved on Sir Isaac Newton's monument in Westminster Abbey as one of his greatest discoveries.

The Newtonian theorem, in one of its most simple forms is $(1+p)^n = 1 + np + \frac{n \cdot n-1}{2}$

$p^2 + \frac{n \cdot n-1 \cdot n-2}{2 \cdot 3} p^3,$ &c.; and the following

improvement of it is given by Dr. Hutton, in the Appendix to his Mathematical and Philosophical Dictionary, where it is said to have been lately discovered by Mr. Bonycastle of the Royal Military Academy, and then published for the first time. Let $s = p - \frac{1}{2} p^2 + \frac{1}{3} p^3 - \frac{1}{4} p^4 + \frac{1}{5} p^5,$ &c. This series, as is well known, is equal to the hyperbolic logarithm of $1 + p$. The improved form of the theorem is this,

$(1+p)^n = 1 + sn + \frac{1}{2} s^2 n^2 + \frac{1}{2 \cdot 3} s^3 n^3 + \frac{1}{2 \cdot 3 \cdot 4}$

$s^4 n^4,$ &c. Also if $s = p + \frac{1}{2} p^2 + \frac{1}{3} p^3 + \frac{1}{4} p^4 + \frac{1}{5} p^5,$ &c. or the hyperbolic logarithm of $1 - p$, then

$(1-p)^n = 1 - sn + \frac{1}{2} s^2 n^2 - \frac{1}{2 \cdot 3} s^3 n^3 + \frac{1}{2 \cdot 3 \cdot 4}$

$s^4 n^4,$ &c.

Dr. Hutton also gives a demonstration of this form of the binomial theorem, and, from principles purely algebraical, he also shows how it may be applied to the construction of logarithms, and the solution of exponential equations; but we must observe, that he is mistaken in supposing this discovery of Mr. Bonycastle's to be entirely new, and that it was never before published; for the same series for a binomial is taken notice of by Euler in different parts of his writing. It is particularly mentioned in his Calculus Differentialis, part 2. chap. iv., where he says that a^w

$= 1 + \frac{w \cdot \log. a}{1} + \frac{w^2 \cdot (\log. a)^2}{1 \cdot 2} + \frac{w^3 \cdot (\log. a)^3}{1 \cdot 2 \cdot 3},$

&c. the very same, he adds, that had formerly been obtained in the Introduction (Int. in Anal. infin). We have been induced to mention this oversight of Dr. Hutton's, rather with a view to prevent our readers from being led into a mistake concerning the inventor of this form of the binomial theorem, than to cavil at a gentleman, who

has done so much for the improvement of the science of mathematics.

BINOMINOUS, *adj.* Lat., from *binus* and *nomen*, having two names.

BINOMIUS, from *bin*, and *nomen*, name; in middle age writers, denotes a person with two names. Most Christians anciently were binomii, as having had other names in their heathen state, which they changed at their conversion. Besides, it was an ancient custom for parents to give names to their children immediately after they were born, and sometimes other ones afterwards at their baptism; one of which frequently became a cognomen, or surname. It was a constant practice to assume a new name at baptism, as the religious still do in the Romish church, on their reception into the monastic state; and Jewish proselytes at their circumcision.

BINTANG, an island in the Eastern seas, on the coast of Malacca, at the entrance of the straits of Singapore. It is about thirty-five miles in length, and eighteen in breadth, surrounded by rocky islets. The island produces gold dust; its principal town is Reheo or Rio, which was taken and destroyed by the Portuguese in 1527, and is governed by a sultan. Long. 104° 30' E., lat. 1° 2' N.

BIOBIO, or **ΒΙΟΒΗΟ**, a large river of Chili; rises in the Andes, and after running through veins of gold and fields of sarsaparilla, enters the South Sea, near the city of Concepcion, opposite the Isle of Avequira, in lat. 37° 0' S. It is the northern boundary of Chili, and its entrance known by two remarkable hills, called the Teats of Biobio, which are situated at the north, betwixt it and the bay of Concepcion, and serve to both as land-marks for navigators. It is about one mile across at the mouth, has good depth of water in the middle, and the tide rises about seven feet and a half at the full and change of the moon.

BIOCOLYTE, from *βία*, violence, and *καλνω*, to hinder; in the Byzantine empire, an order of officers appointed to prevent the violence frequently committed by the soldiers. They were suppressed by the emperor Justinian.

BIOGRAD, a town of Dalmatia, anciently Alba Maritima, and the former residence of the kings of Croatia. It has a good harbour at a distance from the town, secured by several small islands, and is considered as belonging to the county of Zara; being nearly twenty miles south-east of the town of that name.

BIOGRAPHER, } From *βίος*, life, and
BIOGRAPHY, } *γραφω*, I write. Biogra-
BIOGRAPHICAL. } phy is that portion of li-
terature which is devoted to the lives of individuals.

Our Grub-street *biographers* watch for the death of a great man, like so many undertakers, on purpose to make a penny of him. *Addison.*

In writing the lives of men, which is called *biography*, some authors place every thing in the precise order of time when it occurred. *Watts.*

The necessity of complying with times, and of sparing persons, is the great impediment of *biography*. *Johnson.*

BIOGRAPHY is undoubtedly the most entertaining and instructive kind of history. It admits of all the painting and passion of romance; but with this capital difference, that our passions are more keenly interested, because the characters and incidents are not only agreeable to nature, but strictly true. Few books more attract or are more proper to be put into the hands of young people, than those of a biographical kind. The history of this study is that of the whole republic of letters. We would only suggest that groupes of biographical memoirs, chronologically arranged, are much wanted as a kind of appendix to all our popular histories.

BIOLYCHNIUM, from *βίος*, life, and *λυχνος*, light; a substantial fire, flame, or heat, which some ancient physicians supposed inherent or actually lodged in the heart, and remaining there as long as life lasts. Some would have it to have been the human soul, others the animal spirits, and others the Deity, that did the office of a biolychnium, and was the spring of all the actions and motions of the body. Casp. Hoffman and Coringius have written treatises on the ancient doctrine of the lamp of light or innate heat.

BION, a bucolic poet, a native of Smyrna, lived at the same time with Ptolemy Philadelphus, whose reign reached from the fourth year of the 123d Olympiad to the second year of the 133d. He was an incomparable poet, if we may believe the lamentations of his disciple Moschus. His few pieces which are left do not contradict this testimony.

BION, surnamed Borysthenites, because he was a native of Borysthenes, was a philosopher of a great deal of wit, but very little religion: he flourished about the 120th Olympiad; but falling sick, like many other profane persons, he became superstitious.

BIORKO, an island of Sweden, in the Malar, three miles from Stockholm, where anciently stood Birca.

BIOTA, in zoology, a name introduced by Dr. Hill for the *POLYPE*, which see.

BIO THANATI, from *βία*, violence, and *θανος*, death, in some medical writers denotes those who die a violent death. The word is also written, and with more propriety, *biathanati* sometimes *biathanati*. In a more particular sense, it denotes those who kill themselves. In this sense the word is used both by Greek and Latin writers. See *SCICIDE*.

Also a name of reproach given by the Heathens to the primitive Christians, for their constancy and forwardness to lay down their lives in martyrdom.

BI'OVAC, *n. s.* } Fr. from *wey wach*, a
BI'NOVAC, } double guard, Germ. See
BI'VOUAC. } BIVOUAC.

BIPAROUS, *adj.* Lat. from *binus* and *pario*. Bringing forth two at a birth.

BIPARTITE, *adj.* Lat. from *binus* and *partior*. Having two correspondent parts; divided into two.

BIPARTITION, *n. s.* from bipartite. The act of dividing into two; or of making two correspondent parts.

BIPED, *n. s.* Lat. *bipes*. An animal with two feet.

No serpent, or fishes oviparous, have any stones at all; neither *biped* nor quadruped oviparous have any exteriorly. *Brown's Vulgar Errors.*

BIPEDAL, *adj.* Lat. *bipedalis*. Two feet in length; or having two feet.

BIPENNATED, *adj.* Lat. from *binus* and *penna*, having two wings.

All *bipennated* insects have poises joined to the body. *Derham.*

BIPENNIS, a two-edged axe, used anciently by the Amazons in fight; as well as by the seamen, to cut asunder the cordage of the enemy's vessels. It was a weapon chiefly of the oriental nations, made like a double axe, or two axes joined back to back, with a short handle. Modern writers usually compare it to our halberd or partizan; from which it differs in that it had no point, or that its shaft or handle was much shorter.

BIPETALOUS, *adj.* Lat. of *bis*, and Gr. *πεταλον*. A flower consisting of two leaves.

BIPPLICATA, in conchology, a species of *Voluta*. It is of a tapering shape, smooth, white spotted with yellow, and dotted with black; lip acute; pillar with two plaits.

BIPUNCTARIA, in entomology, a species of *phalæna*, geometra; anterior wings cinereous, undulated with brown; a dusky band in the middle, and two black dots.

BIPUNCTATA, a species of *apis*, inhabiting Siberia. This insect is black, hairy, and with two yellow belts; the first with two lateral black dots. Also a species of *aranea*, with a black, globose abdomen, marked with two excavated dots.

BIPUNCTATUM, a species of *opatrum*, color brown, thorax cylindrical and immarginate, with two hollows.

BIPUNCTATUS, a species of *bruchus*, inhabiting Helvetia. It is cinereous; wing-cases brown, with an ocellar, black dot at the base of each. Also, a species of *carabus*, of a brassy color, with two dots on the wing-cases.

BIPUNCTELLA, in entomology, a species of *phalæna*, tineæ, wings cinereous brown, with a marginal white spot. Also a species of *phalæna*, tineæ, with fuscous wings, with a common denotated white stripe; thorax snowy-white with two black spots. This is *tineæ echiella* of Schmettler.

BIPUSTULATA, a species of *cantharis*, malachius, of a green color; apex of the wing-cases red. This is *thelephorus viridianus nitidus* of Degeer.

BIPUSTULATUM, a species of *opatrum*, inhabiting Pomerania. Its form is narrow and elongated; color ferruginous: wing-cases slightly grooved.

BIPUSTULATUS, a species of *attelabus*; found in North America: color black, with a rufous spot at the base of each of the wing-cases.

BIQUADRATE, } *n. s.*, in algebra. The **BIQUADRATIC**. } fourth power, arising from the multiplication of a square number or quantity by itself. *Harris.*

BIQUADRATIC EQUATION, is that which rises to four dimensions, or in which the unknown quantity rises to the fourth power; as $x^4 + ax^3 +$

$bx^2 + cx + d = 0$. The first resolution of a biquadratic equation was given in Cardan's Algebra, chap. 39, being the invention of his pupil and friend, Lewis Ferrari, about the year 1540. This is effected by means of a cubic equation, and is indeed a method of depressing the biquadratic equation to a cubic, which Cardan demonstrates and applies in a great variety of examples. We subjoin

Euler's Rule for BIQUADRATIC EQUATIONS, The celebrated Leonard Euler gave, in the sixth volume of the Petersburg Ancient Commentaries, for 1738, an ingenious and general method of resolving equations of all degrees, by means of the equation of the next lower degree, and among them of the biquadratic equation by means of the cubic; and this last was also given more at large in his Treatise on Algebra translated from the German into French in 1774, in 2 vols. 8vo. The method is this: Let $x^4 - ax^2 - bx - c = 0$, be the given biquadratic equation, wanting the second term. Take $f = \frac{1}{2}a$, $g = \frac{1}{10}aa + \frac{1}{3}c$, and $h = \frac{1}{27}bb$; with which values of f, g, h , form the cubic equation, $z^3 - fz^2 + gz - h = 0$. Find the three roots of this cubic equation, and let them be called p, q, r . Then shall the four roots of the proposed biquadratic be these following, viz.

When $\frac{1}{2}b$ is positive;	When $\frac{1}{2}b$ is negative:
1st. $\sqrt{p} + \sqrt{q} + \sqrt{r}$,	$\sqrt{p} + \sqrt{q} - \sqrt{r}$,
2d. $\sqrt{p} + \sqrt{q} - \sqrt{r}$,	$\sqrt{p} - \sqrt{q} + \sqrt{r}$,
3d. $\sqrt{p} - \sqrt{q} + \sqrt{r}$,	$-\sqrt{p} + \sqrt{q} + \sqrt{r}$,
4th. $\sqrt{p} - \sqrt{q} - \sqrt{r}$.	$-\sqrt{p} - \sqrt{q} - \sqrt{r}$.

The following is Mr. SIMPSON'S RULE. Mr. Simpson gave also a general rule for the solution of biquadratic equations, in the second edition of his Algebra, p. 150, in which the given equation is also resolved by means of a cubic equation, as well as the two former ways; and it is investigated on the principle, that the given equation, is equal to the difference between two squares: being indeed a kind of a generalisation of Ferrari's method. Thus, he supposes the given equation, viz.

$x^4 + px^3 + qx^2 + rx + s = x^2 + \frac{1}{2}px + A^2 - Bx + C^2$; then from a comparison of the like terms, the values of the assumed letters are found, and the final equation becomes

$$A^3 - \frac{1}{2}qA^2 + kA - \frac{1}{2}l = 0$$

where $k = \frac{1}{3}pr - s$, and $l = \frac{1}{3}r^2 + s \cdot \frac{1}{3}p^2 - q$. The value of A being found in this cubic equation, from it will be had the values of B and C , which have these general values, viz.

$$pA - r \\ B = \sqrt{2A + \frac{1}{4}p^2 - q} \text{ and } C = \frac{2B}{2B}$$

finally, the root x will be obtained from the assumed equation $x^2 + \frac{1}{2}px + A^2 - Bx + C^2 = 0$, or $x^2 + \frac{1}{2}px + A = \pm Bx \pm C$, in four several values. Mr. Simpson subjoins an observation, viz. that 'the value of A , in this equation, will be commensurate and rational, and therefore the easier to be discovered, not only when all the roots of the given equation are commensurate, but when they are irrational and even impossible.' But this has since been found erroneous, as the instances in which it holds true,

are very few indeed, in comparison with the number of those in which it fails. For other methods of solving biquadratic equations, see ALGEBRA. For the construction of biquadratic equations, see *Des Cartes's Geometry*, with the *Commentaries of Schooten and others*.

BIQUADRATIC PARABOLA, a curve of the third order, having two infinite legs, and expressed by one or other of these three equations, viz.

$$a^2 x = y^3, \text{ as in fig. 1.}$$

$$a^2 x = y^3 - a^2 y^2, \text{ as in fig. 2.}$$

$$a^2 x = y^3 - a + b \cdot y^3 = ab y^2, \text{ as in fig. 3,}$$

Fig. 1.

Fig. 2.

Fig. 3.

where $x = AP$ the absciss $y = PQ$ the ordinate, $b = AB$, $c = AC$, and $a =$ a certain given quantity. But the most general equation of this curve is the following, which belongs to fig. 4.

$$ay = x^4 + bx^3 + cx^2 dx + c;$$

Fig. 4.

Fig. 5.

where $x = Ap$ or AP the absciss, and $-y$ or $+y$ is the ordinate pm or PM , also a, b, c, d, e , are constant quantities; the beginning of the absciss being at any point A in the indefinite line AP . But if the beginning of the absciss A be where this line intersects the curve, as in fig. 5, then the nature of the curve will be defined by this equation $a \times pm = Ap \times Bp \times Cp \times Dp$, wherever the point p is taken in the infinite lines RS . When the curve has no serpentine part, as fig. 6, the equation is more simple, being in this case barely $a \times pm = Ap^2 \times pB$.

Fig. 6.

BIQUADRATIC POWER is the squared square, or fourth power of any number or quantity. Thus sixteen is the biquadrate, or fourth power of two, or it is the square of four, which is the second power of two.

BIQUADRATIC ROOT, of any quantity, is the square root of the square root, or the fourth root of that quantity. So that the biquadratic root of sixteen is two, and the biquadratic root of eighty-one is three.

BIQUALAR, among the Algerines, a cook of the divan.

BIQUINTILE, an aspect of the planets, when they are 144 degrees distant from each other. It is thus called, because they are distant from one another by twice the fifth part of 360 degrees.

BIR, or **BLER**, a town of Asiatic Turkey, in the province of Diarbeck, with a castle where the governor resides, seated on the eastern bank of the Euphrates. Long. $38^\circ 6'$ E., lat $36^\circ 10'$ N.

BIRAGUE (Clement), a Milanese engraver, and the inventor of the art of cutting diamonds,

flourished about A. D. 1580. His first performance on stone was a portrait of Don Carlos, prince of Spain. He lived long at the court of Philip II.

BIRAO, in botany, the name given by the inhabitants of the Philippine islands to a plant more commonly known among botanical writers by the name *tugus*, and supposed by Camelli, who carefully observed it on the spot, to be the true amomum of the ancient Greeks.

BIRBHOOM, a district of Bengal. See **BENGAL**.

BIRCH TREF, *n. s.* Sax. *bjrc*, Lat. *betula*. The leaves are like those of the poplar; the shoots are very slender and weak; the catkins are produced at remote distances from the fruits, on the same tree; the fruit becomes a little squamose cone; the seeds are winged, and the tree casts its outer rind every year. *Miller*.

BIRCH, in botany. See **BETULA**. Various uses are made of different parts of this tree, particularly, 1. Birch bark, being bituminous and consequently warm and emollient, is used in fumigations to correct a distempered air. The inner silken bark was anciently used for writing tables before the invention of paper; though Ray rather assigns the office of paper to the cuticle, or outer skin, which peels off yearly. And with the outward, thicker, and coarser part, are houses in Russia, Poland, and other northern tracts, covered, instead of slates and tile. The Indians make pinnaces with white cedar, which they cover with large flakes of birch bark; sewing them with thread of spruce roots, and pitching them, as the ancient Britons did, with the willow. Pliny speaks of a bitumen actually procured from the birch tree.

BIRCH (Thomas), D. D. historical and biographical writer, was born in London in 1705. His parents were Quakers; and his father, Joseph Birch, a coffee-mill maker by trade. The son, by unremitted diligence, though he had not an university education, became qualified to take orders in the church of England. In 1728 he married the daughter of the Rev. Mr. Cox, to whom he was curate; but his felicity was of short duration, Mrs. Birch dying in less than twelve months after their marriage. In 1732 he was recommended to lord chancellor Hardwicke, then attorney-general; to whom, with the succeeding Earl, he was indebted for all his preferments. He was first presented with the living of Ulking in Essex in 1732. Mr. Birch was chosen a member of the Royal Society, Feb. 20th 1734-5; and of the Society of Antiquaries, Dec. 11th 1735, of which he afterwards became director till his death. Before this, the Marischal College of Aberdeen conferred on him, by diploma, the degree of M. A. 1743. By the interest of Lord Hardwicke, he was now presented to the sinecure rectory of Llandwry Wrefey in Pembrokeshire; in 1743-4, to the rectory of Siddington St. Peter's, in Gloucestershire, and soon after, to the united rectories of St. Michael, Wood-street, and St. Mary, Staining; and in 1745-6, to those of St. Margaret Pattens, and St. Gabriel, Fenchurch-street.—In Jan. 1752, he was elected one of the secretaries of the Royal Society. In 1753 the Marischal College of Aberdeen created him D. D. He

also became one of the trustees of the British Museum; and in 1761, rector of Debden in Essex. In the latter part of his life he was chaplain to the princess Amelia. His health declining in 1765, he was ordered to ride for the recovery of it; but going out for this exercise, January 9th 1766, was unfortunately thrown from his horse, on the road betwixt London and Hampstead, and died on the spot, in the sixty-first year of his age. He bequeathed his library of books and MSS. to the British Museum. He likewise left about £300 to be laid out in government securities, for the purpose of increasing the stipend of the three assistant librarians of that establishment. His principal publications were, 1. The General Dictionary, Historical and Critical; including a new translation of Mr. Bayle, and interspersed with several thousand new lives. The whole design was completed in 10 volumes folio. 2. Dr. Cudworth's Intellectual System (improved from the Latin edition of Mosheim), his Discourse on the true Notion of the Lord's Supper, and two Sermons, with an Account of his Life and Writings, 2 vols. 4to. 1743. 3. The Life of the Hon. Robert Boyle, 1744; prefixed to an edition of that excellent philosopher's works, revised by Dr. Birch. 4. Lives of Illustrious Persons of Great Britain, annexed to the engravings of Houbraken and Vertue, 1746—1752. 5. An Enquiry into the Share which King Charles I. had in the Transactions of the Earl of Glamorgan. 1747, 8vo. 6. An edition of Spenser's Fairy Queen, 1751, 3 vols. 4to. with prints from designs by Kent. 7. The Miscellaneous Works of Sir Walter Raleigh; to which was prefixed the Life of that great man, 1751, 2 vols. 8vo.. 8. The Theological Moral, Dramatic, and Poetical Works of Mrs. Catharine Cockburn; with an Account of her Life, 1751, 2 vols. 8vo.. 9. The Life of Dr. John Tillotson, Archbishop of Canterbury; compiled chiefly from his original Papers and Letters, 1752, 8vo. 10. Milton's Prose Works, 1753, 2 vols. 4to; with a New Life. 11. Memoirs of the reign of Queen Elizabeth, from 1581 till her death, 1754, 2 vols. 4to. 12. The History of the Royal Society of London for Improving Natural Knowledge, from its first rise, 4 vols. 4to. 1756 and 1757. 13. The Life of Henry Prince of Wales, eldest son of king James I. compiled chiefly from his own papers and other MSS., 1760, 8vo. His numerous communications to the Royal Society may be seen in the Philosophical Transactions, &c. Dr. Birch was a pioneer of literature; to him Dr. Johnson was repeatedly obliged for literary information: he bestowed on him a Greek epigram, and for many years corresponded with him. But he is said to have satirically observed—'Tom Birch is as brisk as a bee in conversation, but no sooner does he take a pen in his hand, than it becomes a torpedo to him, and benumbs all his faculties.'

BIRCH WINE. See BLTULA.

BIRCH'EN, *adj.* from birch. Made of birch.

His beavered brow a *birchen* garland bears. *Pope.*

BIRD (William), an eminent musician and composer, was one of the children of the chapel in the reign of Edward VI., and brought up under Tallis. The early compositions of Bird

were mostly for the service of the church. He published a work entitled *Sacrarum Cantionum, quinque vocum*, in 1589; among which is that noble composition *Civitas Sancti tui*, which has so long been sung as an anthem to the words 'Bow thine ear, O Lord.' He was also the author of a work entitled *Gradualia, ac Cantiones Sacre, Quinis, Quaternis, Trinisque vocibus Concinnatæ, lib. primus*. Of this there are two editions, the latter published in 1610. He seems to be the first among English musicians that ever made an essay in the composition of that elegant species of vocal harmony, the madrigal; the *La Virginella* of Ariosto, which he set in that form for five voices, being the most ancient English musical composition of the kind. Of his compositions for private entertainment, there are extant, Songs of sundry Natures, some of Gravitie, and others of Myrth, fit for all Companies and Voyces, printed in 1589; and two other collections of the same kind, the last printed in 1611. But the most permanent memorials of his fame are his motets and anthems; to which may be added, a fine service in the key of D with the minor third, the first composition in Dr. Boyce's Cathedral Music, vol. iii. and that well-known canon of his, *Non nobis Domine*. Bird died in 1623.

BIRD (Edward), R.A. a painter of eminence, who died at Bristol in November, 1819. He excelled in comic subjects, and was at once distinguished for an accurate attention to nature, and facility of execution. He was patronised by the marquis of Stafford, who placed in his celebrated gallery, among the works of the old masters, the first picture of any consequence painted by Bird. His 'Chevy Chase' procured him the appointment of historical painter to the princess Charlotte of Wales; his 'Psalm Singers' in a country church was painted for his majesty: others of his productions are in the collections of various amateurs.

BIRD', *v. & n.*

BIRD'ING,

BIRD'MAN,
BIRD'SPELLING.

Ang.-Sax. *bræidan*, to broaden, that is to spread, or to expand, as with wings—hence the application of the word as a generic description of the feathered tribe. Johnson, however, derives it from the Saxon, *bird* or *brud*, a chicken. In common talk, fowl is used for the larger, and bird for the smaller kind of feathered animals.

On every bough, the *birdes* herd I syng
With voice of angell, in hir harmonie.

Chaucer. Assemlie of Fowles.

And all the while sweet musike did divide
Her looser notes, with Lydian harmony;
And all the while sweet *birdes* thereto applide
Their daintie layes and dulcet melody,
By caroling of love and iollity. *Spenser.*

How Michael the archangel shall sound his trumpet, how he shall gather all the scattered Jewes in the Holy Land, and there make them a great banquet, wherein shall be all the *birds*, beasts,

fishes that ever God made, a cup of wine that grew in Paradise, and hath been kept in Adam's cellar ever since. At the first course shall be served in that great oxe, in Job. iv. 10. 'that every day feeds on a thousand hills;' Psal. l. 10, that great leviathan and a great *bird*, that laid an egge so big, that by chance tumbling out of the nest, it knocked down 300 tall cedars, and breaking as it fell drowned 160 villages. This *bird* stood up to the knees in the sea, and the sea was so deep, that a hatchet would not fall to the bottom in seven years. *Burton. Anat. Mel.*

The poor wren,
The most diminutive of *birds*, will fight,
Her young ones in her nest, against the owl.

Shakspeare.

I do invite you to-morrow morning to my house to breakfast; after we will a *birding* together. *Id.*

To be generous and of free disposition, is to take those things for *birdbolts* that you deem cannon bullets. *Id.*

I will creep up into the chimney.—There they always use to discharge their *birding*-pieces; creep into the kill hole. *Id.*

And on her shield the lone *bird* might be seen,
The Arabian bird shining in colours new;
Itself unto itself was only mate;
Ever the same but new in newer date:
And underneath was writ 'such is chaste single state.' *Fletcher. Purple Island.*

A poor lark entered into a miserable expostulation with a *birdcatcher*, that had taken her in his net. *L'Estrange.*

As a fowler was bending his net, a blackbird asked him what he was doing: why, says he, I am laying the foundations of a city; and so the *birdman* drew out of sight. *Id.*

Holly is of so viscous a juice, as they make *birdlime* of the bark of it. *Bacon's Nat. Hist.*

As the wakeful *bird*
Sings darkling, and in shadiest covert hid
Tunes her nocturnal note. *Milton.*

With stores of gather'd glue contrive
To stop the vents and errancies of their live;
Not *birdlime*, or Ideau pitch, produce
A more tenacious mass of clammy juice. *Dryden.*

There sings
A *bird* unseen—but not remote—
Invisible his airy wings,
But soft as harp that Houri strings
His long entrancing note. *Byron. Bride of Abydos.*

BIRD, BLACK. See TURDUS.

BIRD, BLUE. See MOTACILLA.

BIRD-CALL, or DECOY-BIRD, a bird trained up to call and allure other birds into the fowlers' nets. See BIRD-CATCHING.

BIRD, CANARY. See FRINGILLA.

BIRD, DUNG. See UPUPA.

BIRD, HUMMING. See TROCHILUS.

BIRD, MESSAGE, avis internuntia, a peculiar species of birds employed to carry letters either for expedition or safety. See CARRIER PIGEON.

BIRD, MOCKING. See TURDUS.

BIRD OF PARADISE. See PARADISE.

BIRDS, CYPRIAN, aves cyprice, a kind of odorous candles.

BIRDS, METHOD OF MAKING FEATHERED PICTURES OF. Mr. Edwards, in his Natural History of Birds, vol. ii. p. 119, gives the following recipe for making pictures of birds with their natural feathers: First, take a thin board, or pannel of deal or wainscot, well seasoned,

that it may not shrink: then smoothly paste on it white paper, and let it dry; and if the wood casts its color through, you may paste on a second paper; let the second paper dry; then get ready any bird, and draw it as exact as may be on your papered pannel, of its natural size; middle sized birds are best for this work, then paint what ground-work, or tree, or other thing you design to set your bird on, together with the bill and legs of the bird in water-colors, leaving the bird to be covered with its own natural feathers. You must prepare the part to be feathered, by laying on pretty thick gum Arabic, dissolved in water, with a large hair-pencil; then lay the pannel flat, and let it dry hard; when dry, cover it with gum-water a second time, and let it dry; and then a third, in case it does not lie with a good body on the paper; the thickness of a shilling, when dried hard, is sufficient. When your piece is prepared, take the feathers off from your bird as you use them; beginning always at the tail and points of the wings, and working upwards to the head; observing to cover that part of your draft with the feather that you take from the same part in your bird, letting them fall one over another in their natural order: you must prepare your feathers by cutting off the downy part that is about their bottoms; and the larger feathers must have the insides of their shafts shaved off with a knife to make them lay flat; the quills of the wings must have their inner webs clipped off, that in laying them the gum may hold them by their shafts. When you begin to lay them, take a pair of steel pliers to hold the feathers in; and have some gum-water, not too thin, and a large pencil, ready to moisten the gummed ground-work by little and little as you work it: then lay your feathers on the moistened parts; which must not be waterish, but something tacky or clammy to hold the feathers. You should prepare a parcel of small leaden weights, in the form of sugar-loaves, which you may cast in sand by first making holes in its surface with a pointed stick; these weights will be necessary to set on the feathers you have newly laid on, to hold them to the gum till they are dry: but you must be cautious lest the gum come through the feathers; for it not only smears them, but dries to the bottoms of the weights, and you will be apt to pull off the feathers with the weights, which will disorder your work: when you have wholly covered your bird with feathers, you must, with a little thick gum, stick on a piece of paper cut round, of the bigness and in the place of the eye, which you must color like the eye of the bird. When the whole is dry, dress the feathers round the outline that may chance to stare a little, and rectify what may be mended in any other part: then lay a sheet of clean paper on it, and on that a heavy book, or some such thing, to press it: after which it may be preserved in a frame covered with a glass.

BIRDS, METHODS OF PRESERVING. Various methods have been attempted for preserving birds from putrefaction, so as to retain their natural form and position, as well as the beauty of their colors and plumage. A good antiseptic for animal substances has been much enquired

after; as, for want of it, many curious animals, and birds particularly, from foreign parts, entirely miscarry, and others of the finest plumage are devoured by insects. The following improved methods by Dr. Lettsom seem to be the least troublesome and the most complete:—‘After opening the bird by a longitudinal incision from the breast to the vent; dissecting the fleshy parts from the bones; and removing the entrails, eyes, tongue, and brains (which in large birds may be extracted through the eye-holes with a surgeon’s director), the cavities and inside of the skin are to be sprinkled with the powders mentioned below. Glass eyes, which are preferable to wax, are then to be inserted, and the head stuffed with cotton or tow; and a wire is to be passed down the throat through one of the nostrils, and fixed on the breast bone: wires are also to be introduced through the feet, up the legs and thighs, and inserted into the same bone; next, fill the body with cotton to its natural size, and sew the skin over it: the attitude is lastly to be attended to, and whatever position the subject is placed in to dry, it will be retained afterwards. The drying compound is as follows:—

Corrosive sublimate	$\frac{1}{4}$ lb.
Saltpetre, prepared or burnt	$\frac{1}{2}$ lb.
Alum burnt	$\frac{1}{4}$ lb.
Flowers of sulphur	$\frac{1}{2}$ lb.
Camphor	$\frac{1}{2}$ lb.
Black pepper	1 lb.
Tobacco, ground coarse	1 lb.

Mix the whole, and keep it in a glass vessel, stopped close. Small birds may be preserved in brandy, rum, arack, or first runnings; though the color of the plumage is liable to be extracted by the spirit. Large sea-fowl have thick strong skins, and such may be skinned; the tail, claws, head, and feet are carefully to be preserved, and the plumage stained as little as possible with blood. The inside of the skin may be stuffed as above. Kuckahn observes (in the *Phil. Trans.* vol. lx. p. 319,) that ‘baking is not only useful in fresh preservations, but will also be of very great service to old ones, destroying the eggs of insects: and it should be a constant practice once in two or three years to bake them over again, and to have the cases fresh washed with camphorated spirit, or the sublimate solution, which would not only preserve collections from decay much longer, but also keep them sweet.’ But Dr. Lettsom remarks, that ‘Baking is apt to crimp and injure the plumage, unless great care be used: and therefore the proper degree of heat should be ascertained by means of a feather, before such subjects are baked.’ And he prescribes as the best preservative, boxes well glazed: and he adds, ‘When the subject is to be kept for some time in a hot climate, it should be secured in a box filled with tow, oakum, or tobacco, well sprinkled with the sublimate solution.’ In Guiana, the number and variety of beautiful birds is so great, that several persons in the colony advantageously employ themselves, with their slaves and dependents, in killing and preserving these animals for the cabinets of naturalists in different parts of Europe. The method of doing this, as related by Mr. Baucroft (in his *Nat. Hist. of*

Guiana,) is, ‘to put the bird which is to be preserved in a proper vessel, and cover him with high wines, or the first running of the distillation of rum. In this spirit he is suffered to remain for twenty-four or forty-eight hours, or longer, till it has penetrated through every part of his body. When this is done, he is taken out, and his feathers, which are no ways changed by this immersion, are placed smooth and regular. It is then put into a machine, made for the purpose, among a number of others, and its head, feet, wings, tail, &c. are placed exactly agreeable to life. In this position they are all placed in an oven very moderately heated, where they are slowly dried; and will ever after retain their natural position, without danger of putrefaction.’

BIRDS, SINGING, are, the nightingale, black-bird, starling, thrush, linnet, lark, throistle, Canary bird, bullfinch, goldfinch, &c. See some very curious experiments and observations on the singing of birds.—*Philosophical Transactions*, vol. lxxiii. part. ii. No. 31. Their first sound is called chirp, which is a single sound repeated at short intervals; the next call, which is a repetition of one and the same note; and the third sound is called recording, which a young bird continues to do for ten or eleven months, till he is able to execute every part of his song; and when he is perfect in his lessons, he is said to sing his song round. Mr. Pennant has proved their notes to be no more innate than language in man; they all sing in the same key; and the honorable Daines Barrington has attempted to reduce their comparative merits to a scale; and to explain first how they came to have particular notes. See SONG OF BIRDS.

BIRD-BOLT, a small arrow with three heads, which was discharged at birds from a cross-bow. This arrow is borne in coat-armour as in the annexed figure. *Argent three bird-bolts sable.*

BIRD-CALL, a little stick cleft at one end, in which is put a leaf of some plant, wherewith to counterfeit the crier’s call of several birds, and bring them to the net, or snare, or lime-twig, to be taken. A laurel-leaf fitted on the bird-call, counterfeits the voice of lapwings; a leek that of nightingales, &c.

BIRD-CATCHING the art of taking birds or wild-fowl, whether for food, for the pleasure of their song, or for their destruction, as being pernicious to the husbandman, &c. The methods are by birdlime, nets, decoys, &c. See BIRDLIME, and DECOY.

In the suburbs of London there are many persons, who, during the months of October and March, get their livelihood by an ingenious, and we may add, a scientific, method of bird-catching, which is totally unknown in other parts of Great Britain. The reason of this trade being confined to so small a compass arises from there being no considerable sale for singing birds except in the metropolis: and as the apparatus for this purpose is heavy, and must be carried on a man’s back, it prevents the bird-catchers going to above three or four miles distance. This method of bird catching must have been long prac-

tised, as it is brought to a most systematic perfection, and is attended with very considerable expense. The nets are a most ingenious piece of mechanism; are generally twelve yards and a half long, and two and a half wide; and no one, till he becomes eye-witness of the puller's success, would imagine that a bird, which is so very quick in all its motions, could be caught by the nets flapping over each other. The wild birds fly, as the bird-catchers term it, chiefly during the month of October, and part of September and November; as the flight in March is much less considerable than that of Michaelmas. The several species of birds of flight do not make their appearance precisely at the same time, during the months of September, October, and November. The pipit, a small species of lark, but inferior to the others in singing, for example, begins to fly about Michaelmas, and then the woodlark, linnet, goldfinch, chaffinch, greenfinch, and other birds of flight succeed; all of which are not easily caught, or in any numbers at any other time; and more particularly the pipit and the woodlark. These birds, during the Michaelmas and March flights, are chiefly on the wing from day-break to noon, though there is afterwards a small flight from two till night; but this is so inconsiderable, that the bird-catchers take up their nets at noon. It well deserves the attention of the naturalist whence these periodical flights of certain birds arise. As the ground, however, is ploughed during the months of October and March for sowing the winter and spring corn, it should seem that they are thus supplied with a profusion both of seeds and insects, which they cannot so easily procure at any other season. It has been observed, too, that during their sitting, they fly always against the wind: hence there is a great contention amongst the bird-catchers who shall gain that point; if, for example, it is westerly, the bird-catcher who lays his nets most to the east is sure almost of catching every thing, provided his call-birds are good: a gentle wind to the south-west generally produces the best sport. The bird-catcher generally carries with him five or six linnets, of which more are caught than any other singing bird, two goldfinches, two greenfinches, one woodlark, one redpoll, a yellow hammer, titlark, and aberdavine, and perhaps a bullfinch; these are placed at small distances from the nets in little cages. He has besides what are called slur-birds, which are placed within the nets, are raised upon the slur, and gently let down at the time the wild bird approaches them. The slur is a movable perch to which the bird is tied, and which the bird-catcher can raise at pleasure by means of a long string fastened to it. The slur birds generally consist of the linnet, goldfinch, and greenfinch, which are secured to the slur by what is called a brace; which secures the bird without injuring the plumage. It is a sort of bandage, formed of a slender silken string, fastened round the body, and under the wings, so as to hinder the bird from being hurt, let it flutter ever so much. As it has been found that there is a superiority in birds that are in song, the bird-catchers contrive that their call-birds should moult before the

usual time. They therefore, in June or July, put them into a box made quite close, under two or three folds of blankets, and leave their dung in the cage to raise a greater heat; in which state they continue, being perhaps examined but once a week to have fresh water. As for food, the air is so putrid, that they eat little during the whole state of confinement, which lasts about a month. The birds frequently die under the operation; and hence the value of a stopped bird, as the bird-catchers style it, rises greatly. When the bird has thus prematurely moulted, he is in song whilst the wild birds are out of song, and his note is louder and more piercing than that of a wild one; but it is not only in his note he receives an alteration, the plumage is equally improved. The black and yellow in the wings of the goldfinch, for example, become deeper and more vivid, and acquire a beautiful gloss, which is not to be seen in the wild bird. The bill, which in the latter is black at the end, in the stopped bird becomes white and more taper, as does its legs: in short there is as much difference between a wild and a stopped bird, as there is between a horse kept in body clothes and one at grass. When the bird-catcher has laid his nets, he disposes his call-birds at proper intervals. There is a most malicious joy in these call-birds, to bring the wild ones into the same captivity; which may likewise be observed with regard to decoy ducks. (See DECOY.) Their sight and hearing infinitely excels that of the bird-catcher. The moment they see a hawk, they communicate the alarm to each other by a plaintive note; nor will they then jerk or call though the wild birds are near. But at any other time, the instant that the wild birds are perceived, notice is given by one of the rest of the call-birds, as by the first hound that hits on the scent to the rest of the pack; after which, follows the same sort of tumultuous joy. The call-birds, while the bird is at a distance, do not sing as a bird does in a chamber, they invite the wild ones by what the bird-catchers call short jerks, which, when the birds are good, may be heard at a great distance. The ascendancy by this call is so great, that the wildest bird is stopped in its flight; and, if not a sharper, as the bird-catchers style a bird acquainted with the nets, lights boldly within twenty yards perhaps of three or four bird-catchers, on a spot which otherwise it would not have taken the least notice of. Nay, it frequently happens, that if only half a flock are caught, the remainder will immediately afterwards light in the nets, and share the same fate; and should only one bird escape, that bird will suffer itself to be pulled at till it is caught; such a fascinating power have these call-birds. Here it is worth mentioning, that the bird-catchers frequently lay considerable wagers whose call-bird can jerk the longest, as that determines the superiority. They place them opposite to each other, by an inch of candle; and the bird who jerks the oftenest before the candle is burnt out, wins the wager. There have been instances of a bird giving 170 jerks in a quarter of an hour; and of a linnet, in such a trial, persevering in its emulation till it swooned from the perch. Birds, when near each other, and in sight, seldom jerk or sing. They either

fight, or use short and wheedling calls; the jerking of these call-birds, therefore, face to face, is a most extraordinary instance of contention for superiority in song.

Various methods are used to catch different kinds of birds. The bullfinch, though not properly a singing bird, or a bird of flight, as it does not often move farther than from hedge to hedge, yet, as it sells well on account of its learning to whistle tunes, and sometimes flies over where the nets are laid, the bird-catchers have often a call-bird to ensnare it, though most of them can imitate the call with their mouths. It is remarkable that the female bullfinch answers the purpose of a call-bird as well as the male, which is not experienced in any other species of birds taken by the London bird-catchers. The nightingale is not a bird of flight, in the sense in which bird-catchers use this term. Like the robin, wren, and many other singing birds, it only moves from hedge to hedge, and does not take the periodical flights in October and March. Those who catch these birds make use of small trap-nets, without call-birds; and are considered as inferior in dignity to other bird-catchers, who will not rank with them. The arrival of the nightingale is expected by the trappers in the neighbourhood of London, the first week in April: at the beginning, none but cocks are taken; but in a few days the hens make their appearance, generally by themselves, though sometimes with a few males. The latter are distinguished from the females not only by their superior size, but by a great swelling of their vent, which commences on the first arrival of the hens. They are caught in a net trap, the bottom of which is surrounded with an iron ring; the net itself is rather larger than a cabbage-net. When the trappers hear or see them, they strew some fresh mould under the place, and bait the trap with a meal-worm. Ten or a dozen have been thus caught in a day. The common way of taking larks (see *ALAUDE*) is in the night, with nets called trammels. These are usually made of thirty-six yards in length, and about six yards over, with six ribs of packthread, which at the ends are put upon two poles about sixteen feet long, and made lesser at each end. These are to be drawn over the ground by two men, and every five or six steps the net is made to touch the ground, otherwise it will pass over the birds without touching them. When they are felt to fly up against the net, it is clapped down, and then all are safe that are under it. The darkest nights are best for this sport; and the net will not only take larks, but all other birds that roost on the ground. In the depth of winter people sometimes take great numbers of larks by nooses of horse-hair. The method is this: Take 100 or 300 yards of packthread; fasten at every six inches a noose made of double horse-hair; at every twenty yards the line is to be pegged down to the ground, and so left ready to take them. The time to use this is when the ground is covered with snow, and the larks are to be allured to it by some white oats scattered all the way among the nooses. They must be taken away as soon as three or four are hung, otherwise the rest will be frightened; but though the others are scared away just where the sports-

man comes, they will be feeding at the other end of the line, and the sport may be thus continued for a long time. Those caught in the day are taken in clap-nets of fifteen yards long, and two and a half broad; and are enticed within their reach by bits of looking glass, fixed in a piece of wood, and placed in the middle of the nets, which are put in a quick whirling motion by the string the larker commands; he also makes use of a decoy-lark. These nets are used only till the fourteenth of November; for the larks will not dare to frolic in the air, except in fine sunny weather; and of course cannot be inveigled into the snare. When the weather grows gloomy, the larker changes his engine, and makes use of a trammel-net, twenty-seven or twenty-eight feet long, and five broad; which is put on two poles eighteen feet long, and carried by men under each arm, who pass over the fields and quarter the ground as a setting dog: when they hear or feel a lark hit the net, they drop it down, and so the birds are taken. Linnaeus observes that the male chaffinches fly by themselves, and in the flight precede the females; but this is not peculiar to them. When the tit-larks are caught in the beginning of the season, it frequently happens, that forty are taken and not one female among them; and probably the same would be observed as to other birds (as has been done with relation to the wheat-ear), if they were attended to. Experienced bird-catchers tell us, that such birds as breed twice a year generally have in their first brood a majority of males, and in their second of females, which may in part account for the above observation.

The following method of catching wild pigeons is eagerly pursued as a diversion in different parts of Italy, particularly by the inhabitants of Cava in the Hither Principato, and is thus described by Mr. Swinburne. The people 'assemble in parties; and if any stranger chances to stray to their rendezvous, they give him a most cordial welcome. I am not in the least surprised (says Mr. Swinburne) at their passionate fondness for this sport, as I found it extremely bewitching, keeping the attention constantly alive, and the springs of the mind pleasingly agitated by expectation; the situations where the toils are spread are incomparably beautiful, the air is pure and balsamic, and every thing around breathes health and satisfaction. When the periodical flights of stock-doves return from the northern and western parts of Europe to gain warmer regions for their winter abode, the fowler repairs to the mountain and spreads his nets across the intermediate hollows, the passes through which the birds direct their course, to avoid unnecessary elevation in their flight. These nets are hung upon a row of large trees planted for the purpose. The branches being very thick and close at top, and the bole lofty and bare, a great opening is left below for the toils, which reach to the ground; and by means of pulleys, fall in a heap with the least effort. Sometimes they are extended upon poles that exceed the height of the trees. At a small distance is a lofty circular turret, like a column with a little capital or cap, upon which a man is stationed to watch the approach of the game. As he com-

mands a free view over all the country, and practice has made his sight as acute as that of the lynx, he describes the birds at a wonderful distance. The doves advance with great velocity; but the alert watchman is prepared for them; and just as they approach his post, hurls a stone above them with a sling: upon this the whole flock, whose fears have birds of prey for their great object, supposing the stone to be an enemy of that kind ready to pounce on them, dart down like lightning to avoid the blow by passing under the trees; but there they rush into the jaws of death, by dashing against the net, which instantly drops and so entangles them that not one of them can escape the active hands of the fowler. These birds are sometimes taken by dozens at one fall, and are accounted fine eating. The dexterity with which the slingers manage their weapon is very remarkable; they throw the stone to a great height without any violent effort, and even without whirling the sling round before they discharge the pellet. In the Pyrenean mountains where the same diversion is followed, the watchmen use a bow and arrow, trimmed with the feathers of a hawk.

The following simple but ingenious method of catching aquatic birds is used in Mexico by the natives. The lakes of the Mexican vale, as well as others in the kingdom, are frequented by a prodigious multitude of ducks, geese, and other water-birds. The Mexicans leave some empty gourds to float upon the water, where those birds resort, that they may be accustomed to see and approach them without fear. The bird catcher goes into the water so deep as to hide his body, and covers his head with a gourd: the ducks come to peck at it; and then he pulls them by the feet under water.

Great numbers of the inhabitants of the Orkneys feed, during the season, on the eggs of the birds of the cliffs. The method of taking them is so very hazardous, as to prove the extremity to which the poor people are driven for want of food. Shapinsha, Sanda, Hoy, Foula, and Noss Head are the most celebrated rocks; and the neighbouring natives the most expert climbers and adventurers after the game of the precipice. The height of some are about fifty fathoms; their fronts roughened with shelves or ledges sufficient only for the birds to lay their eggs upon. To these the dauntless fowlers ascend, pass intrepidly from one to the other, collect the eggs and birds, and descend with the same indifference. In most places the attempt is made from above: they are lowered from the slope contiguous to the brink by a rope, sometimes made of straw, sometimes of the bristles of the hog: they prefer the last even to ropes of hemp, as it is not liable to be cut by the sharpness of the rocks; the former is apt to untwist. They trust themselves to a single assistant, who lets his companion down, and holds the rope, depending on his strength alone; which often fails, and the adventurer is sure to be dashed to pieces or drowned in the sea. The rope is often shifted from place to place, with the depending weight of the fowler and his booty. The person above receives signals for the purpose, his associate being out of sight; who, during the operation,

by help of a staff, springs from the face of the rocks, to avoid injury from the projecting parts. But the most singular species of bird-catching is on the holm of Noss, a vast rock severed from the Isle of Noss by some convulsion, and only about sixteen fathoms distant. It is of the same stupendous height as the opposite precipice, with a raging sea between; so that the intervening chasm is of matchless horror. Some adventurous climber reaches the rock in a boat, gains the height, and fastens several stakes on the small portion of earth which is to be found on the top; correspondent stakes are placed on the edge of the correspondent cliffs. A rope is fixed to the stakes on both sides, along which a machine, called a cradlle, is contrived to slide; and by the help of a small parallel cord, fastened in like manner, the adventurer wafts himself over, and returns with his booty.

In some remote parts of Russia there is practised a singular invention for taking great quantities of gelinottes or grouse. They choose the most open places in the birch woods; and there plant long forks in the earth opposite the larger trees, on these are laid a horizontal stick, gallows-ways, to which are tied small bundles of ears of corn. At a small distance from this contrivance, is a kind of large funnel or inverted cone, made with long birch twigs, thin and flexible, the lower extremities stuck in the earth, very near to one another; but by spreading towards the top, it forms an opening of above a yard in diameter. In this opening is placed a wheel made of two circles that intersect each other, and are surrounded with straw and ears of corn. This wheel turns on an axis fastened to the sides of the funnel, so that there is room enough between the sticks of the cone and the circles to admit of the wheel's turning freely about. The birds first perch upon the transverse sticks near the tree; and when they have a mind to fall upon the cord tied to the wheel, they must necessarily stand upon one of the projecting parts of the circles of which it is composed. At that instant the wheel turns, and the gelinotte falls head foremost to the bottom of the trap, which is there so contracted that he cannot get out. They sometimes find the machine half full of gelinottes.

The manner of bird catching in the Ferro islands is exceedingly hazardous. The cliffs which contain the objects of their search are often 200 fathoms in height, and are attempted both from above and below. In the first case, the fowlers provide themselves with a rope 80 or 100 fathoms in length. The fowler fastens one end about his waist and between his legs, recommends himself to the protection of the Almighty, and is lowered down by six others, who place a piece of timber on the margin of the rock, to preserve the rope from wearing against the sharp edge. They have besides, a small line fastened to the body of the adventurer, by which he gives signals that they may lower or raise him, or shift him from place to place. The last operation is attended with great danger, by the loosening of the stones, which often fall on his head, and would infallibly destroy him, were it not protected by a strong thick cap; but even that is

found unequal to save him against the weight of the larger fragments of rock. The dexterity of the fowlers is amazing; they will place their feet against the front of the precipice, and dart themselves some fathoms from it, with a cool eye survey the places where the birds nestle, and again shoot into their haunts. In some places the birds lodge in deep recesses. The fowler will alight, disengage himself from the rope, fix it to a stone, and at his leisure collect his booty, fasten it to his girdle, and resume his seat. At times he will again spring from the rock, and with a fowling net placed at the end of a staff, catch the old birds that are flying to and from their retreats. When he has finished his dreadful employ, he gives a signal to his friends, who pull him up, and share his hard earned profit. The feathers are preserved for exportation: the flesh is partly eaten fresh, but the greater part is dried for winter's provision. The fowling from below has also its share of danger. The party goes on the expedition in a boat; and when it has attained the base of the precipice, one of the most daring, having fastened a rope about his waist, and furnished himself with a long pole with an iron hook at one end, either climbs or is thrust up by his companions, who place a pole under his breech, to the next footing spot he can reach. He, by means of a rope, brings up one of the boat's crew; the rest are drawn up in the same manner, and each is furnished with his rope and fowling staff. They then continue their progress upwards in the same manner, till they arrive at the region of the birds; and wander about the face of the cliff in search of them. They then act in pairs; one fastens himself to the end of his associate's rope, and, in places where birds have nestled beneath his footing, he permits himself to be lowered down, depending for his security on the strength of his companion, who has to haul him up again; but it sometimes happens that the person above is overpowered by the weight, and both perish. They fling the fowls into the boat, which attends their motions. They often pass seven or eight days in this tremendous employ, and lodge in the crannies which they find in the face of the precipice.

BIRDLIME is prepared in different ways. The best birdlime is made of the middle bark of the holly boiled seven or eight hours in water, till it is soft and tender: then laid in heaps in pits in the ground and covered with stones, the water being previously drained from it; and in this state left for two or three weeks to ferment, till it is reduced to a kind of mucilage. This being taken from the pit is pounded in a mortar to a paste, washed in river water, and kneaded, till it is freed from extraneous matters. In this state it is left four or five days in earthen vessels, to ferment and purify itself, when it is fit for use. It reddens tincture of litmus. Exposed to a gentle heat it liquefies slightly, swells in bubbles, becomes grumous, emits a smell resembling that of animal oils, grows brown, but recovers its properties on cooling, if not heated too much. With a greater heat it burns, giving out a brisk flame and much smoke. The residuum contains sulphate and muriate of potash, carbonate of lime and alumina, with a small portion of iron.

The insleto affords a juice superior to that of the holly; and if a young shoot of the common alder be cut through, a stringy juice will draw out in threads, and follow the knife like birdlime or the juice of the holly.

When birdlime is to be put in wet places the common birdlime is apt to have its force soon taken away. It is necessary, therefore, to have recourse to a particular sort, which, from its property of bearing water unhurt, is called water birdlime; and is prepared thus:—Take a pound of strong birdlime; wash it in spring water till the hardness is all removed; then beat it well that the water may be separated, so as not a drop remains; then dry it well and put it into an earthen pot; add to it as much grease as will make it run, with two spoonfuls of strong vinegar, one spoonful of oil, and a small quantity of Venice turpentine. Let the whole boil for some minutes over a moderate fire, stirring it all the time. Then take it off; and, where there is occasion to use it, warm it, and cover the sticks well with it. This is the best sort of birdlime for snipes, and other birds that frequent wet places. The most successful method of using birdlime is this:—Cut down the branch of any bushy tree whose twigs are thick, straight, and smooth; the willow and the birch tree afford the best of this kind. Let all the superfluous shoots be trimmed off, and the twigs all made neat and clean; they must all be well covered with the birdlime within four inches of the bottom. No part of the bark, where the lime should come, must be left bare; but it is a nice matter to lay it on properly; for if it be too thick it will give the birds a distaste, and they will not come near it; and if there be too little of it, it will not hold them when they are there. When the bush is thus prepared, it must be set up in some dead hedge, or among bushes, near the outskirts of a town, or the like, if in the spring; for these places are the resort of the small birds at that time. If it be used in summer, the bush must be placed in the midst of a quick-set hedge, or in white-thorn trees, near fields of corn; and, in the winter, the proper places are about stacks of corn, hovels, barns, and the like. When the lime-bush is thus planted, the sportsman must stand as near it as he can, without being discovered; and with the mouth, or otherwise, make such notes as the birds do when they attack or call one to another. The time of day for this sport is from sunrise to ten o'clock, and from one to sunset. Another very good method of bringing the birds together is by a stale: a bat makes a very good stale, but it must be fastened so as to be in sight at a distance. An owl is a still better stale; for this bird never goes abroad but it is followed by all the small birds. They will gather together in great numbers about it; and, having no convenient place to sit on but the lime-bush, many will be taken. If a living owl or bat is not to be had, the skin stuffed will serve the purpose, and will last twenty years. Some have used the image of an owl carved in wood, and painted in the natural colors; and it has been found to succeed very well.

BIRDS-NEST, PURPLE. See **ORCHIS**.

BIRDS-NESTS, in natural history and cookery, the nests of a small Indian swallow (See **HIRUNDO**), very delicately tasted, and frequently mixed among soups. On the sea coasts of China, at certain seasons of the year, there are seen vast numbers of these birds. They leave the inland country at their breeding time, and come to build in the rocks, and fashion their nests out of a matter which they find on the shore, washed thither by the waves. The nature of this substance is scarcely yet ascertained. According to Kempfer it is molluscæ or sea-worms; according to M. le Poivre, fish-spawn; according to Dalrymple, seaweeds; and according to Linnaeus it is the animal substance, frequently found on the beach, which fishermen call blubbers or jellies. The nests are hemispherical, and of the size of a goose's egg, and in substance much resemble the ichtyocolla or isinglass. The Chinese gather these nests, and sell them to all parts of the world; they dissolve in broths, &c. and make a kind of jelly of a very exquisite flavor. These nests are found in great abundance in Sumatra, particularly about Croe, near the south end of the island. Four miles up the river of that name is a large cave, where the birds build in vast numbers. The nests are distinguished into white and black, of which the first is by far the more scarce and valuable, being found in the proportion of one only to twenty-five. 'The white sort,' says Mr. Marsden, 'sells in China at the rate of 1000 to 1500 Spanish dollars the pecul; the black is usually disposed of at Batavia for about twenty dollars the same weight, where it is chiefly converted into glue, of which it makes a very superior kind. The difference between the two has been supposed to be owing to the mixture of the feathers of the birds with the viscous substance of which the nests are formed: and this they deduce from the experiment of steeping the black nests for a short time in hot water, when they are said to become in a great degree white. Among the natives I have heard some assert, that they are the work of a different species of bird. It was suggested to me that the white might probably be the recent nests in which they were taken; and the black, such as had been used for a number of years successively. This opinion appearing plausible, I was particular in my enquiries as to that point, and learned what seemed much to corroborate it. When the natives prepare to take the nests, they enter the caves with torches, and forming ladders according to the usual mode, of a single bamboo notched, they ascend and pull down the nests, which adhere in numbers together, from the side and top of the rock. They informed me, that the more regularly the cave is stripped, the greater proportion of white nests they are sure to find, and that on this experience they often make a practice of beating down and destroying the old nests in larger quantities than they trouble themselves to carry away, in order that they may find white nests

the next season in their room. The birds, during their building time, are seen in large flocks on the beach, collecting in their bills the foam which is thrown up by the surf, of which there is little doubt but they construct their nests, after it has undergone, perhaps, a preparation from a commixture with the saliva, or other secretion, with which nature has provided them for that purpose.'

BIRDS-PEPPER. See **CAPSICUM**.

BIRD ISLAND, an island of the North Pacific Ocean, discovered in 1788 by the captain of the Prince of Wales, and afterwards visited by Vancouver in 1794. This solitary island or rock derives its name from the multitude of birds which crowd upon it. It has the form of a saddle, high at each end and low at the middle. Its greatest extent, which is in a direction south seventy-four degrees west, and north seventy-four east, does not exceed one mile; nor is it more than a league round. Its northern, eastern, and western extremities rise perpendicularly from the ocean in rugged cliffs, inaccessible but to its winged inhabitants. On its southern side the ascent is not so steep; and on the western shore is a small sandy beach, where, in fine weather and a smooth sea, a landing might be made. Here Vancouver saw some appearance of verdure, but neither tree nor shrub; every other part consisted only of naked rock. The Sandwich Islanders speak of it by the name of Modoo Manoo, that is, Bird Island; and it seems to claim some pretensions to be ranked in the group of the Sandwich Islands, being thirty-nine leagues north and fifty-one west of Onehow. Long. 198° 8' E., lat. 23° 6' N.

BIRD ISLAND, an islet in Strangford Lough, on the coast of Ireland, eight miles south of Newtown. 2. A small island in the Eastern seas, six miles north of Pulo Lucotta. 3. An island in the South Pacific Ocean, about four miles in circumference, which was discovered by captain Cook in 1769. 4. A small island in the Eastern Indian Sea, near the west coast of Sumatra. 5. An island in the South Pacific, near the north-west coast of New Georgia, discovered by captain Cook in 1775. 6. An island in the Indian Sea, about four miles in circumference, covered with green shrubs and rocky in the centre. 7. A small island off the coast of Africa. Lat. 24° 20' S. 8. A small island near the east coast of Newfoundland, six miles south-east of Cape Bonavista. 9. A small island in the gulf of St. Lawrence, sixty-three miles west of Cape Anguilla, on the island of Newfoundland. Long. 60° 45' W., lat. 47° 55' N. 10. A small island in the Carribean Sea. A long bank, called the Bank of Aves, extends from this island to St. Eustatius, about 130 miles to the N. N. E.

BIRD ISLANDS, small low islands near the north-east coast of New Holland, which, when seen by captain Cook, were almost covered with birds. 2. Sixteen miles west of Cape Grenville. 3. A cluster of islands in the Carribean Sea, near the coast of South America. 4. Two islands near the north coast of the island of Antigua, in the West Indies, distinguished by the names of Great and Little, though they are both small.

BIRDSTARES, *n. s. aracus*. A plant.

BIRDSTONGUE, *n. s.* An herb.

BIREMIS, from *bis*, double, and *remus*, an oar, in Roman antiquity, a vessel with two rows of oars, concerning the disposition of which authors are not agreed.

BIREN (Ernest John), duke of Courland, was descended from a humble family, his father being simply huntsman to a former duke of Courland. Ernest received his education at the university of Königsburgh in Prussia, and in 1714 visited Petersburg, to solicit the situation of a court-page, which he was refused on account of his mean descent. He then returned to Courland, and obtained the favor of Bestucheff, the chancellor, who introduced him to the duchess dowager and regent, Anne; who, charmed with his address, made him her chief favorite, and promoted him to almost the entire government of the country. When Anne ascended the throne of Russia, it was stipulated that Biren should not accompany her; but she soon sent for him, and during her whole reign he ruled in Russia, as at Courland, with sovereign sway, almost peopling the deserts of Siberia with exiles: 20,000 are said to have been despatched there during his administration of ten years. Mr. Coxe says he even treated his mistress with the most haughty violence; but on the other hand it is universally admitted, that Russia flourished under his influence, and that he was careful to employ men of ability in every department. On the death of Ferdinand duke of Courland, in 1737, Anne compelled the nobles to choose him for their sovereign; and he now boldly crushed every vestige of freedom in the states. He prevailed on the empress, on her death-bed, to nominate her nephew Ivan, then an infant, her successor, and himself regent during his minority; and at her death, endeavoured, with his usual decision, to secure his authority. But prince Munich, at the head of a strong party, succeeded in seizing his person in 1740, and conducting him to Siberia in his turn. Here he remained, with five roubles a day for his maintenance, during the whole reign of Elizabeth. On the accession of Peter III. the exiles were all recalled. Offers were then made to him to induce him to resign his duchy, but this he always refused to do. He was at length, in 1763, restored to all his honors by Catharine II.; and died at Mittau in 1772, in his eighty-third year.

BIRGANDER, *n. s.* *chenaloper*. A fowl of the goose kind.

BIRKENBERG, a small market town of Bohemia, in the circle of Beraun, near the town of Pzibram, with a productive silver mine.

BIRKENFELD, a town and bailiwick of Germany, in the circle of the Upper Rhine, including thirty-two villages and two iron foundries. It was taken by the French in 1794; and became the principal place of a district of the same name, in the department of Sarre. The town recently contained 1061, and the canton 5892 persons. The district comprehends thirty-eight communes, and its whole territorial extent includes 1615 kilometres. It is situated thirty miles E. N. E. of Treves, and thirty N. N. W. of Deux-Ponts.

BIRKENFELD, the late capital of the county,

seated near the river Nahe. Long. 7° 14' E., lat. 49° 35' N.

BIRKENHEAD, or **BERKENHEAD** (Sir John), a famous political author, born about 1615. Being secretary to archbishop Laud, he created him M. A. in 1639; and in 1640, procured him to be chosen probationer fellow of All Souls College. This obliged him to reside constantly at Oxford; and on king Charles I's making that city his head-quarters during the civil war, he conducted a journal in defence of the royal cause, by which he gained great reputation. By the king's recommendation, he was chosen reader in moral philosophy; which he enjoyed till 1648, when he was expelled by the parliamentary visitors. He afterwards retired to London, and wrote several poetical pieces; for which he acquired the title of the loyal poet, and suffered several imprisonments. On the Restoration, he was created LL.D. by the university of Oxford; and in that quality, as an eminent civilian, was consulted by the convocation, Whether bishops ought to be present in capital cases! He was about the same time elected to serve in parliament for Wilton. He was knighted, November 14th, 1662; and, upon Sir Richard Fanshaw's vacating the office, was appointed to succeed him as master of requests. He afterwards received various royal favors, which drew upon him some very severe attacks from those who opposed the court. His memory has been transmitted with honor to posterity by Dryden, Langbaine, and Winstanley. He died in Westminster, December 4th, 1679.

BIRMAN, or **BURMHAN EMPIRE**. See **BURMHAN**.

BIRMINGHAM, a large market and manufacturing town of Warwickshire, on the river Rea, formerly called Birmisham, from the name of the lords of the manor. The principal part of the town stands on the side of a hill, nearly in the form of a half moon. The lower and older part is filled with the workshops and warehouses of the manufacturers. The upper part of the town contains a number of new and regular streets, and a handsome square. Birmingham has several good churches, particularly one in the lower part of the town, which is an ancient building with a very tall spire; and another, which is a grand modern structure, having a square stone tower with a cupola and turret above it. The Old Church has a peal of twelve bells, and a set of chimes. St. George's church, near Constitution Hill, one of the seventy lately voted by parliament, is a still more recent edifice, just finished. It is also in contemplation to erect another new church at Dale-end. Here are also five chapels of ease of the established religion, including a new chapel, lately built at Bordesley, in the suburbs, besides a great number of meeting-houses for dissenters of all denominations, and two synagogues for the Jews. Here are also a due variety of charitable endowments. The free school is a very ancient institution, but the present building, a large and handsome edifice, with a neat tower in the centre, and a statue of Edward VI. in front, was erected in 1707; the blue coat school was established in 1724, which receives 150 boys, and forty girls; into the dis-

senters' charity school forty boys and twenty girls are admitted; the general hospital, erected in 1766, is supported by voluntary contributions and many large bequests, it possesses an income of about £1000 per annum, and, upon an average, accommodates upwards of seventy patients weekly. This town was never incorporated, and is governed by two constables and two bailiffs. It is about two miles long, including the hamlets of Deritend and Bordesley; and contains between 80,000 and 90,000 inhabitants (exclusive of those of the parish of Aston, in which Castle-Bromwich is included, making a further population of 14,366), of whom 19,344 families are returned as employed in trade and manufactures; particularly in the manufacture of fire-arms, hardware, plated articles, trinkets, and jewellery; which have an unrivalled sale. The art of staining glass has been carried to great perfection here by Mr. Eginton, whose works, in a style superior to any ancient remains preserved, now adorn many churches and other edifices throughout the kingdom. There are also very extensive brass foundries, and numerous articles, useful and ornamental, are executed of that material: there are also manufactories of whips, and papier-machée commodities. Here are two crosses, the one called the Welsh and the other the Old Cross; over the latter is held the court of requests, established in 1752, and occasionally some of the town meetings. Also an elegant new theatre. In the summer season the inhabitants have the amusement of a Vauxhall; and in the winter there are concerts and balls in a superb assembly-room, at the hotel.

Birmingham was for many centuries noted for its extensive leather-market, which is now gone to decay. The greatest advantage to this emporium of trade, is the extension, of late years, of its canal navigation, now communicating with most parts of the kingdom. The old canal, cut in 1768, brings the raw materials, and fuel from the Wednesbury collieries; this again, in 1772, was extended to Atherley, and thence communicates to the Severn by Shrewsbury, Gloucester, and Bristol, and joins the Trent to Gainsborough, Hull, and London. It has also a junction with the Grand-Line Canal, through Staffordshire, to Manchester and Liverpool, thereby conveying the produce of its manufactories entirely by water carriage to the principal sea-ports of the British Ocean, the Irish Sea, and St. George's Channel. By means of the New or Birmingham and Fazely canal, a communication is opened to Tamworth, Polesworth, Atherston, Nuneaton, Coventry, and Oxford; and thence by the canal, or Thames, to London. The place is every year improving rapidly. In most of the principal streets the foot-paths are paved with flag-stones, and the whole town is lighted with gas. In 1822, an act was passed for rebuilding the bridge over the Rea, at Deritend. There are a number of noblemen's and gentlemen's seats in the neighbourhood; together with the famous Soho works, belonging to Messrs. Boulton and Watt, forming one of the most extensive manufactories in the kingdom, as well for the number of hands it employs, as for the variety of articles it produces. It consists of four squares, with

connecting ranges of shops, like streets, capable of employing above 1000 workmen, in all the varieties of the button, buckle, plated, or argent-moulu, steel, and trinket manufactures. The improved steam-engines of Messrs. Boulton and Watt, also made here, deserve to rank among the most extraordinary inventions of the age. Lately there has been erected, at Lady-Well, the completest set of baths in the kingdom. The principal bath consists of an oblong piece of water, thirty-six yards by eighteen, situate in the centre of a garden, having twenty-four recesses for undressing, and being surrounded by a wall; besides seven marble baths, which are at all times ready for hot and cold bathing. Dr. Price notices this as the healthiest town in England; the soil around is a red sand, which preserves the place remarkably dry: and it is worthy of observation, that from the register of burials, in the average of six years, ending 1801, the scale of mortality was as one to fifty-nine only, whilst that of Manchester appears to have been one to thirty-seven, and the metropolis of London as one to thirty-one. The market, on Thursday, is well supplied with all kinds of provision and cattle; it has also two other markets, and large cattle fairs on the Thursday in Whitsun-week, and 29th September.

This town is supposed to have existed in the reign of king Alfred; but it was not a place of note for centuries after. In 1643 it was besieged and taken by prince Rupert, and ordered to be burnt to the ground; but, owing to some propitious circumstances, the conflagration did very little damage. In the year 1665, or 1666, Birmingham suffered severely from the plague; and in a short time subsequent to this it began to be considerably enlarged. In the year 1700, however, it consisted only of thirty streets. Before the Revolution, its other manufactures were confined to coarse iron wares; but the skill of its artists was brought into great notice and exertion by the following circumstance. William III. having expressed his regret, that it should be necessary to import fire-arms from foreign countries, Sir Richard Newdigate, member of parliament for Warwickshire, engaged, on the part of his constituents, to supply the demands of government; and an order, which was sent to Birmingham, having been speedily and satisfactorily executed, it has continued from that period to furnish the greatest proportion of muskets, swords, and other small arms. In 1745 Mr. Boulton's invention of inlaid steel for buckles, watch-chains, and other articles, was brought to perfection; and in 1764 the great works at Soho were established. Subsequent to these improvements, the town appears to have made the most rapid advances to wealth and prosperity: yet in 1795, it is said, there was but one cannon in the place. In the year 1791 serious riots took place in Birmingham, when two Unitarian places of worship, and the celebrated Dr. Priestley's house and valuable library, were destroyed by the populace, whose disorders were continued during several days; and it is calculated that property was destroyed to the value of £50,000. Distant sixty-two miles north-west of Oxford, eighty-seven north of Bristol, and 109 N. N. W. of London.

BIRNAGHUR, an ancient decayed city of Gujerat, in Hindostan, which formerly contained 300 temples, now in ruins. The inhabitants were principally Brahmins.

BIRNAM, a hill of Scotland in Perthshire, celebrated by Shakspeare in his tragedy of *Macbeth*. It rises, with a rude and striking magnificence, to the height of 1580 feet above the level of the sea, in the parish of Little Dunkeld. It looks full in the face, at the distance of about twelve miles, the celebrated Dunsinnan hill, the seat and fortress of *Macbeth*. Within the range of an arrow from this mount, are to be seen a number of tumuli or small heaps of stones, about the length of a human body. Higher up the same face of Birnam, are the ruins of an oblong square building, with circular turrets at the corners. It is called (in Gaelic) Forhajillon. Birnam was anciently a forest, and a part of the royal domain of Scotland.

BIROSTRIS, in conchology, a species of bulla, inhabiting Java. It has two beaks, which are elongated and smooth; margin thickened outwardly.—*Lister*.

BIROTA, or **BIROTUM**, in Roman antiquity, a kind of vehicle, so denominated from its moving upon two wheels. It carried about 200lbs. weight, and was drawn by three mules.

BIRRUS, or **BYRRUS**, in Roman antiquity, 1. A cloak made of woollen cloth, worn by the soldiers. 2. A robe anciently worn by the priests or bishops.

BIRSHA, king of Gomorrah, one of the five kings who rebelled against Chedorlaomer. Gen. xiv.

BIRT', *n. s.* A fish, the same with the **TURBOT**; which see.

BIRTH, } The third person of
BIRTHDAY, } the verb to *bear*. Ang-
BIRTHDOOM, } Sax. beorthe; Germ. *burt*,
BIRTHMARK, } from the verb *beren*.
BIRTHNIGHT, } Whatever beareth is a
BIRTHPLACE, } *birth*; a convenient place
BIRTHRIGHT, } to moor a ship in is called
BIRTHTIDE, } *a birth*; also the proper
BIRTHSTRANGLER, } place on board to put
 chests, &c. is called the *birth* of the mess; to
 bear, is however not only to sustain; but bear
 into life, into existence, used of vegetables as
 well as of animals. *Birth* is likewise the act of
 carrying into life. It is figuratively used for
 extraction, lineage, rank by descent. *Birthdoom*
 is used as kingdom, dukedom, privilege by
birth. *Birthright* is the right of the first-born;
 the privileges to which a man is born.

Paraventure in thilke large book

Which that men clepe the Heven, ywriten was

With sterres, whan that he his *birthe* took,

That he for love should han his deth, alas!

For in the sterres, cleer than is glss,

Is writen, God wot, who so coude it rede,

The deth of every man withouten drede.

Chaucer. Canterbury Tales.

————— I was in thilke same looser yeeres

(Whether the Muse so wrought me from my *byrth*,
 Or I too much beleevd my shepherd peeres.)

Somedele y bent to song and musikes mirth.

Spenser's Shepherd's Calendar.

Most virtuous virgin, born of heavenly *birth*.

Spencer.

The people fear me; for they do observe
 Unfathered heirs, and loathly *births* of nature.

Shakspeare.

This is my *birthday*; as this very day

Was Cassius born.

Id.

My *birthplace* hate I, and my love 's upon

Id.

This enemy's town.

Thy blood and virtue

Contend for empire in thee, and thy goodness

Id.

Shares with thy *birthright*.

Let us rather

Hold fast the mortal sword; and like good men,

Bestride our downfallen *birthdom*.

Id.

Finger of *birthstrangled* babe,

Ditch-delivered by a drab. *Id. Macbeth.*

That poets are far rarer *births* than kings,

Your noblest father proved.

Ben Jonson.

————— that the true

Anointed king Messiah might be born

Barred of his right; yet at his *birth* a star,

Unseen before in heaven, proclaims him come,

And guides the eastern sages.

Milton.

Orient light,

Exhaling first from darkness, they beheld,

Birthday of heaven and earth. *Id.*

Thou hast been found

By merit, more than *birthright*, Son of God. *Id.*

The' angelick song in Bethlehem field,

On thy *birthnight*, that sung the Saviour born.

Id. Paradise Regained.

In Spain, our springs like old mens' children be,

Decayed and withered from their infancy;

No kindly showers fall on our barren earth,

To hatch the seasons in a timely *birth*.

Dryden.

While no baseness in this breast I find,

I have not lost the *birthright* of my mind. *Id.*

Your country dames,

Whose cloaths returning *birthday* claims. *Prior.*

I loved her first, I cannot quit the claim,

But will preserve the *birthright* of my passion.

Otway.

To say that liberty and property are the *birthright*
 of the English nation, but that, if a prince invades
 them by illegal methods, we must upon no pretence
 resist, is to confound governments. *Addison.*

In ships decayed no mariner confides,

Lured by the gilded stern and painted sides;

Yet at a ball unthinking fools delight

In the gay trappings of a *birthday* night. *Swift.*

See through this air, this ocean, and this earth,

All matter quick and bursting into *birth*. *Pope.*

Much I misdoubt this wayward boy

Will one day work me more annoy;

I never loved him from his *birth*.

Byron. Bride of Abydos.

BIRTH, in midwifery. See **MIDWIFERY**.

BIRTH, or **BERTH**, in sea language, the station
 in which a ship rides at anchor, either alone or
 in a fleet, comprehending the extent of the space
 in which she ranges at the extent of her cables.
 Thus, the seamen say, 'she lies in a good *birth*,'
 i. e. in a convenient situation, or at a proper dis-
 tance from the shore and other vessels; and
 where there is good anchoring ground, and shelter
 from the violence of the wind and sea.

BIRTHDAY, the anniversary return of the day
 whereon a person was born. The ancients
 placed a good deal of religion in the celebration
 of the birthdays, and took omens from thence of
 the felicity of the coming year. The manner of
 celebrating birthdays was by a splendid dress;

M

wearing a sort of rings peculiar to that day; offering sacrifices; the men to their genius, of wine, frankincense; the women to Juno; giving suppers, and treating their friends and clients; who in return made them presents, wrote and sung their panegyrics, and offered vows and good wishes for the frequent happy returns of the same day. The birth-days of emperors were also celebrated with public sports, feasts, vows, and medals struck on the occasion. But the ancients, it is to be observed, had other sorts of birth-days besides the day on which they were born. The day of their adoption was also reputed as a birth-day, and celebrated accordingly. The emperor Adrian, we are told, observed three birth-days, viz. the day of his nativity, of his adoption, and of his inauguration. In those times it was held, that men were not born only on those days when they first came into the world, but on those also when they arrived at the chief honors and commands in the commonwealth, e.g. the consulate. Hence the expression of Cicero, in his oration ad Quirites, after his return from exile: 'A parentibus, id quod necesse erat, parvus sum procreatus; a vobis natus sum consularis.'

BIS AL NIL is frequently mentioned among the Arabian writers; and as al nil signifies only of the river Nile, the whole name should seem to express the character of some poisonous plant growing in the Nile.

BISA, or BIZA, a coin of Pegu, current there for half a ducat. It is also a weight used in that kingdom, equal in Venetian weight to 2 lb. 5 oz.

BISACUTA, in middle-age writers, an axe with two edges, or which cuts either way; or a missive weapon pointed at both ends. Walsingham represents the securis bisacuta as peculiar to the Scottish nation. See BATTLE-AXE.

BISALTA, a town in Egypt, anciently called Acanthos.

BISALTIDE, in entomology, a species of papilio, inhabiting Surinam. The wings are fulvous, black at the tips; with two ocellar dots on the anterior pair, and three on the posterior ones.

BIS-ANNUAL, a name given by botanists to those plants which ordinarily do not flower till the second year.

BISARCA, in botany, a name used by some authors for the herb tarragon.

BISBEA; from *βισβη*, a vine; a feast celebrated by the Messapii after the pruning of their vines, to obtain of the gods that they might grow again the better.

BISCARA, or PESCARA, a town of Africa, in Bidadulgerid, belonging to Algiers. It once belonged to the province of Zeb in Numidia, and still retains some remains of the ancient city. It is surrounded by a mud wall; and defended by a few cannon. In the hot season the town is often almost depopulated by the abundance of scorpions, to whom the inhabitants are obliged to leave it for a time. It has a small trade in slaves and dates. It stands in lat. 34° 40' N., and long. 5° 15' E. The natives are found in different employments at Algiers.

BISCAY, a province of Spain, bounded on the north by the sea called the Bay of Biscay, on the south by Old Castile, on the west by the Asturias, and on the east by France and Navarre. It con-

prises the three provinces of Alava, Guipuzcoa, and Biscay Proper, and is in general mountainous and barren; but in some places it produces corn, and everywhere a great quantity of apples, oranges, and citrons. The people make cider of the apples, which is their common drink. They have also wine called chacolino, which is pleasant, but will not keep long. Their valleys produce a little flax, and their hills a great deal of ship-timber. The sea affords them excellent fish of all sorts. Copper and marble are also found here; and a spring near the village of Aguana produces salt, great quantities of which are extracted by evaporation. This province likewise contains several mineral springs, hot and cold. One has been mentioned, which is thought to have a communication with the sea, though situated thirty-seven leagues from the shore. The water not only rises and falls with the tide, but, when the sea is much agitated, it often overflows. The wool that is exported here comes from Old Castile; but their greatest riches are derived from their mines of iron; which is extremely good, and transported to all parts. They are famous for the manufacture of swords and knives. Biscay is the country of the ancient Cantabri, so imperfectly subdued by Augustus, and slightly annexed to the Roman empire. Their mountains have in all ages afforded them opportunities of withdrawing themselves from every yoke that has been attempted to be imposed upon them, and fostered an hereditary bravery. The king of Spain, it is said, who is simply called Lord of Biscay, has no right to impose taxes here; but a demand is made in his name, and the supply granted in the shape of a donative, or free gift, the manner of raising it remaining with the states of the province. No custom-house was allowed within the province until lately; nor is any bishop to be found here. Biscay furnishes a specific contingent of men to the army and navy, which exempts it from the militia laws and impress. A great portion of the inhabitants assume the title of noblesse, or gentry. The population is small in proportion to the extent of its territory; for the whole does not contain more than 310,000 inhabitants. In this are included 4000 priests, 2043 monks and nuns; and 117,000 persons who claim the rank of noblesse. In the 720 parishes of which this province consists, there are 4 cities, 176 towns, and 446 villages. The chief towns are Bilbao, Orduna, Durango, Fontarabia, St. Sebastian, Tolosa, and Victoria.

The inhabitants of Biscay are a people quite distinct from the other Spaniards. Their language is accounted aboriginal, and unmixed with either Italian, French, or Spanish; it seems to be a dialect of the Celtic, and is described as very soft, harmonious, and energetic. The Biscayners are stout, brave, and choleric to a proverb. The best sailors in Spain belong to the ports of Biscay, and its mountains produce a very valuable race of soldiers. Even when out of their own province, it is said, they are amenable only to the grand Judge of Biscay, who holds his court at Valladolid; and this is a privilege of which they are very jealous. Guipuzcoa enjoys nearly the same privileges as Biscay Proper, except, that as the frontier of the kingdom, it

receives garrisons, and is defended by fortified towns. The women are beautiful, tall, light, and merry; their garb is neat and pastoral; their hair falls in long plaits down their backs; and a veil or handkerchief, twisted round in a coquetish manner, serves them for a very becoming head-dress. On Sundays they generally wear white, tied with rose-colored knots.

'The lordship of Biscay,' says a modern traveller, 'still presents, in many respects, a striking picture of the simplicity of ancient manners. The country is covered with detached houses, without any decoration, but commodious; each placed in the middle of the proprietor's manor, and near a river. Their proximity and connexion make them look like villages. Most of these houses, and their dependencies, are inhabited by persons whose families have possessed them from time immemorial. Their proprietors are called Eche-jaunes, or lords of houses. Districts composed of a certain number of these houses are called republics; the parish church usually standing in the centre. Antique villas appear at certain distances among these modest habitations; they are all of simple architecture, and most of them flanked with square towers. These have likewise been transmitted from father to son for many ages. It would be a disgrace to sell them. Their possessors, under the title of *Parientes-magores*, are, as it were, the elders of the district. They were formerly regarded as chiefs and judges, and still preserve a marked distinction and preponderance.' Although many of the nobility are in reduced circumstances, and often cultivate their domains with their own hands, they retain a real respectability in the eyes of their neighbours; and there is an old proverb among them, *la pobreza no es vileza*, 'poverty is no blemish.' See *Townsend's Journey*, and *Laborde's View of Spain*.

BISCAY, BAY or, that part of the Atlantic Ocean which opens between the Island of Ushant, near the western promontory of France, and Cape Ortegal, the north-west point of Spain. It washes all the western coast of France, with the northern shores of the peninsula, and advances, between St. Sebastian and Bayonne, nearly to the western extremity of the Pyrenees. The entrance into this bay is known to mariners from a remarkable swell of the sea.

Also a large bay on the south coast of Newfoundland, between Cape Race, and Cape Pine, about the beginning of the fifty-fourth degree of west longitude.

BISCAY, NEW, one of the provinces into which the kingdom of Mexico, or New Spain, was formerly divided, and which now forms part of the intendency of Durango. It is bounded on the north by New Mexico, on the east by New Leon, on the south by Zacatecas, and on the west by Culiacan.

BISCHITZ, a market town of Bohemia, on the Elbe, in the circle of Buntzlau.

BISCHOFBURG, a town of East Prussia, in the circle of Heilsberg, with 1600 inhabitants. Here is a Catholic church, and most of the inhabitants are of that communion. Considerable quantities of yarn and linen are manufactured and exported. Fifty-four miles south of Königsberg.

BISCHOP (Abraham), son of Cornelius, was instructed by his father to design historical subjects and portraits; but preferred the painting of fowls, particularly those of the domestic kind, to any other subjects. He designed every object after nature, and usually painted in a large size, such as ornamental furniture for grand halls.

BISCHOP (Corn.), portrait and history painter, was born at Antwerp in 1630, and was the disciple of Ferdinand Bol. His pencil, coloring, and manner resembled those of his master; and by judges, he is esteemed not inferior to him in historical subjects or portraits, having been always assiduous to study after nature. However, an impartial judge would perhaps think his compositions heavy, and without expression. He died in 1674.

BISCHOP, or **BISCOP** (John De), an excellent painter and engraver, born at the Hague in 1646. He is spoken of with great commendation, and his drawings are held in the highest estimation by the curious. But he is best known as an engraver; and his works are numerous. They are chiefly etchings, harmonised by the graver; and though slight, yet free, spirited, and pleasing. He gives a richness to the color and a roundness to the figures, far beyond what is usually done with the point, so little assisted by the graver. It is said that he owed his excellency to his genius alone, having never studied under a master. He worked chiefly at Amsterdam, where he died in 1786, aged forty.

BISCHROMA, in music, the same as our triple quaver. See **CHROMA**.

BISCHWEILER, a flourishing town of France, in Alsace, department of the Lower Rhine. It contains 3400 inhabitants, for the most part Calvinists, who manufacture cloth, madder, tobacco, and leather, and carry on a small trade on the Motter, the river on which it is situated. Four miles south-east of Hagenu, ten north of Strasburg.

BISCIA, in ichthyology, a name by which some have called the acus, or tobacco-pipe fish.

BISCOT, in law, a fine of two-pence on every perch of land, for not repairing banks.

BISCUIT, *n. s.* From Lat. *bis*, twice, and Fr. *cuit*, baked. A kind of hard dry bread, made to be carried to sea: it is baked for long voyages four times. Of more general application to compositions, whether sweet or otherwise, prepared by the pastrycook and confectioner.

The *biscuit* also in the ships, especially in the Spanish galleys, was grown hoary, and unwholesome.

Knolles's Hist.

Many have been cured of dropsies by abstinence from drinks, eating dry *biscuit*, which creates no thirst, and strong frictions four or five times a-day.

Arbutnot on Diet.

BISCUIT, SEA, is a sort of bread much dried, to make it keep for the service of the sea. It was formerly baked twice, or oftener, and prepared six months before the embarkation. It will keep good a whole year. The process of biscuit-baking for the British navy is as follows, and it is equally simple and ingenious: The meal, and every other article, being supplied with much certainty and simplicity, large lumps of

dough, consisting merely of flour and water, are mixed up together; and, as the quantity is so immense as to preclude by any common process a possibility of kneading it, a man manages, or, as it is termed, rides a machine, which is called a horse. This machine is a long roller, apparently about four or five inches in diameter, and about seven or eight feet in length. It has a play to a certain extension, by means of a staple in the wall, to which is inserted a kind of eye, making its action like the machine by which they cut chaff. The lump of dough being placed exactly in the centre of a raised platform, the man sits upon the end of the machine, and literally rides up and down throughout its whole circular direction, till the dough is equally indented; and this is repeated till it is sufficiently kneaded, at which times, by the different positions of the lines, large or small circles are described, according as they are near to, or distant from the wall.

The dough is now handed over to a second workman, who slices it with a prodigious knife; and it is then in a proper state for the use of those bakers who attend the oven. These are five in number; and their different departments are as well calculated for expedition and correctness as the making of pins, or other mechanical employments. On each side of a large table, where the dough is laid, stands a workman; at a small table near the oven stands another; a fourth stands by the side of the oven to receive the bread; and a fifth to supply the peel. By this arrangement the oven is as regularly filled, and the whole exercise performed in as exact time, as a military evolution. The man on the further side of the large table moulds the dough, having previously formed it into small pieces, till it has the appearance of muffins, although rather thinner, and which he does two together, with each hand; and as fast as he accomplishes this task, he delivers his work over to the man on the other side of the table, who stamps them with a docker on both sides with a mark. As he rids himself of this work, he throws the biscuits on the smaller table next the oven, where stands the third workman, whose business is merely to separate the pieces into two, and place them immediately under the hand of him who supplies the oven, whose work of throwing, or rather chucking the bread upon the peel, must be so exact, that if he looked round for a single moment, it is impossible he should perform it correctly. The fifth receives the biscuit on the peel, and arranges it in the oven; in which duty he is so very expert, that though the different pieces are thrown at the rate of seventy in a minute, the peel is always disengaged in time to receive them separately.—As the oven stands open during the whole time of filling it, the biscuits first thrown in would be first baked, were there not some counteraction to such an inconvenience. The remedy lies in the ingenuity of the man who forms the pieces of dough, and who, by imperceptible degrees, proportionably diminishes their size, till the loss of that time, which is taken up during the filling of the oven, has no more effect to the disadvantage of one of the biscuits than to another. So much critical exactness and neat activity occur in the exercise of this labor, that it is difficult to

decide whether the palm of excellence is due to the moulder, the marker, the splitter, the chucker, or the depositor; all of them, like the wheels of a machine, seeming to be actuated by the same principle. The business is to deposit in the oven seventy biscuits in a minute; and this is accomplished with the regularity of a clock; the clack of the peel, during its motion in the oven, operating like the pendulum. The biscuits thus baked are kept in repositories, which receive warmth from being placed in drying lofts over the ovens, till they are sufficiently dry to be packed into bags, without danger of getting mouldy; and when in such a state, they are then packed into bags of a hundred weight each, and removed into storehouses for immediate use.

The number of bakehouses belonging to the victualling-office at Plymouth are two, each of which contains four ovens, which are heated twenty times a day, and in the course of that time bake a sufficient quantity of bread for 16,000 men. The granaries are large, and well constructed; when the wheat is ground, the flour is conveyed into the upper stories of the bakehouses, whence it descends through a trunk in each, immediately into the hands of the workmen.

The bakehouse belonging to the victualling-office at Deptford consists of two divisions, and has twelve ovens, each of which bakes twenty shoots daily (Sundays excepted); the quantity of flour used for each shoot is two bushels, or 112lbs, which baked produce 102lbs of biscuit. Ten pounds are regularly allowed on each shoot for shrinkage, &c. The allowance of biscuit in the navy is one pound for each man per day, so that one of the ovens at Deptford furnishes bread daily for 2,040 men.

But it must be confessed, that sea-biscuit of the best preparation often carries in it a principle of destruction. Sometimes it is in the bran, which occasions insects, and hollow spaces in the interior part of the biscuit, giving it a disposition to mould; and sometimes it is a want of cleanliness which prevails in the bread-room of the vessel. M. Cardon, a biscuit-baker of Hesse, in conjunction with others of the business, has recently made experiments, the result of which is: that 100lbs. of flour give 126 of dough; which, divided into cakes of eight or nine ounces, when well baked, afford 90lbs. of biscuit. Instead of making use of old leaven, and of ten or twelve pounds weight to each quintal of flour, he recommends to use the leaven while fresh, in a quantity of fifty pounds, and to make the dough less firm, that it may be kneaded with more ease. He has shown biscuit made after this manner, to several masters of ships, who have found it excellent, and that it stands the test of floating on the surface of water, without falling to pieces.

BISCUTELLA, **BUCKLER-MUSTARD**, or **Bastard Mithridate mustard**: A genus of the tetradynamia order, and siliculosæ class of plants. The silicule is flat, compressed, rounded, above and below two-lobed, and the leaves of the calyx are gibbous at the base. There are ten species, chiefly natives of the Levant, and adjoining shores, except *B. Peruviana*, which, as its name imports, grows wild in Peru.

BISECT, *v.* *Bis*, *binus*, two, and *seco*, *sec-*
BISECTION. } *tum*, to cut. To divide into two
parts.

The rational horizon *bisecteth* the globe into two
equal parts. *Brown's Vulgar Errors.*

BISEGMENT, *n. s.* in geometry, a part di-
vided into two equal parts.

BISELLIARI, or **BISELLIARIUM**, in antiquity,
those who enjoyed the honor or privilege of
the Bisellium. The word occurs in an old in-
scription, *cn. plaetorio vivo augustali bisellia-*
rio. Gruter, Inscr. p. 1099. Scaliger in his
index to Gruter, mistook the biselliarii for
artificers who made these seats.

BISELLIUM, from *bis*, and *sella*, a chair,
in antiquity, a kind of seat or chair, larger and
richer than ordinary, big enough to hold two
persons, wherein to sit in courts, theatres, and
other public assemblies.

BISERRULA, a genus of the decandria order,
and diadelphia class of plants: natural order
thirty-second, papilionaceæ: the legumen is locu-
lar and flat; and the partition contrary; serrate
on the edges. Of this genus there is only one spe-
cies known; viz. *B. pelecinus*, an annual plant
with purple flowers, growing in Italy, Sicily,
Spain, and the south of France.

BISERTA, a lake of Africa, in Tunis. The
mullets in this lake are the best in Barbary.

BISERTA, a large gulf of Africa, and the *Sinus*
Hipponensis of the ancients. It is formed by
the Capes Blanco and Ziebeb; and has a beau-
tiful sandy inlet near four leagues wide, which
once admitted the largest vessels, but through
the negligence of the Turks can now admit only
those of the smallest size, and is in danger in a
short time of being totally choked up. Some
remains of the pier of Hippo are extant; by which
it appears to have run out into the sea so as to
break the north-east wind, and make this one of
the safest and most beautiful havens in these
parts.

BISERTA, a town of Africa, in the kingdom of
Tunis, seated on the gulf. It was formerly very
considerable, and is said to have contained 6000
houses. Biserta has about eight villages under
its government; a large plain called *Matter* or
Mater; and the territory of *Choros*, the *Clypea*
or *Corobis* of the ancients. This is a tract of great
extent, and would be very fertile were it not for
the frequent incursions of the Arabs.

BISET (Charles Emanuel), a painter of con-
siderable eminence, born at Mechlin in 1633,
was remarkable for introducing a multitude of
figures into his designs, with an extraordinary
variety of drapery. His general subjects were
conversations, balls, concerts, and assemblies of
genteel persons. His pictures had a strong effect
at a distance, and even when nearly inspected,
showed a neatness of pencil, a spirited touch,
and a good expression.

BISET, *n. s.* a stock dove, or young pigeon.

BISETÆ, from *bis*, and *seta*, bristle, in natu-
ral history, a genus of flies of the class of *se-*
ticaudæ, distinguished by their having two hairs
growing out of their tails. There are many spe-
cies, and they are usually divided by authors into
two principal kinds; such as have sharp ends,

and such as have blunt ones. There are several
species of the former found in our hedges.

BISHARYE, a tribe of Bedowin Arabs, in-
habiting part of the mountains on the west of the
Red Sea, between Abyssinia and Egypt. Mr.
Burckhardt passed through these regions in his
route from the country of the Berbers, to the
western shores of the Arabian Gulf. Here he
found two tribes of Arabs, the Ababde and the
Bisharye; the latter of whom he thus describes:
‘The Bisharye, who rarely descend from their
mountains, are a very savage people, and their
character is worse even than that of the Ababde.
The only cattle are camels and sheep; and they
live entirely on flesh and milk, eating much of
the former raw: according to the relations of se-
veral Nubians, they are very fond of the hot blood
of slaughtered sheep; but their greatest luxury
is said to be the raw marrow of camels. A few
of these Arabs occasionally visit Dere or Assouan
with senna, sheep, or ostrich feathers; the ostrich
being common on their mountains, and their
senna is of the best kind. In exchange for these
commodities, they take linen shirts, and dhourra,
the grains of which they swallow raw, as a dainty,
and never make it into bread. These traders
do not long remain on the banks of the Nile, as
the dread of the small pox drives them back to
their tents. The Bisharye are much addicted to
theft, and will even rob the house of the person
who receives them as guests. Their youth make
plundering excursions as far as Dongola, and
along the route to Sennaar, mounted upon cam-
els, of a breed superior to any other that exists
between the shores of the Mediterranean and
Abyssinia. Few of the Bisharye speak Arabic.
They fear none but the Ababde, who know their
pasturing places in the mountains, and often sur-
prise their encampments.’ The females, he
states, are as handsome as those of Abyssinia;
but very licentious.

BISHBESH, a town of Lower Egypt, on that
branch of the Nile reaching from the canal of
Trajan to the ancient Pelusiac, which joined lake
Menzaleh. It appears to be the ancient Bubaste,
a city celebrated for religious rites and Baccha-
nalian orgies. The remains here are stupendous;
enormous masses of granite, almost all mutilated,
lie in great heaps, many of them made into mill-
stones, some of which, completely cut, have been
left on the spot, probably from their enormous
size. Forty miles north-east of Cairo. Lon.
31° 52' E., lat. 30° 33' N.

BISHOP, *v. & n.*

BI-Ū'OPING.

BI-Ū'OPHOOP,

BI-Ū'OPLIKE,

BI-Ū'OPLY,

BI-Ū'OPRICK.

Επίσκοπος, from *ἐπι* and
σκοπεω, to look into. Lat.
episcopus, an overseer.
From the Latin the Saxons
formed *biſcop*, which was
afterwards softened into
bishop, a high order of clergy in the church of
Rome and church of England. Ayliffe has well
defined a bishop, to be an overseer or superin-
tendent of religious matters in the Christian
church.

And to a *bishop*, and his constable, eke,
He took his wit to kepe; when he is gon
To Scotland ward, his fomen for to soke.

Chaucer. Canterbury Tales.

Scarce can a *bishoprick* forpass them by,
But that it must be gelt in privitie. *Spenser.*
You shall find him well accompanied
With reverend fathers, and well learned *bishops.*
Shakspeare.

They are prophane, imperfect, oh! too bad,
Except confirmed and *bishoped* by thee. *Donne.*
It will be fit, that, by the king's supreme power in
causes ecclesiastical, they be subordinate under some
bishop, and *bishoprick* of this realm.

Bacon's Advice to Villiers.
Their zealous superstition thinks, or pretends, they
cannot do God a greater service, than to destroy the
primitive, apostolical, and anciently universal govern-
ment of the church by *bishops.* *King Charles.*

When *bishops* shall lay all religion by,
And strive by law to establish tyranny. *Marvell.*
In case a *bishop* should commit treason and felony,
and forfeit his estates, with his life, the lands of his
bishoprick remain still in the church. *South.*

A virtuous woman should reject marriage, as a good
man does a *bishoprick*; but I would advise neither to
persist in refusing. *Addison. Spectator.*

Bloody contests in the streets, and in the churches
too, showed what an object of ambition the *bishoprick*
of Rome was, even before the destruction of the western
empire. *Bolingbroke.*

To BISHOP, is to confirm.

BISHOP, *n. s.* A cant word for a mixture of
port wine, oranges, sugar and cloves.
Come buy my fine oranges, sauce for your veal,
And charming when squeezed in a pot of brown ale;
Well roasted with sugar and wine in a cup,
They'll make a fine *bishop* when gentlefolks sup. *Swift.*

BISHOPS.—In the dead languages, the word
now commonly translated bishop, was originally
used with a political meaning, as when Plutarch
says, Πάντα ὡς ἐπε καὶ παντὸν ἐπίσκοπος ἢ ἄνθρω-
πος φεῖσθαι, omnia ipsi administrabat et curabat Phi-
dias; or Cicero is called episcopus oræ et Cam-
paniæ.

On the introduction of Christianity, it came to
be used in an ecclesiastical sense; and may be
considered either in relation to one church or
assembly of Christians, or to a number of churches
united under one superintendent. The former
is the mode in which the Presbyterians and Eng-
lish dissenters generally consider the term to be
used in the New Testament: the latter, that in
which the Roman Catholics and the Established
Church regard it.

'From the time of Ignatius, A. D. 100,' say
the Episcopalians, 'the word bishop has been
universally used to denote the highest of the
three orders of clergy in the Christian church,
which are the bishops, ἐπίσκοποι, the presbyters
or elders, πρεσβύτεροι, and Deacons, διακονοί.
It is our belief that in the times of the Apostles,
the three orders existed in subordination to each
other, and that whilst Episcopacy has, on the
ground of being an apostolic institution, an equal
claim to the presbytery to our respect, it pos-
sesses, as being the order to which presbyters have
been always subject, a right of pre-eminence over
the other orders of the clergy.'

Presbyterians, on the other hand, regard all
the teachers of religion as essentially equal in
authority. They argue that no vestige of pre-
eminence one over the other appears amongst the
apostles, the evangelists, or the seventy disci-

ples; that the terms ἐπίσκοπος and πρεσβύτερος,
are used as synonymous, and convertible in al-
most every passage of the New Testament where
they occur; or, in other words, that the same
persons who are called ἐπίσκοποι, are likewise
called πρεσβύτεροι, the former expression being the
name of office, and the latter the epithet of respect.
In proof of this assertion, they adduce a well-
known passage in the twentieth chapter of the
Acts of the Apostles, where we are informed, that
Paul, having summoned the elders of the church
at Ephesus, τὰς πρεσβυτέρους τῆς ἐκκλησίας, the
presbyters of the church, addressed them, that
is the elders or presbyters, in the following
words: 'Take heed, therefore, to yourselves, and
to all the flock over which the Holy Ghost hath
made you (the presbyters) ἐπίσκοπους, bishops or
overseers.' Here, says Dr. Campbell, 'there can
be no question, that the same persons are denomi-
nated presbyters and bishops.' 'Nor does this pas-
sage,' the presbyterians add, 'by any means stand
alone. There is a similar one in the epistle to
Titus, chapter i. ver. 5. compared with verses
6 and 7, and 1 Pet. v. 2.' 'The bishops or pres-
byters of the apostolical age,' they further con-
tend, 'were usually the pastors each of a single
congregation.' They say, usually the pastors, each
of a single congregation, because, as they affirm,
there are instances where two or more pastors
have been allotted to one Christian assembly;
though the converse of this proposition is not
true, that there are instances in the age referred
to, of two or more congregations subjected to the
authority of one bishop. In establishing the pro-
position enunciated above, it is asserted, that,
when Titus, acting in the capacity of an extraor-
dinary minister, was left at Crete, it was, for the
following purposes, among others, 'that he
should ordain presbyters or bishops in every city,'
Tit. i. 5. Now, from this statement, they say, it
is evident, at first sight, that these presbyters or
bishops could not be diocesans. Had it been
the intention of Paul to establish, by the agency
of Titus, a diocesan authority in Crete, we should
have found one individual put in possession of
that authority, with a college of priests for his
assistants. But this was not the case: Titus
was left to ordain presbyters or bishops in every
city, that is, to furnish the Christians of each city
with an ordinary pastor.

Some ancient catalogues contain an account of
eleven pastors in this island at the period im-
mediately following this; a fact, it is said, obviously
inconsistent with the episcopalian hypothesis.
They further quote the instructions of Acts xiv.
23, as of a similar kind, and Dodwell's admission.
'Est sane admodum peccaria omnis illa argu-
mentatio, qua colligitur disciplinæ ecclesiasticæ
in posterum recipiendæ rationem omnem' &
Scripturis Novi Fœderis esse hauriendam. Nul-
lus enim est qui id profitiatur aperte sacri Scrip-
toris locus.' Parænesis, N. 14. 'Can that, there-
fore,' the presbyterians ask, 'be an institution of
Christ, for which there is no authority in the sa-
cred writings, and which, according to the author
just quoted, was not in existence before the con-
clusion of the apostolical period.'

The identity of these orders is contended for
by Suicer. (Thesaurus Eccles. vol. i. p. 80.) in

voce, *ἐπισκοπος*): 'Bishops and presbyters were not different orders in the apostolic church,' he says 'but constituted one and the same degree or order, and therefore were by divine right equal in dignity and authority.' He adduces the testimonies of Theodoret upon Philipp. cap. i. where the apostle mentions the bishops and deacons. Theodoret, observes: 'Επισκόπους τοὺς πρεσβυτέρους καλεῖ ἀμφότερα γὰρ εἶχον κατ' ἐκείνον τὸν καιρὸν τὰ ὀνόματα.' 'He calls the presbyters bishops, for they had at that time both the names.' Afterwards this quotation from Eucumenius, a writer of the ninth century:— 'Οὐκ ἐπειδὴ ἐν μιᾷ πόλει πολλοὶ ἦσαν ἐπίσκοποι ἀλλ' ἐπισκόπους τοὺς πρεσβυτέρους καλεῖ τότε γὰρ ἔτι ἐκονώνοντι τοῖς ὀνόμασι, καὶ οἱ ἐπίσκοποι ἐπάκουοι καὶ πρεσβύτεροι ἐκαλοῦντο, καὶ τὸ ἑμπαινοῦν οἱ πρεσβύτεροι ἐπίσκοποι.' 'It is not because there were many bishops in one city, that he addresses the bishops and deacons, but he calls the presbyters, bishops; for at that time they still had the same names in common, and the bishops were called deacons and presbyters, and, vice versa, the presbyters, bishops: and again, Theodoret, in 1 Tim. iii. 'Τοὺς αὐτοὺς ἐκάλουν ποτε πρεσβυτέρους καὶ ἐπίσκοπους.' 'They once called the same persons presbyters and bishops.'

In reply to those statements some Episcopalians (as Bishop Taylor in his *Episcopacy Asserted*) contend that, of necessity there must be found in scripture a form of church government; that James the brother of our Lord is called an apostle (Gal. i. 29.) and yet he was not of the number of the twelve, but was bishop of Jerusalem and had precedence there, summing up the decision of the counsel, Acts xv. 19., *Διό γιγνώσκω* wherefore I judge. See also Acts xii. 17.; the majority however of the respectable advocates of Episcopacy now observe, that while we may collect from the application of the word *ἐπίσκοπος* in Acts i. 20, to express the office held by the Apostles, taken in conjunction with the circumstance of St. Peter i. ii. 25. terming our Lord himself the shepherd and Bishop, *ἐπίσκοπος*, of our souls, that the office of a bishop was one of high rank and great responsibility, we must not look to the revealed word of God for proof of the establishment of a church government, but must examine carefully the history of the Church in the first three centuries; and enquire what was the actual state of the Christian world during that period. At the head of the fathers, whom they quote upon this subject, stands Ignatius. According to Chrysostom he was the frequent and familiar associate of the apostles, and received episcopal ordination from them by the imposition of hands. In an epistle to the Magnesians ascribed to this eminent person, he distinctly refers to three orders of functionaries existing in the same church: mentioning Damas as bishop of Magnesia, Bassus and Apollonius as presbyters, and Tatian as deacon. In his Epistle to the Philadelphians, a similar enumeration is given: 'Attend,' says he, 'to the bishop, to the presbytery, and to the deacons.' A passage from his epistle to the Trallians is yet more emphatic and conclusive: 'Be ye subject,' he says, 'to the bishop as to Jesus Christ, to the presbyters as the apostles of Jesus Christ, and to the deacons

as ministers of the mysteries of Jesus Christ; and he adds, with an anxiety and earnestness not to be expected in so early a writer upon such a subject, these remarkable words, 'without these there is no elect church, or congregation of holy men.' To the same purpose the authority of Clement, bishop of Alexandria, who also lived in the second century, is adduced: He, too, speaks of the three orders of functionaries existing in the church and mentions several persons who had arrived at the episcopal dignity, through the intermediate gradations of presbyter and deacon. To the testimonies of Ignatius and Clement, the Episcopalians also add those of Tertullian, Cyprian, Origen and Jerome. In Eusebius it is added there exists catalogues of Bishops up to the times of the Apostles at Jerusalem, Antioch, Alexandria, Rome, Jerusalem, Laodicea, and Cæsarea; and that not one instance can be produced during that period, nor any instance at all until the time of the Reformation, of any Christian church, professing the pure faith, which was not governed by Bishops.—Such is an impartial statement of the arguments on both sides of this disputed question.

The Church of Rome is episcopal, and the church of England so far acknowledges the validity of the ordination of that church that a Romish priest is only required to abjure its peculiar errors, and he can officiate without reordination. The late Dean Kirwan of Ireland, we believe, was thus ordained in the Romish church.

The Greek Church is also episcopal, having metropolitans, archbishops and bishops, who are always chosen in Russia from among the archimandrites, or heads of the monasteries: the synod presenting two or three candidates to his imperial Majesty, who decides on one.

At the Reformation episcopacy was lost or discontinued in several countries, not so much from objections to that form of government as from the manner in which the existing prelacy had abused it. Thus the Lutherans in the conclusion of the Augustan confession express themselves as having no view to depriving the Bishops of their government, but only to ask them to let the gospel be purely preached. Let them give us an hierarchy said Calvin, in which the bishops may be so above the rest, as they refuse not to be under Christ, and depend upon him as their only head! In England and Sweden episcopacy was preserved: in Scotland it withered from the first; and the discipline finally established became a mixture of the Lutheran superintendency and the Calvinistic presbytery.

The Bishops of the Church of England are twenty-seven in number, including the two Archbishops. The province of Canterbury includes twenty two dioceses; viz. Canterbury, London, Winchester, Bangor, Bath and Wells, Bristol, Chichester, Ely, Exeter, Gloucester, Hereford, Litchfield and Coventry, Lincoln, Llandaff, Norwich, Oxford, Peterborough, Rochester, Salisbury, St. Asaph, St. David's, Worcester. The province of York includes five, viz. York, Durham, Chester, Carlisle, Sodor and Man. The spiritual functions which are the peculiar distinctions of the order, are those of ordination and confirmation. They also have a power of gover-

ning the clergy of their respective dioceses, and of admonishing, and suspending ecclesiastical persons from the performance of the services of the church. They institute to benefices upon the presentation of the patrons, but, if the presentation belong to the Bishop, the act of institution is then termed collation. They license persons to serve as curates, either to assist the resident ministers of parishes, or to supply their absence. They have power to call the clergy to reside on their benefices under severe penalties for non-compliance; and to licence them to be absent from their cures, under special circumstances either of privilege or of personal necessity. By the common law, the bishop is to certify the judges, touching legitimate and illegitimate births and marriages; and by that and the ecclesiastical law, he is to take care of the probates of wills and granting administrations. A bishop's power is confined to his own diocese. He is assisted in his duty by his archdeacons, who are termed by the Canon law the 'Bishops' Eyes.' The bishop, by his archdeacons, visits his diocese every year, and generally in person every three years, at which time confirmations are held; during the Bishop's personal visitations the power of his archdeacon is suspended.

By virtue of their bishoprics the prelates of England are lords of parliament, and form part of one of the three estates of parliament, under the name of the lords spiritual. They sit in the upper house, as holding, or being supposed to hold, baronies of the king; for William the Conqueror changed the spiritual tenure of frank almain or free alms, under which the bishops held their lands during the Saxon government, into the feudal or Norman tenure by barony, which subjected their estates to all civil charges and assessment from which they were before exempt; and in right of succession to those baronies, which were unalienable from their respective dignities, the bishops and abbots were allowed their seats in the House of Lords. Bishops take rank next to viscounts. A difference however exists in the privileges of the bishops, as respects their being tried by their peers upon indictment for treason, or felony, or misprision of either; and sitting upon such trials in the court of the lord high steward: from this privilege they are excluded on the ground of not being noble in blood. Custom has also practically excluded them from sitting on trials for capital offences, upon impeachments, or indictments in full parliament. They have usually withdrawn voluntarily in such cases, but have entered a protest expressing their right to stay.

The archbishop of Canterbury is styled Metropolitanus et Primus totius Angliæ. The archbishop of York, Primus et Metropolitanus Angliæ. They are called Metropolitan, because they were at first consecrated in the metropolis of their province. The archbishop of Canterbury hath precedence before all the nobility of the realm, immediately after the blood royal, he hath the privilege of crowning the king of England, and hath prelates for his officers. The bishop of London is his provincial dean, the bishop of Winchester his chancellor, the bishop of Lincoln his vice-chancellor, the bishop of Salisbury his

precentor, the bishop of Worcester his chaplain. He hath the power of dispensation in any case not contrary to the law of God, and on this right is founded his power of granting special licenses to marry at any time or place, to hold two livings and the like, and also his power of conferring any degrees in prejudice of the universities. The archbishop of York is next in precedence; he hath precedence before all dukes not of the blood royal, and before all the great officers of state except the lord chancellor. He hath the privilege to crown the queen consort, and to be her perpetual chaplain. The bishop of Durham is next, the bishop of Winchester next, the remainder according to their seniority of consecration. But if any be a privy councillor he ranks after the bishop of Durham.

A suffragan is a titular bishop advanced to assist the bishop of any diocese in his spiritual function, or one who supplies the place of the bishop, so that by his suffrage, matters committed to him are determined. They are regulated by an act of Henry VIII (26 Hen. VIII. c. 14). By this act, every bishop at his pleasure may present two honest and discreet spiritual persons within his diocese to the king, that he may give one of them the title, style, and dignity of any of the following sees: Thetford, Ipswich, Colchester, Dover, Guildford, Southampton, Taunton, Shaftsbury, Molton, Marlborough, Bradford, Leicester, Gloucester, Shrewsbury, Bristol, Penrith, Bridgewater, Nottingham, Grantham, Hull, Huntingdon, Cambridge, Penrith, Berwick, St. Germain, and the Isle of Wight.

In Ireland there are four archbishops: Armagh, primate of all Ireland; Dublin, primate of Ireland; Cashel, primate of Munster; Tuam, primate of Connaught. And eighteen bishops: Meath, Kildare, Derry, Raphoe, Limerick, Ardferit and Aghadoo, Dromore, Elphin, Down and Connor, Waterford and Lismore, Leighlin and Ferns, Cloyne, Cork and Ross, Killaloe and Killeenora, Kilmore, Clogher, Ossory, Killala and Acheryilly, Clonfert and Kilmacduagh. By an act 18 Car. I. c. 10, a bishopric in Ireland is declared incompatible with any ecclesiastical dignity or benefice in England or Wales. The church of England has also bishops of Quebec, Nova Scotia, and Calcutta; and latterly have been consecrated a bishop of Barbadoes, and of Jamaica.

The right of electing bishops is vested, if not by law, at least by the practice of the church, in the king. Immediately after the demise of any prelate, notice of that circumstance is given to the crown by the dean and chapter of his cathedral; who, at the same time, request permission to supply, by their choice, the vacancy which has taken place. His majesty then issues what is called a *congè d'elire*, accompanied by a missive, or recommendation of some individual to the benefice. This recommendation has the full effect of a command; for the dean and chapter have not the privilege of rejection. Should they decline electing, and persist in declining for the space of twelve days, they incur the severe penalties of a *pæmuniere*, under which term are implied, outlawry, or exclusion from the king's protection: a forfeiture to the crown

of lands and tenements, goods and chattels; and imprisonment during his majesty's pleasure. After the interval of twelve days just alluded to, the king presents, by his letters patent, to the vacant see. The election, or presentation, is next intimated to the archbishop of the province, who is required to proceed without delay in confirming the bishop elect. Should he decline, he likewise incurs a *præmunire*. The mandate, requiring confirmation, bears the authority of the great seal. As soon as it is received by the archbishop, it is transmitted to an officer called his vicar-general. The ceremony of confirmation then takes place. Those who have any objections to the new bishop, are solemnly invited to appear and substantiate them, and are denounced as contumacious, if they refuse to do so. The oaths of allegiance and supremacy, together with that of canonical obedience, and that against simony are next administered. A minute of the proceedings is then read by the vicar-general, after which the bishop is installed or constituted the ecclesiastical superior of his diocese, being fully invested with episcopal authority; though, according to some lawyers, he cannot lay claim to the temporalities of his benefice, unless he shall have been consecrated by the archbishop. The ceremony of consecration differs in some respects from that of confirmation. It must be performed, as we have just intimated, by the archbishop; or in particular cases by three bishops, lawfully commissioned for that purpose. The essential parts of this ceremony, according to Burnet, (art. xxxix. p. 564), are prayer and the imposition of hands; but to these are added investiture with the episcopal robes, together with the use of a certain form of words adapted to the occasion. The age at which persons are qualified to be made bishops in the English church is thirty.

BISHOPS, TITULAR, OR BISHOPS IN PARTIBUS INFIDELIUM, in ecclesiastical history, those with the title of a bishopric, whose diocese was in the possession of infidels or heretics. The denomination took its rise from the expulsion of the bishops and clergy out of the Holy Land by the Saracens; when flying into Italy for shelter, coadjutories were given for their subsistence.

BISHOPS, VAGUE, those without any diocese, sometimes attendant on camps, or in foreign countries, for the conversion of infidels. They were sometimes also granted by popes to monasteries, exempt from the jurisdiction of the diocesan, where they perform all the episcopal functions.

BISHOP-ABBOT, *episcopus abbas*, was an abbot invested with the episcopal order; of which we meet with several in the richer and more considerable monasteries.

BISHOP AND HIS CLERKS, in geography, some little islands and rocks on the coast of Pembroke-shire, near St. David's in Wales, which are very dangerous to mariners. Sheep are pastured on three; the others afford a retreat to sea fowl, which are caught for the sake of their down. A light-house was erected in 1777. Distant four miles west of St. David's. Long. $5^{\circ} 20' W.$, lat. $51^{\circ} 54' N.$

BISHOP'S COURT, an ecclesiastical court, held in the cathedral of each diocese, the judge whereof is the bishop's chancellor, who judges by the civil and canon law; and if the diocese be large, he has his commissaries in remote parts, who hold what they call consistory courts, for matters limited to them by their commission.

BISHOP'S CASTLE, a market town and parish of England, in the county of Salop, on the river Clun. The town-house is a neat edifice, and it is an ancient corporation, which has sent members to parliament ever since the reign of queen Elizabeth. Population 1367. Distant eight miles from Montgomery, sixteen S.S.W. of Shrewsbury, and 152 north-west of London.

BISHOPS STORTFORD, a market-town of Hertfordshire, on the borders of Essex, thirteen miles south-east from Ware, and thirty north from London; containing 3358 inhabitants. It has a canal made navigable to the river Lea, with an extensive range of warehouses for storing corn and malt, which articles constitute its principal business. Between Hockeril and Stortford, on an artificial hill, a castle was built in the time of William the Conqueror, called Castle Hill, the remains of which were entirely pulled down in 1649, and an inn built with the materials. King John granted the town a charter of incorporation, and in the reign of Edward I. it was summoned to send members to parliament, a privilege it does not now enjoy. The four principal streets face the cardinal points, and it is kept very clean by the river Stort, which runs through it. The church is a venerable gothic structure, containing many ancient monuments. The free-school is a handsome edifice, of a square form, in the centre of the High-street. Here are several well-endowed alms-houses for aged persons, and a good market on Thursday.

BISHOPS WEARMOUTH, a parish of the county of Durham, standing on the river Wear. It was once a place of considerable note, and its church, the mother church to Sunderland. On the north side of the river lies Monks Wearmouth, so called from an extensive monastery, which was twice destroyed by the Danes and Scots. In the neighbourhood are several manufactories, and the trade and intercourse have been lately much benefited by the erection of a cast-iron bridge over the river, planned under the direction of Rowland Burdon, Esq. M. P. for Durham. It is 100 feet high, and 236 long, having only one arch. Population 7000. Distant $12\frac{1}{2}$ miles from Durham, and 272 from London.

BISI (*Bonaventura*), a celebrated miniature painter, was born at Bologna, and a disciple of Lucio Massari. Instead of working from his own invention, he imitated in small size, the pictures of Guido, Corregio, Titian, and other great masters, and these he finished with astonishing grace, neatness, and beauty. He died in 1661.

BISIGNANO, a town of Naples, in the Hither Calabria. It has a strong fort, a bishop's see, and the title of a principality. It is seated on a mountain near the river Boccona.

BISILIQUEOUS, in botany, having the seed contained in two pods, proceeding from one flower.

BISK', *n. s.* Fr. *bisque*, soup; broth made by boiling several sorts of flesh.

A prince, who in a forest rides astray,
And, weary, to some cottage finds the way,
Talks of no pyramids, or fowls, or *bisks* of fish,
But hungry sups his cream served up in earthen dish.
King.

BISK, or **BISQUE**, in cookery, a rich sort of broth or soup, made of pigeons, chickens, force-meat, mutton gravy, and other ingredients. The word is French, formed from the Latin *biscocta*; because the *bisque*, consisting of a diversity of ingredients, needs several repeated coctions to bring it to perfection. There is also a *demibisque*, made at low expense, in which only half the ingredients are used; and a *bisque* of fish, made of carps, minced with their roes and lobsters.

BISLINGUA, double-tongued, a name used by many authors for the narrow-leaved *ruscus*, or butcher's broom, called by many others, the Alexandrian bay, or *laurus Alexandriæ*.

BISMAR, a Danish denomination for a small weight used in the Orkneys, for weighing small quantities of butter, from a merk to a bispund or twenty-four merks.

BISMILLAH, a solemn form used by the Mahomedans at the beginning of all their books and other writings, signifying, In the name of the most merciful God. It is also used among the Arabs as a word of invitation to eat.

BISMUTH, a genus of metals. Its generic characters are reddish-white, soft, brittle, specific gravity 9.822, easily melting, and soluble in acids. The species are, *B. nativum*, seu *wismutum nativum*; *B. ochraceum*, seu *wismutum pulverulentum*, flowers of bismuth, or bismuth ochre; *B. sulphuratum*, seu *wismutum sulphure*, sulphurated bismuth, or sulphuret of bismuth; *B. martiale*, seu *wismutum lamellis cuneatis*, martial sulphurised bismuth. Bismuth is somewhat harder than lead, and is scarcely, if at all malleable. The internal face, or place of fracture, exhibits large shining plates, disposed in a variety of positions; thin pieces are considerably sonorous. It melts at a temperature of 480° Fahrenheit, and its surface becomes covered with a greenish-gray or brown oxide. A stronger heat ignites it, and causes it to burn with a small blue flame; at the same time that a yellowish oxide, known by the name of flowers of bismuth, is driven up. This oxide appears to rise in consequence of the combustion; for it is very fixed, and runs into a greenish glass when exposed to heat alone. This oxide consists of 100 metal + 11.275 oxygen, whence its prime equivalent will be 9.87, and that of the metal itself 8.37. In a strong heat, and a closed vessel, it sublimes entire, and crystallises very distinctly when gradually cooled. The sulphuric acid has a slight action upon bismuth, when it is concentrated and boiling. Sulphureous acid gas is exhaled, and part of the bismuth is converted into a white oxide. A small portion combines with the sulphuric acid, and affords a deliquescent salt in the form of small needles. Nitric acid dissolves bismuth with the greatest rapidity and violence; at the same time that much heat is extricated, and a large quantity of nitric oxide

escapes. The solution, when saturated, affords crystals as it cools; the salt detonates weakly, and leaves a yellow oxide behind, which effloresces in the air. Upon dissolving this salt in water, it renders that fluid of a milky white, and lets fall an oxide of the same color. The nitric solution of bismuth exhibits the same property when diluted with water, most of the metal falling down in the form of a white oxide, called magistery of bismuth. This precipitation of the nitric solution, by the addition of water, is the criterion by which bismuth is distinguished from most other metals. The magistery or oxide is a very white and subtle powder; when prepared by the addition of a large quantity of water, it is used as a paint for the complexion, and is thought gradually to impair the skin. The liberal use of any paint for the skin seems indeed likely to do this; but there is reason to suspect, from the resemblance between the general properties of lead and bismuth, that the oxide of this metal may be attended with effects similar to those which the oxides of lead are known to produce. If a small portion of muriatic acid be mixed with the nitric, and the precipitated oxide be washed with but a small quantity of cold water, it will appear in minute scales of a pearly lustre, constituting the pearl powder of perfumers. These paints are liable to be turned black by sulphuretted hydrogen gas. The muriatic acid does not readily act upon bismuth. Alkalies precipitate its oxide: but not of so beautiful a white color as that afforded by the affusion of pure water. The gallic acid precipitates bismuth of a greenish-yellow, as feroprussiate of potash does of a yellowish color. There appear to be two sulphurets, the first a compound of 100 bismuth to 22.34 sulphur; the second of 100 to 46.5; the second is a bisulphuret.

This metal unites with most metallic substances, and renders them in general more fusible. When calcined with the imperfect metals, its glass dissolves them, and produces the same effect as lead in cupellation; in which process it is even said to be preferable to lead.

Bismuth is used in the composition of pewter, in the fabrication of printer's types, and in various other metallic mixtures. With an equal weight of lead, it forms a brilliant white alloy, much harder than lead, and more malleable than bismuth, though not ductile; and, if the proportion of lead be increased, it is rendered still more malleable. Eight parts of bismuth, five of lead, and three of tin, constitute the fusible metal, sometimes called Newton's, from its discoverer, which melts at the heat of boiling water, and may be fused over a candle in a piece of stiff paper, without burning the paper. One part of bismuth, with five of lead, and three of tin, forms plumber's solder. It forms the basis of a sympathetic ink. The oxide of bismuth precipitated by potash from nitric acid, has been recommended in spasmodic disorders of the stomach, and given in doses of four grains, four times a-day. A writer in the Jena Journal says he has known the dose carried gradually to one scruple without injury.

Bismuth is easily separable, in the dry way, from its ores, on account of its great fusibility.

It is usual, in the processes at large, to throw the bismuth ore into a fire of wood, beneath which a hole is made in the ground to receive the metal, and defend it from oxidation. The same process may be imitated in the small way, in the examination of the ores of this metal; nothing more being necessary than to expose it to a moderate heat in a crucible, with a quantity of reducing flux; taking care, at the same time, to perform the operation as speedily as possible, that the bismuth may be neither oxidised nor volatilised. See SALT.

Its affinities for the metals and acids are nearly in the following order:—

Bismuth.	Oxide of Bismuth.
Lead,	Oxalic acid,
Silver,	Arsenic,
Gold,	Tartaric,
Mercury,	Phosphoric,
Antimony,	Sulphuric,
Tin,	Muriatic,
Copper,	Nitric,
Platinum,	Fluoric,
Nickel,	Sacclactic,
Iron,	Succinic,
Sulphur.	Citric,
	Lactic,
	Acetic,
	Prussic,
	Carbonic.

BISNEE, a district of Hindostan, between Bengal and Assam, the rajah of which is tributary to both of these states. It is situated on the north side of the Brahmapootra river, between 26° and 27° of northern latitude. Bisnee, the capital, is the residence of the rajah, who is very poor.

BISOMUM, or **DISOMUM**, in Roman antiquity, a tomb for two dead bodies, or the ashes of two. The ancients frequently buried two, three, or four bodies in the same sepulchre, disposed beside each other; for it was held an impiety to lay one on the top of another. Hence the sepulchres of the primitive Christians had the words *bisomi*, *trisomi*, *quadrisomi*, &c. inscribed on them, to indicate the number of bodies deposited in them.

BISON, in zoology, the trivial name of a species of *bos*. See *Bos*.

Bison, in entomology, a species of scarabæus; thorax, the anterior part, pointed; and two lunated horns on the head. Found in Spain, and the southern parts of France. Color black.

BISPINOSA, in entomology, a species of mantis, thorax roundish, bidentated in front; wing-cases very short, and bordered with yellow. Also a large species of cicada, inhabiting the island of Sumatra. Color brown, with a single spine on each side of the thorax; wings dusky, with a streak of black spots.

BISPINOSUS, a species of *cerambyx stenocorus*, inhabiting South America. Thorax unarmed, and slightly tuberculated; wing-cases bidentated; joints of the antennæ armed with spines; body testaceous.—Also a species of *carabus*, found in Europe. Color black; posterior part of the thorax truncated; anterior shanks two spined.—Also a species of *tabanus*, a native of

Sweden. Color brown; abdomen ferruginous, and black at the base, with two spines on the scutell.

BISSACRAMENTALES, a denomination given by Romish writers to protestants, on account of their only holding two sacraments.

BISSAGOS, a group of islets which lie off the western coast of Africa, between the Gambia and Sierra Leone, near the mouth of the Rio Grande. The principal isles amount to the number of sixteen. Bissao, Bulama, Jate, Bussi, and Manterre, are alluvial islands, separated from the continent only by inconsiderable streams. Galpinas, Arcas, Formosa, Canabac, Carache, Corbelle, Genthera, Cavallo, Mel, Casegu, and Cove, are in the open sea. Besides these there are a great number of smaller islands, of which the most remarkable are Bourbon, Sarcicere, Poelon, Papaygo, and Los Parcos. Towards the ocean these islands are covered by a succession of banks of sand and mud, which render the approach to them very dangerous. The banks extend more or less from the 9th to the 12th parallel, and as far east as the meridian of Ferro. The inhabitants are called Bissagos, or Bijugas. They are a tall, robust, and intrepid race, fond of war. Such is their pride, that they will even commit suicide, on receiving an affront which they cannot avenge. They are said at the same time to be very ingenious, and ready of comprehension. The Biafaras, a much milder race, who inhabited the islands nearest to the continent, have been driven out by them, and now inhabit the banks of the Rio Grande. An attempt was made in 1792 to plant a colony upon Bulama, one of these islands, which however failed. See BULAMA.

BISSAO, one of the largest of the archipelago of the Bissagos, is forty miles long by thirty wide. It rises towards the middle in a hollowed plain, and is extremely fertile, producing abundantly millet, rice, lemons, limes, bananas, with oxen and cows of a remarkable size. The inhabitants are called Papels, and are enterprising and warlike; many Portuguese have also long been settled here. This island has a fine road, with a muddy bottom, and excellent anchorage at a place called the Great Port. Long. 14° 10' W., lat. 11° 24' N.

BISSART (Peter), professor of canon law in the university of Bologna, was descended from the earls of Fife in Scotland, and born in that country in the reign of James V. He was educated at St. Andrew's; from thence he removed to Paris; and, having spent some time in that university, proceeded to Bologna, where he commenced LL. D. and was afterwards appointed professor of canon law. He continued in that employment several years with great reputation, and died in 1568. He is said to have been not only a learned civilian, but an excellent poet, orator, and philosopher. Patricii Bissarti opera omnia, viz. poemata, orationes, lectiones feriales, &c. Lib. de irregularitate, &c. were published at Venice in 1563, 4to.

BISSELAËON, in the materia medica, a name used in many works of the most ancient Greek and Roman writers, to express the oil of pitch, or the fluid substance which swims at the surface

or melted pitch, and was used in many external disorders.

BISSET (Robert), a native of Scotland, was educated at Edinburgh for the clerical profession. He took the degree of LL.D., and becoming a schoolmaster at Chelsea, employed himself largely in writing for the press. His chief productions are—*A History of the Reign of George III.* 6 vols. 8vo.; the *Life of Edmund Burke*, 2 vols. 8vo.; and an edition of the *Spectator*, with lives of the authors, 6 vols. He died in 1803, aged forty-six.

BISSENTIALIS, or **BISSENTIALIS OLLA**, an ancient measure or vessel, containing twelve ounces, or two sextaries.

BISSEXTILE, *n. s.* Lat. from *bis*, and *sextilis*, leap year; the year in which the day, arising from six odd hours in each year, is intercalated.

The year of the sun consisteth of three hundred and sixty-five days and six hours, wanting eleven minutes; which six hours omitted, will, in time, deprave the compute: and this was the occasion of *bissextile*, or leap year. *Brown.*

Towards the latter end of February is the *bissextile*, or intercalary day; called *bissextile*, because the sixth of the calends of March is twice repeated.

Holder on Time.

BIS'SON, *adj.* Derived by Skinner from *by*, and *sin*, blind.

But who, oh! who hath seen the mobled queen
Run barefoot up and down, threatening the flames
With *bisson* rheum? *Shakspeare. Hamlet.*

BISTI, in commerce, a small coin of Persia. Some say that is among the current silver coins of Persia, and worth only a little above three farthings of our money; others speak of it as a money of account; perhaps it is used for both.

BISTONIS, in ancient geography, a lake of Thrace near Abdera, on which dwelt the Bistones: hence 1. *B. turbo*, a wind blowing from Thrace; and 2. *B. tyrannus*, an epithet used by Lucan, for Diomedes king of Thrace, who fed his horses with human flesh.

BISTORT, or knotgrass, in botany, the trivial name of a species of polygonum. See **POLYGONUM**.

BISTOURY, a surgeon's instrument used in making incisions, of which there are three sorts; the blade of the first turns like that of a lancet: but the straight bistoury has the blade fixed in the handle; the crooked bistoury is shaped like that of a half moon having the edge on the inside.

BISTRE, the burnt oil extracted from the soot of wood. It is of a brown transparent color, having much the same effect in water-painting, where alone it is used, as brown pink in oil. Though this color is extremely serviceable in water-colors, and much valued by those who know and can procure it: yet it is not in general use, perhaps on account of its not being easily procured of a perfect kind; hardly any of it being good, except that imported from France. Bistre may, however, be prepared with great ease in the following manner: take any quantity of soot of dry wood, but let it be of beech, if possible. Put it into water in the proportion of

two pounds to a gallon, and boil them half an hour: then after the fluid has stood some little time to settle, but while yet hot, pour off the clearer part from the earthy sediment at the bottom; and if on standing longer it forms another earthy sediment, repeat the same method, but this should be done only while the fluid remains hot; evaporate then the fluid to dryness; and what remains will be good bistre, if the soot was of a proper kind. The goodness of the bistre may be perceived by its warm deep brown color, and transparency when moistened with water.

BISTRIATA, in entomology, a species of cicada deflexa, inhabiting France. Color yellow, with two transverse bands of brown.

BISTRIGALIS, a species of phalæna. Color black; cinereous wings, with two ferruginous streaks, and a black dot. Inhabiting Europe.

BISTRIGARIA, a species of phalæna geometra, with cinereous wings, undulated with two linear streaks. Found only in Europe.

BISTRIGATA, another European species of phalæna geometra; griseous, with two whitish streaks.

BISTRITZA, a market town of Hungary, in the district of Besztercze, and county of Trentschin, on the Waag, with a castle and a Catholic church. Six miles north-east of Bolesko.

BISULCATUS, a species of curculio, inhabiting Italy. Color black, with a cinereous border, and two furrows on the beak.

BISULCUS, a species of ichneumon. Color black, with two impressed lines before; legs rufous; sting short.

BITCH *n. s.* Sax. *bitze*; the female of the canine kind, as the wolf, the dog, the fox, the otter; opprobriously applied to a woman who is a virago.

And at his feet a *bitch* wolf suck did yield

To two young babes.

Spenser.

I have been credibly informed, that a *bitch* will nurse, play with, and be fond of young foxes, as much as, and in place of, her puppies.

Locke.

Him you call a dog, and her a *bitch*.

Pope.

John had not run a madding so long, had it not been for an extravagant *bitch* of a wife.

Arbuthnot.

BITCHE, a town and lordship of Lorraine, at the foot of one of the Vosges mountains, near the Schwalbe. It is built in the form of a half moon, and contains 2715 inhabitants. Since the revolution it has been the chief place of a canton in the department of the Moselle. On a hill overlooking the town is the strong citadel, which was taken by Louis XIV. in 1670, but given back at the peace of Ryswick. When the lordship came into the possession of France, this castle was repaired and strengthened. Bitche was one of the barrier fortresses delivered over by the allies in 1815, for a limited time, to the supervision of Lord Wellington. Sixteen miles E. S. E. of Sarguemines, and eighteen miles of Weissenbourg. Long. 7° 30' E., lat. 49° 4' N.

BITE *v. & n.* } Ang.-Sax. *bitan*, literally to
Bi'TE, } make an incision, or to man-
Bi'TING, } gle with the teeth; metapho-
Bi'TINGLY, } rically, whatever wounds the
Bi't *v. & n.* } mind; hurts or gives pain,
Bi'TLESS. } like a bite, whether by strata-

gem or force; whatever would take us in or prey upon us; whatever is sharp or acrid; piercing or penetrating. A bit is a small portion of any thing; like what is taken from a larger substance by a bite of the mouth. It is also applied to the instrument attached to the bridle of a horse, and which crosses his mouth, and remains there till the bridle is removed; he champs the bit, but he cannot masticate it; it sometimes signifies all the iron appurtenances of a bridle; a biter is not only one that takes in another, but that is himself taken in; a sharper bites, that is, he deceives you, and gives you pain by his duplicity and dishonesty; but he also is a biter, who, like a fish, eagerly swallows the bait by which he is hooked and caught.

Right as a serpent hideth under floures
Til he may see his time for to bite. *Chaucer.*

With that, at him, a quivering dart he threw,
With so fell force and villainous despite,
That through his habericon the forke head flew,
And through the linked mayles emperced quite,
But had no power in his soft flesh to bite. *Spenser.*
Others the utmost boughs of trees doe crop,
And brouze the woodbine twiggcs that freshly bud;
This with full bit doth catch the utmost top
Of some soft willow. *Id.*

Sir Guyon, as by fortune then befell,
Forth from the thickest preasse of people came;
His owne good steed, which he had stolen, to clame;
And the' one hand seizing on his golden bit,
With the' other drew his sword. *Id.*

We have strict statutes, and most biting laws,
The needful bits and curbs of headstrong steeds. *Shakspere.*

My very enemy's dog,
Though he had bit me, should have stood that night
Against my fire. *Id.*

These are the youths that thunder at a playhouse,
and fight for bitten apples. *Id.*

No empty hopes, no courtly fears, him fright;
Nor begging wants his middle fortune bite,
But sweet content exiles both misery and spite. *Fletcher. Purple Island.*

I have known a very good fisher angle diligently
four or six hours for a river carp, and not have a bite. *Walton.*

There are few that know all the tricks of these
lawyers; for aught I can see, your case is not a bit
clearer than it was seven years ago. *Arbuthnot.*

John was the darling; he had all the good bits, was
crammed with good pullet, chicken, and capon. *Id.*

If on Parnassus top you sit,
You rarely bite, are always bit. *Swift.*
Let a man be ne'er so wise,
He may be caught with sober lies;
For, take it in its proper light,
'Tis just what coxcombs call a bite. *Id.*
Great barkers are no biters. *Camden.*

A biter is one who tells you a thing you have no
reason to disbelieve in itself, and perhaps has given
you, before he bit you, no reason to disbelieve it for
his saying it; and, if you give him credit, laughs in
your face, and triumphs that he has deceived you.
He is one who thinks you a fool, because you do not
think him a knave. *Spectator.*

If you had allowed half the fine gentlemen to have
conversed with you, they would have been strangely
bit, while they thought only to fall in love with a fair
lady. *Pope.*

He bought at thousands, what with better wit
You purchase as you want, and bit by bit. *Id.*

The evil consequences which sometimes arise from
the want of that timely intimation of danger which
pain gives, is known to the inhabitants of cold coun-
tries by the example of frost-bite, limbs.

Paley's Theology.

Who thundering comes on blackest steed?

With slackened bit and hoof of speed.

Byron. Giaour.

BITS, in the menage. See HORSES, and ME-
NAGE.

BITS, or BITTS, in ship-building, the name of
two great timbers, usually placed abaft the man-
ger, in the ship's loof, through which the cross-
piece goes: the use of it is to belay the cable
thereof, while the ship is at anchor.

BITHYNIA, an ancient kingdom of Asia,
formerly known by the names of Mysia, Myg-
donia, Bebrycia, Mariandynia, and Bithynia.
It was bounded on the west by the Bosphorus
Thracius, and part of the Propontis, on the south
by the river Rhyndacus and Mount Olympus, on
the north by the Euxine Sea, and on the east by
the river Parthenius. The chief cities were
Myrlææ, Nicomedia, Chalcedon, Heraclea, and
Prusa. As to its history, we find nothing of
moment recorded, except the infamous conduct
of Prusias, one of its kings, in delivering up to
the Romans Hannibal, the great Carthaginian
general, who fled to him for protection. His
great grandson, Nicomedes IV., bequeathed the
kingdom to the Romans. From them it was
taken by the Turks, to whom it still remains
subject, and retains its ancient name.

BITHYNIARCHA, the superintendent of the
sacred games in ancient Bithynia.

BITHYNIARCHIA, a sort of superior priest-
hood in ancient Bithynia, to which belonged the
superintendency of the sacred games, and which
gave an exemption to the Bithyniarcha from the
care of tutorage.

BITIS, in zoology, a species of coluber, found
in Brasil. Above, yellow, varied, with white
and red, and transverse brown bands; beneath,
yellow, with a middle row of very minute
scales.

BIT NOBEN, salt of bitumen. A white
saline substance lately imported from India,
which is not a natural production, but a Hindoo
preparation of great antiquity. It is called in
the country, bit noben, pandanoon, and soucher-
loon, and popularly khala mimuc, or black salt.
This salt is more extensively used in Hindostan,
than any other medicine whatever. The Hindoos
use it to improve the appetite and digestion;
they also consider it as a specific for obstructions
of the liver and spleen; and it is in high estima-
tion in paralytic disorders, cutaneous affections,
and indeed all chronic disorders of man and
beast.

BITONTO, an episcopal town of Naples, in
the Terra di Bari, seated in a plain eight miles
south of the gulf of Venice; and 118 miles east
of Naples. It is celebrated for the victory ob-
tained by the Spaniards in its neighbourhood
over the Imperialists, 25th May 1734, and which
resulted in the entire subjugation of Naples to
Don Carlos of Spain. Philip V. caused a pillar
to be erected on the field of battle, and gave the
title of duke of Bitonto to the count of Monte-

mar, the Spanish general. It contains about 13,000 inhabitants.

BITTACUS, in natural history, a name given by Ctesias, and other Greek authors, to the parrot.

BITTER, *adj.* & *n.* } Of the same derivation as bite; but applied particularly to the taste; that which is pungent, penetrating and unpalatable; distasteful; nauseous; hence it is figuratively employed to express anguish of heart; excessive grief; calamity and woe; as likewise hatred; malice; implacability; severity of temper; piquancy; satire and keenness of reproach.

For, God it wote, he sate full oft and songe,
Whan that his sho ful *bitterly* him wronge,
That was no wight, save God and he that wiste
In many a wise how sore that I him twiste.

Chaucer. Canterbury Tales.

Thereto the blatant beast, by them set on,
At him began aloud to bark and bay
With *bitter* rage and fell contention,
That all the woods and rockes nigh to that way
Began to quake and tremble with dismay. *Spenser.*

And there beside him sate upon the ground
His wofull ladie, piteously complainyng
With loud laments, that most unlucky stound,
And her sad selfe with carefull hand constraynyng
To wype his wounds, and ease their *bitter* paynyng. *Id.*

Friends now fast sworn,
Unseparable, shall within this hour,
On a dissension of a doit, break out
To *bitterest* enmity. *Shakspeare.*

Noble friends and fellows, whom to leave
Is only *bitter* to me, only dying. *Id.*

I so lively acted with my tears,
That my poor mistress, moved therewithal,
Wept *bitterly*. *Id.*

Indeed, my younger boy presumed too much
Upon his manhood, gave him *bitter* words,
Drew his sword first; and so, I know not how,
For I was out of my wits, he fell with's head
Just in my bosom. *Webster.*
Bitter and earnest writing must not hastily be con-
demned. *Bacon.*

And shun the *bitter* consequence: for know,
The day thou catest thereof, my sole command
Transgrest, inevitably thou shalt die. *Milton.*

Bitter constraint, and sad occasion dear,
Compels me to disturb your season due. *Id.*

Tell him, that if I bear my *bitter* fate,
'Tis to behold his vengeance for my son. *Dryden.*

Bitter is an equivocal word; there is *bitter* worm-
wood, there are *bitter* words, there are *bitter* enemies,
and a *bitter* cold morning. *Watts' Logic.*

The word of God, instead of a *bitter*, teaches us a
charitable zeal. *Spratt.*

Pierpont and Crew appeared now to have contracted
more *bitterness* and sourness than formerly, and were
more reserved towards the king's commissioners. *Clarendon.*

What energy the hand
Of virtue mingles in the *bitter* tide,
Of passion swelling with distress and pain,
To mitigate the sharp with gracious drops
Of cordial pleasure. *Akenside.*

Love shews all changes—hate, ambition, guile,
Betray no further than the *bitter* smile. *Byron. Corsair.*

— Thou mockest my weakness; and wouldst
steal

My breast before the time when it must feel.

But trifle now no more with my distress,
Such mirth hath less of play than *bitterness*. *Id.*

But, oh! the scenes 'mid which they met and parted
The thoughts, the recollections, sweet and *bitter*!

Maturin. Bertram.

BITTERFIELD, a town belonging to the Prussian states, in the duchy of Saxony, on the Mulda. It has 2000 inhabitants, and was founded by a colony of Flemings, whose descendants, forming an independent body, are said to possess all things in common. Here are many cloth-makers and potters. Sixteen miles south of Dessau, and eighteen S. S. W. of Wittenberg. Long. 12° 23' E., lat. 51° 39' N.

BITTER PRINCIPLE. 'Many vegetable substances,' says Dr. Thomson, 'have an intensely bitter taste, and on that account are employed in medicine, by brewers, &c. This is the case with the wood of the quassia amara and excelsa, the common quassia of the shops; with the roots of the gentiana lutea, common gentian; the leaves of the humulus lupulus, or hop; the bark or wood of the spartium scoparium, or common broom: the flowers and leaves of the anthemis nobilis, or chamomile, and many other substances. Some of these bodies owe their taste to the presence of a peculiar vegetable substance, differing from every other, which may be distinguished by the name of the Bitter Principle. When water is digested over quassia for some time it acquires an intensely bitter taste and a yellow color, but no smell. When water thus impregnated is evaporated to dryness, in a low heat, it leaves a brownish yellow substance which retains a certain degree of transparency. It continues ductile for some time, but at last becomes brittle. This substance I shall consider as the Bitter Principle in a state of purity. If it contains any foreign body it must be in very minute proportion. This substance I find to possess the following properties: 1. Its taste is intensely bitter. Color brownish yellow. 2. When heated, softens and swells, and blackens; then burns away without flaming much, and leaves a small quantity of ashes. 3. Very soluble in water and alcohol. 4. Does not alter the color of infusion of litmus. 5. Lime water, barytes water, and strontian water occasion no precipitate. Neither is any precipitate thrown down by silicated potash, aluminated potash, or sulphate of magnesia. 6. The alkalies occasion no change in the diluted solution of the bitter precipitate. 7. Oxalate of ammonia occasions no precipitate. 8. Nitrate of silver renders the solution muddy, and a very soft flaky yellow precipitate falls slowly to the bottom. 9. Neither corrosive sublimate nor nitrate of mercury occasion any precipitate. 10. Nitrate of copper, and the ammoniacal solution of copper, produce no change; but muriate of copper gives the white precipitate, which falls when this liquid is dropt into water. 11. Sulphate and oxy muriate of iron occasion no change. 12. Muriate of tin renders the solution muddy, but occasions no precipitate unless the solution be concentrated, in that case a copious precipitate falls. 13. Acetate of lead occasions a very co-

pious white precipitate, but the nitrate of lead produces no change. 14. Muriate of zinc occasions no change. 15. Nitrate of bismuth produces no change, though when the salt is dropped into pure water, a copious white precipitate appears. 16. Tartar emetic produces no change, but when the muriate of antimony is used the white precipitate appears, which always falls when this salt is dropped into pure water. 17. Muriate and arseniate of cobalt occasion no change. 18. Arseniate of potash produces no effect. 19. Tincture of nut-galls, infusion of nut-galls, gallic acid, occasions no effect. These properties are sufficient to convince us that the Bitter Principle is a substance differing considerably from all the other vegetable principles.' A second and third species of the Bitter Principle are also pointed out by this author, and his conclusions have been sanctioned by Mr. Brande. Dr. Murray (see his Chemistry), however, objects to them in toto.

BITTERS, in medicine, have been divided by Mr. Gray (Elements of Pharmacy) into the pure bitters, viz. absinthium (worm-wood), aloes spicata extractum (socotrine or Turkey aloes), aloes vulgaris extractum (hepatic or Bombay aloes), amygdala amara (bitter almond), centaurei cacumina (centaury tops), colocynthis pulpa (bitter apple pulp), gentianæ radix (gentian root), menyanthes (bogbean), quassia lignum (quassia wood), simaroubæ cortex (mountain damson bark), spartii cacumina (broom tops), taraxaci radix (dandelion). The aromatic bitters are anthemides flores (chamomile), calami radix (sweet flag root), cascarillæ cortex (cascarilla bark), cuspariæ cortex (angustura bark), lauri folia (bay leaves), linonum cortex (lemon peel), marrubium (horehound), myrrha (myrrh), valerianæ radix (valerian root). The astringent bitters are the various barks, while only one sweet bitter is enumerated as a drug, namely, the dulcamaræ caules (bitter sweet stalks). Many medical men condemn the continued and dietetic use of bitters, as rendering the person employing them more than commonly liable to apoplexy and paralytic seizures: in proof of which it is alleged that many individuals who had taken the Portland powder for a length of time, have unexpectedly fallen victims to palsy and apoplexy. But it is to be recollected that the tendency to gout and paralysis is very often co-existent; and although every habitual excitant is to be avoided, the occasional use of them is often very beneficial.

BITTERN, } Fr. *butour*; a bird with long
BITTOUR. } legs, and a long bill, which
feeds upon fish; remarkable for the noise which
he makes, usually called bumping.

The poor fish have enemies enough, besides such
unnatural fishermen as otters, the cormorant, and the
bittern. Walton.

Then to the water's brink she laid her head;

And, as a *bittour* bumps within a reed,

To thee alone, O lake, she said, I tell. Dryden.

BITTERN, in ornithology. See ARDEA.

BITUBERCULATA, in entomology, a species of cassida: color black, with a white margin; wing-cases spotted with black, a single

tubercle at the base of each. A native of Cayenne.

BITUBERCULATUS, a species of curculio, a native of New Zealand: color, ferruginous; thorax length of the wing-cases, and dotted with two tubercles on the back. Also a species of cryptocephalus crioceris, a native of Africa: color, fulvous; wing-cases, pale, bordered with fulvous.

BITUMEN, } Lat. *bitumen*; Gr. *πετρε-*
BITUMED, } *πιθος, πεθος*, from *πιω*. A
BITUMEN, } kind of slime mortar, says
BITUMENATED, } Golding, issuing out of the
BITUMENOUS, } ground in divers places
about Babylon, and which was one of the ingredients used in building the wall of that once famous city. It is also sometimes scummed off lakes, as the Asphaltis in Judea, and is occasionally of so hard a consistence as to be used for coals.

Mix with these

Iæzan pitch, quick sulphur, silver's spume,

Sea onion, hellebore, and black *bitume*. May.

Where is Marcus' Scaurus Theater, the *bituminated*
walls of Babylon? and how little rests of the Pyra-
mids of Egypt! Feltham.

It is reported, that *bitumen* mingled with lime, and
put under water, will make as it were an artificial
rock, the substance becometh so hard. Bacon.

The fabrick seemed a wood of rising green,

With sulphur and *bitumen* cast between. Dryden.

BITUMEN. This term includes a considerable range of inflammable mineral substances, burning with flame in the open air. They are of different consistency, from a thin fluid to a solid; but the solids are for the most part liquefiable at a moderate heat. The principal bitumens are: *Naphtha*; a fine, colorless oil, which issues out of clay in Persia and Media. It is highly inflammable, and is decomposed by distillation. It dissolves resins, but is not itself soluble either in alcohol or ether. It is the lightest of all the dense fluids, its specific gravity being 0.708. *Petroleum*, which is a dark oil, found dropping from rocks or oozing from the earth, in various parts of Europe and Asia: this also is insoluble in alcohol, and contains a portion of the succinic acid. *Barbadoes tar*, which is a viscid black inflammable substance, also insoluble in alcohol, and containing the succinic acid. *Asphaltum*, mineral pitch, of which there are three varieties: the collesive; the semi-compact, maltha; the compact, or asphaltum. These are smooth, inflammable substances, which melt easily, leaving but little ashes, if pure. They are partially acted on by alcohol and ether.

Mineral tallow, a white substance resembling tallow. It was found in the sea on the coasts of Finland, in the year 1736; and is also met with in some rocky parts of Persia. It is near one-fifth lighter than tallow; burns with a blue flame, leaving a black viscid matter behind, which is with more difficulty consumed. *Elastic bitumen*, of which there are two varieties: 1. Mineral caoutchouc, the color of which varies from yellowish brown to olive blackish or reddish brown. The light colored is often in a semi-fluid state, and adheres to the fingers; the olive brown is solid and elastic. 2. Suberiform mineral caout-

chouc. This substance, when recently cut, exactly resembles fine close cork in color and texture; but, by exposure for a few days to the air, it becomes of a pale reddish brown color. The different sorts of coal are also ranked as bituminous substances.

BITUMEN HYBLEANUM, in mineralogy, a name given by Boccone and others to a peculiar species of bituminous fossil, which is flexible while in the earth. It is a stony substance, smelling like the common bitumens, and composed of a very great number of thin plates, laid regularly on one another. When burnt in a candle the bituminous smell is perceived very strong; and the stone, though when first taken up it be flexible like paper, yet in time hardens and becomes brittle like other fossils of that lax consistence. There are found whole hillocks covered with it. This does not prevent their bearing plants and herbage, the roots of the grass, &c. insinuating themselves between the laminæ of this stone, and getting nourishment there.

BITUMEN JUDAICUM. See **ASPHALTUM**.

BITUREX, **BITURICÆ**, or **BITURIGES**, afterwards corrupted to **BOURGES**, the name of Avaricum, from the custom in the lower age of calling towns from the names of the people. See **AVARICUM**.

BITURIGES, or **BITURIGES CUBI**, the ancient inhabitants of that part of Gallia Celtica, afterwards assigned to Aquitania, now called Berry.

BITURIGES VIBISCI, a people of Aquitain.

BIVENTER, in anatomy, called also digastric, or two-bellied, a muscle of the lower jaw. See **ANATOMY**.

BIVITTATUS, in entomology, a species of scarabeus melolontha, inhabiting Brasil: color yellow and glossy; on the head and thorax two common stripes, and many abbreviated green striae on the wing-cases. Also a species of curculio, found in St. Thomas's Island: black; wing-cases striated with dots; marginal and dorsal interrupted stripe of yellow.

BIUMBRES, an appellation given to the inhabitants of the torrid zone, because, at two different seasons of the year, their shadows are projected two different ways. The same with the Amphiscii.

BI'VALVE, } From Lat. *binus* and *valva*.
BI'VALVED, } Having two valves or shut-
BI'VALVULAR. } ters: a term used of those fish that have two shells, as oysters; and of those plants whose seed-pods open their whole length, to discharge their seeds, as peas.

In the cavity lies loose the shell of some sort of *bivalve*, larger than could be introduced in at those holes. Woodward.

BIVOUAC. See **BROVAC**.

BIVOUAC, Ger. a guard, is used for a guard performed by a whole army at a siege, or when lying before an enemy, and during the night; but in modern military usage is frequently applied to any number of men keeping night-watch or guard at a distance from quarters; and an army that does not encamp, but lies under arms all night, is, in like manner, said to bivouac.

The excubiæ of the Romans correspond with these duties, which were done night and day.

BIXA, in botany, the roucou or arnotto tree; a genus of the monogynia order, and polyandria class of plants; ranking, in the natural method, under the thirty-seventh order, columniferæ: cor. ten-petaled: cal. quinque-dentate: the caps. hispid and bivalved. Of this genus there is but one species known, viz. *B. orellana*, a native of the warm parts of America. It rises with an upright stem to the height of eight or ten feet, sending out many branches at the top, forming a regular head, garnished with heart-shaped leaves, ending in a point, and having long foot-stalks. The flowers are produced in loose panicles at the end of the branches. See **ARNOTTO**.

BIZARRE, in botany, a term used among florists for a particular kind of carnation, which has its flowers striped or variegated with three or four colors.

BIZOCHI, or **BISOCHI**, in church history certain heretical monks, who are said to have assumed the religious habits contrary to the canons, rejected the sacraments, and maintained other errors.

BIZZARO, in the Italian music, a fanciful kind of composition, sometimes fast, slow, soft, strong, &c. according to the composer's fancy.

BLAB, *v. & n.* Junius refers to babbling; **BLAB'ING**, *n.* } in Dutch, *blabberen*. 'Per-
BLAB'BER, *v.* } haps,' says the Lexicon of the Ency. Met. 'from *labben*; Ang.-Sax. *lapan*, to lap or lip.' To talk from the lips without thought or consideration; to let out, as if unable to contain it, all that we know; to betray from mere folly without malice or design. Dr. Johnson says, it usually implies rather thoughtlessness than treachery; but may be used in either sense.

Might I enjoy my love till I unfold it,
 I'd lose all favours when I *blabbing* told it.

Spenser.

Why have I *blabbed*? Who shall be true to us,
 When we are so unsecret to ourselves? *Shakspeare*.

Your mute I'll be;

When my tongue *blabs*, then let mine eyes not see.

Id.

The secret man heareth many confessions; for who will open himself to a *blab*, or babbler? *Bacon*.

To have revealed

Secrets of man, the secrets of a friend,
 Contempt and scorn of all, to be excluded

All friendship, and avoided as a *blab*. *Milton*.
 Whoever shews me a very inquisitive body, I'll shew him a *blab*, and one that shall make privacy as publick as a proclamation. *L'Estrange*.

I should have gone about shewing my letters, under the charge of secrecy, to every *blab* of my acquaintance. *Swift*.

Nor whisper to the tattling reeds,

The blackest of all female deeds:

Nor *blab* it on the lonely rocks,

Where echo sits, and listening rocks. *Id.*

Nature has made man's breast no windores,
 To publish what he does within doors;
 Nor what dark secrets there inhabit,
 Unless his own rash folly *blab* it. *Hudibras*.

Sorrow nor joy can be disguised by art,
 Our foreheads *blab* the secrets of our heart.

Dryden.

It is unlawful to give any kind of religious worship to a creature; but the very indices of the fathers cannot escape the index expurgatorius, for *blabbing* so far at a truth. *Sittingfleet*.

BLACK', *v. n. & adj.* } Ang.-Sax. *blac-ian*,
 BLACK'EN, } Germ. *black*. Of un-
 BLACK'ENER, } known etymology. Li-
 BLACK'ING, } terally applied to the
 BLACK'ISH, } color of the night; to
 BLACK'LY, } darkness; figuratively,
 BLACK'NESS, } to what obscures, pol-
 BLACK'BROWED, } lutes, or soils a charac-
 BLACK'EYED, } ter or reputation; to
 BLACK'FACED, } whatever is gloomy, dis-
 BLACK'GUARD, } mal, fearful, and terri-
 BLACK'MOOR, } fic; to that which is
 BLACK'NESS, } concealed; to nefari-
 BLACK'VISAGED. } ous, wicked, foul, atro-
 cious and disgusting criminality. It therefore
 describes natural objects, mental apprehensions,
 and moral delinquencies. Over them all it
 throws the pall of night, the gloomy horrors of
 the outer darkness.

In the twilight, in the evening, in the *black* and
 dark night. *Proverbs.*

The heaven was *black* with clouds and wind, and
 there was a great rain. *1 Kings.*

Him had lever, I dare wel undertake,
 At thilke time (than all his wethers *blake*),
 That she had had a ship hireself alone,
 And therefore, wost thou what is best to done.

Chaucer. Cant. Tales.

By that the welkin Phœbus gan availle
 His wearie waine, and now the frostie night
 Her mantle *black* through heaven gan overhaye.

Spenser.

Here no night-ravens lodge, more *black* than pitch,
 Nor elvish ghosts, nor ghastly owles doe flee. *Id.*

A dire induction am I witness to;
 And will to France, hoping the consequence
 Will prove as bitter, *black*, and tragical. *Shakspeare.*

She hath abated me of half my train;
 Look'd *black* upon me. *Id.*

His faults in him seem as the spots of heaven,
 More fiery by night's *blackness*. *Id.*

Come, gentle night; come, loving, *black-browed*
 night.

Give me my Romeo. *Id.*

More to west
 The realm of Bocchus to the *blackmoor* sea. *Milton.*

Either my country never must be freed,
 Or I consenting to so *black* a deed. *Dryden.*

Rise, wretched widow, rise; nor, undeplord,
 Permit my ghost to pass the Stygian ford:
 But rise, prepared in *black* to mourn thy perished
 lord. *Id.*

Let us *blacken* him what we can, said that mis-
 creant Harrison of the blessed king, upon the wording
 and drawing up his charge against his approaching
 trial. *South.*

Let a *black-guard* boy be always about the house, to
 send on your errands, and go to market for you on
 rainy days. *Swift.*

They are no more afraid of a *blackamore*, or a lion,
 than of a nurse or a cat. *Locke.*

There should emerge one or more very *black* spots,
 and, within those, other spots of an intenser *blackness*.
Newton.

His tongue, his prating tongue, had changed him
 quite
 To sooty *blackness* from the purest white. *Addison.*

To horse! to horse! my coal-*black* steed
 Paws the ground and snuffs the air!
 There is not a foal of Arab's breed
 More knows whom he must bear.

Byron. Deformed Transformed.

BLACK, THE COLOR OF. Black is supposed to
 be owing to the absence of light, most of the
 rays falling upon black substances being not re-
 flected but absorbed by them. • Concerning the
 peculiar structure of such bodies as fits them for
 appearing in this or that particular color, see
 the article COLOR.

BLACK, in painting. There are several species
 of blacks used in painting, of which the following
 are the principal. Frankfort black, of which
 there are two sorts, one a natural earth inclining
 to blue; and the other made from the lees of
 wine burnt, washed, and ground with ivory,
 bones, or peach stones. This black is much
 used by the copper-plate printers, for their fine
 ink to work their engravings. Ivory black is
 burnt ivory, or bones reduced to powder, and
 ground in oil or water as required. Spanish
 black is burnt cork reduced in a similar manner.
 Harts black is that which remains in the retort
 after the spirits, volatile salt, and oil have been
 extracted from hartshorn, and, when properly
 levigated, answers the purpose of painters nearly
 as well as ivory black. Lamp black is originally
 the soot collected from lamps, but is generally
 prepared in England at the turpentine manufac-
 tories, by burning the dregs after the refining of
 pitch or other resinous matter, or small pieces of
 pitch pine in furnaces constructed for the pur-
 pose; the smoke is made to pass through a long
 horizontal flue, terminating in a close boarded
 chamber, which has its roof covered with a coarse
 cloth, through which the air passes, and leaves
 the soot or lamp black behind. The goodness
 of this black depends much on its lightness and
 depth of color.

BLACK (Joseph), M. D. celebrated for his chem-
 ical discoveries, was born in France, on the
 banks of the Garonne, in 1728. His father, who
 was born in Belfast, of a Scottish family which
 had settled there, being engaged in the wine trade
 made Bourdeaux the chief place of his residence;
 where he was distinguished as a man of exten-
 sive information, and liberal sentiments. The
 character of Mr. Black attracted the attention, and
 gained him the friendship, of the benevolent and
 discerning Montesquieu, then one of the presi-
 dents of the court of justice in the province;
 and fragments of their correspondence are pre-
 served in the Black family. Mr. Black sent his
 son Joseph, at about twelve years of age, to
 Belfast, for his education. He removed to the
 university of Glasgow in 1746. While he
 studied at that university, his attention appears
 to have been chiefly engaged by physical science;
 and he gained the particular notice of Dr. Dick,
 then professor of natural philosophy. Having
 finished the ordinary course of study, he deter-
 mined on medicine as his profession. About
 this time the university of Glasgow appointed
 Dr. Cullen lecturer on chemistry; a science
 which had hitherto been considered more as a
 curious than as an useful art; but this great man
 having taken a wide and comprehensive view of
 the unoccupied field of philosophical chemistry,
 and being satisfied that it was susceptible of
 great improvement, determined to enter the un-
 beaten path, and to lead his followers to all those
 regions which are included in this comprehen-

sive and attractive science. Mr. Black became his pupil; and now, perhaps, the foundation was laid of that knowledge and fame which he afterwards acquired as a philosopher and a chemist. Dr. Cullen was interested in the progress of his students, and delighted in encouraging and assisting them. He soon perceived that the bias of the young philosopher's pursuits accorded with his own. Mr. Black was received into the closest intimacy, and became a valuable assistant to Dr. Cullen, in his chemical operations; the experiments of the pupil being often stated as good authority in proof of what was advanced by the lecturer. To complete his medical studies, Dr. Black went to Edinburgh in 1751, at which period the mode of lithontriptic medicines, particularly lime-water, in alleviating the pains of stone and gravel, divided the opinions of professors and practitioners. This was an interesting subject both to the physician and chemist; and particularly suited the taste of Mr. Black. From some of his memorandums, he seems at first to have held the opinion, that the causticity of alkalies is owing to the igneous matter which they derive from quick-lime; but, after prosecuting his experiments, this grand secret of nature was developed to his view; which led him to conclude, that the acrimony of these substances was not owing to their combination with igneous particles; that it was their peculiar property; and that they lost this property and became mild, by combining with a certain portion of air, which he named fixed air; because it was fixed or become solid in the substances into the composition of which it entered. This grand discovery, which forms one of the most important eras in chemical science, was the subject of his inaugural dissertation, published when he obtained his medical degree in the university of Edinburgh. Dr. Cullen about this time was removed to Edinburgh, leaving the medical chair at Glasgow vacant; and Dr. Black was considered amply qualified to fill it. Accordingly, in 1756, the university of Glasgow appointed him professor of anatomy and lecturer on chemistry; but the former branch either did not suit his taste, or he did not consider himself qualified to be useful in it; for he soon after made arrangements with the professor of medicine, by which the departments were exchanged, taking upon himself that of the institutes and practice of medicine. Dr. Black was now in a situation, fortunately for the public and for science, which allowed him full time to dedicate his talents to cultivating his favorite science of chemistry. At first, however, his lectures on medicine chiefly occupied his attention; and in them he gave great satisfaction. He also became a favorite physician in Glasgow. Between the years 1759 and 1763 his speculations concerning heat, which had occupied his attention at intervals, from the commencement of his philosophical investigations, were brought to maturity; and his discoveries in this department of science were by far the most important of all that he made. The nature of these investigations will appear in their proper place; but it may be observed here, that although Dr. Black never published an account of his doctrine of latent heat, by detailing it every

year subsequent to 1762, in his lectures, which were attended by scientific men from all parts of Europe, gave an opportunity for others to avail themselves of his researches. The ideas which Dr. Crawford adopted respecting the capacity of bodies for heat, were originally borrowed from Dr. Black; and the investigations of Lavoisier and Laplace concerning heat, which they published many years after, were evidently derived from him; some of them, indeed, being the very experiments suggested by him. M. De Luc, however, having expressed his admiration of Dr. Black's theory of latent heat, offered to become his editor, and Dr. Black was prevailed upon to communicate the proper information; but what was the surprise of the doctor and his friends, when the *Idées sur la Meteorologie* of that philosopher were published in 1788, to find the doctrine claimed by De Luc as his own; the writer only expressing his satisfaction, from what he had learned, that Dr. Black's opinions and his coincided! Dr. Cullen being appointed professor of medicine in the university of Edinburgh, in 1766, left the chemical chair of that university vacant; and Dr. Black, who had filled his place in Glasgow, was now, with universal consent, appointed to succeed him in Edinburgh. Here his talents were still more conspicuous, and he was more extensively useful. The consequence was, perhaps, in some respects to be regretted; his whole attention was directed to his lectures, with a view to adapt them to the most illiterate of his hearers; and thus the improvement of the science was neglected. He was, however, completely successful in his object; for his lectures were not only instructive, but delightful, and the knowledge of chemistry was greatly extended. The delicacy of Dr. Black's constitution was doubtless another reason why he did not contribute more towards rearing that noble superstructure of chemical science, the foundation of which he had been the means of establishing on a firm basis. The slightest cold, or the smallest approach to repletion, instantly affected his breast, and brought on a degree of fever, followed by a spitting of blood, of two or three days continuance. Only relaxation of thought and gentle exercise restored him; but whenever he engaged in close study on any subject, a sensible increase of his complaints was the consequence. He indeed seemed to have no ambition to appear as an author; but when his friends, desirous he should have the honor of his discoveries, and prevent others from adopting them as their own, urged him to publish an account of his investigations, he repeatedly began the task, and as often laid it aside. It was the necessity of placing what was pointed at in his inaugural dissertation in a proper light, that brought his *Experiments on Magnesia, Quick-lime, and other Alkaline Substances*, to public view; and after much entreaty, his *Observations on the more ready Freezing of Water that has been boiled*, was published in the *Philos. Trans.* for 1774; to which, if we add his *Analysis of the Waters of some Boiling Springs in Iceland*, made at the desire of his friend T. J. Stanley, Esq. which was read to the Royal Society of Edinburgh, and published by the council; we mention all the works from his pen that he ever

printed. Dr. Black anxiously wished that he might not long be confined to a sick-bed; and in this he was fully gratified. Sitting at table, on the 26th of November, 1799, with his accustomed fare, some bread, a few prunes, and a measured quantity of milk diluted with water, with the cup in his hand, when his pulse was to give the last stroke, he rested it on his knees, and expired without a convulsion, shock, or stupor, to announce or retard the approach of his end. Dr. Black was a stranger to none of the elegant accomplishments of life; he had a fine musical ear, with a voice to obey it in the completest manner; and he not only sung and performed on the flute, but he could sing a plain air at sight. Though he had not studied drawing, he possessed considerable talent as a painter. He was a lover of society, and beloved in it; his countenance was pleasant, and his manners graceful. His Lectures on the Elements of Chemistry were published in 2 vols. 4to. in 1803, by Dr. Robison, who prefixed a memoir of the author, to which we are indebted.

BLACK, in geography, a river of North America, in Vermont, which rises near Shrewsbury, in Rutland county, and passing into Windsor county, runs south for several miles, till at last, turning south-east, it falls into the Connecticut, opposite to Charlestown.

BLACK, the name of another river in Vermont, which rises in Minden township, Orange county, and running north about thirty miles, falls into the lake Memphremagog.

BLACK'BERRIED Heath, Lat. *empetrum*. The name of a plant.

BLACK'BERRY, *n. s.* The fruit of the bramble.

The policy of these crafty sneering rascals, that stale old mouse-eaten cheese Nestor, and that same dog-fox Ulysses, is not proved worth a *blackberry*.

Shakspeare.

Then sad he sung the Children in the Wood;
How *blackberries* they plucked in desarts wild,
And fearless at the glittering faulchion smiled. *Gay.*

BLACK'BERRY, Bush, *n. s.* Lat. *rubus*. A species of bramble.

BLACK'BIRD, *n. s.* from black and bird. The name of a bird.

Of singing-birds, they have linnets, gold-finches, *blackbirds*, thrushes, and divers others. *Carew.*

A schoolboy ran unto it, and thought
The crib was down, the *blackbird* caught. *Swift.*

BLACK-BIRD, in ornithology. See **TURDUS**.

BLACK-BOOK, a book kept in the Exchequer, in which the orders of that court are entered. See **EXCHEQUER**.

BLACK-BOOK OF THE ENGLISH MONASTERIES was a work that gave a detail of the scandalous enormities practised in religious houses; and was compiled by the visitors under king Henry VIII. to blacken them, and thus hasten their dissolution.

BLACKBURN, a market-town of Lancashire, seated on the Blackwater, near the river Derwent, and containing about 20,000 inhabitants. It carries on a great trade, but is chiefly noted for its manufactures of calicoes. Muslins and cotton have also been added; and it is much improved by the late inland navigation; it has now communications with the rivers Mersey, Dee, Rib-

ble, Ouse, Trent, Severn, Uumber, Thames, Avon, &c. The old weekly market on Monday, was changed, in 1774, to Wednesday, and is well supplied. Over the river are four stone bridges. It lies eight miles east of Preston, and 212 from London.

BLACKBURN, a river of Scotland, in Roxburghshire, remarkable for its beautiful water-falls, and no less so for a natural bridge of stone over it. See **BRIDGE**, **NATURAL**.

BLACKBURNE (Francis), archdeacon of Cleveland, was born at Richmond, in Yorkshire, in 1705. He was admitted pensioner of Catharine Hall, Cambridge, at the age of seventeen, and took the degree of bachelor. Being elected conduct or chaplain-fellow he was ordained deacon, on this title, in 1728. In 1739 he took priest's orders, on his induction to the rectory of his native town Richmond, and was for some time chaplain to Dr. Hutton, archbishop of York, by whom he was collated, in 1750, to the archdeaconry of Cleveland, and in the same year to the prebend of Bilton. In the course of this year he wrote An Apology for the Author of a Book, entitled, Free and Candid Disquisitions relating to the Church of England, &c. supposed to have been himself. He subsequently printed several single sermons and charges. In 1756 he published a work entitled No Proof in the Scriptures of an Intermediate State of Happiness or Misery, between Death and the Resurrection. He wrote several other pieces on the same topic, concluding, in 1765, with A Short Historical View of the Controversy concerning the Intermediate State: of which work an edition, with large additions, was published in 1772. In 1768 he began to publish his sentiments on subscription to articles of faith in Remarks on the Rev. Dr. Powell's Sermon in Defence of Subscription; a work preliminary to The Confessional; or a Full and Free Enquiry into the Right, Utility, Edification, and Success of Establishing Systematical Confessions of Faith and Doctrine in Protestant Churches, 8vo, 1766. This consists of eight chapters, the three first of which contain a view of the rise and progress of confessions of faith, the right to establish them, and their utility and expediency when established; the fourth and fifth chapters examine bishop Burnet's mode of justifying subscription, and expose the casuistry of those who pursue a different method; the sixth and seventh appreciate the sentiments and reasoning of the writers who plead for a latitude, and whence the practice of subscribing in different senses has been derived; and the last sums up the whole. The work excited considerable attention, and a supposition being entertained that the writer would not remain in the church, some leading members of the dissenting congregation in the Old Jewry, London, on the death of Dr. Chandler, in 1766, invited Dr. Blackburne to succeed him. This proposal he declined; but shortly after refused a living of considerable value, because it required him to renew his subscription, although the revenue of all his other preferments did not exceed £200 per annum. In 1768 he published Considerations on the present State of the Controversy between the Protestants and Papists of Great Britain and Ireland, in which he denies

the title of the latter to toleration on Protestant principles, on the ground, that persecutors on system ought not to receive toleration. In order to restrain abuses which had crept into the spiritual court at Richmond, he accepted in 1767 the office of commissioner to the commissary of that archdeaconry, and acted in that capacity with great skill and judgment. When advanced in years, he adopted the idea of writing the life of Martin Luther, but was diverted from the design by the death of the philanthropic Mr. T. Hollis, a memoir of whom was undertaken by archdeacon Blackburne. He executed his professional duties to the last, dying at his parsonage-house at Richmond, August 7th 1787. Dr. Blackburne, though connected with that party by relationship, was not, it seems, a Unitarian. On the secession of Dr. Disney from the church, he drew up an answer to the question, 'Why are you not a Unitarian?' which was not published, however, until after his decease. There appears considerable inconsistency in his continuing within the pale of an establishment, to whose leading feature of a subscription to the articles he so decidedly objects: yet he is said to have considered the imposition, rather than the sense of them, the object of his dissent; and so to have excused himself for retaining his preferment.

BLACK-CATTLE, *n. s.* Oxen, bulls, and cows.

The other part of the grazier's business is what we call *black-cattle*, produces hides, tallow, and beef for exportation.

Swift.

BLACK FOREST, a celebrated forest in Germany, in Suabia, more properly called the *SCHWATZWALD*, which see.

BLACK FRIARS; a name given to the Dominican order; called, also, predicants and preaching friars; in France Jacobins.

BLACKGUARD. This name was originally given to the scullions and coal-carriers to great houses and royal residences, who, in the progresses of the families from one place to another, usually rode in the carts with the pots and kettles. In modern nomenclature it stands for the low, base, vulgar, and impudent, whether they ride in coaches, or drive them; whether they wear stars or black shoes.

BLACKHALL (Dr. Offspring), bishop of Exeter in the beginning of the eighteenth century, was born at London, 1654, and educated at Cambridge. For two years he refused to take the oath of allegiance to king William and queen Mary, but at last submitted, though he condemned the Revolution, and all that had been done pursuant to it. He was a man of great piety, had much primitive simplicity and integrity, and a constant evenness of mind. In a sermon before the House of Commons, January 36th, 1699, he animadverted on Toland's assertions in his *Life of Milton*, that Charles I. was not the writer of the *Basilike*, and on some insinuations against the authenticity of the Holy Scriptures; which produced a controversy between him and that author. In 1600 he preached a course of sermons in St. Paul's at Boyle's lecture, which were afterwards published; and was consecrated bishop of Exeter in 1707. He died at Exeter in 1715.

BLACKHEATH, a fine elevated plain, in the county of Kent, five miles south-east of London, situated in the parishes of Greenwich, Lewisham, and Lee, and commanding very beautiful prospects both of the metropolis, and the country around. In 1400 the interview between Henry IV. and the emperor Manuel Palaeologus, when he visited England to solicit aid against Bajazet, took place on Blackheath. Holinshed, iii. 519. It was here that, in 1415, the citizens of London solemnly congratulated Henry V. after the battle of Agincourt. Ib. 556. Here, also, in the following year, the same body met the emperor Sigismund, who came to mediate a peace between France and England, and conducted him to the king, at Lambeth. Ib. On this plain the famous Wat Tyler mustered his 100,000 men. Here, also, Jack Cade appeared in 1450. Here were the royal head-quarters of the Lancasterians in the commencement of the contest between Henry VI and Edward IV.; and it was the plain of battle on which Lord Audley and the Cornish rebels were defeated, in 1497, by Henry VII. The site of Michael Joseph's tent was shown to Lambard when he wrote his *Perambulations of Kent*. It was called *The Smith's Forge*, for Joseph, one of the ringleaders in this insurrection, was by trade a blacksmith. Cardinal Campeius was received here on his arrival by a splendid deputation from the court, in 1519; and Henry VIII. twenty-one years afterwards, chose it as the spot on which he met Anne of Cleves. Holinshed, 948. In the year 1780 a cavern was discovered on the side of the ascent to Blackheath by the Dover road, consisting of seven spacious apartments, from twelve to thirty-six feet wide, some with large conical domes, thirty-six feet high, supported by a column of chalk, forty-three yards in circumference; 170 feet from the surface of the ground is a well of clear water twenty-seven feet deep. This noble plain is annually lessening by the number of houses erected on it.

BLACK ISLAND, an island near the coast of America, belonging to the state of Rhode island. Long. 71° 35' W., lat. 41° 7' N.

BLACK ISLANDS; islands near the coast of Labrador. Long. 56° 30' W., lat. 53° 54' N.

BLACKHALL HEAD, a cape on the south-west of Ireland, at the north side of the entrance into Bantry bay, in the county of Cork. Long. 9° 55' W., lat. 51° 32' N.

BLACKHEAD, a cape on the east coast of Ireland, at the north entrance into Belfast Lough, four miles north-east of Carrickfergus. 3. A cape on the south coast of Ireland, on the west side of Kinsale harbour, five miles south of Kinsale. 3. A cape on the west coast of Ireland, on the south side of the entrance into Galway bay. Long. 9° 11' W., lat. 53° 7' N. 4. A cape on the west coast of Scotland, in the county of Wigton, six miles W.S.W. of Stranraer. 5. A cape of England, on the coast of Cornwall. Long. 5° 4' W., lat. 50° 1' N. 6. A cape on the east coast of New Zealand, twenty-two miles N.N.E. of cape Kidnappers. 7. A cape on the east coast of Labrador. Long. 64° 50' W., lat. 59° 58' N.

BLACKING is a term sometimes used to sig-

nify a factitious black; as shoe-black, &c. A mixture of ivory or lamp-black with linseed oil makes a common oil-blackening. For a shining watery blacking small beer is used, in the proportion of about a pint to two ounces of ivory black, with the addition of half an ounce of brown sugar, and a quarter of an ounce of gum arabic. The white of an egg substituted for the gum makes the black more shining; but is supposed to hurt the leather, and make it apt to crack. The famous compositions under this name, that whiten the walls of the royal parks, &c., and the neighbourhood of various large towns, are notorious, we believe, for containing large portions of the oil of vitriol for the benefit of the tanners and shoe-makers. A celebrated maker and vender of one of these nostrums, we understand, actually reduced himself to blindness by his long attention to the concocting of it.

BLACK LAND, in agriculture, a term by which husbandmen denote a particular sort of clay soil, which, however, they know more by its other properties than by its color, which is rarely any thing like a true black, and often but a pale gray. This, however pale when dry, always blackens by means of rain; and when ploughed up at these seasons, it sticks to the ploughshares, and the more it is wrought, the muddier and duskier colored it appears. This sort of soil always contains a large quantity of sand, and usually a great number of small white stones.

BLACK-LEAD, *n. s.* from black and lead. A mineral found in the lead-mines, much used for pencils; it is not fusible, or not without a very great heat.

You must first get your *black-lead* sharpened finely, and put fast into quills, for your rude and first draught. *Peacham.*

BLACK LEAD; plumbago. See **LEAD**, **BLACK**.

BLACK LEATHER, is that which has passed the currier's hands, where, from the russet, as it was left by the tanners, it is become black, by having been scored and rubbed on the grain side with a solution of vitriolated iron, or, as it is vulgarly called, *copperas*. See **LEATHER**.

BLACK-LEGS, a name given in Leicestershire to a disease frequent among calves and sheep. It is a kind of jelly which settles in their legs, and often in the neck, between the skin and the flesh.

BLACKLOCK (Thomas), D. D., a Scottish divine and poet, was born in 1720, at Annan, in Dumfriesshire. His father was a bricklayer, respectable in his character, but of limited means. Before he was six years old, this son lost his sight by the small-pox; and being thus incapable of exercising any trade, his father encouraged the inclination he had early shown for books. By the aid of his companions at home he acquired some knowledge of Latin; and poetry, in his peculiar circumstances, possessed of course irresistible attractions for him. At twelve years of age he produced some pieces of considerable merit. At the age of nineteen he lost his father: and, some of his poems having been shown to Dr. Stevenson of Edinburgh, that gentleman formed the benevolent design of procuring for him in Edinburgh a classical education. Thither he accordingly went in 1741, as a student of divinity, and continued his studies

at the university till 1745. In 1746 he published a volume of his poems in 8vo., and obtained, among other literary acquaintance, that of the celebrated David Hume, who warmly interested himself in his favor. In 1754 these poems had reached a second edition in 8vo. Mr. Spence, professor of poetry at Oxford, from regard to the author, prefixed an account of his life and writings. About this time he made himself acquainted with the French language. In 1759 he was licensed as a preacher by the presbytery of Dumfries, and obtained no small reputation by the different sermons he preached, of which he left some volumes in MS. Having married in 1762, he obtained, by Lord Selkirk's interest, the royal presentation to the parish of Kirkcudbright, but the inhabitants strongly opposing the presentation, a moderate annuity was proposed to Mr. Blacklock upon his resigning his right to the living. With this provision he finally removed, in 1764, to Edinburgh, and opened a school, in which he continued until within a short time before his death. In 1767 the university of Aberdeen conferred on him the degree of D. D. Dr. Blacklock died after an illness of only eight days, on the 7th July, 1791. Besides his poems above-mentioned, he wrote *Paraclesis*, or *Consolations* deduced from *Natural and Revealed Religion*, &c.; also the *Graham*, an *Heroic Ballad*, 1774. See the article **BLIND**.

BLACK MAIL, in antiquity, a certain rate of money, corn, cattle, or other matter, anciently levied on the inhabitants of towns on the Scottish borders, by various persons allied with notorious robbers and adventurers of that neighbourhood, in order to be freed and protected from pillage. It was prohibited as felony, by 43 Eliz. c. 13.

BLACK MONKS, a denomination given to the Benedictines, called in Latin *nigri monachi*, or *nigro monachi*; sometimes *ordo nigrorum*, the order of blacks.

BLACKMORE, (Sir Richard), a physician, and voluminous writer of theological, poetical, and medical works. Having declared himself early in favor of the Revolution, king William, in 1697, knighted him, and chose him one of his physicians in ordinary. On queen Anne's accession, Sir Richard was also appointed one of her physicians. Dryden and Pope treated his poetical performances with great contempt; and in a note in the *Dunciad*, we are informed that his 'indefatigable muse produced no less than six epic poems: *Prince and King Arthur*, twenty books; *Eliza*, ten; *Alfred*, twelve; *The Redeemer*, six; besides *Job*, in folio; the whole book of *Psalms*; *The Creation*, seven books; *Nature of Man*, three books; and many more.' Gay gives us a satirical catalogue of his principal performances, which we have not space to insert. It will be quite enough for the reader to know, with regard to his Scripture pieces,

What wonders then the man grown old did,
Sternhold himself he out Sternhold'd;
Made David seem so mad and freakish,
All thought him just what thought king Achish.
No mortal read his Solomon,
But judg'd Rehoboam his own son;
Moses he serv'd as Moses Pharaoh,
And Deborah as she Sisera.

Addison, however, in the *Spectator* (No. 339), bestowed some liberal commendations on his poem on the Creation; and Johnson, at the close of a dull, sarcastic life of the poet, eulogises the same production. He died October 9th, 1729.

BLACK MOUNTAINS, a chain of mountains in Germany, in the circle of Suabia, one of the highest and most rugged of which, Mount Rottensolhe, was the scene of a most obstinate contest between the French and Austrians on the 9th July, 1796. The centre of the French army under General St. Cyr was four times repulsed, but the fifth charge proving successful, the Austrians were driven from the mountain with the loss of 1100 men.

BLACK NIB, a cape of Ireland, in the Irish Sea, on the east coast of the county of Down. Long. $5^{\circ} 24' W.$, lat. $54^{\circ} 21' N.$

BLACK PROCESSION, in ecclesiastical writers. Anciently at Malta, there was a black procession every Friday, where the whole clergy walked with their faces covered with a black veil.

BLACK-PUD'DING, *n. s.* from black and pudding. A kind of food made of blood and grain.

Though they were lined with many a piece

Of ammunition bread and cheese,

And fat black-puddings, proper food

For warriors that delight in blood. *Hudibras.*

BLACK RENTS, the same with **BLACK MAIL**, which see.

BLACK RIVER, a town of New Jersey, twenty-one miles N. N. W. of New Brunswick.

BLACK RIVER, a river of Ireland, which runs into Lough Corrib, eight miles south of Ballinrobe. 2. A river of America, which runs into Honduras Bay. Long. $85^{\circ} 28' W.$, lat. $15^{\circ} 55' N.$ 3. A river of South Carolina, which runs into the Pedee. Long. $99^{\circ} 5' W.$, lat. $23^{\circ} 29' N.$ 4. A river of America, which runs into Lake Michigan. Long. $86^{\circ} 52' W.$, lat. $42^{\circ} 42' N.$ 5. A river of Canada, which runs into lake Superior. Long. $86^{\circ} 52' W.$, lat. $48^{\circ} 40' N.$ 6. A river of North America, which runs into Black Bay, in Lake Superior. Long. $83^{\circ} 15' W.$, lat. $48^{\circ} 45' N.$ 7. A river of Jamaica, one of its largest streams, and navigable for canoes about thirty miles.

BLACK-ROD, *n. s.* from black and rod. The usher belonging to the order of the garter; so called from the black rod he carries in his hand; he is of the king's chamber, and likewise usher of the parliament.

BLACK SEA, or **EUXINE**. See **EUXINE**.

BLACK SHEEP, in Oriental history, the ensign or standard of a race of princes, once settled in Armenia and Mesopotamia; hence called the dynasty of the black sheep.

BLACK-SMITH, *n. s.* from black and smith, A smith that works in iron; so called from being very smutty.

The blacksmith may forge what he pleases. *Houel.*

Shut up thy doors with bars and bolts; it will be impossible for the blacksmith to make them so fast, but a cat and a whoremaster will find a way through them. *Spectator.*

BLACK, SPANISH, so called, because first invented by the Spaniards, and most of it bought from them; is no other than burnt cork, used in various works, particularly among painters.

BLACKSTONE, or **PAWTUCKET**, a river of the United States, in Massachusetts, which rises in Worcester county and running south-east passes into the State of Rhode Island, and runs over Pawtucket Falls, in that state, where mills are erected. Here it gets the name of Providence, and turning S. S. E. falls into the Naraganset Bay. It is navigable up to Providence, in ships of 950 tons burden.

BLACKSTONE (Sir William), an eminent English lawyer, was born in London in July 1723. His father, a silk mercer and citizen of London, died some months before his birth. He was the youngest of four children; and his mother died before he was twelve years old. From his birth, therefore, the care of his education and fortune was kindly undertaken by his maternal uncle, Mr. Thomas Bigg, an eminent surgeon of London. At seven years of age he was sent to the Charter-house, and applied himself to every branch of youthful education, with the same assiduity which accompanied his studies through life. At the age of fifteen he was at the head of the school, and well qualified to be removed to the university. He was accordingly entered a commoner at Pembroke college, in Oxford, on the 30th November, 1738, and the next day matriculated. About this time he obtained Mr. Benson's gold Milton prize-medal, for verses on that poet. In February, 1739, the society of Pembroke college unanimously elected him to one of Lady Holford's exhibitions for Charterhouse scholars. Before he was of age he compiled a treatise entitled Elements of Architecture, intended for his own use only. Having made choice of the law for his profession, he was entered in the Middle Temple on the 20th November, 1741, and on this occasion composed his Lawyer's Farewel to his Muse; since published by Doddsley in the fourth volume of his Miscellanies. In November, 1743, he was elected into the society of All-souls college; and in the November following delivered the anniversary speech in commemoration of archbishop Chichele, the founder, and other benefactors of the house. From this period he divided his time between the university and the Temple. In the former he pursued his academical studies, and on the 12th June, 1745, commenced bachelor of civil law; on the 28th November, 1746, he was called to the bar. Though little known in Westminster-hall, he was actively employed, during his occasional residence at the university, in attending to its interests, and improving its interior concerns. In May, 1749, as a small reward for his services, and to give him further opportunities of advancing the interests of the college, he was appointed steward of their manors. And in the same year, on the resignation of his uncle, Seymour Richmond, Esq., he was elected recorder of the borough of Wallingford in Berkshire. April 26th, 1750, he commenced doctor of civil law, and thereby became a member of the convocation, which enabled him to extend his views beyond the circle of his own society,

to the general benefit of the university. In the summer, 1753, he took the resolution of wholly retiring to his fellowship and an academical life, still continuing the practice of his profession as a provincial council. His Lectures on the Laws of England appear to have been an early and favorite idea; for immediately after he quitted Westminster-hall, he entered on reading them at Oxford; and even at their commencement, such were the expectations formed from the acknowledged abilities of the lecturer, that they were attended by a very crowded class of young men of the first families. But it was not till 1758 that the lectures in the form they now bear were read at the university. Mr. Viner having by his will left not only the copyright of his abridgment, but other property to a considerable amount, to the university of Oxford, to found a professorship, fellowship, and scholarships of common law, Mr. Blackstone was, on the 20th of October, 1758, unanimously elected Vinerian professor, and on the 25th read his introductory lecture. His lectures were now of such established reputation, that he was invited to read them himself to his late majesty Geo. III. when prince of Wales. This he declined, in consequence of his engagements in the university; but transmitted copies of many of them for the perusal of his royal highness. It is doubtful whether the Commentaries were originally intended for the press; many imperfect and incorrect copies, however, having been taken, and a pirated edition being expected to appear in Ireland, the learned lecturer thought proper to print a correct edition himself; and in November, 1765, published the first volume, under the title of Commentaries on the Laws of England: in the course of the four succeeding years the remaining parts of this admirable work appeared. Before this period, the reputation his lectures acquired him, had induced him to resume his practice in Westminster-hall; and, in a course somewhat inverted from the general progress of his profession, he who had quitted the bar for an academic life, was sent back from the college to the bar, with a considerable increase of business. He was likewise returned to parliament, first as member for Hindon, and afterwards for Westbury in Wilts. In the celebrated Middlesex election case he drew upon himself the attacks of various persons of ability in the senate, and likewise the animadversions of Junius; which circumstances probably strengthened his aversion to a parliamentary life. On the resignation of Mr. Dunning in 1770, he was offered the place of solicitor-general, which he refused; but soon after, on the promotion of Sir Joseph Yates to a seat in the court of common pleas, accepted a seat on the bench, and on the death of Sir Joseph succeeded him. As a judge he was not inactive, and, when not occupied in the duties of that station, was generally engaged in some scheme of public utility. The act for detached houses for hard labor for convicts, as a substitute for transportation, owed its origin in a great measure to him; as well as a considerable augmentation of the judges' salaries. This respectable author and valuable man died on the 14th February, 1780, in the fiftieth year of his age.

BLACK STRAKES, a range of planks immediately above the wales in a ship's side. They are always covered with a mixture of tar and lamp-black.

BLACKTAIL, *n. s.* from black and tail. A fish; a kind of perch, by some called ruffs, or popes. See POPE.

BLACKTHORN, *n. s.* from black and thorn. The same with the sloe. See PLUM, of which it is a species.

BLACK TIN, in mineralogy, a denomination given to the tin ore when dressed, stamped, and washed ready for the blowing house, or to be melted into metal. It is brought into this state by means of beating and washing; and when it has passed through several buddles, or washing troughs, it is taken up in form of a black powder, like fine sand, and called black tin.

BLACK WADD, in mineralogy. See MANGANESE.

BLACKWALL (Anthony), A. M. a learned author, after completing his academical education at Cambridge, was appointed head master of the free school, and lecturer of All-hallows, in Derby, where he distinguished himself in 1706 by an edition of Theognis. He was afterwards headmaster of the free school at Market-Bosworth in Leicestershire. Here he published, anonymously, A New Latin Grammar, being a short, clear, and easy Introduction of young Scholars to the Knowledge of the Latin Tongue; containing an exact account of the two first parts of Grammar. In his Introduction to the Classics, first published in 1718, 12mo. he displayed the beauties of the writers of antiquity to the understanding and imitation even of common capacities, in a concise and admirable manner peculiar to himself. But his most celebrated work, and one which is still considered as a standard book on the subject, is the Sacred Classics Defended and Illustrated; or, an Essay humbly offered towards preserving the Purity, Propriety, and True Eloquence of the Writers of the New Testament, in 2 vols. He died at Market Bosworth, April 8th, 1730.

BLACKWALL, an important hamlet of the county of Middlesex, adjoining to London, on the east side of the Thames. Here are very extensive docks and yards for shipping. The wet docks are the most capacious and best constructed of any in Great Britain. Vast quantities of nuts and fragments of trees were found here in digging some of them in 1790. See DOCKS.

BLACKWATER, a river of England, in the county of Essex, which rises from Saffron Walden, in the north-west part of the county, and is at first a continuation of the river Pant. Having passed Bocking, Coggeshall, and Kelvedon, it joins the Chelmer at Malden, and flows into an estuary called Blackwater Bay, celebrated for the quality of its oysters. 2. A river of England, which rises near Cranbourn, in the county of Dorset, and joins the Stour near its mouth. 3. A river of Ireland, which rises on the confines of Kerry, and running through the counties of Cork and Waterford, falls into the sea at Youghall Bay. Also, 4, a river of Ireland, which runs into Lough Neagh, five miles N.N.E. of Charlemont. 5. A river of Virginia, which runs into the Atlantic at

Black Bay. Long. $76^{\circ} 10' W.$, lat. $36^{\circ} 30' N.$ 6. A river of Maryland, which runs into the Chesapeake. Long $76^{\circ} 15' W.$, lat. $38^{\circ} 24' N.$ Also, 7, a river of New Hampshire, which joins the Merrimack. Long. $71^{\circ} 38' W.$, lat. $43^{\circ} 24' N.$

BLACKWELL (Alexander), a native of Scotland, who, not succeeding in his own country as a physician, endeavoured to establish himself as a printer in London. Here he also failed, then went to Sweden and practised physic; but engaging in a conspiracy with count Tessin, he was tortured and beheaded in 1747. The British ambassador was recalled the same year; among other reasons, for the imputations thrown on his Britannic Majesty in the trial of Dr. Blackwell. Soon after which appeared a genuine Copy of a Letter from a Merchant in Stockholm, to his Correspondent in London, containing an impartial Account of Dr. Blackwell, his Plot, Trial, &c.; in this work he is said to have denied on the scaffold the crime for which he died.

BLACKWELL (Elizabeth), wife of the preceding, published a curious Herbal, containing 500 cuts of useful plants, taken from the life, of which an improved edition, with the text in Latin and German was published at Nuremberg, in folio, 1750—1760; and at Leipzig, in 8vo. 1794.

BLACKWELL (Thomas), brother of the preceding Alexander Blackwell, was born in 1701, and died in 1757. He wrote, 1. Enquiry into the Life and Writings of Homer, 1735; and again in 1736. 2. Proofs of the Enquiry, &c. 1736. 3. Letters concerning Mythology, 8vo. 4. Memoirs of the Court of Augustus, 2 vols. 4to. 1755; and a third volume, which was posthumous.

BLAD'DER, *v.* & *n.* Ang.-Sax. *blædr*, Germ. *blatter*; Dutch, *bladder*; Swed. *bladra*; from the Ang.-Sax. *blæd*, wind, a vessel made of elastic materials, and capable of distension by air or liquid of any kind; that vessel in the body which contains the urine; a blister raised on the skin; a pustule, &c. any thing puffed or inflated.

That huge great body which the giant bore
Was vanquished quite, and of that monstrous mass
Was nothing left, but like an empty bladder was.

Spenser.

I have ventured,
Like little wanton boys that swim on bladders,
These many summers in a sea of glory,
But far beyond my depth: my highblown pride
At length broke under me.

Shakspeare.

A bladder but moderately filled with air, and strongly tied, being brought near the fire, grew exceeding turgid and hard; but being brought nearer to the fire, it suddenly broke, with so loud a noise as made us for a while after almost deaf.

Boyle.

The contents of the gall-bladder are not exactly of the same kind as what passes from the liver through the direct passage.

Paley's Theology.

BLADDER, in anatomy, a thin expanded membranous body, found in several parts of an animal, serving as a receptacle of some juice, or of some liquid excrement; from whence it takes various denominations, as urine-bladder, gall-bladder, &c. Below a certain magnitude they are more usually denominated in the diminutive, vesicles, or vesiculæ. See AIR-BLADDER, and AIR-VESSELS.

BLADDER, by way of eminence, is a large vessel, which serves as a receptacle of the urine of animals, after its secretion from the blood in the kidneys. This is sometimes also called, by way of distinction, the urinary bladder, vesica urinaria. The bladder is situated in the pelvis of the abdomen; in men immediately on the rectum; in women on the vagina uteri. Though the urinary bladder be naturally single, yet there have been instances of nature varying in this particular. The bladder of the famous Casaubon, upon dissecting his body after his death, was found to be double; and in the Philosophical Transactions, we have an account of a triple bladder found in the body of a gentleman, who had long been ill, and no one could guess the cause. The urinary bladders of brutes are differently contrived from the human bladder, and from each other, according to the structure, economy, and manners of living of each creature. See ANATOMY.

BLADDER, AIR. See AIR-BLADDER.

BLADDER, GALL. See ANATOMY.

BLADE, } Blade, *n.* s. Sax. *blæð*,
BLA'DING, } *blæð*, Fr. *bled*. The spire of
BLA'DED, } grass before it grows to seed;
BLA'DY, } the green shoots of corn which
BLADE'ONE, } rise from the seed. This seems

to be the primitive signification of the word blade; from which, I believe, the blade of a sword was first named, because of its similitude in shape; and, from the blade of a sword, that of other weapons or tools. But why, it may be asked, was this term applied to grass originally. Blat is a corruption of plat, and plat signifies flat,—the shoulder-blade, then, will be the flat-bone of the shoulder. The spire of grass is flat: but we are accustomed to associate with the term blade not only the flatness, but the sharpness of the spear and the sword. Etymology is, after all, but a very conjectural species of knowledge. Blade is metaphorically applied to any who pretends to the sharpness or brightness of a sword blade; thus used it is an expression of contempt.

He sought all round about, his thirsty blade
To bathe in blood his faithless enemy.

Faerie Queene.

For it is a kind of grasse with a stalk, as big as a great wheaten reed, which hath a blade issuing from the top of it, on which, though the cattle feed, yet it groweth every day higher, until the top be too high for an ox to reach.

Sir Francis Drake Revived.

When Phœbe doth behold
Her silver visage in the watery glass,
Decking with liquid pearl the bladed grass.

Shakspeare.

Anon comes Pyramus, sweet youth, and tall,
And finds his trusty Thisby's mantle slain.
Whereat, with blade, with bloody blameful blade,
He bravely broached his boiling bloody breast;
And, Thisby tarrying in mulberry shade,
His dagger drew and died.

Id.

Boldly assault the Necromancer's hall;
Where, if he be, with dauntless hardihood,
And brandish'd blade, rush on him, break his glass,
And shed the luscious liquor on the ground.

Milton. Comus.

You'll find yourself mistaken, Sir, if you'll take upon you to judge of these *blades* by their garbs, looks, and outward appearance. *L'Estrange.*

If we were able to dive into her secret recesses, we should find that the smallest *blade* of grass, or most contemptible weed, has its particular use. *Swift.*

Then, turning about to the hangman, he said, Dispatch me, I pri'thee, this troublesome *blade*. *Prior.*

Be his this sword, whose *blade* of brass displays A ruddy gleam, whose hilt a silver blaze. *Pope*

He fell most furiously on the broiled relics of a shoulder of mutton, commonly called a *bladebone*. *Pope.*

Strit not—lest even to thee perchance
Some erring *blade* or ball should glance.

Byron. Bride of Abydos.

BLADE, in botany, that part of a plant which arises out of the concave of the sheath, and, at the top, usually divides into two parts, which are covered with globules of the same nature as those of the apices, but not so copious. See **BOTANY**.

BLADE, in commerce, a thin slender piece of metal, either forged by the hammer or run and cast in moulds to be afterwards sharpened to a point, edge, or the like. Sword blades are made by the armourers, knife-blades by the cutlers, &c. The English and Damascus blades are most esteemed. Among the French, those of Vienne have the preference. The conditions of a good blade of a small sword are, that it be light and tough, apter to bend than break. When it will stand in the bend, it is called a poor man's blade.

BLADE-BONE. See **ANATOMY**.

BLADEN, a county of North Carolina, in the district of Wilmington, bounded on the south by Brunswick, on the north by Cumberland, on the east by New Hanover, on the west by the state of South Carolina, and on the north-west by Robeson county. The chief town is Elizabeth.

BLADEN (Martin), a lieutenant-colonel under the duke of Marlborough, was afterwards made a lord of trade, and employed in various civil capacities. He is principally known as the translator of Cæsar's Commentaries. Bladen was the uncle of Collins the poet.

BLADENSBURG, a post town of Maryland, in Prince George's county, on the east side of a branch of the Potomac, about seven miles above Washington. It is thirty-eight miles south-west by south of Baltimore, and 140 south-west by west of Philadelphia.

BLADHIA, in botany, a genus of plants of the class pentandria, and order monogynia. The generic character is, CAL. five-paitite: COR. 10-tata, fivefid: BERRY one seeded: SEED arillate. Four species are described, all natives of Japan.

BLÆRIA, in botany, a genus of the tetrandria monogynia class of plants. Its characters are: CAL. quadripartite: COR. quadrifid: STAM. inserted in the receptacle, and the fruit a capsule, with four cells, containing many seeds. There are two species.

BLÆSLING, in zoology, a synonyme of the greater coot, or fulica atenia. See **FULICA**.

BLÆSUS, among medical writers, the same with balbus; a stammerer or lisper.

BLAFART, in commerce, a small coin cur-

rent at Cologne, worth something more than a farthing of our money.

BLAGRAVE (John), was the second son of John Blagrave, Esq. of Bulmarsh-court in Berkshire, and descended of an ancient family. Being sent to Oxford, he applied himself chiefly to the study of mathematics; but without taking any degree. In his mansion near Reading, he passed most of his days, and died there in 1611. Among other charities, he left £10 to be annually disposed of in the following manner: On Good-Friday, the church-wardens of each of the three parishes of Reading send to the town-hall 'one virtuous maid, who has lived five years with her master;' there, in the presence of the magistrates, the three throw dice for the £10. The losers are returned with a fresh one the year following, and again the third year, till each has had three chances. His works are, 1. A Mathematical Jewel, London 1585 fol. 2. Of the Making and Use of the Familiar Staff, London 1590, 4to. 3. Astrolabium Uranicum Generale, London, 1596, 4to. 4. The art of Dialling, London, 1609, 4to.

BLAGRAVE (Joseph), a descendant of the same family, was born at Reading about the year 1609, and died at the age of seventy, leaving behind him an Introduction to Astrology, of which art he was a noted professor. He also wrote the Astrological Practice of Physic, printed in 8vo. a book on surgery, and a supplement to Culpepper's Herbel.

BLAIN', *n. s.* Sax. *blegene*. Dut. *bleyne*; a pustule; a botch; a blister.

Itches, *blains*,

Sow all the Athenian bosoms, and the crop

Be general leprosy.

Shakspeare.

Botches and *blains* must all his flesh imboss,

And all his people.

Milton.

Whene'er I hear a rival named,

I feel my body all inflamed;

Which, breaking out in boils and *blains*,

With yellow filth my linen stains. *Swift.*

BLAIN, among farriers, a distemper incident to horses, being a certain bladder growing on the root of the tongue, against the wind pipe, which swells so as to stop the breath. See **FARRIER**.

BLAIR, (Hugh), an eminent divine and critic of the eighteenth century, was descended from the Blairs of Blair, in Ayreshire. His great-grandfather, Robert Blair, was a strenuous opposer of Episcopacy in Scotland. The subject of this memoir was the son of Mr. John Blair, a respectable merchant, and one of the magistrates of Edinburgh. He was born on the 7th of April, 1718, and obtained his education at the high school. In the year 1739 he received the degree of M. A. He was licensed to preach by the presbytery of Edinburgh on the 21st of October, 1731. Upon the 23d of September, 1742, he was ordained minister of Colessie in Fifeshire. In 1743 he was admitted second minister of the Cannongate; he removed to lady Yesters, within the city, on the 4th of October, 1754; and from thence to the high church on the 15th of June, 1758. In 1757 the university of St. Andrews presented him with the degree of D.D. In 1755 his friends prevailed on him to deliver a course

of lectures on Rhetoric and Belles Lettres. This considerably raised his reputation, already of the first rank as a preacher, and in 1760 the town council of Edinburgh appointed him professor of Rhetoric in the university. In 1762 his majesty was pleased to confer a salary upon the office of £70 per annua. Dr. Blair first proposed, and carried into effect a subscription, to enable Mr. Macpherson to collect what remained of Ossian's poems, and wrote a dissertation to establish their authenticity. After reading his lectures in the university more than twenty years, he was induced to publish them in 1783. But the composition of sermons, and pulpit eloquence, had always been his chief object of pursuit, and the basis on which he wished to rest his fame. Crowded audiences, of every rank in life, had long decided the public opinion of his merits as a preacher. He even rendered religion fashionable among many in the higher ranks by whom it had formerly been despised. In 1777, therefore, he published a volume of sermons, which required a most extensive and rapid circulation, and was succeeded by a second volume in 1779. In 1780 he obtained a pension of £200 a year, at the particular request it is said of her late majesty. His growing infirmities, in 1783, induced him to retire from the regular discharge of his professional duties, and an addition was now made of £100 a year to his pension. Other volumes of his sermons have been published since his decease. Their circulation has been unparalleled, and they have been translated into most of the languages of Europe. With a taste nice and discriminating, a judgment clear and well informed, language chaste and perspicuous, Dr. Blair attains a happy medium between the declamatory addresses of the French preachers, and the abstruse metaphysical style of many of our English divines. Every thing he discusses is made attractive, and our moral feelings are warmed and invigorated by the most exquisite and imperceptible art: but some reasonable objections have been taken to the singular absence of principles, peculiarly *religious*, in his sermons. 'Scriptural doctrines' says a valuable contemporary, 'do not always appear to have been illustrated by him with sufficient attention, nor Scriptural motives to have obtained a place due to their importance; and too strong a bias may perhaps be observed, in his writings, in favor of moral discussions, abstracted from the consideration of the truths inculcated by Revelation.' Dr. Blair died on the morning of Saturday the 27th of December, 1800, in the eighty-third year of his age, and the fifty-ninth of his ministry.

BLAIR (John), L. L. D. and F. R. S. an eminent chronologist, was educated at Edinburgh; and was for some time usher to a school in Hedge Lane, London. In 1754 he gave the world that valuable publication, *The Chronology of the History of the World, from the Creation to the year 1753*. Illustrated in LVI. Tables. This volume, in which he is said to have been assisted by his cousin Dr. Hugh Blair, is dedicated to lord chancellor Hardwicke; it soon established his fame, and produced a happy change in his destiny. In January 1758, he was elected F. R. S. and in

1761, F. S. A. In 1756 he published a second edition of his tables. In September 1757 he was appointed chaplain to the princess Dowager of Wales, and mathematical tutor to the duke of York; and in 1761 obtained a prebendal stall at Westminster, the vicarage of Hinchley, and the rectory of Burton Coggles in Lincolnshire. In September 1763 he attended his royal pupil on a tour to the continent; visited Lisbon, Gibraltar, Minorca, and the principal cities in Italy, and several parts of France; and returned in August 1764. In 1768 he annexed to the new edition *Fourteen Maps of Ancient and Modern Geography*, for illustrating the *Tables of Chronology and History*, and a *Dissertation on the progress of Geography*. In March, 1771, he was presented to the vicarage of St. Bride's in London. In April, 1776, he resigned St. Bride's, and was presented to the rectory of St. John in Westminster. He died June 24th 1782. A course of his *Lectures on the Canons of the Old Testament* were published by his widow.

BLAIR (Robert), a Scottish divine and poet, was born in 1701, and died in 1747. He was the author of the well-known poem entitled *The Grave*, first printed in 1743, and since frequently reprinted.

BLAISE, a river of France in the department of Eure and Loire, formerly giving name to the Blaisois, a *ci-devant* province of France, bounded on the north by Beauce, on the east by the Orleanois, on the south by Berry, and on the west by Touraine.

BLAISE (St.), a martyr who suffered in the fourth century, under Dioclesian, by command of Agrieola, governor of Cappadocia. He is said to have had his flesh torn with iron combs previous to his being beheaded, which seems to be the cause for the respect paid to his memory by wool-combers.

BLAISE (St.), KNIGHTS OF, a military order instituted by the kings of Armenia. Justinian calls them knights of St. Blaise and St. Mary, and places them not only in Armenia, but in Palestine. The precise year of their institution is not known.

BLAIZE, CAPE, a promontory on the coast of West Florida, in the Gulf of Mexico, which separates the bay of Apalache on the east from that of St. Joseph; into which last it turns in the shape of a shepherd's crook.

BLAKE, (Robert), a famous English admiral, born in August 1589, at Bridgewater in Somersetshire, where he was educated. He went from thence to Oxford, in 1615, and in 1617, he took the degree of B. A. In 1623 he wrote a copy of verses on the death of Camden, and soon after left the university. The puritan party returned him member for Bridgewater, in 1640; and he served in the parliament army with great courage during the civil war: but when the king was brought to trial, he highly disapproved the measure as illegal, and said frequently, 'he would as freely venture his life to save the king, as ever he did to serve his parliament.' In 1648-9 he was appointed, in conjunction with colonel Dean and colonel Popham, to command the fleet; and soon after blocked up prince Maurice and prince Rupert in Kinsale

harbour. On their getting out, Blake followed them from port to port: and at last attacked them in that of Malaga, burnt and destroyed their whole fleet, two ships only excepted; the Reformation, in which prince Rupert himself was, and the Swallow, commanded by prince Maurice. In 1652 he was constituted sole admiral; when he defeated the Dutch fleet commanded by Van Tromp, Ruyter, and De Wit, in three several engagements, in which the Dutch lost eleven men of war, thirty merchant ships, and 15,000 men. Soon after, Blake, and his colleagues, with a grand fleet of 100 sail, stood over to the Dutch coast; and forced the enemy into the Texel, where they were kept some time by Monk and Dean, while Blake himself sailed northward. At last, however, Tromp escaped and drew together a fleet of 120 men of war. On the third of June, therefore, Dean and Monk came to an engagement with the enemy off the North Foreland, with indifferent success: but the next day Blake coming to their assistance with eighteen ships, gained a complete victory. In April 1653, Cromwell having turned out the parliament, and assumed the supreme power, Blake is said to have observed on this occasion to his officers, 'It is not for us to mind state affairs, but to keep foreigners from fooling us.' In November 1654 Cromwell sent him with a strong fleet into the Mediterranean, with orders which he well executed to support the honor of the English flag. In the beginning of December, Blake came into the road of Cadiz, where he was treated with all imaginable respect: a Dutch admiral would not hoist his flag while he was there; and his name was now so formidable, that a French squadron having stopped one of his tenders, which had been separated from Blake in a storm, the admiral, as soon as he knew to whom it belonged, sent for the captain on board, and drank Blake's health before him with great ceremony, under a discharge of five guns. The Algerines were so much afraid of him, that, stopping the Saltee rovers, they obliged them to deliver up what English prisoners they had on board, and sent them freely to Blake, to purchase his favor. This, however, did not prevent his coming on the 10th of March before Algiers, and sending an officer on shore to the dey to demand satisfaction for the piracies committed on the English. The dey conciliated him by an apology, accompanied with a large present of fresh provisions, and Blake leaving Algiers, sailed on the same errand to Tunis, where the dey returned for answer a defiance and denied him the liberty of taking in fresh water. 'Here, said he, are our castles of Goletta and Porto Ferino; do your worst.' Blake now, therefore, deliberately demolished these fortresses, and sent nine of the enemy's own vessels, which he found in the harbour, up to the town as fire-ships. This daring action spread the terror of his name through Africa and Asia. From Tunis he sailed to Tripoli, and to Malta, and obliged the respective governments to restore the effects taken by privateers from the English, and so established the glory of the English name, that most of the princes and states of Italy thought fit to pay their compliments to the protector, by solemn embassies.

He passed the next winter either in lying before Cadiz, or in cruising up and down the straits; and was at his old station, at the mouth of that harbour, when he received information that the Spanish plate fleet had put into the bay of Santa Cruz, in the island of Teneriffe. Upon this he weighed anchor, with twenty-five men of war, on the 13th of April 1657; and on the twentieth rode off the bay of Santa Cruz, where he discovered sixteen Spanish ships, in the form of a half-moon. Near the mouth of the haven stood a strong and well defended castle; besides which there were seven forts round the bay, joined by a line of communication manned with musketeers. To make all safe, Don Diego Diaques, general of the Spanish fleet, caused the smaller vessels to be moored close along the shore; while the six large galleons stood farther out at anchor, with their broadsides towards the sea. Notwithstanding these advantages possessed by the enemy, and the strength of the place, Blake burnt or sunk all the ships of the Spanish fleet, and by a fortunate change of wind came out without loss. It is here worthy of remark, that Blake's own brother having failed in some part of duty during this service, he immediately removed him from his command, although he still behaved to him with fraternal affection. Finding a complicated disorder of a dropsical and scorbutic kind, now making rapid progress, he sailed for England, and amidst his frequent enquiries for the sight of the English coast, expired while the fleet was entering Plymouth-sound, August 27th, 1657. The protector ordered him a magnificent public funeral in Westminster Abbey, whence, however, his body was pitifully expelled at the Restoration; and Englishmen suffered a prince, who himself betrayed their country, to remove this brave admiral's bones, as those of a rebel, to St. Margaret's church-yard.

BLAKEA, in botany, a species of the class dodecandria monogynia: with a calyx composed of six leaves below, and entire above; six petals, and a six-celled polyspermous capsule. There is only one species.

BLAME, *v. & n.*

BLAM'ING,

BLAMA'BLE,

BLAM'ABLENESS,

BLAME'ABLY,

BLAM'E'FUL,

BLAME'LESS,

BLAME'LESSLY,

BLAME'LESSNESS,

BLA'MER,

BLAME'WORTHY,

BLAME'WORTHINESS.

Dut. *blamen.* Fr.

blasmer. Ital. *biasmare.*

Probably from the

Greek, *βλάμμα*, per-

fect of the verb *βλάπτω*.

To hurt, signifying to

deal harshly with.—

Blame is the mildest

daughter in the severe

family of censure: to

blame, expresses less

than to reprove; we

simply charge with a fault in blaming; but in reproving, severity is mixed with the charge: reproach expresses more than either; it is to blame acrimoniously; to blame is simply to find fault with; to pass an unfavorable judgment upon; it is, for the most part, the act of a superior.

Immortal God! that savedst Susanne
From false *blame*, and thou merciful mayde,
Mary, I mene, daughter to saint Anne,
My socour be, or elles shall I die.

Chauce.

He wondered at her wisdom heavenly rare,
Whose like in women's wit he never knew;
And when her courteous deeds he did compare,
Gan her admire, and her sad sorrow rue,
Blaming of fortune, which such troubles threw,
And joyd to make proofe of her cruelty
On gentle dame, so hurtlesse and so trew.

Spenser.

The soveraigne of the seas he *blames* in vain,
That once sea beaten will to sea againe.

Id.

Our power

Shall do a courtesy to our wrath, which men
May *blame*, but not controul.

Shakespeare.

I unspeak mine own detraction; here abjure

The taints and *blames* I laid upon myself,
For strangers to my nature.

Id.

Blunt-witted lord, ignoble in demeanour,

If ever lady wronged her lord so much,

Thy mother took into her *blameful* bed

Some stern untutored churl.

Id.

Although the same should be *blameworthy*, yet this
age hath forborn to incur the danger of any such
blame.

Hooker.

In me you've hallowed a pagan muse,
And denized a stranger, who, mistaught
By *blamers* of the times they marred, hath sought
Virtues in corners.

Donne.

Fair angel, thy desire which tends to know

The works of God, thereby to glorify

The great workmaster, leads to no excess

That reaches *blame*, but rather merits praise.

Milton.

Porphyrus, you too art did tempt your fate;

'Tis true, your duty to me it became;

But, praising that, I must your conduct *blame*.

Dryden.

Each finding, like a friend,

Something to *blame*, and something to commend.

Pope.

In arms, the praise of success is shared among
many; yet the *blame* of misadventures is charged
upon one.

Hayward.

They lay the *blame* on the poor little ones, some-
times passionately enough, to divert it from them-
selves.

Locke.

It is the wilful opposing explicit articles, and not
the not believing them when not revealed, or not
with that conviction, against which he cannot *blame-
lessly*, without pertinacy, hold out, that will bring dan-
ger of ruin on any.

Hammond.

BLAMONT, or BLANBENBERG, a town of
France, in Lorraine, the head of a canton in the
department of the Meurthe. It is seated on the
Vezouse, sixteen miles east of Lunéville, and
thirty-two E.S.E. of Nancy. Population 1860.
Long. 6° 52' E., lat. 48° 40' N.

BLANC, MOUNT, so called from the mountain,
was a French department from 1792 till 1815.
It consisted of the Duchy of Savoy. It was bound-
ed on the west by the Rhone, which separates it
from the department of the Ain; on the north by the
lake of Geneva; on the east by the Alps, which
divide it from the Valais and Piedmont; and on
the south by the departments of the Upper Alps
and Isere. It was eighty-three miles in length
from west to east, and sixty-seven in breadth from
north to south; though some geographers make it
ninety miles long and eighty broad. The surface
is hilly, and the air cool, but the soil is fertile;
and those mountains which are not covered with
snow in winter abound with pastures that feed
vast numbers of cattle. The lakes swarm with

fish, and the woods with stags, fallow deer, roe-
bucks, wild boars, marmots, hares, partridges
wood-cocks, pheasants, &c. The inhabitants are
sober and industrious. The principal rivers are
the Arc, the Isere, and the Arve. Chambery is
the capital. This was the ancient patrimonial
inheritance of the dukes of Savoy, before they
became kings of Sardinia. For its history, be-
fore its annexation to France, see SAVOY.

BLANC, MOUNT; Fr. Mont Blanc, i. e. the
white mountain; a stupendous mountain of
France, in the above department, the highest
elevation of the Alps, and, indeed, of Europe.
Its mantle of circumventive snow gives it this
name.

As seen from the Col de Balme, and the
vale of Chamouni, the summit of Mont Blanc
seems to be of a roundish form, its surface smooth
and covered with snow, its whole appearance
uniting beauty with grandeur, and its towering
head rising majestically above the surrounding
mountains; but, when seen from the valley of
Aosat, its sides are less completely covered with
snow, its aspect is more rugged and dark, and the
prospect which it presents partakes more of the
wild and terrific. It rises imperceptibly from
amidst the numerous irregular mountains which
bound the vale of Chamouni, then terminates
rather abruptly in a point or top called Aiguille
de Goute, or Dôme de Gouté. Beyond this
height, with a considerable hollow between, it
forms another mount, called by some Little Mont
Blanc, or, more properly, the Middle Dome.
From this station it gradually sinks again into a
concave surface, in the midst of which is a small
pyramid of ice; and then reaches its highest point
of elevation, which is in the shape of a compressed
hemisphere, and is called from its form La Bosse
du Dromedaire. Upon a nearer inspection, the
summit of this gigantic mountain is found to be
a very narrow ridge, lying nearly in a horizontal
direction, resembling the roof of a house; and, at
its west end particularly, scarcely sufficiently
broad to admit of two persons walking abreast.
The snow which covers the top is encrusted with
ice, of a firm consistence, but penetrable by a
staff; and beneath this icy surface, especially on
the declivities of the summit, is discovered a soft
dusty snow without any cohesion.

Strata of granite form the highest rocks of
Mont Blanc, running parallel to one another,
and nearly in a vertical direction. Those on the
east side are mixed with steatites; those on the
south with schorl and lapis cornus; and some
of them, about 150 yards below the summit,
have the appearance of having been shivered
with lightning. According to M. De Luc, its
height above the level of the sea is 2391½ French
toises, or 15,304 English feet; according to Sir
George Shuckburgh 15,662 feet; and, according
to other observations, 15,680 feet, or nearly three
English miles above the level of the sea.

M. De Saussure observed the silene acaulis,
or moss campion, in flower, at the elevation of
11,392 feet above the sea; still higher, on the
most elevated rocks, he found the lichen sulphu-
reus and lichen rupestris of Hoffman; and, on
the summit, he noticed two butterflies on the
wing, which he supposed to have been driven

thinner by the wind. On the top of Mont Blanc, on the third day of August, Reaumur's thermometer stood, in the shade, at $2\frac{1}{2}$ below the freezing point, or 27 of Fahrenheit; while, at the same time, at Geneva, it was found at 22·6 or 82 of Fahrenheit, which gives a difference of nearly 25 degrees of Reaumur, or 55 of Fahrenheit, between the temperature of the atmosphere at both places. De Luc's barometer fell to $16\cdot01\frac{40}{1000}$, while it stood at Geneva at $27\cdot2\frac{0\cdot5}{1000}$, a difference of 11·2, with a small fraction. By experiments with the hygrometer the air was found to contain six times less humidity than that of Geneva; and to this extreme dryness of the atmosphere, the burning thirst, which Saussure and his companions experienced in the extraordinary elevation, is supposed to have been owing. While fifteen or sixteen minutes are sufficient to boil water at Geneva, and fourteen or fifteen at the sea side, it requires half an hour on the top of this mountain. By experiments with the electrometer, the electricity of the air was found to be positive, and the balls diverged only three lines; and by experiments with lime water, and the caustic alkali, atmospheric acid, or fixed air, was detected in the atmosphere. Owing to the extreme rarefaction of the air, sounds were remarkably feeble, and the report of a pistol discharged on the summit, did not exceed that of a small Chinese cracker in a room. From the same cause respiration becomes exceedingly difficult at so immense an altitude; and it was found that the pulses of three persons which beat at Chamouni, in a state of repose, 49, 60, and 72, were increased, on the summit of Mont Blanc, to 98, 112, and 100.

A sketch of the adventurous attempts to ascend this noble mountain may not be uninteresting to the reader. The first adventurer upon this arduous task was M. Couteran, who took the three guides of Chamouni, Michael Paccard, Victor Tissay, and Marie Coutet. They set out from the priory about eleven o'clock in the evening, on the 13th of July 1776; and after spending fourteen hours in surmounting many dangerous ascents, crossing valleys of ice, and traversing plains of snow, reached the top next to Mont Blanc, about 13,000 feet above the Mediterranean. They at first imagined themselves to be within a league of its summit; but soon perceived that it would require four hours more to reach it; and as the day was advanced, and the vapors gathering into clouds, they were obliged, with regret, to relinquish their enterprise; and, after a journey of twenty-two hours, arrived at Chamouni about eight o'clock in the evening.

The indefatigable Bourrit was the next traveller, who, after repeated unsuccessful attempts, departed from Bionasay on the 11th of September 1784, accompanied by six guides, and was scaling, as he expressed it, the rampart of Mont Blanc, when he was so extremely affected by the intensity of the cold as to be unable to proceed. But two of his guides, Marie Coutet, and Francis Guidet, having gone before their company, ascended to the dome of Gouté; passed the middle dome, and walked along the ridge between that and the summit, as far as some high rocks, which appear from the vale of Chamouni like small points in

the snow; but the approach of night compelled them to return.

On the 4th of September, 1785, Marie Coutet, and James Balmat, reached a place under a rock at a considerable elevation, where they passed the night; and setting out before sun-rise, passed the dome of Gouté, and were proceeding towards the summit, when a violent storm of hail obliged them to desist. On the 13th Messieurs de Saussure and Bourrit, with twelve guides, left Bionasay, passed the night at a hut, which they had ordered to be constructed, about 7808 feet above the level of the sea, and reached the dome of Gouté next morning without much difficulty; but a fresh fall of snow rendered farther progress impracticable. In July, 1786, six guides of Chamouni failed in another attempt; but James Balmat, one of their number, having been separated from his companions, passed the night in a spot above the dome of Gouté, more than 12,000 feet above the level of the sea; and, having reconnoitred the situation next morning, observed a place of more easy access than any that had hitherto been attempted. On his return to Chamouni he communicated his observation to Dr. Paccard, a physician of the place, who attended him during a severe indisposition, the effect of the cold and fatigue to which he had been exposed; and, in gratitude for that gentleman's attendance, engaged to conduct him to the summit of the mountain. They set out from Chamouni on the 7th of August, spent the night on the mountain of La Côte; at three in the morning pursued their route to the dome of Gouté; passed under the middle dome towards the east, along the ridge which is seen from Geneva, and which lies on the left of the summit. Here Dr. Paccard was almost deterred by the cold and fatigue from pursuing the enterprise; but encouraged by Balmat to proceed, and frequently walking sideways to shelter their faces from the piercing wind, they at length, about six o'clock in the afternoon, and after an ascent of fifteen hours, attained the summit of Mont Blanc. They remained about half an hour on this memorable spot, where the cold was so intense as to freeze the provisions in their pockets, congeal the ink in their inkstands, and sink the mercury of Fahrenheit's thermometer to $18\frac{1}{2}$ degrees; their faces were excoriated, their lips swelled, and their sight greatly debilitated by the reflexion of the snow.

On the 13th of August, 1787, M. de Saussure set out from Chamouni, accompanied by eighteen guides, and provided with a tent, mattresses, philosophical instruments, and all necessary accommodations. They passed the first night on the top of the mountain La Côte; encamped at four o'clock in the following afternoon, about 12,762 feet above the level of the sea; and next morning pursued the ascent in places frequently so steep that the guides were obliged to hew out steps with a hatchet. After a very slow progress, and frequent halts for breath, they reached the summit about eleven o'clock in the forenoon; where they remained four hours and a half, enjoying a most sublime and extensive prospect, and making a variety of useful and interesting experiments. Here they observed the surround-

ing mountains, not in regular lines and continued ridges, as they appear when viewed from the plain, but in the most irregular groups and insulated masses; connected indeed at their bases, yet completely detached from each other, distinct in their forms, and separated at their summits. In this elevated station they experienced great difficulty of respiration, which was increased by the slightest exertion, by a stooping posture, and by the use of wine or brandy; were kept in a state of continued fever, and tormented with a burning thirst; felt no appetite for food, no relish for strong liquors, no relief in any thing but in draughts of fresh water. About two o'clock in the afternoon they began to descend; and arrived next morning, without any accident, at the valley of Chamouni. On the eighth of August, a few days after Saussure's expedition, Mr. Beaufoy, an English gentleman, succeeded in a similar attempt; but, on account of the enlargement of the chasms in the ice, it was accomplished with greater difficulty. See *Coxe's Travels in Switzerland*, vol. 2. *Saussure's Voyages dans les Alpes*, vol. 4.

The following account of an attempt to reach the summit of Mont Blanc in 1820 was supplied by one of the gentlemen of the party to the *New Monthly Magazine*, and is interesting as containing one of the best descriptions of the avalanche of these regions with which we are acquainted. The writer, Mr. Dornford, says it is the only original account of the attempt yet published.

'About the middle of last August I arrived at Geneva, accompanied by my friend H—, of Brazenose, whom I had fallen in with at Berne, and who was, like myself, devoting a part of the long vacation to a Continental tour. I had, before leaving England, set my heart upon ascending Mont Blanc, and found no difficulty in prevailing on my companion, who had already made the tour of the greater part of Switzerland, to accompany me. Having called on a gentleman of Geneva, to whom I had an introduction, with a view of making the necessary enquiries, I learnt from him that a small party were then on the point of setting out with the same intention. I lost no time in finding them out, and proposing to share in their undertaking; and the following afternoon, August 16, we set off together, in a hired calèche, for the valley of Chamounix. Our party consisted of four persons. Our new acquaintances were Le Chevalier Hamel, a Russian, then employed by the emperor in making some philosophical observations in the neighbourhood, and M. Sellique, an optician of Geneva, and native of Paris, a man of considerable attainments in various branches of natural philosophy. His grand object in accompanying us was to make trial of a new barometer, of his own construction, in measuring the height of Mont Blanc, the accuracy of some former observations for the same purpose having been recently called in question. Dr. Hamel had already made, ten days before, an unsuccessful attempt to reach the summit by a different route, being the same which Saussure attempted in 1785.

'At length, the long-expected morn arrived: at four o'clock we were summoned from our

beds, where we had not enjoyed much sleep, and about five we all set out on foot, making with the guides a party of sixteen. These latter were each furnished with a knapsack pretty well loaded, in which were placed provisions for three days for the whole party, mathematical instruments, additional clothing for ourselves on the following day, four blankets, &c.

'Our caravan assumed a most romantic appearance; the costume of the guides, each with a French knapsack, and one or two with old pelisses, being decidedly military. It reminded me strongly of a party of guerillas in the Pyrenees, where uniformity either in dress or appointments was considered as an unnecessary refinement. We had each a large straw hat tied under the chin, and a spiked-pole, about eight feet long, in our hands. Besides this, our shoes were furnished with short spikes at the heels to assist us in the descent. We were clothed as lightly as possible, that the motion of our limbs might not be impeded, for we were told to expect a march of eleven or twelve hours, the latter half of which was to be spent in climbing.

'In about two hours we reached the last human abode, being a chalet or summer-cottage, inhabited by François Favret, who had been one of Saussure's guides, and whose son was in our party. The veteran mountaineer, Favret, accompanied us about three hours higher up to the edge of the glacier, to carry his son's knapsack, and then followed us with his eyes till we disappeared in one of the awful fissures, with which it is everywhere intersected. We had left the wood behind us just before we reached the chalet, and the ascent was now considerably steeper. We trod for some time a very precarious path along the brink of an awfully deep and precipitous ravine, where I occasionally felt some tendency to dizziness. This feeling, however, I concealed so successfully, that I believe neither the guides nor my companions had any suspicion of it; and by following Saussure's advice, in the published account of his ascent, and fixing my eyes steadfastly upon the precipice, I gradually accustomed myself to the view, and was soon enabled to pursue my path with the greatest confidence. By the time we reached the Pierre de L'Echelle, a large round stone, where we halted for breakfast, on the edge of the glacier, I felt quite at home, and resigned myself completely to the delightful sensations which our situation inspired. In a cavern below this rock our guides found a ladder, which they had left there the year before, and which they employ in the passage of the Glacier de Bossons, now close before us. It was about half-past nine when we reached this resting place, and we felt disposed to do justice to a couple of cold fowls, which were produced from the knapsack of one of the guides. These were soon despatched, together with a bottle of light French wine, and in twenty-five minutes we resumed our march.

'Five minutes march from the Pierre de L'Echelle brought us to the edge of the Glacier de Bossons, and we entered immediately on a track, which baffles all description. The Mer de Glace, which has been compared to a sea sud-

denly congealed in the midst of a storm, cannot, our guides assured us, enter into competition with it. The fissures are so frequent, so wide, so deep, the different views, varying every instant, which the scenery presents, are so awful, so fantastic, that no adequate idea of them can be presented to the mind by the most eloquent pen. At one time the traveller finds himself denied apparently all further progress by an immense precipitous tower of ice: this is surmounted by a stair-case of notches, which one of the guides cuts in the ice with a hatchet, which he carries for that purpose. Then he must descend into an awful chasm, from which he must emerge in the same manner. Again he meets with fissures, called by the guides crevasses, of unknown depth, which are crossed by laying the ladder over them, and passing on all fours. If the crevasse be too wide for the length of the ladder, the traveller must descend down one side, and re-ascend the opposite one, which is the most formidable method of all. On one or two occasions, when we came to crevasses of this description, we were obliged to descend by the ladder upon a wall of ice, not above a foot in breadth, which divided the crevasse longitudinally. This would not hold above one or two at a time, so that the first party were forced to mount the opposite brink, before the second party descended; and the ladder was thus passed backwards and forwards, until all had crossed, one of the guides remaining all the time stationary on the wall to move the ladder. Here the least giddiness would probably have been fatal, but happily we were by this time so well broken in, that we contemplated the blue gulphs on each side with tolerable composure.

During the first part of the passage of the glacier, we were exposed to the fall of some globular masses of ice, which, from the velocity with which they whizzed past us, must have come from a considerable height. One of the guides, however, stood sentry on an elevated post, to advertise us of their approach. In several places, bridges of snow, of very different degrees of strength, are formed across the crevasses. Dr. Hamel was impatient, and offered to show the way over one, for, to our eyes, there seemed to be no danger; but our guide obliged us to return some distance to find another method of passing over the crevasse. In about ten minutes, we arrived at a spot considerably lower, from whence we could see the bridge in profile; and we then saw that his suspicions were well-founded, the farther side of the bridge not being above six inches thick; so that had we persisted, one or two of the party must have fallen through. I mention this as an instance of the extreme caution of the guides, where there is any real danger, and to prove the falsehood of a charge, which was afterwards brought against us, of having forced the guides to proceed contrary to their better judgment. In about three hours, we reached the further side of the glacier, a distance of somewhat less than a mile.

We now ascended several slopes of snow of different elevations, from thirty to sixty degrees, in a zig-zag direction. I think this method of proceeding brought the danger more home to

my mind than any other. The surface being quite hard, the guides were obliged to cut notches for our steps, and these being very irregular, the difficulty of maintaining the balance was much increased: a single false step might have been fatal, and the view of the immense distance we must in that case inevitably fall, tended to unnerve the mind. After proceeding in this way, for about an hour, we arrived by a very steep slope, at the base of the Grand Mulet, a name given to a ridge of rocks, or rather a single rock, which rises almost perpendicularly to a great height, out of the eternal snow which surrounds it on all sides, and which is, from the nature of its construction, generally bare of snow itself. In ascending this ridge, we had a new species of danger to contend with. Our steps were all upon loose fragments of the rock, which was schistous. These occasionally gave way beneath our tread, and fell, with a tremendous noise, into the depths below. Owing, however, to the caution of our excellent guides, who perpetually warned us against suspicious stones, we surmounted this perilous ascent without any accident. At half-past four we reached the summit of the ridge, where we were to pass the night; having been about eleven hours and a half walking and climbing, almost without intermission: our guides soon constructed for us a kind of tent, but scarcely had we got under cover than it began to rain, and in about an hour we had a violent thunder-storm, which continued, with but little intermission, during the whole night. In the morning the way was equally dangerous to advance or retreat; or rather the latter, on examination, was found impossible; and it was soon too late to proceed upwards, since it was absolutely necessary to return to the same rock to sleep, so that, at length, we made up our minds to pass another night in our present bivouac.

Our amusements during the day of our compelled halt, were very similar to those of a piquet on an outpost, which commands a view of the enemy's camp; for the greater part of the time was spent in looking through an excellent telescope belonging to M. Sellique, and in reconnoitring the ground below. From our elevated post, we saw distinctly the windows of our hotel at the Prieuré, and sometimes fancied we discovered some one there watching us in a similar manner. Sometimes we lounged over a pamphlet of Saussure's ascent, from which we gathered that he had taken a day and a half to arrive at our present situation, accompanied by eighteen guides. We made arrangements for letting off our rockets at night, and some considerable time was occupied in mending one of Dr. Hamel's barometers, an air-bubble having found its way into the tube during the ascent of the day before. I was employed in making a bottle of lemonade for the following day, when it was pronounced excellent, and proved an admirable substitute for the wine, against which our feverish palates revolted. The evening of this day being also rainy, we reserved our fireworks for the following one, to celebrate our return; but about two o'clock in the morning we saw the stars through the apertures of our canvass, though the fog still seemed

rising from the valley. We were thus kept in suspense until five o'clock, when the sun, silvering with its rays the summit of the mountain, appeared, as it were, to invite us onward.

At twenty minutes past eight we arrived at the Grand Plateau, where the rug was soon spread, and we were glad to repose for a few minutes. From this height we had a most magnificent view of the scenery below. The morning fog having been gradually dissolved, we now saw every thing with the utmost distinctness. Hitherto we had seen nothing beneath us but a tranquil sea of white clouds, pierced here and there by the summit of some elevated crag, which appeared like an island in the midst of the deep; but now the whole valley was thrown open to our sight. We had a distinct view of the Lake of Geneva, and the heights beyond: while the ridge of the Jura bounded the panorama to the west. The Aiguille du Midi, which, during the early part of our ascent, had seemed to vie in height with Mont Blanc itself, now lay at our feet. The Dome de Gouté, on our right, was still a little above us; and we saw several avalanches, which had fallen from thence during the night. We had not, as yet, suffered much from the difficulty of respiration, partly because we had addressed ourselves to the ascent with empty stomachs, and partly from the steady deliberate step with which we continued to ascend. Though we felt no great appetite, yet, at the urgent entreaties of the guides, who assured us that we should feel it absolutely impossible to eat as we advanced higher up, we finished two more of the chickens. The lemonade proved much more acceptable, for we had now arrived at a high state of fever, and our thirst was incessant. About nine we resumed our march, with the expectation of reaching the summit at half-past eleven, and without another regular halt. After having proceeded an hour and a quarter, according to our usual method, in a zig-zag course, in the direction of the summit, and having at length reached the level of the Dome de Gouté, still at some distance on our right, we suddenly made an obtuse angle to the left, and thus leaving the Dome behind us, directed our course towards the eastern shoulder of the mountain, called by the guides the Mont Maudit. On our arrival there, we were to make one more bend to the right, and this last tack, to use a nautical phrase, would conduct us to the summit. In turning the corner of the Mont Maudit, we expected to incur some difficulty; but it was the last, the ascent from thence to the summit being very gradual. In encountering these mauvais pas, as the guides call them, recourse was to be had to the ropes, to attach ourselves together by threes in a party; but, as this passage was a work of five or ten minutes only, we did not anticipate much danger; or rather, it was hardly possible to think of danger, with the end of all our toils so full in our view. We were now scarcely 400 yards below the level of the summit, and expected to reach it in less than an hour.

About twenty minutes after the change in our direction above alluded to, the difficulty of breathing gradually increasing, and our thirst being incessant, I was obliged to stop half a minute

to arrange my veil; and the sun being at that moment partially concealed by a cloud, I tucked it up under the large straw hat which I wore. In this interval, my companion H—— and three of the guides passed me, so that I was now sixth in the line, and of course the centre man. H—— was next before me; and, as it was the first time we had been so circumstanced during the whole morning, he remarked it, and said we ought to have one guide at least between us, in case of accident. This I overruled by referring him to the absence of all appearance of danger at that part of our march, to which he assented. I did not then attempt to recover my place in front, though the wish more than once crossed my mind, finding, perhaps, that my present one was much less laborious. To this apparently trivial circumstance I was indebted for my life. A few minutes after the above conversation, my veil being still up, and my eyes turned at intervals towards the summit of the mountain, which was on the right, as we were crossing obliquely the long slope above described, which was to conduct us to the Mont Maudit, the snow suddenly gave way beneath our feet, beginning at the head of the line, and carried us all down the slope to our left. I was thrown instantly off my feet, but was still on my knees and endeavouring to regain my footing, when, in a few seconds, the snow on our right, which was of course above us, rushed into the gap thus suddenly made, and completed the catastrophe by burying us all at once in its mass, and hurrying us downwards towards two crevasses about a furlong below us, and nearly parallel to the line of our march. The accumulation of snow instantly threw me backwards, and I was carried down, in spite of all my struggles. In less than a minute I emerged, partly from my own exertions, and partly because the velocity of the falling mass had subsided from its own friction. I was obliged to resign my pole in the struggle, feeling it forced out of my hand. A short time afterwards I found it on the very brink of the crevasse. This had hitherto escaped our notice, from its being so far below us, and it was not until some time after the snow had settled, that I perceived it. At the moment of my emerging, I was so far from being alive to the danger of our situation, that on seeing my two companions at some distance below me, up to the waist in snow, and sitting motionless and silent, a jest was rising to my lips, till a second glance showed me that, with the exception of Mathieu Balmat, they were the only remnants of the party visible. Two more, however, being those in the interval between myself and the rear of the party, having quickly re-appeared, I was still inclined to treat the affair rather as a perplexing though ludicrous delay, in having sent us down so many hundred feet lower, than in the light of a serious accident, when Mathieu Balmat cried out that some of the party were lost, and pointed to the crevasse, which had hitherto escaped our notice, into which, he said, they had fallen. A nearer view convinced us all of the sad truth. The three front guides, Pierre Carrier, Pierre Balmat, and Auguste Tairray, being where the slope was somewhat steeper, had been carried down with

greater rapidity, and to a greater distance, and had thus been hurried into the crevasse, with an immense mass of snow upon them, which rose nearly to the brink. Mathieu Balmat, who was fourth in the line, being a man of great muscular strength, as well as presence of mind, had suddenly thrust his pole into the firm snow beneath, when he felt himself going, which certainly checked, in some measure, the force of his fall. Our two hindmost guides were also missing, but we were soon gladdened by seeing them make their appearance, and cheered them with loud and repeated hurrahs. One of these, Julien Devouassoux, had been carried into the crevasse, where it was very narrow, and had been thrown with some violence against the opposite brink. He contrived to scramble out without assistance, at the expense of a trifling cut on the chin. The other, Joseph Marie Couttet, had been dragged out by his companions, quite senseless, and nearly black from the weight of snow which had been upon him. In a short time, however, he recovered. It was long before we could convince ourselves that the others were past hope, and we exhausted ourselves fruitlessly for some time in fathoming the loose snow with our poles. When the sad truth burst upon us, our feelings may perhaps be conceived, but cannot be expressed. The first reflection made involuntarily by each of us—'I have caused the death of those brave fellows,' however it was afterwards overruled in our calmer moments, was then replete with unutterable distress. We were separated so far from one another by the accident, that we had some distance to come before we could unite our endeavours. The first few minutes, as may be readily imagined, were wasted in irregular and unsystematic attempts to recover them. At length, being thoroughly convinced, from the relative positions of the party when the accident happened, that the poor fellows were indeed in the crevasse, at the spot pointed out by Mathieu Balmat, the brother of one of them; in our opinion, only one thing remained to be done, and that was to venture down upon the snow which had fallen in, and, as a forlorn hope, to fathom its unknown depths with our poles. After having thus made every effort in our power for their recovery, we agreed to abandon the enterprise altogether, and return to the Grand Mulet.'

The party did make every possible effort to ascertain the situation of their lost companions. They ventured, against the judgment of the remaining guides, on the loose snow, and, after thrusting in their poles to their full length, knelt down and applied their mouths to the end, shouting along them, and then listening for an answer, in the fond hope that they might be still alive, sheltered by some projection of the icy walls of the crevasse; 'but, alas!' adds the narrator, 'all was silent as the grave, and we had too much reason to fear that they were long since insensible, and probably at a vast depth beneath the snow on which we were standing. We could see no bottom to the gulf on each side of the pile of snow on which we stood; the sides of the crevasse were here, as in other places, solid ice, of a cerulean color, and very beautiful to the

eye. Two of the guides, our two leaders, had followed us mechanically to the spot, but could not be prevailed upon to make any attempts to search for the bodies. One of these soon proposed to us to continue the ascent. This was Marie Couttet, who had escaped so narrowly with his life; but Julien Devouassoux loudly protested against this, and resolutely refused to advance. Whether or not we could have prevailed on a sufficient number to accompany us to the summit, I cannot say; but we did not bring the point to trial, having now no room left in our minds for any other idea than that of the most bitter regret. I hardly know whether we should then have felt sufficient interest to lead us a hundred yards onwards, had that been the only remaining interval between us and the summit. Had we recovered our lost companions, I am sure the past danger would not have deterred us; but to advance, under present circumstances, required other hearts than ours.'

BLANC DE BERRY, a town of France, in the department of the Indre, and ci-devant province of Berry; seated on the river Creuse, which divides it into two parts. The land about it is barren, and full of trees, heath, and lakes. It is thirty-five miles east of Poitiers. Population about 4000.

BLANC COURSIER HERALD, created by patent on the revival of the order of the Bath, 1725, 'to attend the first and principal companion of the order for the time being.' He enjoys all rights, privileges, and immunities as any other herald; and his office is united, and perpetually consolidated with the office of genealogist of the said order.

BLANCA, an island on the coast of Terra Firma, and one of the small Antilles, north of Margareta.

BLANCHARD (James), a painter, was born at Paris, who acquired the rudiments of his profession under Nicholas Boller, his uncle; but left him at twenty years of age, and travelled into Italy. He staid two years at Rome, and from thence went to Venice, where he became charmed with the works of Titian, Tintoret, and Paul Veronese, and followed their manner. His capital piece is a picture of the descent of the Holy Ghost, in the church of Notre Dame. He died in the flower of his age, in 1683. Blanchard is esteemed the best of the French colorists.

BLANCHE, v. } Fr. *blanc*; Ital. *bianco*;
BLANCHER, } Span. *blanco*; Ang.-Sax. *blanc*;
can; Germ. *blinken*; blinken, to shine, to glitter, to twinkle or blink; and, by consequence, to whiten. Thus to blanch is to illuminate; to whiten; to give a fair appearance; a fair face to any thing; it is now obsolete in the sense of blinking; that is of shrinking from, and evading what is unpleasant; though it has this meaning as used by Sidney.—*Ency. Met.*

The judges thought it dangerous to admit ifs and ands, and to qualify treason; whereby every one might express his malice, and blanch his danger.

Bacon.

Optimi consiliiarii mortui; books will speak plain, when counsellors blanch.

Id.

You can behold such sights,
And keep the natural ruby of your cheeks,
When mine is blanch'd with fear. *Shakspeare.*
()

A way of whitening wax cheaply may be of use; and we have set down the practice of tradesmen who blanch it. *Boyle.*

And sin's black dye seems *blanched* by age to virtue. *Dryden.*

Their suppers may be bisket, raisins of the sun, and a few *blanched* almonds. *Wiseman.*

BLANCHE, CARTE. See CARTE.

BLANCHE DE LA PORTE, the wife of Baptista de la Porta, a native of Padua, distinguished herself, in the thirteenth century, by her courage and her chastity. On the death of her husband at the siege of Bassano, she was violated by the conqueror Acciolinus; and, to escape the repetition of his brutality, she threw herself into the tomb of her husband, and caused a stone to fall upon her, by which she was crushed to death.

BLANCHING, in coinage, the operation performed on the planchets, or pieces of silver, to give them the requisite lustre and brightness. Pieces of plate are also blanching when it is wished to have them continue white, or have only some parts of them burnished. See METALLURGY.

BLANCH-LYON, one of the pursuivants at arms.

BLANCO, CAPE, a promontory of European Turkey, on the south coast of the Morea. Long. $21^{\circ} 56' E.$, lat. $36^{\circ} 44' N.$ 2. A cape on the south coast of the island of Sicily. Long. $13^{\circ} 10' E.$, lat. $35^{\circ} 28' N.$ 3. A cape on the north coast of Corsica, a little to the west of Cape Corso. 4. A promontory on the south coast of Corfu, one of the Ionian islands. Long. $20^{\circ} 6' E.$, lat. $39^{\circ} 28' N.$ 5. A cape on the north coast of Spain, in the principality of Asturias. Long. $6^{\circ} 54' W.$, lat. $43^{\circ} 35' N.$ 6. A promontory on the west coast of Iviça, one of the Pithyusæ islands. Long. $1^{\circ} 16' E.$, lat. $39^{\circ} 1' N.$ 7. A cape on the south coast of the island of Majorca. Long. $2^{\circ} 45' E.$, lat. $39^{\circ} 21' N.$ 8. A promontory of Naples, on the east coast of Calabria. Long. $17^{\circ} 25' E.$, lat. $38^{\circ} 59' N.$ 9. A cape of Syria, in the Mediterranean. Long. $35^{\circ} 6' E.$, lat. $33^{\circ} 2' N.$ 10. A cape on the west coast of Natolia. Long. $26^{\circ} 18' E.$, lat. $38^{\circ} 14' N.$ 11. A cape on the south-west coast of the island of Cyprus. Long. $32^{\circ} 15' E.$, lat. $35^{\circ} 12' N.$ 12. A cape on the western coast of Africa. It projects to a considerable distance into the sea, and except Cape Verd, forms the most westerly point of this continent. It was discovered by the Portuguese in 1441. The approach is dangerous. Long. $16^{\circ} 58' E.$, lat. $20^{\circ} 47' N.$ 13. A cape on the coast of Morocco, near Mazagan. Long. $9^{\circ} 20' W.$, lat. $33^{\circ} 10' N.$ 14. A cape in Tunis, near Bizerta. Long. $9^{\circ} 50' E.$, lat. $37^{\circ} 15' N.$ 15. A cape on the coast of Peru, about 120 miles west of Guayaquil. It forms the south point of the great gulf of Tumbez, or Guayaquil. Long. $81^{\circ} 6' W.$, lat. $4^{\circ} 18' S.$ 16. A cape on the coast of the province of Costa Rica, and kingdom of Guatemala. 17. A cape on the coast of Brasil, in the province of Paraíba. 18. A cape on the coast of Terra Firma, and province of Venezuela. 19. A cape on the north-western point of the bay of Salinas, in the tenth degree of northern latitude, on the coast of Terra Firma. In some maps it is called the western point of

the gulf of Nicoya. 20. A cape on the north-west coast of New Albion. 21. A cape of Patagonia, south-east of Julian Bay, eight leagues west of Pepys' island.

BLANCS MANTEAUX, a name originally given to the Servites, or servants of the Blessed Virgin, on account of their white cloaks; but since applied to divers sorts of religious, who have successively inhabited the house of the Servites.

BLAND', *adj.* Lat. *blandus*, soft; mild; BLAN'DIMENT, } gentle. To smooth; to soften; to flatter by words or BLAN'DISH, } gestures; kind speeches; BLAN'DISHING, } BLAN'DISHMENT. } tender carressing.

The little babe up in his arms he hent,
Who, with sweet pleasure and bold *blandishment*,
'Gan smile. *Spenser.*

Lo! there before his face his ladie is,
Under black stole hyding her bayted hooke,
And, as half blushing offred him to kis,
With gentle *blandishment* and lovely looke,
Most like that virgin true, which for her knight him took. *Id.*

Mustering all her wiles,
With *blandished* parleys, feminine assaults,
Tongue-batteries, she surceased not day nor night
To storm me over-watched, and wearied out. *Milton.*

In her face excuse
Came prologue, and apology too prompt;
Which, with *bland* words at will, shethus addressed. *Id.*

Each bird and beast, behold
Approaching two and two; these cowering low
With *blandishment*. *Id.*

Adam waked, so customed, for his sleep
Was aery light, from pure digestion bred,
And temperate vapors *bland*, which the' only sound
Of leaves and fuming rills, Aurora's fan,
Lightly dispersed, and the shrill matin song
Of birds on every bough. *Id.*

Strong were his hopes a rival to remove,
With *blandishments* to gain the public love. *Dryden.*

An even calm
Perpetual reigned, save what the zephyrs *bland*
Breathed o'er the blue expanse. *Thomson.*

BLAND (Elizabeth), daughter of Robert Fisher of Long-acre, and wife of Mr. Nathaniel Bland, a linen-draper in London, was a lady distinguished in the seventeenth century by her skill in the Hebrew, particularly in writing the Hebrew character. A philactery in Hebrew, of her writing, is preserved among the curiosities of the Royal Society.

BLANDA, in ancient geography, a Roman city in the territory of Barcino, in Hispania Citerior: now called Blanes.

BLANDFORD, or BLANDFORD-FORUM, a market town of Dorset, ten miles north-west from Wimborne-Minster, and $103\frac{1}{2}$ west from London. It is situate on the Stour, near the Downs; and contains 2643 inhabitants, employed in trade and manufactures, principally that of shirt-buttons, made by females. This was a British town long before the arrival of the Romans. It gives the title of marquis to the duke of Marlborough; and is governed by a bailiff and ten common-councilmen, who have power to purchase and enjoy lands in fee; a common seal, and a serjeant-at-mace. It formerly sent members to parliament. Two of the

capital burgesses can determine suits in the borough, not exceeding £10. The church is a neat modern structure, in the Grecian style. The streets are handsome, and the houses generally built of brick.

Blandford has suffered more by fires than any other town in England. Camden and Coke mention one which happened before 1579; and by another, in 1677, it was almost destroyed. In 1713 a fire consumed the greatest part of East-street; and in 1731 the whole town, except that part of East-street which had been before burnt, was destroyed. This fire began at a soap-boiler's at the corner of two streets, and communicated to a grocer's, where was a cask of gunpowder, which, being blown up, dispersed the burning thatch and embers in every direction, communicating them also by the drift of a strong wind, to the neighbouring villages of Blandford, St. Mary, and Brianstone. 'Almost the whole town,' it is said by a spectator, 'was in flames together about seven o'clock; and the goods and furniture carried into the streets for safety, were abandoned to destruction by the owners. The church was long preserved, but the steeple at length caught fire, and was quenched oftener than once. At midnight, however, the flames were seen breaking through the roof, and in two hours afterwards the lead melted; the stones split, and flew; nay, so fervent and irresistible was the heat, that the bells themselves dissolved and ran down in streams.' On this occasion fourteen persons perished, 400 families were burnt out of their houses, and the value of the property destroyed, exclusive of what was covered by insurances, amounted to £84,348. To add to the calamity, the small pox was raging at the time, yet of sixty families infected by it, who were all removed under hedges in the fields, only one person died. A great scarcity of provisions prevailed the morning after the fire, but this was soon relieved by the neighbourhood, and sixty wooden buildings were speedily erected to shelter the sufferers. Towards the rebuilding of the town, king George II. subscribed £1000, the queen £200, and the prince of Wales £100.

Near Blandford stood the famous Damary oak, which was rooted up for firing in 1755. In 1747 it measured seventy-five feet high, the branches extending seventy-two; the trunk at the bottom was sixty-eight feet in circumference, and twenty-three in diameter; it had a cavity in its body fifteen feet wide. During the civil war, and till after the Restoration, an old man sold ale in it; and when the town was burnt down, it sheltered a whole family.

BLANDFORD, a thriving town of Virginia, pleasantly situated in a plain, on the eastern branch of Appamatow river, containing 1200 inhabitants. It is ten miles north-east of Petersburg. The marshes in the vicinity of the town, which formerly rendered it unhealthy, are now drained.

BLANDFORDIA, in botany, a genus of what Linnæus calls the patrician order. Class, hexandria; order, monogynia. Natural order, cornæ. Linn. Its essential characters are, cor. funnel-shaped, with six marginal segments: filaments inserted into the tube: caps. stalked, of three cells:

SEEDS, numerous and bristly. The species are, 1. *B. nobilis*, scarlet blandfordia. 'Bractæas but half the length of the partial stalks while in flower. Leaves narrow-linear.' *Br.*—Native of the neighbourhood of Port Jackson. 2. *B. grandiflora*, large-flowered blandfordia. Bractæas nearly as long as the partial stalks while in flower; the inner but one-third as large as the outer.—Observed at Port Jackson by Mr. Brown.

BLANDONONA, in ancient geography, a small city of Liguria in Italy: now called Bron, or Broni.

BLANDRATA (George), an Italian physician of the sixteenth century, who successively professed Popery, Lutheranism, Calvinism, Arianism, and Socinianism, and was at length assassinated by his nephew, to whom he had left his property, in 1593. In 1568 he printed a controversial treatise entitled *Brevis Enarratio Disputationis Albanæ de Deo trino*, &c. in one volume 4to.

BLANES, anciently Blanda, a sea-port of Spain, in Catalonia, seated near the Toderà, twenty miles south of Girona.

BLANK' *v. n. s. & adj.* } This is undoubtedly
BLANK'NESS. } ly of the same etymology, and of the same meaning as blanch. It is used, however, more frequently in a metaphorical sense, to express the emotions of the mind when inward terror turns the face pale; and the white and ghastly look reveals the astonishment and dismay which are working in the breast. Paper unsoiled is blank, that is, white; thus any thing without marks or characters is blank: blank also signifies nonplused; confounded: to blank is to evade; to confuse; to efface; to annul: a blank is when any thing is wanting.

All former purposes were *blanked*, the governour at a bay, and all that charge lost and cancelled.

Spenser.

Our substitutes at home shall have *blank* charters, Whereunto, when they know that men are rich, They shall subscribe them for large sums of gold.

Shakspeare.

If you have heard your general talk of Rome, And of his friends there, it is lots to *blanks* My name hath touched your ears. *Id.*

For him, I think not on him; for his thoughts, Would they were *blanks*, rather than filled with me. *Id.*

Slander,
Whose whisper o'er the world's diameter,
As level as the cannon to his *blank*,
Transports its poisoned shot. *Id.*

DUKE. And what's her history.

VIO. A *blank*, my lord: She never told her love,
But let concealment, like a worm i' the bud,
Feed on her damask cheek. *Id.*

To the *blank* moon
Her office they prescribed; to the' other five
Their planetary motions. *Milton.*

Dagon must stoop, and shall ere long receive
Such a discomfit, as shall quite despoil him
Of all these boasted trophies won on me,
And with confusion *blank* his worshippers. *Id.*

If the atheist, when he dies, should find that his
soul remains, how will this man be amazed and
blanked! *Tillotson.*

Adam, soon as he heard
The fatal trespass done by Eve, amazed,
Astonied stood and *blank*; while horror chill
Ran through his veins, and all his joints relaxed.

Milton.

For the book of knowledge fair,
Presented with an universal *blank*
Of nature's works, to me expunged and rased.

Id.

There without such boast, or sign of joy,
Solicitous and *blank*, he thus began.

Id.

In fortune's lottery lies
A heap of *blanks*, like this, for one small prize.

Dryden.

She has left him
The *blank* of what he was;
I tell thee eunuch, she has quite unmanned him.

Id.

I cannot write a paper full as I used to do; and
yet I will not forgive a *blank* of half an inch from
you.

Swift.

Life may be one great *blank*, which, though not
blotted with sin, is yet without any characters of
grace or virtue.

Rogers.

So strong the zeal to immortalize himself
Beats in the breast of man, that even a few,
Few transient years, torn from the abyss abhorred
Of *blank* oblivion, seems a glorious prize,
And even to a clown.

Cowper. Task.

BLANK, a small copper coin, formerly current
in France, at the rate of five deniers Tournois.
There were also greater blanks, or pieces of
three blanks, and others of six, in respect where-
of the single sort were called little blanks; but of
these they are all become only monies of account.

BLANK, in coinage, a plate or piece of gold
or silver, cut and shaped for a coin, but not yet
stamped.

BLANKS, in judicial proceedings, certain void
spaces sometimes left by mistake. A blank (if
something material be omitted) in a declaration,
abates it; and such a blank is a good cause of
demurrer.

BLANK VERSE, in modern poetry, that com-
posed of a certain number of syllables, without
the assistance of rhyme. See **POETRY**.

BLANKENHEIM, a small territory of Ger-
many, which had the title of a county, and was
part of that of Eyffel, near the archbishopric of
Cologne and duchy of Juliers; it was annexed to
France in the revolution, and included in the
department of the Rhine and Moselle.

BLANKET, *v. & n.* } French, *blanchet*. A
BLANKETING. } woollen cover, soft, and

loosely woven, spread commonly upon a bed,
over the linen sheet, for the procurement of
warmth; a covering. To blanket, is to cover
with, to hide, to toss in a blanket. It is used
metaphorically by Shakspeare, from the verb to
blank.

Nor heaven peep through the *blanket* of the dark,
To cry, hold! hold!

Shakspeare.

My face I'll grime with filth;
Blanket my loins; tie all my hair in knots.

Id.

The abilities of man must fall short on one side or
other, like too scanty a *blanket* when you are a-bed;
if you pull it upon your shoulders, you leave your
feet bare; if you thrust it down upon your feet, your
shoulders are uncovered.

Temple.

Ah, oh! he cried; what street, what lane, but
knows

Our purgings, pumpings, *blanketings*, and blows?

Pope.

BLANKET, in commerce, a warm woolly sort
of covering. For the manufacture of blankets, Wit-
ney in Oxfordshire has long been famous. See
WITNEY.

BLANKOF (John Teunisz), a painter of great
talent, was born at Alcmær in 1628, and re-
ceived his earliest instruction from Arent Tier-
ling. He was afterwards the disciple of Peter
Scheyenburg and Cæsar Van Everdingen; after
which he went to Rome, and copied the best
masters. He was admitted into the society of
Flemish painters called Bentvogels, who gave
him the name of Jan Maat, and by that name he
is most generally known. His subjects are land-
scapes, views of rivers, sea-shores, havens, ports,
&c. which he executed with a light free pencil.
He died in 1670.

BLANQUILLE, in commerce, a small silver
coin, current in Morocco and on the coast of
Barbary, worth about three-halfpence.

BLAPS, in entomology, one of the fabrician
genera of coleopterous insects; the palpi cla-
vated, and four in number; jaws straight and
bifid; lip membranaceous and cleft; and the
antennæ moliniform at the tip. Gmelin adopts
the genus only as a subdivision of *pinelia*.

BLAPSICULA, in botany, a species of *cyanus*.

BLARE, in commerce, a small copper coin of
Bern, nearly of the same value with the batz.

BLAREGNIES, a town of France, in the
ci-devant province of Hainault. Near this place
the English and their allies, under the duke of
Marlborough, obtained a very bloody victory
over the French, in 1709. The armies on each
side consisted of 120,000 men, of whom at least
30,000 were killed. This battle is most com-
monly called the battle of Malplaquet. See
MALPLAQUET. Blaregnies is seven miles south
of Mons.

BLAS, a cape of South America, on the coast
of Darien, and kingdom of Terra Firma, which
runs two leagues into the sea, and is very dan-
gerous. It is eighteen miles from Porto Bello,
and sixty-two from Carthagena.

BLASE (Bishop). See **BLAISE**.

BLASIA, in botany, a genus of the cryptoga-
mia class and hepaticæ order of plants: male,
solitary; female, no calyx; capsule, imbedded
in the frond, oblique, one-celled, with a tubular
mouth; seeds, numerous. One species only, *B.*
pusilla, a native of Britain, which grows natu-
rally on the banks of ditches and rivulets, in a
gravelly or sandy soil. It grows flat upon the
ground in a patch, composed of numerous thin,
green, pellucid leaves, marked with a few whitish
veins near the base, divided and subdivided
into obtuse segments obscurely crenated on the
edges. The margins of the leaves are a little
elevated, but the interior parts adhere close to
the ground by a fine down which answers the
purpose of roots. The seeds are so small as to
be almost imperceptible.

BLASKETS, or **FERRITERS ISLANDS**, a clus-
ter of islets in the Atlantic, near the west coast
of Ireland. The largest is about three miles

long and half a mile broad, lying at the north side of the entrance into Dingle bay. Long. 10° 22' W., lat. 52° 5' N.

BLASPHEME, } Low Lat. *blasphemo* ;
 BLASPHEMER, } Old Fr. *blasphemer* ; Gr.
 BLASPHEMERESS, } *βλασφημειν, Βαλλω, Peto,*
 BLASPHEMING, } to assail ; and *φημη, fama,*
 BLASPHEMOUS, } fame or reputation. Blas-
 BLASPHEMOUSLY. } phemy, therefore, in its
 BLASPHEMY. } simple acceptation, is an
 assault upon character. But it is now almost
 exclusively applied to any insult offered to the
 Deity.

From thence into the sacred church he broke
 And robd the chancell, and the desks downe threw,
 And altars fouled, and *blasphemy* spoke,
 And the images, for all the goodly hew,
 Did cast to ground, whilst none was them to rew.

Spenser.
 I punished them oft in every synagoge, and com-
 pelled them to *blaspheme*. *Acts.*

O man, take heed how thou the gods dost move.
 To cause full wrath, which thou canst not resist ;
Blasphemous words the speaker vain do prove.

Sidney.
 The truest issue of thy throne
 By his own interdiction stands accursed,
 And does *blaspheme* his breed. *Shakspeare.*
 But that my heart's on future mischief set,
 I would speak *blasphemy*, ere bid you fly ;
 But fly you must. *Id.*

And darest thou to the Son of God propound
 To worship thee accurst ; now more accurst
 For this attempt, bolder than that on Eve,
 And more *blasphemous* ? *Milton.*
 For this he shall live hated, be *blasphemed*,
 Seized on by force, judged, and to death condemned. *Id.*

Even that *blasphemer* himself would inwardly re-
 verence his reprover, as he in his heart really despises
 him for his cowardly base silence. *South.*

Where is the right use of his reason, while he
 would *blasphemously* set up to controul the commands
 of the Almighty ? *Swift.*

Intrinsic goodness consists in accordance, and sin
 in contrariety, to the secret will of God ; or else God
 could not be defined good, so far as his thoughts and
 secrets, but only superficially good, as far as he is
 pleased to reveal himself, which is perfect *blasphemy*
 to imagine. *Hammond.*

Blasphemy, strictly and properly, is an offering of
 some indignity, or injury, unto God himself, either
 by words or writing. *Ayliffe.*

A man can hardly pass the streets, without having
 his ears grated with horrid and *blasphemous* oaths and
 curses. *Tillotson.*

Those who from our labours heap their board,
Blaspheme their feeder, and forget their lord. *Pope.*

Inspire me, night ! with all thy tuneful spheres,
 Whilst I with seraphs share seraphic themes,
 And shew to men the dignity of man,
 Lest I *blaspheme* my subject with my song. *Young.*

Pale meagre spectres wander all around,
 And pensive shades and black deformed ghosts,
 With impious fury some aloud *blaspheme*. *Mrs. Rowe.*

BLASPHEMY is a crime recognised by the civil
 and canon law, and by both the statute and
 common law of England. Justinian adjudged
 to it the punishment of death. An old Scotch
 law doomed the offender to undergo the ampu-
 tation of his tongue. By the canon law the

punishment of it is only a solemn penance upon
 laymen, in the church, and by general custom,
 either a pecuniary or corporal punishment, but
 not death. The 9 & 10 William III. enacts,
 that the offence shall be visited with legal in-
 capacities and imprisonment. This statute ex-
 pressly included Anti-Trinitarians, but so much
 of it as affected them was repealed by the Trinity
 Bill, which passed in 1813 ; notwithstanding
 which, it is doubted whether the common law
 does not still regard the denial of the Trinity as
 a crime.

The English word is derived from the Greek,
 and the original is a compound term, bearing the
 signification of wounding the reputation, of de-
 traction or calumny. The Hebrew word, which
 is translated by the Greek term, now explained
 in the LXX., and by *blasphemy* in the English
 version, is of the same meaning, *רר* opprobrium
 vel convicium, aut *blasphemia est hujus radices*
 interpretatio.—Concord. Sac. Bib. Heb. Calasio,
 ed. Romaine. Both words denote slander, or
 wilful, malignant falsehood against whomsoever
 directed. But, as amongst the Jews contumelious
 language with regard to Jehovah was the highest
 of crimes, the Hebrew word was at length ap-
 propriated to that particular offence.

Dr. Campbell is the only modern critic who has
 treated expressly of the subject of *blasphemy*,
 with a view to correct some popular mistakes
 upon it. 'In theological disputes, nothing is
 more common,' says he, 'to the great scandal
 of the Christian name, than the imputation of
blasphemy, thrown by each side upon the other.
 The injustice of the charge on both sides will be
 manifest on a little reflection, which it is the
 more necessary to bestow, as the commonness of
 the accusation, and the latent but contagious
 motives of employing it, have gradually perverted
 our conceptions of the thing.

'It has been remarked,' he adds, 'already,
 that the import of the word *βλασφημία* is maledi-
 centia, in the largest acceptation, comprehending
 all sorts of verbal abuse, imprecation, reviling,
 and calumny. Now let it be observed, that when
 such abuse is mentioned as uttered against God,
 there is properly no change made in the significa-
 cation of the word ; the change is only in the ap-
 plication, that is, in the reference to a different object.
 The idea conveyed in the explanation now given
 is always included, against whomsoever the
 crime be committed. In this manner every term
 is understood that is applicable to both God and
 man. Thus the meaning of the word *disobey* is
 the same, whether we speak of disobeying God
 or of disobeying man. The same may be said
 of believe, honor, fear, &c. As, therefore, the
 sense of the term is the same, though differently
 applied, what is essential to constitute the crime
 of detraction in one case, is essential also in the
 other. But it is essential to this crime, as com-
 monly understood, when committed by one man
 against another, that there be in the injurious
 person the will or disposition to detract from
 the person abused. Mere mistake in regard to
 character, especially when the mistake is not
 conceived by him who entertains it to lessen the
 character, nay, is supposed, however erroneously,
 to exalt it, is never construed by any one into

the crime of defamation. Now, as blasphemy is, in its essence, the same crime, but immensely aggravated by being committed against an object infinitely superior to man, what is fundamental to the very existence of the crime will be found in this, as in every other species which comes under the general name. There can be no blasphemy, therefore, where there is not an impious purpose to derogate from the Divine Majesty, and to alienate the minds of others from the love and reverence of God.—*Preliminary Dissertation*, prefixed to his Gospels, 8vo. vol. i. p. 448.

It has been a matter of considerable discussion in modern times, how far a crime, in its nature so difficult properly to define—in its strict sense, perhaps, so rarely committed—and the decision upon which it seems so unjust to place in the hands of any one religious party, should remain at all a matter for prosecution by the laws of a civilised state. On the one hand it is contended, that, as Christianity is a part and portion of the law in every country maintaining an established religion, it seems to be involved with the just defence of that religion that blasphemy should be punished; that it is immoral; and that contumely of the Deity, or even of the books of inspiration, ought not to be diffused among the unthinking and the young.

To this it is replied, ‘*Deorum injuriæ diis curæ*,’ though calumny and slander, when affecting our fellow men, are punishable by law; for this plain reason, because an injury is done and a damage sustained, and a reparation therefore due to the injured party; yet, this reason cannot hold where God and the Redeemer are concerned, who can sustain no injury from low malice and scurrilous invective; nor can any reparation be made to them by temporal penalties; for these can work no conviction or repentance in the mind of the offender; and, if he continue impenitent and incorrigible, he will receive his condign punishment in the day of final retribution.’ See *Furneaux’s Letters to Blackstone*. Second ed. pp. 70, 71.

The punishment of constructive blasphemy by law seems still more open to abuse; for, as the above able writer observes, ‘laws for the punishment of blasphemy may be easily turned to the destruction of all religious liberty: for what is blasphemy, in the general sense of the term, but uttering something dishonorable or injurious to the Divine Being? And what controverted religious sentiment is there, which under this general notion, by a court and jury of bigots, may not be condemned as blasphemy? The Athenasian styles the Arian a blasphemer, the Arian the Athenasian; the Calvinist the Arminian, the Arminian the Calvinist: and thus the same laws, differently applied as different parties prevail, will prove fatal to the religious liberty of all of them in their turn.’

BLASPHEMY AGAINST THE HOLY GHOST. Divines are not agreed with respect to the nature of the sin thus denominated (Matt. xii. 31.), and the grounds of the extreme guilt ascribed to it. Tillotson maintains, that it consisted in maliciously attributing the miraculous operations which Christ performed by the power of the Holy Ghost to the devil. Dr. Whithy refers it to

the dispensation of the Holy Ghost, which commenced after our Lord’s resurrection and ascension; and those, he says, were guilty of the crime who persisted in their unbelief and blasphemed the Holy Ghost, representing him as an evil spirit. The crime was unpardonable, because it implied a wilful opposition to the last and most powerful evidence which God would vouchsafe mankind, and precluded the possibility, by rejecting the means, of recovery. In this sentiment Dr. Doddridge coincides. Bishop Pearce’s remarks here are excellent. ‘Under the Jewish law there was no forgiveness for wilful and presumptuous sins: concerning them it is said in Numb. xv. 30, 31, ‘The soul which doeth ought presumptuously, the same reproacheth the Lord; and that soul shall be cut off from among the people, because he hath despised the word of the Lord and hath broken his commandments.’ See, to the same purpose, Numb. xxxv. 31. Lev. xx. 10. and 1 Sam. ii. 25. With regard to the *seculum futurum*, the age to come, or the Christian dispensation, no forgiveness could be expected for such sinners as these Pharisees were; because when they blasphemed the Holy Spirit of God, by which Jesus wrought his miracles, they rejected the only means of forgiveness, which was the merit of his death applied to men by faith, and which, under Christianity, was the only sacrifice that could atone for such a sin: in this sense, as things then stood with them, their sin was an unpardonable one. But then it is not to be concluded from hence, that if they repented of this blasphemy, they could not obtain forgiveness.’ The bishop then quotes an observation of Athanasius, (vol. i. p. 237. Ed. Col.) ‘Christ does not say to him that blasphemeth and repenteth, but to him that blasphemeth, and therefore he means, to him that continueth in his blasphemy; for with God there is no sin that is unpardonable.’

BLAST, *v. & n.* } From Sax. *blæst*; Germ. *blasen*; to blow. A sudden
BLASTER, }
BLASTING, } gust or puff of wind: to
BLASTMENT. } blast, is to strike with an impetuous and destructive force; to wither; to desolate; to destroy; to make a shrill, loud, and sudden noise, by blowing a trumpet, or any instrument of wind music; to cut off prematurely to render infamous; to confound; to strike with terror.

By the blast of God they perish. *Job.*

But rede that boweth doune for every blast—

Ful lightly cesse wind, it wol arise;

But so nil not an oke whan it is east. *Chaucer.*

The blossome which my braunch of youth did beare,
With breathed sighes is blowne away and blast-d.

Spenser. Shepheard’s Calendar.

A myghty tre and of a noble height
Whose beaute blasted was with boystuous winde,
His leaues loste, the sappe was from the rynde. *Skelton.*

I am no blaster of a ladie’s beauty,
Nor bold intruder on her special favours,
I know how tender reputation is,
And with what guards it ought to be preserved.

Beaumont and Fletcher

They that stand high have many *blasts* to shake them;
And if they fall, they dash themselves to pieces.

Shakespeare.

Welcome, then,
Thou unsubstantial air, that I embrace;
The wretch that thou has blown unto the worst
Owes nothing to thy *blasts*.

Id.

In peace, there's nothing so becomes a man,
As modest stillness and humility;
But when the *blast* of war sounds in our ears,
Then imitate the action of the tyger.

Id.

In the morn and liquid dew of youth,
Contagious *blastsments* are most imminent.

Id.

You nimble lightnings, dart your blinding flames
Into her scornful eyes! infect her beauty,
You fen-sucked fogs, drawn by the powerful sun,
To fall and *blast* her pride.

Id.

First Buckingham, that durst 'gainst him rebel,
Blasted with lightning struck, with thunder fell;
Next the twelve commons are condemned to groan,
And roll in vain at Sisyphus's stone.

Marvell.

Blast him O heavens! in his mad career,
And let this isle no more his frenzy fear.

Id.

He blew his trumpet—the angelick *blast*
Filled all the regions.

Milton.

The Veline fountains, and sulphureous Nar,
Shake at the baleful *blast*, the signal of the war.

Dryden.

Three ships were hurried by the southern *blast*,
And on the secret shelves with fury cast.

Id.

Oh! Portius, is there not some chosen creature,
Some hidden thunder in the store of heaven,
Red with uncommon wrath, to *blast* the man
Who owes his greatness to his country's ruin?

Addison.

She that like lightning shined, while her face
lasted,

The oak now resembles, which lightning had *blasted*.

Waller.

Agony unmixed, incessant gall,
Corroding every thought, and *blasting* all
Love's paradise.

Thomson.

He shews himself weak, if he will take my word
when he thinks I deserve no credit; or malicious, if
he knows I deserve credit, and yet goes about to
blast it.

Stillingfleet.

And, with a withering look,
The war-denouncing trumpet took,
And blew a *blast* so loud and dread,
Were ne'er prophetic sounds so full of woe.

Collins.

Nor deemed before his little day was done
One *blast* might chill him into misery.

Byron.

BLAST is also applied in a more general sense to any forcible stream of wind or air, excited by the mouth, bellows, or the like.

BLAST, in agriculture and gardening, a name for what is otherwise called a blight.

BLASTING, among miners, a term for the tearing up rocks, which they find in their way, by gunpowder. The old method of doing this was to make a long hollow of a large gun-barrel in the rock they would split; this they filled with gunpowder; then they firmly stopped up the mouth of the hole with clay, except a touch-hole, at which they left a match to fire it. More commonly now, however, a straw filled with gunpowder is introduced among shot, at the bottom of a cylindrical hole in the rock. Some of the hardest rocks at Fort William and at Bristol were thus exploded by Mr. Joseph.

BLASTING OF WOOD, the rending in pieces logs of wood, such as roots of trees, &c. by means of gunpowder. A very simple method has been described by Mr. Knight of Foster Lane, London, which is thus effected: the instrument used is a screw, with a small hole drilled in the centre. The head of the screw is formed into two strong horns, for the more ready admission of the lever with which it is to be turned, and a wire, for the purpose of occasionally clearing the touch-hole. When a block of wood is to be broken, a hole is to be bored with an auger to a proper depth, and a charge of gunpowder introduced. The screw is to be turned into the hole till it nearly touches the powder; a quick match is then to be put down the touch-hole till it reaches the charge. The quick match is eighteen inches long, to afford the operator an opportunity of retiring, after lighting it, to a place of safety: it is made by steeping a roll of twine or linen thread in a solution of saltpetre.

BLASTUM MYSOLITUM, in the materia medica, a term used by some writers to express the cassia lignea, or cassia bark, when not peeled off from the branches, but kept with the wood.

BLASTUS, in sacred history, chamberlain to king Herod. See Acts xii. 20.

BLATANT, adj. Fr. *blattant*. Bellowing as a calf.

But now I come unto my course again
To his achievement of the *blatant* blast;
Who all this while at will did range and raine,
Whilst none was him to stop, nor none him to re-
strain.

Spenser.

You learned this language from the *blatant* beast.

Dryden.

BLATOBULGIUM, in ancient geography, a place of the Brigantes in Britain, having a camp of exploratores or scouts near Solway Frith and promontory; now called Bullness.

BLATTA, or cock-roach, a genus of insects belonging to the order of hemiptera, or such as have four semicrustaceous incumbent wings. The head of the *blatta* is inflected towards the breast; the antennæ, are hard like bristles; the elytra and wings are plain; the breast is smooth, roundish, and is terminated by an edge or margin; and there are two small horns above the tail. This insect resembles the beetle; and there are ten species, viz. 1. *B. Africana* is ash-colored, and has some hairs on its breast. It is found in Africa. 2. *B. alba* is red, the margin of the breast is white. It is found in Egypt. 3. *B. Americana* is of an iron color, and the hind part of the breast is white. The wings and elytra are longer than its body. It is found in America and the south of France. 4. *B. Orientalis* is of a dusky ash-color, has short elytra, with an oblong furrow in them. This species is frequent in America. 5. *B. nivea* is white, with yellow feelers. It is a native of America. 6. *B. Surinamensis* is livid, and the breast edged with white. It is a native of Surinam. Beside these there have been added by Fabricius, Gmelin, &c. viz. *madagascariensis*, *egyptiaca*, *occidentalis*, *australasica*, *erythrocephala*, *capensis*, *indica*, *nivea*, *irrorata*, *viridis*, *brasiliensis*, *petiveriana*, *cincta*, *picta*, *variegata*, *ruficollis*, *maculata*, *marginata*, *nitidula*, *fusca*, *deusta*, *chlorotica*, *latissima*, *aterrima*.

perspicillaris, Asiatica, schæfferi, sylvestris, Pennsylvanica, livida, rufa, grisea, minutissima, aptera, punctulata, ocellata.

BLATTA, in middle age writers, denotes a purple in the wool or silk, dyed with the liquor of the fish of the blatta. It was also used, according to some, for the kermes; and, according to others, for the purple worm.

BLATTA BYZANTINA, in physiology and pharmacy, a testaceous body, being the operculum, or lid of a turbinated shell, whose fish yields a purple dye. In Dioscorides's time, the best was brought from the Red Sea, viz. the palest and the fattest; the blacker and less from Babylon, or the Persian Gulf; but in later times they took up with those found about Constantinople; whence the present blatta of the shops had its name.

BLATTARIA, Tournefort's generic name for the verbascom of Linnaeus. See VERBASCUM.

BLATTARIE, from blatta, a moth or little worm; the title of Scopoli's twelfth natural class, in his Flora Carniolica.

BLATTER, } Lat. *blatero*, from *blatio*.
BLATTER'ATION, } Vossius derives it from
BLATTER'GON, } the Gr. *βλατρον*, for *βλητρον*,
cast, thrown forth; to roar; to make a senseless noise; babbling; chattering; blabbing; bolting out any thing.

For before it (the tongue) she hath set a pallsado of sharp teeth, to the end that if, peradventure, it will not obey reason, which within holdeth it hard, as if with a strait bridle, but it will *blatter* out and not tarry within, we might bite it until it bled again, and so restrain the intemperance thereof.

Holland. *Plutarch*.

She rode at peace, through his only pains and excellent endurance, however envy list to *blatter* against him.

Spenser.

I hate such *blateroons*.

Howell's *Letters*.

BLATUM. See BLADUM.

BLAU, a river of Germany, in the circle of Suabia.

BLAVET, a sea-port town of France, in the department of the Morbihan, and ci-devant province of Brittany, situated at the mouth of the river of that name. It was one of the stations of the royal navy of France, and called Port Louis, after Louis XIV.

BLAVIA, or BLAVIUM, in ancient geography, a town of Aquitain, on the north bank of the Garonne, below its confluence with the Dordogne, now called Blaye.

BLAYE, an ancient and strong town of France, in the department of the Gironde, and late province of Guienne. It is situated on the Garonne, has a harbour much frequented by foreigners, and the ships which sail to Bourdeaux are obliged to leave their guns here. The river is 3800 feet broad at Blaye; for which reason a battery was built upon an island in 1683, to command the vessels that sail up. The city is built on a rock, and has a citadel with four bastions, which is called the Upper Town. The lower town is separated from the upper by a small river; and the merchants reside in it. The trade of Blaye consists chiefly in wines and brandy. The neighbourhood produces a great deal of corn, which is also sometimes exported.

It is twenty miles north of Bourdeaux. Population about 4000.

BLAYNEY (Benjamin), D. D., was educated at Oxford. He was originally of Worcester College, but quitted it in 1787, on obtaining a fellowship at Hertford College. He resigned the latter appointment for a canonry of Christ Church, with the professorship of Hebrew annexed. He also enjoyed the rectory of Polshot, Wilts, which he held at his death, which took place in 1801. He very ably superintended the common version of the English Bible printed at the Clarendon press, 4to. 1769, (see BIBLE), and published, 1. A Dissertation by Way of Enquiry into the true Import and Application of the Vision related by Dan. ix., &c. 4to. 1784. 2. Jeremiah and Lamentations, a New Translation, with Notes Critical, &c. 8vo. 1784. 3. Zechariah, a New Translation, with Notes Critical, &c.; to which is added a New Edition, with Alterations, of the Dissertation on Daniel, 4to. 1797.

BLAZE', v. & n. } Ang.-Sax. *blæsan*, to
BLAZ'EN, } blow; Germ. *blasen*; Dutch,
BLAZ'ING, } *blaesau*; to emit a flame,
BLAZ'URE. } like a blast; a flame;

blaze implies more the light than the heat; diffusion of light suddenly, widely, rapidly; metaphorically, applied to a rapid and wide diffusion of a report; to an account of ensigns armorial in proper terms; to any thing set forth conspicuously; ostentatiously.

But he went out, and began to publish it much, and to *blaze* abroad the matter.

Mark.

This lady brought in her right hond

Of brenning fire a *blazing* bond,—

Whereof the flame and hote fire

Hath many a lady in desire

Of loue brought.

Chaucer.

Utters of secrets he from thence debarred,
Babblers of folly, and blazers of crime.

Spenser.

And eke you virgins that on Parnasse dwell,

Whence floweth Helicon, the learned well,

Help me to *blaze*

Her worthy praise,

Which in her sexe doth all excell.

Id.

I cannot tell you what was this knightes name, nor of what cowntre, but the *blasure* of his armes was goulles, two fusses, sable, a border sable.

Froissart. *Cronycle*.

When beggars die, there are no comets seen;
The heavens themselves *blaze* forth the death of princes.

Shakspeare.

The main *blaze* of it is past; but a small thing would make it flame again.

Id. *Coriolanus*.

Thy throne is darkness in the abyss of light.

A *blaze* of glory that forbids the sight.

Dryden.

What groans of men shall fill the martial field!

How fierce a *blaze* his flaming pile shall yield!

What funeral pomp shall floating Tiber see!

Id.

Thus you may long live an happy instrument for your king and country; you shall not be a meteor, or a *blazing* star, but stella fixa; happy here, and more happy hereafter.

Bacon.

The noise of this fight, and issue thereof, being *blazed* by the country people to some noblemen thereabouts, they came thither.

Sidney.

Such musick worthiest were to *blaze*

The peerless height of her immortal praise,
Whose lustre leads us.

Milton.

For what is glory but the *blaze* of fame,

The people's praise, if always praise unmist?

Id.

But, mortals, know, 'tis still our greatest pride
To blaze those virtues which the good would hide.

Pope.

Then glossy smooth lay all the liquid plain. *Id.*
This, in ancient times, was called a fierce; and
you should then have *blazed* it thus: he bears a fierce
sable between two fierce, or.

Peacham.

Those hearts that start at once into a *blaze*,
And open all their rage like summer storms
At once, discharged, grow cool again and calm.

C. Johnson's *Medæa*.

If of Dryden's fire the *blaze* is brighter, of Pope's
the heat is more: regular and constant.

Johnson.

Slow sinks, more lovely ere his race be run,
Along Morea's hills the setting sun;
Not as in northern climes obscurely bright,
But one unclouded *blaze* of living light!
O'er the hush'd deep the yellow beam he throws,
Gilds the green wave that trembles as it glows.

Byron's *Corsair*.

BLAZEY BAY, a bay of the English channel,
on the south-west coast of the county of Corn-
wall, between Fowey and Deadmen Point.

BLAZON, *n. & v.* } Fr. *blasonner*; general
BLAZON'ER, } applications the same as
BLAZON'RY. } *blaze*; to *blaze* and to
to *blazon* are the same, only that the latter is more
exclusively applied to the figures on ensigns ar-
morial.

O thou goddess,
Thou divine nature! how thyself thou *blazonest*
In these two princely boys! they as gentle
As zephyrs blowing below the violet,
Not wagging his sweet head.

Shakespeare.

One that excels the quirk of *blazoning* pens,
And in the essential vesture of creation,
Deeds bear all excellency.

Id.

What is this but libelling against the senate,
And *blazoning* our injustice everywhere?

Id.

But this eternal *blazon* must not be
To ears of flesh and blood.

Id.

I am a gentleman.—I'll be sworn thou art;
Thy tongue, thy face, thy limbs, action, and spirit,
Do give thee five-fold *blazon*.

Id.

Proceed unto beasts that are given in arms, and
teach me what I ought to observe in their *blazon*.

Peacham.

Give certain rules as to the principles of *blazonry*.

Id. on *Drawing*.

King Edward gave to them the coat of arms,
which I am not herald enough to *blazon* into English.

Addison.

BLAZON, a market town of Austrian Galicia,
circle of Zolkien, with a Catholic and a Greek
church. There is also a village of this name in
the circle.

BLAZONING, or BLAZONRY, in heraldry, the
decyphering the arms of noble families. The
word originally signified the blowing or winding
of a horn; and was introduced into heraldry as
a term denoting the description of things borne in
arms, with their proper significations and intend-
ments, from an ancient custom the heralds, who
were judges, had of winding a horn at jousts
and tournaments, when they explained and re-
corded the achievements of knights. See HE-
RALDRY.

BLEACH, *v. n. & adj.* } Ang.-Sax. *blican*,
BLEACH'ER. } *ablican*, *dealbare*;
Germ. *bleicken*; Dutch, *bleycken*; Swed. *bleka*.
To whiten; to whiten by exposure in the open
air; to grow white.

When turtles tread, and rooks and daws;
And maidens *bleach* their summer smocks. *Shakespeare*.
The white sheet *bleaching* in the open field. *Id.*

For there are various penances enjoined;
And some are hung to *bleach* upon the wind;
Some plunged in waters. *Id.*

And Turner, gay, up to his perch to march,
With face new *bleached*, smoothed, and stiff with
starch. *Martiel*.

The deadly winter seizes; shuts up sense;
Lays him along the snows, a stiffened corpse,
Stretched out and *bleaching* in the northern blast.

Thomson.

Albeit unworthy of the prey-bird's maw,
Let their *bleached* bones, and blood, unbleaching stain,
Long mark the battle-field, with hideous awe. *Byron*.

BLEACHING.

BLEACHING is the art of discharging from
cotton, linen, woollen, and other goods, their na-
turally dark tinge, and rendering them white. It
is an art which has attended the very dawn
of civilisation in all parts of the globe. In
Egypt, India, and Syria, the efficacy of natron,
the nitre of Scripture, in this process, was evi-
dently known from a remote period; (Jer. ii. 22,) and Pliny states (lib. xviii. c. 51), that the an-
cient Gauls were well acquainted with the use
of a lixivium made from the ashes of burnt ve-
getables, as a detergent, and knew how to com-
bine it with animal oil, so as to form a powerful
soap. That in the eastern parts of the world this
art, like almost every other, should have remained
stationary for ages, will not occasion surprise;
but that, in enlightened Europe, a process so im-
portant should have been altogether neglected
by men of science, until within a very recent pe-
riod, seems astonishing. Such, however, is the
fact. Until towards the close of the last century

it had made little or no advances; and to Messrs.
Scheele and Berthollet, foreign chemists (par-
ticularly to the latter) is to be awarded the honor
of effecting a peaceful but entire revolution in
this ingenious art.

This is not now, therefore, the practice of
wetting cloths on the field, and trusting, with the
uncivilised Indian, to the sun and air, to accom-
plish the whiteness of them; but a process essen-
tially chemical, and calling into operation some
of the most splendid, because useful discoveries,
of a Thenard, a Watt, and a Davy. As the old
process is far from being entirely exploded,
however, in remoter parts of this country, and
because it will assist the reader in appreciating
the march of science upon this subject, we shall
treat in this paper, I. Of the old plan of bleach-
ing. II. Of the chemical substances now em-
ployed in that art. III. Of the machinery used.
And, IV. Of the principal improvements in the
modern mode of bleaching.

I.—OF THE OLD PLAN OF BLEACHING.

There are many materials which it is necessary to bleach previously to their being manufactured, and especially those of the more delicate kind, as silk for example, since they would not be able to endure the violence of several of the processes without injury to the tender woof. Such processes, however, do no injury to the strong texture of linen or hempen cloths, and hence they are uniformly woven before they are committed to the bleacher's hands.

Let us, however, follow up these materials from their simplest and rudest state. If ripe flax be examined, it will be found to be composed of fibres or filaments united together by the sap, enveloping a semiligneous substance, and covered with a thin bark. It is the fibrous part only that is used for making cloth, and it must therefore be previously separated from the other matters. The sap or succulent part is composed of extractive principle and water, and the first process is to separate this substance, which holds the filaments together. As soon as the flax is pulled, it is steeped in soft water until the putrefactive fermentation takes place. This degree of fermentation begins with the succulent part, as being more susceptible of decomposition than the rest. Were the flax to be continued long in this state the whole substance of it would be decomposed or destroyed, upon the same principle that malt is injured by too long steeping, or that wort loses its substance by too long a fermentation. It must therefore be taken out of the water while yet green, and before the whole of its sap is separated. Well water and brackish water must be carefully avoided, as also that which flows over gypseous soil. Such water accelerates putrefaction, and hurts the quality of the hemp and flax. This is perfectly agreeable to the principles of chemistry: it is thus that a little salt accelerates animal putrefaction, while a greater quantity tends to prevent it. The portion of saline substances taken up by the water hastens corruption, by extending the putrid fermentation even to the filaments, which it blackens and spoils, while it ought to operate only on the juices.

The flax, when taken from the water, is spread out upon the grass to dry. During the fermentation and decomposition which thence result, there is a speedy combination of oxygen and carbon. Exposure on the grass facilitates the escape of the carbonic acid into the atmosphere, and the plants become of a whitish-gray color. It is known that a lee very slightly alkaline may be substituted with advantage, for this long and noxious operation; it is therefore certain, that a chamber from twenty to thirty feet in length, into which the steam of alkaline caustic water, of the strength of one-fourth of a degree only, is introduced, will be sufficient to produce the same effect as watering on an immense quantity of hemp and flax, suspended on basket-work, in less time, and with less expense, than are required for the different manipulations of watering. The losses occasioned by the negligence of workmen, who, by suffering the hemp and flax to macerate too long, give time to the decomposition to reach the filaments, which renders them brittle, and occa-

sions a considerable waste, will also be avoided. In this process the artist can follow every moment the progress of his operation, and stop it at the favorable period. Nothing now remains but the wood, and the flax or fibrous part. The wood is a hollow tube covered over very compactly with the flax. To separate the wood, it must be kiln-dried, in order to render it frangible or brittle; but care must be taken not to apply too much heat, for fear of injuring the flax.

It is next to be beaten or broken, by which means the flax is not only divided into small fibres, but most of the wood is separated, and the part which adheres is reduced to small fragments. To separate these again, the flax is to be scutched, or threshed, in small parcels at a time, either by manual labor, or mills contrived for the purpose. Hackling is the last process; which is nothing more than drawing or combing the flax in small parcels at a time, through a pile or group of polished and sharp steel spikes, placed firmly in wood through an iron plate. The spikes are placed pretty close together: the first hackle (for different hackles must be used) is coarse, the second finer, and the third finer still. The process of hackling answers a double or triple purpose; first, it divides the fibres of the flax, as much as this can be effected by mechanical means; secondly, it separates the minute fragments of wood which escaped the process of scutching; and lastly, it separates the short coarse flax, commonly called tow.

Spinning and weaving are too well known to need description. The linen, as it comes from the loom, is charged with what is called the weaver's dressing, which is a paste of flour boiled in water; and as this is brushed into the yarn of the warp before it is woven, it is somewhat difficult to separate it when dry. To discharge this paste, the linen must be steeped in water for about forty-eight hours; when this extraneous substance undergoes a kind of fermentation, which does not extend to the substance of the linen itself, upon the same principle that the green sap is disengaged from the flax without injury to its texture. The linen being well washed after this fermentation, contains nothing that water can separate; it is of a grayish white color, although the fibres of which it is composed, when divested of every adventitious substance, are naturally very white. In this state the cloth is committed to the bleacher, and the process of whitening commences. Under the old system it consisted of the following series of operations: 1. Steeping and milling. 2. Bucking and boiling. 3. Alternate watering and drying. 4. Scouring or acidifying. 5. Soaping. 6. Starching and bluing.

1. *Of steeping and milling.*—Green linen, in the different changes which it has undergone, contracts a great degree of foulness. This is chiefly communicated to it by the matters used in the dressing, which should be effectually cleared off. The first thing therefore that is to be done in the bleach-field is to take off all that filth that is foreign to the flax, and might, in unskilful hands, be fixed in the cloth. This is the object of steeping, and to accomplish this end, the cloth is laid

in blood-warm water. A smaller degree of heat than that would not dissolve the dressing so soon : and a greater might coagulate and fix, in the body of the linen, those particles which we design to carry off. In a few hours the dressing made use of in weaving is dissolved, and mixed with the water; and as it had acquired some degree of acidity before application, it becomes a species of ferment. Each ferment promotes its own particular species of intestine motion; the putrid ferment sets in motion the putrefactive fermentation; the vinous ferment gives rise to the vinous fermentation; and the acid ferment to the acetous fermentation. That there is a real fermentation going on in steeping is evident from the air-bubbles which immediately begin to rise, from the scum also which gathers on the surface, and from the intestine motion of the whole liquor. That it must be the acetous fermentation appears from this, that the vegetable particles, already in part scoured, must first undergo this process. The consequence of this operation on the whole is, that the cloth comes out freed in a great measure from its superficial dirt, and more pliant and soft than it was before. The first question to be determined on these principles is, What are the most proper liquors for steeping cloth? Those which, by the old method, are used by bleachers are plain water; lee and water, equal parts; and rye meal or bran mixed with water: but they always make use of lee when they have it. After steeping, the cloth is carried to the putstock-mill, to be freed of all its loose foulnesses. While it presses gently, it also turns the cloth; which is continually washed with a stream of water. Care must be taken, however, that no water be detained in the folds of the linen, otherwise that part may be injured.

2. *Of Bucking and Boiling.*—This is the most important part of the whole process, and deserves a very nice examination; its design is to loosen and carry off, by the help of alkaline lixivia, that particular substance in cloth, which is the cause of its brown color. All ashes used in lee, pearl-ashes excepted, ought to be well pounded before they are put into the copper; for the marcroft and cashub are very hard, and with some difficulty yield their salt: as these two last contain a very considerable proportion of a matter which will in some degree tinge white cloth, and as this is dissolved much more by boiling than by the inferior degrees of heat, while the salts may be as well extracted by the latter, the water should never be brought to boil, and should be continued for some time longer under that degree of heat. The pearl-ashes should never be put in till near the end, as they are very soluble in water. If these salts were always of an equal strength the same quantities would make a lee equally strong, but they are not. Salts of the same name differ very much from each other. The Muscovy ashes become weaker every day, as every bleacher must have observed, till at last they turn quite effete. A decoction from them when new must differ very much from one when they have been long kept. Hence the necessity of some exact criterion to discover when lees are of an equal strength. The taste cannot serve, as that is so variable, cannot be described to another,

and is blunted by repeated trials. The proof-bail has been found to serve the purpose of the bleach-field sufficiently; and, by discovering the specific gravity, to show the quantity of alkaline salts dissolved. But it cannot show the dangerous qualities of these salts; for the less caustic and less heavy this liquor is, the more dangerous and corrosive it may be for the cloth. The third lee, which they draw from these materials by an infusion of cold water, in which the taste of lime is discoverable, appears plainly to be more dangerous than the first. The second lee, which they extract from the same ashes, and which is reckoned about a third in strength, when compared to the first, must be of the same nature; nor should it be used without an addition of pearl-ashes, which will correct it.

It is necessary that the cloth should be made dry before bucking, that the salts may enter into the body of the cloth along with the water; for they will not enter sufficiently if it be wet, and by acting too powerfully on the external threads, may endanger them. The degree of heat is a very material circumstance in this operation. As the action of the salts is always in proportion to the heat, it would appear more proper to begin with a boiling heat, by which a great deal of time and labor might be saved. The reason why this method is not followed appears to be this: if any vegetable or vegetable substance is to be softened and to have its juices extracted, it is found more proper to give it gentle degrees of heat at first, and to advance gradually, than to plunge it all at once in boiling water. This last degree of heat is so strong, that, when applied at once to a vegetable, it hardens instead of softening its texture. Dried vegetables are immediately put into boiling water by cooks, that these substances may preserve their green color, which is only to be done by hindering them from turning too soft. Boiling water has the same effect on animal substances; for if salt beef be put into it, the water is kept from getting at the salts from the outside of the beef being hardened. But if it be considered how much of an oily substance there is in the cloth, especially at first, which will for some time keep off the water, and how the twisting of the threads, and the closeness of the texture, hinders the water from penetrating, we shall find that if boiling water were put on it at once, the cloth might be liable in several parts to a dry heat, which would be much worse than a wet one. That the lees have not access to all parts of the cloth at first, appears plainly from this, that when it has lain after the first bucking, till all the lees are washed out, it is as black in some parts as when it was steeped: which must be owing to the discharge of the coloring particles from those places to which the lee has access, and to their remaining where it has not. It would seem advisable then, in the first bucking or two, when the cloth is foul, to use the lee considerably below the boiling point; that by this soaking or maceration, the foulness may be entirely discharged, and the cloth quite opened for the speedy reception of the boiling lee in the buckings which succeed. The lees should likewise be weakest in the first buckings, because then they act only on the more external parts;

whereas, when the cloth is more opened, and the field of action is increased, the active powers ought to be so too. For this reason they are the strongest after some sourings. In all coarse cloths, however, boiling is substituted in place of bucking. This species of linen cannot afford the time and labor necessary for the latter operation; and therefore they must undergo a shorter and more active method. As the heat continues longer at the degree of boiling, the lees used for the coarse cloth must be weaker than those used for the fine. There is not so much danger from heat in the coarse as in the fine cloth, because the former is of a more open texture, and will allow the lee to penetrate more speedily. In the closer kinds, however, the first application of the salts should be made without a boiling heat being used.

3. *Of alternate watering and drying.*—After the cloth has been bucked it is carried out to the field, and frequently watered for the first six hours. For if, during that time, when it is strongly impregnated with salts, it is allowed to dry, the salts approaching close together, and assisted by a greater degree of heat, increasing always in proportion to the dryness of the cloth, act with greater force, and destroy its very texture. After this time, dry spots are allowed to appear before it gets any water. In this state it profits most, as the latter part of the evaporation comes from the more internal parts of the cloth, and will carry away most from those parts. The bleaching of wax helps to confirm this; for it seems to whiten most when the last particles of water are going off. This continual evaporation from the surface of the cloth shows that the design of the operation is to carry off somewhat remaining after the former process of bucking. This appears likewise from a fact known to all bleachers, that the upper side of cloth, where the evaporation is strongest, attains a greater degree of whiteness than the under side. But it is placed beyond all doubt by experiment, which shows that cloth turns much lighter by being exposed to the influence of the sun, air, and winds, even though the salts have been washed out of it.

4. *Of souring, or acidifying.*—It is well known to all chemists that alkaline salts are convertible, by different methods, into absorbent earths. Frequent solution in water, and evaporation of it again, is one of these methods. The transmutation then of these salts, which are not volatilised or washed away, must be continually going on in the cloth under the alternate waterings and dryings of the former process: not much indeed after the first two or three buckings, because the salts, not having entered deep into the cloth, are easily washed off or evaporated. But when they penetrate into the very composition of the cloth and minutest fibres, of which the first vessels are made, they find greater difficulty of escaping again, and must be more subject to this transmutation. But if we consider the bleaching ashes as a composition of lime and alkaline salts, we must discover a fresh fund for the deposition of this absorbent earth. The common caustic, a composition of this very kind, soon converts itself, if exposed to the open air, into a harmless

earthy kind of powder. The effect of frequent buckings and bleachings is that of loading the cloth with this substance. It becomes then necessary to take it out. No washing can do that, because earth is not soluble in water. Nothing but acids can remove it. These are attracted by the absorbent earth, join themselves to it, and compose a kind of neutral imperfect salt, which is soluble in water, and therefore easily washed out of the cloth. The acid liquors used commonly have been butter-milk, which is reckoned the best, sour milk, infusion of bran, rye-meal, &c. kept for some days till they sour. Sour whey is thought to give the cloth a yellow tinge. The linen ought to be dried before it is put in the sour, that the acid particles may penetrate along with the watery, through the whole. A few hours after it has been there, air-bubbles arise, the liquor swells, and a thick scum is formed, and there is an increase of heat, manifesting signs of fermentation. Sours that are made of bran, rye-meal, &c. ought to be prepared before use, for by this means so much time will be saved. Besides, when the water is poured upon the cloth and bran, as is done in the management of coarse cloth, the linen is not in a better situation than if it had been taken up wet from the field; and by this means the acid particles cannot penetrate so deep. Again, this method of mixing the bran with the cloth may be attended with yet worse consequences. All vegetable substances when much pressed fall into the putrescent, and not the acetous, fermentation. This often happens to the bran pressed betwixt the different layers on the linen, which must weaken the cloth. Hence, all sours should be prepared before the cloth is steeped in them; and none of the bran or meal should be mixed with the cloth. The sours are used strongest at first, and gradually weakened till the cloth has attained to its whiteness. In the first sourings there is more of the earthy matter in the cloth, from the many buckings it has undergone, than what there can be afterwards. As the quantity of this matter decreases, so should the strength of the sour. There is not, however, the least danger at any time from too strong a sour. Dilute sulphuric acid is sometimes employed instead of vegetable acids.

5. *Of soaping and hand rubbing.*—After the cloth comes from the souring, it should be well washed in the washing-mill, to take off all the acid particles which adhere to its surface. All acids decompose soap by separating the alkaline salts and oily parts from each other. Were this to happen on the surface of the cloth, the oil would remain, nor would the washing-mill afterwards be able to clean it. From the washing-mill the fine cloth is carried to be rubbed by women's hands with soap and water. As the liquors, which are generally employed for souring, are impregnated with oily particles, many of these must lodge in the cloth, and remain, notwithstanding the preceding milling. It is probable that all the heavy oils are not evaporated by bleaching. Hence it becomes necessary to apply soap and warm water, which unite with, dissolve, and carry them off. It is observed, that if the cloth when it is pretty white get too much soap, the following bleaching is apt to

make it yellow ; on that account they often wring out the soap. It is a matter worth enquiring into, whether it be better to use hard or soft soap for the cloth. Most bleachers agree that the hard is apt to leave a yellowness in the cloth ; and it is said that hard soap is disused in Holland on this account. As there must be a considerable quantity of sea-salt in the hard, which is not in the soft soap, and as this salt appears prejudicial to cloth, the soft soap ought certainly to be preferred.

But the management of coarse cloth is very different in this operation from that of fine. Instead of being rubbed with hands, which would be too expensive, it is laid on a table, run over with soap, and then put betwixt the rubbing-boards, which have ridges and grooves from one side to another like teeth. These boards have small ledges to keep in the soap and water, which saves the cloth. They are moved either by hand, or by a water-wheel, which is more equal and cheap. The cloth is either drawn by degrees through the boards by men ; or, which is better, the same wheel moves two rollers, with ridge and groove, so that the former enters the latter, and by a gentle motion round their own axis the cloth is gradually pulled through the boards. This mill was invented in Ireland about thirty years ago, and the Irish bleachers use it for their fine as well as coarse cloths. But the objections against these rubbing-boards are considerable. By rubbing on so unequal a surface the fibrous part of the cloth is worn ; by which means it is much weakened. These boards also give the cloth a cottony surface, so that it does not long keep clean. They also flatten the threads, and take away all that roundness and firmness which is the distinguishing property of cloth bleached in the Dutch method. For these reasons they must be very prejudicial to fine cloth, and should never be used in bleaching it. As they seem to be in some measure necessary to lessen the expense of bleaching coarse linen, they ought never to be used above twice, or thrice at most. They might be rendered much more safe by lining their insides with some soft elastic substance, that will not wear the cloth so much as the wooden teeth do. Short hair has been tried in one instance, and was found to answer very well. When the coarse cloth has undergone a rubbing, it should be immediately milled for an hour, and warm water poured now and then on it to make it lather. This milling has very good effects ; for it clears away all the dirt which the rubbing-boards have loosened, and which at the next boiling would have discolored the cloth ; and besides that, it makes the cloth less cottony, and more firm than when whitened by the rubbing only.

6. *Starching and bluing*, which is the last operation in the process of bleaching, is too simple to need a particular detail, and is conducted in the common mode to which laundry-women are accustomed. It often happens, indeed, that the cloth, when exposed to the weather to be dried after this operation, gets rain, which undoes all again, and forces the bleacher to a new expense. To remedy this inconvenience, some bleachers very properly employ a dry-house,

where the cloth may be dried after this operation in any kind of weather.

This method of bleaching was formed on the theory of the coloring matter, of each fibre of the hemp or flax, entering into the minute filaments, of which they are composed. Some experiments of Mr. Kirwan have proved that this matter was chiefly resinous. Hence the first lee, or solution of potash, is supposed to act upon the external coating of these filaments, separating and exposing them to the action of the air, or rather to the acidifying principle with which it is impregnated, and which is known as oxygen gas. The second boiling in potash opens a second layer, and thus, successively, layer after layer, until the whole is divided, or opened to the centre. Were the solution of potash sufficiently strong to force its way at once to the centre, it would act upon the filaments themselves, and destroy the texture of the cloth.

Each filament, after the process of potash, retains an impregnation of coloring matter, so intimately united as to resist the further action of it. This can only be removed by the slow and gradual influence of the oxygen gas of the atmosphere. From the properties of oxygen gas and potash, their manner of operating is very obvious. The oxygen gas dissolves in each boiling a certain quantity of the coloring matter, with which it forms carbonic acid gas, and partly divides the filaments that eluded the action of potash. The carbonic acid gas, from its volatility, flies off and mixes with the atmosphere. Thus, alternately, the one dissolving, and the other burning out (for bleaching is slow combustion), the linen is whitened. Now to obtain this result by the common mode of the action of the oxygen of the atmosphere, requires a long period of time, in consequence of the necessity of a frequent repetition of the same process. To hasten this result, therefore, by a more manageable and concentrated application of oxygen, has been the uniform effort of every modern chemist who has turned his attention to this important art.

II.—OF THE CHEMICAL SUBSTANCES AT PRESENT EMPLOYED IN BLEACHING.

It will here be useful to take a brief view of the principal substances usually employed in this art ; both those which have been continued from the former practice, and the new chemical agents adverted to. These are 1. Pot and pearlashes. 2. Soda. 3. Soap. 4. Oxymuriatic acid. 5. Oxymuriate of lime. 6. Sulphuric acid.

Pearl and potash, as imported from America, is of three sorts, the first or best containing from sixty to sixty-five per cent. of real alkali, the remainder being sulphate and muriate of potash, muriate of soda, uncombined charcoal, and carbonic acid, mixed with about six per cent. of water. The second sort is inferior, and the third is sometimes largely and purposely mixed with common salt to give it weight. It is of course the bleacher's interest to procure that which contains the least of these adventitious salts. Pearl-ashes differ only from potash, in containing a greater quantity of carbonic acid, and forming a milder alkali, as it is termed. The strength of a solu-

tion made from either is generally ascertained by the hydrometer. But, as the salts are not always of a uniform degree of purity, other tests have been proposed on the principle of saturating these alkalies by an acid. The following is M. Berthollet's method. 'Sulphuric acid,' he says, diluted with water till it is brought to a determinate point of concentration, answers well. By saturating a certain weight of this dilute acid with a fixed weight of fine pure chalk, dried by the heat of boiling water, the standard may be fixed. This acid is the one most readily to be had, and whose constitution is most uniform. The chalk selected for determining its concentration is a substance equally common; it does not present the difficulties which occur in procuring pure potash, and the temperature of boiling water, employed for drying it, can be very easily observed with precision. To avoid the embarrassment attending the preparation of standing acid, a quantity of it sufficient for the trials of many years may be made at once.

Were these analyses made on pieces of potashes, taken at random from the barrels, only ambiguous results would be got, because in the same barrel there are often different qualities. The experiment should, therefore, be made only on solutions prepared on the great scale as lees, and always with the same weights of alkali to the same number of measures of water. The most expeditious manner of making these solutions in the cold, is to suspend the potash at the surface of the water in a vessel of iron, pierced with a great number of holes, or formed of coarse iron wire. They should not be drawn off till we are certain that the whole potash is dissolved, and till by agitation the liquid is rendered uniform. Besides these circumstances, the assay of potashes requires slips of paper stained with litmus, or any other color equally sensible to acids, as that of mallows, radishes, &c. We should also procure a glass rod, a small glass measure, and lastly, a tube having as many times the capacity of the small measure, as measures of water have been employed to one quintal of potash.

We fill the tube with the solution of potash, and transfer it into the goblet. We next fill the same tube with the test acid, which is also poured into the goblet; we agitate with the glass rod, and then draw a trace on one of the slips of stained paper with the extremity of this rod moistened with the mixture. If the trace do not become red, we add to the goblet a small measure of the test acid, stir, and then make another trace on the paper, alongside of the former. If the color of the paper be not now changed, we add one measure of acid more, and continue thus till the last drawn trace is red.

If we wish to compare the qualities of several potashes, it is obvious, that we must regard as the best that which has required the greatest number of measures of acid to produce a red streak, since it is the one which saturates most acid. It is also obvious, that we might express numerically the qualities of the different species of potash, representing them by the number of measures of acid which each of them has satu-

rated; which amounts to counting the traces formed on the paper in each trial, taking the first for as many as the tube contains of little measures, and adding unity for each of the following marks till the last, which we should not reckon, because its color indicates that we have passed the term of its saturation.

Another method has been suggested by Dr. Higgins of Dublin: to take a given quantity of the alkali, and dissolve it in twice its weight of boiling water, stirring the mixture during the solution of the salt; while yet warm, it must be filtered through unsized paper. When all the liquor has passed through the filter, a very small quantity of cold water is gradually poured on the saline residuum on the filter, in order to wash out the remainder of the alkali. The undissolved salt, remaining on the filter, is sulphate of potash, which must be carefully taken off, dried, and weighed, in order to ascertain its quantity. To determine whether any common salt is contained in the alkali which has been filtered, evaporate the clear solution a little in a sand-bath, and set it in a cool place for twenty-four hours; at the end of which time, any common salt it may contain, will be found crystallised in the form of regular cubes at the bottom of the vessel. The sulphate of potash and common salt being dried, weighed, and deducted from the weight of the crude alkali employed, will give the precise weight of the pure alkali it contains. Carbonate of soda, or the mineral alkali, is also sometimes used as an agent in bleaching. Little difference is observable between its effects to those of the vegetable alkalies, when the strength of the alkaline-lees and other circumstances are the same. As a detergent it is well calculated for the finishing of the finer fabrics of muslin; it being ascertained that six ounces of pure carbonate of soda, mixed with ten ounces of soap, produce effects in bleaching equal to one pound and a half of soap, when used by itself.

The barilla, as imported from Spain, is in large masses, of a dark gray color, and usually contains about twenty-three per cent. of pure alkali, never more than thirty-three. The rest of the mass is charcoal, and common salt mixed with sulphate and sulphite of soda.

M. Descroizilles employed for many years the test suggested above, of saturating a given quantity of alkaline salt with diluted sulphuric acid, and has given the following table of the mean result:—

	Real Alkali In 100 Parts.
Best American pearl ashes . . .	60 to 73
Caustic ditto pot-ashes in reddish lumps	60 63
Second ditto ditto in gray lumps . . .	50 55
Second ditto pearl ashes . . .	50 55
White Russian pearl-ashes . . .	52 58
White Dantzic ditto . . .	45 52
Alicant barilla	20 33
Inferior kinds of barilla . . .	10 15
Natron	20 30
Salt of tartar of the shops . . .	72

Mr. Karwin gives the following table of the compositions of salts:—

	Alkali.	Acid.	Water.
Crystallised carbonate of potash	41	43	16
Ditto carbonate of soda	21½	14½	64
Ditto ditto desiccated	60	40	

Soap we need not here dwell upon; the best white and soft soaps are those most commonly used.

The great modern agent used in bleaching, and that which has given all its celebrity and facility to the new plan, is oxygenated muriatic acid. Berthollet thus describes it:—

Muriatic acid, the marine acid of the old chemists, and the hydrochloric of the modern French school, combines with oxygen, and thereby assumes the properties of oxygenated muriatic acid; but, to make this combination effective, the oxygen must have lost its elastic state. Thus it exists in the oxide of manganese (manganese of commerce) in very considerable quantity. When, therefore, one part of oxide of manganese is mixed with four parts of the fuming, or six parts of ordinary, muriatic acid, one portion of the acid combines with the oxide of manganese, with the disengagement of the oxygen superfluous to this combination, which, combining immediately with another portion of the muriatic acid, thus forms the oxygenated muriatic. The operation is promoted and completed by the action of heat. The oxygenated muriatic acid assumes on its separation the gaseous state, when it is soluble in water. The resulting liquid is of a greenish-yellow color, and of a very penetrating odor. If the temperature approaches that of freezing water, the oxygenated muriatic acid gas becomes concrete, and adheres to the tube which conducts it into the water, whence it precipitates, so that the liquid is less impregnated than at a somewhat higher temperature.

It is easy to show that the oxide of manganese contains much oxygen; for, on urging it with a strong fire, it evolves a great quantity; after which, the oxide can produce but very little oxygenated muriatic acid. We may be easily satisfied also of the existence of oxygen in the oxygenated muriatic acid. We have only to expose to the light of the sun a phial filled with the above liquid, from which phial a bent tube dips under a receiver filled with water. Bubbles of air are soon disengaged, which pass into the receiver, constituting an elastic fluid, which possesses all the properties of pure air or oxygen gas. When these bubbles cease to issue, the liquid has lost its odor, color, and all its distinctive properties. It is now water impregnated with ordinary muriatic acid. The composition and decomposition, therefore, equally prove, that oxygenated muriatic acid is simply a combination of muriatic acid and oxygen. But this speedy decomposition by light shows, that the oxygen very readily abandons the muriatic acid, either to assume the elastic state, or to enter into other combinations; and it is on this that the characteristic properties of oxygenated muriatic acid depend.

If vegetable colors be plunged into oxygenated muriatic acid, they disappear more or less quickly; and when there is a mixture of different coloring particles, some disappear more

readily than others, the whole, however, being more or less affected. When the oxygenated muriatic acid has thus exhausted its action, it is found to be reduced to the state of ordinary muriatic acid; the coloring particles have, therefore, abstracted its oxygen. If we evaporate the liquid, in order to examine the state of the coloring particles, we find that it yields a blackish residuum, as if its particles had suffered a slight combustion. It is in this way also that colors are more or less speedily destroyed by the action of the air, especially when it is promoted by the solar beams. Hence, the oxygenated muriatic acid easily and quickly produces the effects which air and light operate in a longer space of time, because the oxygen, deprived in part of its elasticity, and adhering loosely to the acid, enters readily into combination with the substances for which it has an affinity.

Other methods of procuring the oxygenated muriatic acid have been adopted. A very common one is to take equal parts, by weight, of common salt and manganese, intimately mixed together. Some bleachers moisten the mixture with water, to the consistence of a thick paste, so that the dissolved salt may incorporate more intimately with the manganese. An equal weight of sulphuric acid is then taken as of the other materials, which is diluted with its bulk of water, and allowed to cool before being poured into the retort on the combined salt and manganese. The charge for the distillation thus consists of equal parts of salt, manganese, and sulphuric acid, diluted with an equal bulk of water. This is the method in the neighbourhood of Glasgow.

In Ireland the proportions are generally said to be:

Manganese	6 parts
Common salt	6 parts
Sulphuric acid	5 parts
Water	5 parts.

In Germany and France:

Manganese	20 parts
Common salt	64 parts
Sulphuric acid	44 parts
Water	54 parts.

For the happy discovery of the advantages of this mode of bleaching we are indebted to an accidental circumstance. The celebrated Scheele, as we have intimated, while employed in making experiments on manganese, about the year 1774, noticed its powers in rendering vegetable substances colorless. This he communicated to Berthollet in France, about the year 1786, and the latter lost no time in applying the properties of this curious substance to the most important practical purposes. In 1789 he published his experiments on the application of it to the bleaching of cotton and linen cloth: Mr. Watt of Birmingham, we believe, having previously been made acquainted with it by that distinguished chemist. The new method of bleaching was now quickly and successfully introduced into manufactories at Valenciennes, Rouen, and Courtray; then into those of Manchester and Glasgow; and it has since been generally adopted in Great Britain, Ireland, and throughout Europe.

But oxygenated muriatic acid used alone was soon found to weaken the texture of the cloths,

and its vapors were suffocating. An addition of alkali to the liquor was now tried, and potash became generally used for that purpose. This relieved the workman, by depriving the acid of its vapors, without destroying its bleaching powers. Yet it diminished them; and the potash, which was all lost in the process, was very expensive. An oxy-muriate of lime was therefore proposed to be used, in 1798, by Mr. Tennant of Glasgow. He demonstrated that the oxy-muriatic acid would combine with the alkaline earths, lime, barytes, or strontites, and form oxy-muriates easily soluble in water. To obtain it, it is merely requisite to pass the gas, as it is disengaged, through slaked lime till it be saturated. This lime is afterwards dissolved in a certain proportion of water, which solution is then ready to be employed. In regard to this employment of lime, Berthollet observes, the oxygenated muriate of lime has one advantage over the lixivium of Javelle (the oxygenated muriate of potash or soda), from the great difference of price between lime and potash or soda; and its state of condensation, and desiccation, renders its carriage less expensive. But it has also the inconvenience of transforming a portion of the oxygenated muriatic acid, and of containing superoxygenated muriate, which cannot be indicated in this combination by nomenclature, which is precise only with regard to very uniform combinations: it appears even that the proportion of superoxygenated muriate is considerable: for if, after expelling by a slight degree of heat the oxygenated muriatic acid which had retained its properties, the remaining substance be examined, it is found no longer to produce discoloration; and if it be urged with a stronger heat in this state, much oxygen gas is disengaged. Welter tells us, that in his comparative experiments he had observed, that the gas condensed by lime produced only one-tenth of the effect which may be obtained when it is received in water. The use of the oxygenated muriate of lime must therefore be disadvantageous; but it may be convenient for certain purposes, from the facility of carriage and preservation, where the economy of the process is of secondary consequence. Under this point of view it merits the commendation which it has received.

The addition of sulphuric acid to the solution of the oxygenated muriate of lime, increases the effect, by the decomposition of the superoxygenated muriate; but to produce this effect fully, a quantity of acid is required, which might become dangerous. These objections do not apply to the addition of chalk, which has been recommended by Descroizilles, of which he makes use in his elegant manufactory. Its value is very trifling; and although our experiments appear to prove that it somewhat lessened the total effect of the oxygenated muriatic acid, yet this diminution is so small that it may be neglected. Hence, though the process with the simple oxygenated muriatic acid may be executed without inconvenience, there is no harm in employing the addition of chalk, so as to repress the greater part of the odor. We even recommend not to omit its use, whenever persons are not very well instructed in conducting the operations with the customary attentions which are required.

The oxy-muriatic acid has since been combined by Mr. Tennant with lime in the dry way, for which improvement he justly received another patent. A great saving is thus made by the bleacher in the expense of the alkali; the improvement in fact constituted almost another new era in the history of bleaching. The concrete oxy-muriate of lime is diffused in water by agitation, and the insoluble matter is allowed to settle until the liquor becomes clear.

In the Quarterly Journal of Science and the Arts, for July, 1822, Dr. Ure has published a paper on the composition and manufacture of chloride of lime, where the proper proportions of the ingredients employed in its formation are investigated. 'When a mixture of sulphuric acid, common salt, and black oxide of manganese,' says he, 'are the ingredients used, the absolute proportions are:

1 atom muriate of soda,	7.50	29.70	100.00
1 atom peroxide of manganese	5.50	21.78	73.30
2 atoms oil of vitriol (1.846 sp. gr.)	12.25	48.52	163.30
	25.25	10.000	336.60

And the products ought to be			
Chlorine disengaged	1 atom,	4.5	17.82
Sulphate of soda	1	9.0	35.64
Protosulphate of manganese	1	9.5	37.62
Water	2	2.25	8.92
		25.25	100.00

'These proportions are, however, very different from those employed by many, nay, I believe, by all manufacturers; and they ought to be so, on account of the impurity of their oxide of manganese. Yet making allowance for this, I am afraid that many of them commit great errors in the relative quantities of their materials.

'From the preceding computation it is evident that one ton of salt, with one ton of the above native (impure) oxide of manganese, properly treated, would yield 0.59 of a ton of chlorine, which would impregnate 1.41 ton of slaked lime, producing two tons of bleaching powder, stronger than the average of the commercial specimens; or, allowing for a little loss, which is unavoidable, would afford two tons of ordinary power, with a little more slaked lime.'

I have lately analysed, says this excellent chemist in his new edition of Berthollet on Dyeing, two samples of recently made bleaching powder, made by two eminent manufacturers, one in Scotland, the other in England, and found the composition as follows:

Chlorine	18.00	16.7
Lime	37.00	31.3
Muriate of lime	28.50	29.0
Water	16.50	23.0
	100.00	100.0

The above quantity of lime is associated or mixed with the chlorine. The muriate of lime (chloride of calcium) is formed in the process, and is a product very disadvantageous to the

BLENHEIM.

manufacturer, since it takes up about one-half of his chlorine unprofitably, and adds a compound to his powder, probably injurious to the bleacher. Bleaching powder may be formed, which contains no appreciable proportion of the muriate of lime, as I have shown in the above memoir. By proper management the manufacturer of chloride of lime might therefore double his useful product at scarcely any additional expense.

Sulphuric Acid, or oil of vitriol, when pure, is a colorless fluid, without smell, and slightly viscid. The specific gravity of the sulphuric acid of commerce is generally 1850, about twice the weight of distilled water, but the French chemists make it 2.2553 or more. The manufacture of it is now carried on to a great extent in Great Britain. It is sometimes adulterated with lead, and supersulphate of potash; a portion of the former being taken up during its formation, in chambers of that metal; hence a white precipitate is often found in the bottom of the bottles containing it.

In popular language, sulphureous acid may be said to be a solution of sulphur in oxygen, which doubles the weight of this gas, without

augmenting its bulk. It obviously, therefore, consists by weight of equal quantities of the two constituents. Its equivalent will either be $2 \text{ oxygen} + 2 \text{ sulphur} = 4$; or $1 \text{ oxygen} + 1 \text{ sulphur} = 2$. Now the analysis of sulphite of barytes by Berzelius gives 200.22 base to 86.53 acid; which being reduced, presents for the prime equivalent of sulphureous acid, the number 4. See SULPHURIC ACID.

III. OF THE MACHINERY USED IN BLEACHING.

This of course must be principally regulated by the scale and kind of business carried on. No pursuit has better paid for the introduction of scientific machinery, when it has been carried to any considerable extent; and, where heavy cotton cloths or linen are whitened, it requires considerable aid from machines. Amongst them a water wheel of sufficient power to give motion to the dash wheels, or wash stocks, rollers, or squeezers, &c. is conspicuous.

2. *Wash Stocks* are assistants in turning and washing the linen, now almost exploded; but the following diagram will show the construction:

Fig. 1.

Fig. 2.

Fig. 1. is a front and fig. 2. a side view of this invention. A, A, are the stocks or feet, suspended on iron pivots at B, and receiving their motion from wipers on the revolving shaft C. The cloth is laid in at D, and by the alternate strokes of the feet, and the curved form of the turnhead E, the cloth is washed and gradually turned; while a stream of water rushes on the cloth through holes in the upper part of the turnhead. These machines are often found in the bleaching grounds in Scotland and in Ireland; and are sometimes made with double feet, suspended above and below two turnheads, and wrought with cranks. They perform from twenty-four to thirty strokes per minute.

2. A more preferable and scientific mode of accomplishing this object is found in the use of the dash wheel, plate I. figs. 1 and 2. The pieces of cloth are put into the quadrantal compartments of the wheel, into which a stream of pure water flows through a circular slit in its posterior surface. By the rotation of the wheel, the cloth is dashed backwards and forwards between the quadrantal partitions. Twenty-five revolutions per minute is the proper speed of a wash wheel, six feet in diameter. Some persons

suppose them to perform better with twenty-six or twenty-seven revolutions. But any considerable deviation from this velocity either impairs the utility of the machine, or destroys its functions altogether. The parts are so distinctly delineated by the artist, as to supersede the necessity of letters of reference and minute explanations.

Squeezers are rollers, represented in plate II. figs. 2 and 3, whose motion draws the cloth between them, after it has passed the dash-wheel. I have here given one constructed by Parkinson of Manchester. A is the lower roller. B the upper roller. C D a lever which presses upon the brass of the upper roller. F E another lever to increase the power connected with C D. The extremity of F is kept down by a pin: in some cases a weight is used instead of it.

Plate II. fig. 1. is a bucking boiler, and exhibits the fire-place, the iron boiler, surmounted by the wooden crib, with its grated bottom, and the central iron pipe.

We come now to the most important articles of the bleachers' establishment, the apparatus for obtaining the oxy muriatic acid. This is represented in plate III.

Fig. 1. is a horizontal projection according to the line A B', and a section of one of the furnaces according to C D. A, tub of immersion. B, receiver. M, M, M, M, M, plates which close exactly the space between the upper shallow tub, and the sides of the receiver. Only the side looking to the furnace is left open. Q, pipe into which the syphon for running the acid into the immersion tub is introduced. O, O, cross pieces which support the shallow tubs, and are fixed into the extremities, N, N, N, N, of four uprights. K, circular groove cut out in the plate, which closes the space between the second shallow tub and the side of the receiver, for the passage of the conductor tubes, one of which is traced in the figure. C, C, partition which separates the receiver from the furnaces. D, plan of a furnace, of the boiler E, serving for a sand bath, and of the mattress F, which communicates by the tube G with the intermediate bottle H, enclosed in its double box I: in the furnace, round the sand bath, and opposite each angle, channels have been cut, which serve as chimneys and registers. A section of the second furnace D is made at the height of the fire-place, that the grate *d* may be perceived, and the plate of iron *d'*, which separates the fire-place from the ash-pit.

Fig. 2. Vertical section of the receiver, and of the immersion tub, according to the lines A B and C D. L, L, L, shallow tubs, separated from each other by the cross pieces O, fixed on the uprights N. The space between them and the sides of the receiver is closed by the plates M, M, M, so as to leave a free space, but on sides alternately opposite; that is to say, from the side of the furnaces to the inferior shallow tub, as also to the superior, and on the side of the immersion tub, to the middle shallow tub. P, P, P, tubes which allow the gas to pass from one shallow tub to its superior, when it contains a stratum of it, equal to the length of these tubes. The tube of the upper shallow tub is made long enough, as is shown, to disperse the gas, which being undissolved in the water, would be diffused in the air, and annoy the workmen. K, conductor tube, which proceeds from the intermediate bottle, and terminates under the lower shallow tub. Q, pipe which communicates down to the bottom of the apparatus, in order that the syphon R may conduct the most concentrated acid (aqueous chlorine) into the immersion tub. S, tube of safety. D, elevation of the furnace provided with all its distillatory apparatus.

Fig. 3. The vertical projection of the two distillatory apparatuses, according to the line D, D. The letters indicate the same objects as in the two preceding figures.

Fig. 4. The vertical section of a furnace, and of one of the boxes, with a view of showing its internal form, and the position of the sand bath.

Fig. 5. Plan of a furnace without a sand bath.

Fig. 6. Plan and elevation of the boiler serving as a sand bath. Fig. 7. F, mattress; T, cock of the mattress. Fig. 8. V, small syphon to draw out the air from beneath the shallow tubs. Fig. 9. I, box, with two square cells, serving to contain the intermediate bottles, drawn on a double scale. Y, small box, which encloses the bottle held in one of the cells, by the corners X, X, X, X. Fig. 10. Elevation of the same box, furnished with its two bottles. Plan and elevation of the small boxes Y.

Fig. 11. Vertical section of the apparatus. A, tub. B, boiler, the bottom of which is concave, and provided with a stop-cock T. On the pipe to which this stop-cock is attached, a socket is soldered, into which the glass tube V enters, that communicates by another kneed socket with one of the wooden pipes F, which afford passage to the steam. This tube serves to show what height the liquor rises to in the boiler. The bottom of this is sustained on the edges of the interior masonry of the furnace, except in the part corresponding to the aperture S, through which the smoke passes off. Its edges are turned back on the masonry for receiving the tub, they are then raised round it, in order that the vapor and the liquid may not find an outlet between the tub and the boiler. H, grating of deal, the ribs of which rest at their ends on the edges of the masonry of the furnace, and which are supported by two bars. I, connected with the grating by four copper straps, which bear upon the corners. D, body of the pump. It has at its lower part an inverted cup, pierced with small holes, to prevent in the aspiration (sucking), the introduction of bodies, which might hinder the valves from shutting, or might scratch the body of the pump. It is prolonged by a thin copper pipe, C, which, at the upper part of the tub, carries a copper heel, on which the cylinder of copper, K, rests. This cylinder stands on four castors. It carries four sockets, to each of which an arm, X, X, is adjusted, of a length equal to the diameter of the tub, and pierced with holes, like the bulb of a watering pot. In order that the lee raised by the pump may be diffused, the pipe of the pump is perforated in like manner with small holes, in the whole portion which corresponds to the copper cylinder; and, in order that the lee may not run off by the bottom of this cylinder, it presses exactly at this part on the pipe of the pump. The arms X are fitted on like the bayonet to the muzzle of a musket; they are taken off, for the introduction and removal of the cloths. The cylinder is terminated by a ratchet wheel L, the number of whose teeth should be a prime number, in order that having no exact divisor, the arms may not be periodically brought back to the same positions. The ratchet L is set in motion by a rod *a*, hooked to one of the pieces of wood that form the frame-work, on which the balance-beam *d* of the pump rests, and fixed very freely by a pin to a horizontal rod *b*. This rod is fixed in like manner by its other extremity, to one of the branches of a bell movement M, whose other branch communicates by the rod *c*, with the balance-beam. Hence, on turning the handle *e*, every movement of the balance-beam is communicated to the rods, and onwards to the ratchet, which, for each stroke of the piston, percurs the space of one tooth. The body of the pump D, and the pipe C, are joined by two straps and screws. Under these straps passes an iron collar, traversed by six bolts, whose screwed ends are fixed with nuts to a copper platform placed

on the grating. By this means the pump rests on the grating, and bears no weight on the bottom of the boiler. The pipe C is also held fast at its upper end by an iron strap, adapted to and fixed on the cross bar *f*. G represents the copper funnel, by which are introduced the solution of potash, and the waters necessary for the lixivium. It terminates in one of the tubes F, to prevent the solution of potash spouting out on the adjoining pieces. P indicates the form of the fire-place, the grate being at R, and the ash-pit at Q. The smoke issues by the aperture S, of which only half the altitude is seen here; it circulates by the flue U round the boiler, entering then into the tube of the chimney, which rises vertically.

Fig. 2. Horizontal section of the tub taken above the platform of copper *l*, on which are fixed by nuts the six bolts which support the body of the pump. *m*, furnace door. The dotted lines *nn*, indicate the separation formed by fire bricks, in the flue which runs round the boiler, and which determines the entrance of the smoke into this passage, as well as its issue into the vertical pipe *p*.

Fig. 3. Vertical projection of the apparatus taken in another direction. *h*, register, with which the chimney *p* ought to be furnished. *g*, rim of the boiler turned up on the outside of the tub.

Fig. 4. Horizontal projection of the apparatus, according to the line T'G''.

Fig. 2. V, horizontal projection of the body of the pump, in which the details of the adjustment of the piston are represented. D, vertical section of the body of the pump; R, clack valve. S, piston; T, cup attached by a strap to the lower extremity of the body of the pump.

Fig. 4. Horizontal projection, and vertical section of the cylinder K, which bears the sockets to which the arms XX are adjusted. C, copper pipe, to which is soldered the heel *x*. *y, y*, brass castors which rest on the heel *x*, and which support the cylinder K. *u, u, u*, sockets, having an opening for receiving the knob soldered to the extremity of the arms. L, ratchet wheel fixed, to the upper part of the cylinder K. It contains in the figure seventeen teeth. These two figures have been made on a double scale, in order that the details might be better understood. The apparatus for the oxygenated muriatic acid, and for the running off of lees, are on the same scales.

N. B. To avoid embarrassing the figures, a small plank is not represented here, which when the apparatus is constructed on as large dimensions as the present, should be placed at about two metres (yards) from the ground, for throwing the goods upon, and from which a child can hand them to the workman, who arranges them in the tub.

Fig. 5. Vessels for the testing of potashes. 1. Small measure; it is filled by plunging the bulb into the liquid, and stopping the tube with the finger whenever it is full. It may then be carried without fear of losing what it contains. To make it flow, the finger has only to be lifted. 2. Tube, containing up to the mark fifty times the small measure. 3. Goblet or jar in which the mixture of the test acid is made, and the solution of potash. 4. Tube employed for stirring, and

making the traces on stained paper. For the trial of the oxygenated muriatic acid, the small measure is filled with the solution of indigo, which is poured into a glass jar of the same form as the above, or into a glass tumbler; then the number of measures is introduced that are required for discharging its color.

Fig. 6. Ordinary distribution (arrangement) of the mode of running off lees. 1. Tub, on whose bottom a wooden grating is placed, or some simple pieces of wood, which prevent the cloths, when heaped, from choking up the aperture of the pipe 3, by which the lee falls back into the boiler. 2. Boiler, here represented cut vertically through its diameter, in order to see its form. Those usually employed are different, and do not possess the advantage which the present one does, of directing the liquid, which spouts up, when the ebullition is brisk, towards the middle of the boiler. It has been, moreover, represented as mounted on a furnace different from those which the bleachers usually construct. Its construction is nearly the same as that of the furnace of

Fig. 1. The form of this boiler and of its furnace is adopted in a great many dye-houses. When their dimensions are good, there is much economy of fuel, and convenience of manipulation. Those of the figure have been copied from well constructed furnaces. If pit coal be burned, the height of the fire-place should be diminished a little, and if turf, a little increased. Instead of sinking the furnace into the ground, its bottom may, however, be put nearly on a level with that of the tub, and the lee made to fall back from the tub into the boiler by a kneed pipe, which reaching to near the bottom of the tub, and opening above the boiler, does the office of a syphon, and reconveys to it the lees which had gone through the whole thickness of the goods. We come now to

IV. THE PRINCIPAL IMPROVEMENTS IN THE MODERN MODE OF BLEACHING.

These appear 1. In the use of the wash-stocks or dash wheels, already described, in which the goods, after being steeped, are cleansed from the weavers' and any other loose stuff attached to them. They are now deposited in layers one above another in a large wooden vat of circular form, sometimes called a kieve, which is then filled with old alkaline lee, at a blood-heat, under which they are carefully kept, moderately compressed. In a few hours an intestine motion is observable, and an increase of temperature takes place; the liquid swells; bubbles of air rise to the surface; and a thick scum is thrown up. The fermentation, which we have noticed in describing the old plan, is now found to proceed for twelve or eighteen hours, according to the weather. When it ceases the goods are withdrawn from the vat, and again carried to the stocks or dash-wheel, in order to be cleared. This must be particularly attended to; if left too long in the steep, after the acetous fermentation ceases, the putrid fermentation begins, and the extraneous colored and other matters, in place of being discharged from the goods, are fixed in them; and the fibre of the cloth is corroded.

2. *In the use of the bucking tub.*—The boiler having been charged with alkaline lee, the goods are placed over it in the vat or kieve already mentioned, and here represented with a central iron pipe, and grated bottom. Whenever the water or alkaline lee boils briskly, its vapor, confined by the goods in the crib, presses on the surface of the liquid, and forces this to issue in a sudden stream from the top of the pipe, whence it is spread over the surface of the goods, and gradually percolates down through them. The liquid in its descent becomes slightly cooled; but after a little while, accumulating and becoming hot again in the boiler, a new eruption of boiling liquid takes place. When linen cloths are nearly white, they are sometimes gently boiled with pearl-ashes, or pearl-ashes and soap, in common cast-iron boilers, with a stop-cock at the bottom; or the boiler already described may be used.

3. *In the immersion of the goods in the oxymu-*

riate of potash or lime.—We have already discussed the formation and operation of these lees. It need only be added here that their specific gravity is generally about 1005. The period of immersion is ten or twelve hours. Souring is accomplished by the use of sulphuric acid, as already hinted, which is made about as strong as good vinegar. But it must be well washed out, or the goods will infallibly rot when dry. The following has been given as a summary of the entire process. 'A parcel of goods consists of 360 pieces of those linens which are called Britannias. Each piece is thirty-five yards long, and they weigh on an average ten pounds each: the weight of the parcel is, in consequence, about 3600 pounds, avoirdupois weight. The linens are first washed, and then steeped in alkaline lee, as formerly described under these processes; they then undergo the following operations:

- 1st. Bucked with 60 lb pearl-ashes, washed, exposed on the field.
- 2d. Ditto . . . 80 . . . do . . . do . . . do . . . do.
- 3d. Ditto . . . 90 . . . potashes . . . do . . . do . . . do . . . do.
- 4th. Ditto . . . 80 . . . do . . . do . . . do . . . do . . . do.
- 5th. Ditto . . . 80 . . . do . . . do . . . do . . . do . . . do.
- 6th. Ditto . . . 50 . . . do . . . do . . . do . . . do . . . do.
- 7th. Ditto . . . 70 . . . do . . . do . . . do . . . do . . . do.
- 8th. Ditto . . . 70 . . . do . . . do . . . do . . . do . . . do.
- 9th. Soured one night in dilute sulphuric acid, washed.
- 10th. Bucked with 50 lb pearl ashes, washed, exposed on the field.
- 11th. Immersed in the oxymuriate of potash twelve hours.
- 12th. Boiled with 30 lb pearl-ashes, washed, exposed on the field.
- 13th. Ditto . . . 30 . . . do . . . do . . . do . . . do . . . do.
- 14th. Soured, washed.

The linens are then taken to the rubbing board, and well rubbed with a strong lather of black soap, after which they are well washed through pure spring water. At this period they are carefully examined, and those which are fully bleached are laid aside to be blued and made up for the market; while those which are not fully white, are returned to be boiled and steeped in the oxymuriate of potash, and soured, until they are fully white.' It may be here remarked that magnesia has been suggested as a substitute for lime in the above process; but its high price will long forbid its general use.

The bleaching of calicoes is conducted upon the same general plan, as that of linen: only the object here is not so much perfect whiteness, as that the goods be well-rooted, as it is called, or completely freed of all coloring and vegetable oils. The process is therefore easier than that of linen bleaching. Fast-colored cottons are bleached in the following way:—After the starch or dressing is well removed by cold water, they are gently boiled with soap, washed, and immersed in a moderately strong solution of oxymuriate of potash or lime. This process is repeated till the white parts of the cloth are sufficiently pure. They are then soured in sulphuric acid. If these operations be well conducted, the colors, instead of being impaired, will be greatly improved, having acquired a delicacy of tint which no other process can impart.

In the bleaching of muslins of the coarser kind, such as jaconet, after they have been

steeped and washed, they are boiled in a weak solution of pot and pearl-ashes; then being again washed, they are twice boiled in soap alone, and then soured in very dilute sulphuric acid: when washed from the sour, they are again boiled in soap, washed, and immersed in the oxymuriate of potash. The boiling in soap, and steeping in the oxymuriate, is now repeated, until the muslin is a pure white. They are then soured and washed in pure spring water. In bleaching the finer fabrics of muslin, such as the mull mull and book muslins, nearly the same process is followed as the above for bleaching of jaconet; only that, on account of the fineness of the fabric, no pearl-ashes are used in boiling, but soap alone. The following is the practice followed by a very skilful bleacher of muslins near Glasgow:—In fermenting muslin goods, we surround them with our spent lees from the temperature of 100° to 150° Fah., according to the weather, and allow them to ferment for thirty-six hours. In boiling 112 pounds. = 112 pieces of yard-wide muslin, we use six or seven pounds of ashes and two pounds of soft soap, with 360 gallons of water, and allow them to boil for six hours; then wash them, and boil them again, with five pounds of ashes, and two pounds of soft soap, and allow them to boil three hours; then wash them with water, and immerse them into the solution of oxymuriate of lime, at five on the test tube, and allow them to remain from six to twelve hours; next wash them, and immerse them into diluted sulphuric acid at the

specific gravity of $8\frac{1}{2}$ on Twaddle's hydrometer = 1.0175, and allow them to remain an hour. They are now well washed, and boiled with $2\frac{1}{2}$ pounds of ashes, and two pounds of soap, for half an hour; afterwards washed and immersed into the oxymuriate of lime as before, at the strength of three on the test tube, which is stronger than the former, and allowed to remain for six hours. They are again washed and immersed into diluted sulphuric acid at the specific gravity of three on Twaddle's hydrometer = 1.015. If the goods be strong, they will require another boil, steep, and sour. At any rate, the sulphuric acid is well washed out before they receive the finishing operation with starch.

‘With regard to the lime, which some use instead of alkali, immediately after fermenting, the same weight of it is employed as of ashes. The goods are allowed to boil in it for fifteen minutes, but not longer, otherwise the lime will injure the fabric.’

For BLEACHING OF PAPER. See PAPER-MAKING.

For BLEACHING OLD PAPER: Boil your printed paper, for an instant, in a solution of caustic soda: that from kelp may be used. Steep it in soap-suds, and then wash it; after which it may be reduced to pulp. The soap may be omitted without much inconvenience. For old written paper to be worked up again: steep it in water acidulated with sulphuric acid, and then wash it well before it is taken to the mill. If the water be heated it will be more effectual. To bleach printed paper, without destroying its texture: Steep the leaves in a caustic solution of soda, either hot or cold, and then in a solution of soap. Arrange them alternately between cloths, as paper-makers do thin sheets of paper when delivered from the form, and subject them to the press. If one operation does not render them sufficiently white, it may be repeated as often as necessary. To bleach old written paper, without destroying its texture: Steep the paper in water acidulated with sulphuric acid, either hot or cold, and then in a solution of oxygenated muriatic acid; after which immerse it in water, that none of the acid may remain behind. This paper when pressed and dried, will be fit for use as before. Chaptal says ‘simple immersion in the oxygenated muriatic acid, and a longer or shorter continuance in it, according to the strength of the liquor, are sufficient to bleach a print; but when a book is the object other precautions are necessary. As it is requisite that the acid should moisten all the leaves, care must be taken to open the book well up, and to make its boards rest on the edge of the vessel, so that the paper alone dips into the liquor. Such leaves as are sticking together, must be adroitly separated, that they may be all equally impregnated. The liquor assumes a yellowish tint, the paper becomes white, and after two or three hours the book is withdrawn, in order to be plunged into pure water, which is to be renewed from time to time, to carry off any remaining oxygenated muriatic acid, along with its disagreeable smell.

‘This process has succeeded with me pretty well. It was the first which I employed. But too frequently the color of the leaves was varie-

gated: sometimes several pages have not been at all bleached; and I was forced to adopt a sure process. We begin by unstitching the books, and reducing them to leaves. These leaves are set in squares contrived in a shallow leaden tub, with very thin plates, so that the leaves, laid flat, are separated from one another by hardly perceptible intervals. The acid is then poured gently in, making it fall on the sides of the tub; and, to prevent the leaves from being deranged after the operation is finished, the acid is drawn off by a stop-cock placed in the bottom of the tub. This liquid is replaced by fresh water, which washes the paper, and deprives it of the odor of the oxygenated acid. It is now hung up to dry, smoothed, and bound. I have restored by this means several precious works, which were of no value from their bad condition. The leaves may be set also upright in the tub, a position which offers some advantages, as they are less readily torn. For this purpose I constructed a wooden frame, which I fixed down at the height which I thought suitable, conformably to the height of the leaves that I wished to bleach. This frame supported very thin slips of wood, leaving between them intervals of half a line. I placed two leaves in each of these intervals, and fastened them with two small wedges of wood, which I pushed between the slips so as to press the leaves against them. I give the more preference to this process, because, when the operation is done, I lift out the frame with the leaves, and plunge the whole into fresh water. By this operation, not only books are restored, but the paper receives a degree of whiteness which it never had. This acid has also the advantage of effacing spots of ink which frequently depreciate books and prints. This liquor does not attack the stains of grease or oil; but it has been long known, that a weak solution of potash (caustic alkali) is a sure means of removing these marks.

‘When I have had to repair engravings in such bad condition that they exhibited merely fragments pasted down on paper, I was afraid of spoiling these fragments in the liquor, from the loosening of the paste. In this case, I took the precaution of enclosing the print in a large cylindrical jar, which I inverted over a glass, into which I put the proper mixture for disengaging oxygenated muriatic gas. This aeriform substance filled the interior of the jar, and acted on the print, consuming the filth, destroying the spots of ink, while the fragments remained glued, and thus preserved their relative position.’

BLEACHING POWDER, or SALT. CHLORIDE OF LIME, which see. It is also called oxymuriate of lime.

BLEAK, } The same word as bleach,
BLEAK'NESS, } differing only in the applica-
BLEAK'Y, } tions. Bleach conveys the
BLEAK'LY. } simple idea of whitening in the
air, but bleak supersedes the notion of cold, as
the herbage is bleached or bleaked by piercing
winds; figuratively used to express whatever
is chill, dreary, cheerless, and desolate.

Intreat the north

*To make his bleak winds kiss my parched lips,
And comfort me with cold.*

Shakspeare.

The goddess that in rural shrine
Dweldest here with Pan, or Sylvan, by blest song
Forbidding every *bleak* unkindly fog
To touch the prosperous growth of this tall wood.

Milton.

On shrubs they browse, and, on the *bleaky* top
Of rugged hills, the thorny bramble crop.

Dryden.

The parching dog-star, and the *bleak* north-east.

Prior.

Her desolation presents us with nothing but *bleak*
and barren prospects.

Addison.

Say, will ye bless the *bleak* Atlantic shore,

Or bid the furious Gaul be rude no more?

Pope.

The inhabitants of Nova Zembla go naked, without
complaining of the *bleakness* of the air; as the armies
of the northern nations keep the field all winter.

Addison.

On some *bleak* shore or solitary den
Far from the path and cheerful haunts of men.

Rowe.

BLEAK, *n. s.* alburnus, from his white or
bleak color. A small river fish.

The *bleak*, or fresh-water sprat, is ever in motion,
and therefore called by some the river-swallow. His
back is of a pleasant, sad sea-water green, his belly
white and shining like the mountain snow. *Bleaks*
are excellent meat, and in best season in August.

Walton.

BLEAR, *v. & adj.* Germ. *blæen*, from
BLEAR'NESS, } which is derived the
BLEARED'NESS, } Dutch, *bluer*, a blister,
BLEAR'EYED. } pustule or tumor. It is
applied to diseases of the eye, which, by rheum
or water, produce dimness or obscurity of
vision. Metaphorically, to dim; impede; or
obstruct the sight, as if disordered with blains,
and watery inflammation.

Full wel coude I him quite
With *blearing* of a proud milleres eye,
If that me list to speke of ribaudrie!
But ik am old; me list not play for age;
Gras time is don, my fodder is now forage.

Chaucer. *Canterbury Tales*.

All tongues speak of him, and the *bleared* sights
Are spectacted to see him.

Shakespeare.

It is a tradition that *blear* eyes affect sound eyes.

Bacon.

Thus I hurl

My dazzling spells into the spongy air,
Of power to cheat the eye with *blear* illusion,
And give it false presentments.

Milton.

It is no more in the power of calumny to blast the
dignity of an honest man, than of the *blear-eyed* owl
to cast scandal on the sun.

L'Estrange.

The defuxion falling upon the edge of the eyelids,
makes a *bleuredness*.

Wiseman.

When I was young, I, like a lazy fool,
Would *blear* my eyes with oil to stay from school;
Averse to pains.

Dryden.

His *blear* eyes ran in gutters to his chin;
His beard was stubble and his cheeks were thin.

Id.

Is it not a pity now, that tickling rheums
Should ever tease the lungs and *blear* the sight
Of oracles like these?

Cowper.

BLEAT, *v. & n.* } Ang.-Sax. *blatan*; Lat.
BLEAT', } *balare*; to cry as a sheep
or lamb.

We were as twinned lambs, that did frisk in the
sun,

And *bleat* the one at the other.

Shakespeare.

You may as well use question with the wolf,
Why he hath made the ewe *bleat* for the lamb.

Id. *Merchant of Venice*.

Jehovah, who, in one night, when he pass'd,
From Egypt marching, equalled with one stroke
Both her first-born and all her *bleating* gods.

Milton.

While on sweet grass her *bleating* charge doth lie,
Our happy lover feeds upon her eye.

Roscommon.

What bull dares bellow, or what sheep dares *bleat*
Within the lion's den?

Dryden.

Set in my ship, my ear reached where we rode,
The bellowing of oxen, and the *bleat*
Of fleecy sheep.

Chapman.

Full swell the woods; their every musick wakes,
Mixed in wild concert with the warbling brooks,
Increased the distant *bleatings* of the hills.

Thomson.

With innocent dismay a *bleating* flock

Crowd back, affrighted at the rolling tides.

G. West.

BLECHINGLEY, or *BLETCHINGLEY*, a town
of Surrey, two miles from Godstone, and twenty-
one south of London, sends two members to par-
liament; and has done so ever since parliaments
existed. The bailiff who returns the members
is chosen annually at the lord of the manor's
court. The town stands on a hill, and has a
fine prospect as far as the Sussex South Downs.

BLECHNUM, in botany, a genus of plants,
class cryptogamia, order filices. Fructification
a continued longitudinal line, each side the rib
of the frond parallel with it; involucre continued
from the surface, opening towards the rib: spe-
cies eight; one or two natives of England.

BLECHUM, in botany, a genus of plants,
class didynamia, order angiospermia: CAL. in
five deep equal segments: COR. funnel-shaped:
CAPS. two-celled, valved, and a contrary par-
tition, at length separating in portions: SEEDS
several, with awl-shaped proops.

B. browni; dense-piked *blechum*, leaves
ovate, slightly toothed; spikes quadrangular;
bracteas ovate, downy. Native of the West
Indies; a perennial, two or three feet high;
flowers of no great beauty.

B. erectum, upright *blechum*; leaves oblong,
somewhat toothed, smooth; spikes ovate; brac-
teas nearly smooth. Found in the western parts
of Jamaica. Stem erect, rather shrubby; flowers
blue.

B. angustifolium, narrow-leaved *blechum*;
leaves linear-lanceolate; spikes oblong; bracteas
ovate, hairy. Native of the Carribee Islands.
Herbaceous, a foot high, with tumid joints;
leaves smooth on both sides; flowers small,
blue.

BLEED, } Ang.-Sax. *blædan*, from *bla-*
BLEED'ING. } sen. Dut. *bløsen*, signifies to
grow red; *blæden* is to let out the red; that is,
the blood; to *bleed* then is to lose blood; to
run with blood; to die by violence; when any
liquid flows or drops from a body, either naturally
or in consequence of incision, that body is said
to *bleed*.

The cruel steele, which thrilled her dying hart,
Fell softly forth, as of its own accord;
And the wyde wound, which lately did dispart
Her *bleeding* brest, and riven bowels gored,
Was closed up as it had not been sored.

Spenser.

I *bleed* inwardly for my lord.

Shakespeare.

Bleed, bleed, poor country!

Great tyranny, lay thou thy basis sure

For goodness dare not check thee.

Id.

When Greeks joined Greeks, then was the tug of war,
The laboured battle sweat, and conquest *bled*.

Lee's Alexander.

The lamb thy riot dooms to *bleed* to-day;
Had he thy reason, would he skip and play? *Pope.*

For me the balm shall *bleed*, and amber flow,
The coral redden, and the ruby glow. *Id.*

That from a patriot of distinguished note,
Have *bled* and purged me to a simple vote. *Id.*

Patriots have toiled, and in their country's cause
Bled nobly; and their deeds, as they deserve,
Receive proud recompense. We give in charge
Their names to the sweet lyre. *Cowper.*

The only heart—the only eye
Had *bled* or wept to see him die,
Had seen those scattered limbs composed,
And mourned above his turbaned steed—
That heart hath burst—that eye was closed—

Byron.

BLEEDING, a hæmorrhage or flux of blood from a wound, rupture of a vessel, or other accident. See HÆMORRHAGE.

BLEEDING AT THE NOSE, OR EPISTAXIS. See EPISTAXIS.

BLEEDING OF PLANTS is drawing out the sap of plants, otherwise called tapping. See TAPPING.

BLEKINGEN, a province of Sweden, having the title of county, situated in South Gothland. It is bounded by Smaland on the north, Schonen on the west, and the Baltic on the other sides. In length it is about 100, and the breadth twenty-five miles, including a surface of less than 1000 square miles, with about 67,000 inhabitants. Though great part of it is mountainous and woody, it is considered one of the most agreeable parts of Sweden. The inhabitants subsist chiefly by hunting, fishing, and breeding of cattle. Carlscrona is the capital.

BLEMISIL, *v. & n.* Junius says from BLEMISH'LESS, } *blame*; Fr. from *bleme*,
BLEMISH'MENT, } which signifies white;
BLEMISH'ING. } a blemish is that which stains or spots what would otherwise, and what ought to be perfectly white. Thus any natural deformity is a blemish; any speck or injury which mars beauty or destroys proportion. Metaphorically it is any thing that sullies, taints, or tarnishes a reputation, that was before sound, fair, and pure; thus it signifies turpitude; reproach, and disgrace.

If any natural *blemish* blot our face,
You do protest it gives our beauty grace.

Drayton.

Full many lords, and many knights her loved,
Yet she to none of them her liking lent,
Ne ever was with fond affection moved,
But ruled her thoughts with goodly government
For dread of blame, and honor's *blemishment*.

Spenser. Faerie Queene.

Likelier that my outward face might have been
disguised, than that the face of so excellent a mind
could have been thus *blemished*. *Sidney.*

That you have been earnest, should be no *blemish*
or discredit at all unto you. *Hooker.*

Open it so from the eyelid, that you divide not
that; for, in so doing, you will leave a remediless
blemish. *Wiseman.*

First shall virtue be vice, and beauty be counted a
blemish,
Ere that I leave with song of praise her praise to so-
lemnize. *Sidney.*

Live thou, and to thy mother dead attest,
That clear she died from *blemish* criminal.

Faerie Queene.

Is conformity with Rome a *blemish* unto the church
of England, and unto churches abroad an ornament?
Hooker.

Not a hair perished:

On their sustaining garments not a *blemish*,
But fresher than before. *Shakespeare.*

Evadne's husband! 'tis a fault

To love, a *blemish* to my thought. *Waller.*

— This three years day these eyes, tho' clear
To outward view of *blemish* or of spot,
Bereft of light, their seeing have forgot.

Milton. Sonnets.

Not that my verse would *blemish* all the fair;
But yet if some be bad, 'tis wisdom to beware.

Dryden.

That your duty may no *blemish* take,
I will myself your father's captive make. *Dryden.*
Such a mirth as this is capable of making a beauty,
as well as a *blemish*, the subject of derision. *Addison.*
Those, who, by concerted defamations, endeavour
to *blemish* his character, incur the complicated guilt of
slander and perjury. *Id.*

To all apparent beauties blind,
Each *blemish* strikes an envious mind. *Gay.*

BLEMMYES, or BLEMYES, a fabulous people of Ethiopia, said to have no heads; their eyes, mouth, &c. being situated in their breasts. See ACCEPHALI. Bochart derives the word *blemmyes* from בלי which implies negation, and מות brain; in which sense the *Blemmyes* should have been people without brains.

Bryant, rejecting the pure Greek ἀκεφάλος, forms three Egyptian wards, Ac-caph-el, which he interprets, the Rock consecrated to the Sun. This, which is the same with Cahen-caphel, (κυνκεφαλος) he affirms was a university in Upper Egypt, which furnished all the temples with priests.

A barbarous people of this name appeared in the third century, as the allies of the Egyptians against Dioclesian. 'The number of the *Blemmyes*,' says Gibbon, 'scattered between the island of Meroe and the Red Sea, was very inconsiderable; their disposition was unwarlike; their weapons rude and inoffensive. Yet in the public disorders these barbarians, whom antiquity, shocked with the deformity of their figure, had almost excluded from the human species, presumed to rank themselves among the enemies of Rome. Such had been the unworthy allies of the Egyptians; and, while the attention of the state was engaged in more serious wars, their vexatious inroads might again harass the repose of the province. With a view of opposing to the *Blemmyes* a suitable adversary, Dioclesian persuaded the Nobatæ, a people of Nubia, to remove from their ancient habitations in the deserts of Libya, and resigned to them an extensive but unprofitable territory above Syene and the cataracts of the Nile; with the stipulation, that they should ever respect and guard the frontier of the empire.' See *Gibbon's History*, chap. xiii. vol. ii. p. 144; *Strabo*, lib. xvii. p. l., 172; *Pomponius Mela*, lib. i. c. 4.

BLENC'H, *v. & n.* } See to BLANCH and to
BLENC'H'ER, } BLINK. To shrink from;
BLENC'H'ING. } to start back; to give
away; to hinder; to obstruct. Not much used.

I'll observe his looks ;
I'll tent him to the quick ; if he but *blench*,
I know my course. *Shakspeare.*

Patience herself, what goddess ere she be,
Doth lesser *blench* at sufferance than I do. *Id.*

Hold you ever to our special drift ;
Though sometimes you do *blench* from this to that,
As cause doth minister. *Id.*

The rebels besieged them, winning the even ground
on the top, by carrying up great trusses of hay before
them, to *blench* the defendants sight, and dead their
shot. *Curw.*

BLENCH, or BLANCH, a sort of tenure of land.
To hold land in *blench*, is by payment of a sugar-
loaf, a couple of capons, a beaver hat, or the
like, if demanded ; *nomine albæ firmæ*, i. e. in
name of *blench*.

BLEND, *v.* } Ang.-Sax. *blendan* ; Swed.
BLEND'ER, } *blanda*, to mix ; to mingle to-
BLEND', *part.* } gether ; to compound. For-
merly to pollute ; to spoil ; to corrupt ; but in
this sense it is now wholly obsolete.

The moon should wander from her beaten way, the
times and seasons of the year *blend* themselves by
disordered and confused mixture. *Hooker.*

Which when he saw, he burnt with jealous fire ;
The eye of reason was with rage *gblend*. *Færic Queene.*

Regard of worldly muck doth foully *blend*,
And low abuse the high heroic spirit. *Id.*

'Tis beauty truly *blend*d, whose red and white
Nature's own sweet and cunning hand laid on. *Shakspeare.*

The mistion taught by the ancients is too slight or
gross ; for bodies mixed according to their hypothesis,
would not appear such to the acute eyes of a lynx,
who would discern the elements, if they were no other-
wise mingled, than but *blended* but not united. *Boyle.*

He had his calmer influence, and his mien
Did love and majesty together *blend*. *Dryden.*

The grave, where even the great find rest,
And *blended* lie the oppressor and the oppressed. *Pope.*

BLEND, among mineralists, a species of lead
marcasite ; by miners called mock ore, mock
lead, and wild lead. The German mineralists
call it *blende*, whence our denomination *blinde*.
It answers to what in *Agricola* is called *Galena*
inanis. It usually lies immediately over the
veins of lead ore, in the mines which produce
it, for it is not found in all. When the mi-
ners see this, they know the vein of ore is very
near.

BLEND-METAL IRON, a coarse sort of iron
from the Staffordshire mines, used for making
nails and heavy ware ; in some places also for
horse-shoes.

BLEND-WATER, or Morehough, a distemper
incident to black cattle, comes either from the
blood, from the yellows, or from the change
of ground. To cure it, take bole armoniac, and
as much charcoal dust as will fill an egg shell, a
good quantity of the inner bark of an oak, dried
and pounded together to a powder, and give it
to the beast in a quart of new milk and a pint of
earning.

BLenheim, a village of Germany, in the
circle of Suabia, memorable for the defeat of the
French and Bavarians in 1704, by the English
and their allies, under the duke of Marlborough
and prince Eugene. The French army amounted

to 60,000 veterans, commanded by Marshal Tal-
lard and the elector of Bavaria. The allied
army, commanded by Eugene and Marlborough,
amounted to about 52,000 men, troops who had
long been familiar with victory, and who had
seen the French, the Turks, and the Russians,
fly before them. Both armies, after many marches
and counter marches, approached each other.
The French were posted on a hill near Hochstet ;
their right covered by the Danube and Blenheim ;
their left by the village of Lutzingen ; and their
front by a rivulet, the banks of which were steep,
and the bottom marshy. Their position being
advantageous, they were willing to await the
enemy rather than offer battle. Marlborough,
however, resolved to engage them at all events,
in consequence of an intercepted letter from
Villeroy, intimating that he was preparing to
cut off all communication between the Rhine and
the allied army. The dispositions, therefore,
being made for the attack, the cannonading began
about nine in the morning, and continued to
about half-past twelve. The troops then ad-
vanced to the attack ; the right under the di-
rection of prince Eugene, the left headed by
Marlborough, and opposed to Marshal Tallard.
Marlborough, at the head of the English troops,
having passed the rivulet, attacked the cavalry
of Tallard with great bravery. Prince Eugene
had not yet attacked the forces of the elector ;
and it was near an hour before he could bring
up his troops to the engagement. Tallard had
posted a large body of forces in Blenheim, and
he now made an attempt to bring them to the
charge. They were attacked by a detachment of
Marlborough's troops so vigorously, that instead
of assisting the main body they could hardly
maintain their ground ; and the French cavalry
being thus taken in flank, was totally defeated.
The English army now penetrated the French
centre, while the forces in Blenheim were sepa-
rated by another detachment ; and Tallard was
made prisoner by the Hessian Troops, who were
in the allied army. Meanwhile, prince Eugene
having repulsed the enemy, the rout became
general, and the consternation of the French
soldiers was such that they threw themselves into
the Danube, without knowing whither they fled.
The allies being masters of the field of battle,
surrounded the village of Blenheim, and com-
pelled a body of 13,000 men, who had maintained
their ground, to lay down their arms. Thus
ended the battle of Blenheim, one of the most
complete victories that ever was obtained ;
12,000 French and Bavarians being slain in the
field or drowned in the Danube ; and 13,000
made prisoners of war ; besides 100 pieces of
cannon. All the French baggage, together with
their military chest, fell into the hands of the
allies. Next day, when the duke of Marlborough
visited his prisoner the marshal, the latter assured
him that he had overcome the best troops in the
world. 'I hope, Sir,' replied the duke, 'you
will except those troops by whom they were
conquered.' Blenheim lies three miles north-
east of Hochstet, and twenty-five north-west of
Augsburg. Long. 10° 25' E., lat. 48° 40' N.

BLenheim-House, a princely house erected
in honor of the duke of Marlborough at Wood-

stock, near Oxford, which with the manor of Woodstock was settled on the duke and his heirs, in consideration of the eminent services by him performed for the public; and for building of which house the sum of £500,000 was granted by parliament, &c. The tenure by which the manor of Woodstock is held, is the presenting at the castle of Windsor annually, on the day on which the battle of Blenheim was fought, a flag embroidered with fleurs-de-lis. In the park formerly stood a royal palace, where king Ethelred called a parliament, and where Alfred is said to have translated Boetius de Consolatione Philosophiæ. It was the principal residence of Henry II., who erected a house here for the abode of Rosamond Clifford, his favorite mistress. Here also he received homage from Rees, prince of Wales, knighted his son Geoffry, and gave away his cousin, the lady Ermengard, to William, king of Scotland. Edward II. was born here, as was Edward the Black Prince; and here Elizabeth was confined during part of the reign of Mary. The palace retained its regal splendor till the civil wars, when it was nearly destroyed. Near the bridge, to the north, there have been planted two sycamore trees on the spot occupied by its last remains. A stately column, 130 feet high, with a statue of the duke on the top, and the pedestal inscribed with tablets of his titles and achievements, is now the principal object in the park. This beautiful mansion extends from wing to wing, 348 feet, after the design of Vanbrugh. On a pediment, towards the garden, is a bust of Louis XIV., taken from the gates of Tournay. The entrance is through a handsome portal, on the top of which is a reservoir of water; this leads to a quadrangle, where are the offices, theatre, &c. The hall is supported by Corinthian pillars, the ceiling of which is beautifully painted, representing Victory crowning the victorious duke. The pictures in the bow-window room are by Schiavoni, Reynolds, Kneller, Tintoret, Rubens, Teniers, Giorgioni, &c., and the tapestry represents the various battles of the duke, one of which is that of Blenheim. The east dressing-room is furnished with crimson damask, and decorated with several capital paintings, as well as the duke's dressing room, and the grand cabinet. The saloon is grand and proportioned to the general magnificence; the lower part is lined with marble; on the sides are pictures of the inhabitants of different nations, in their proper costume, and on the ceiling is a representation of the duke stopped in the career of his victories by Peace, and Time reminding him of the rapidity of his own flight. The library is 183 feet in length, exclusive of the book-cases, and contains a very valuable collection. At one end of the room is a statue of queen Anne by Rysbrack, and at the other a marble bust of Alexander the Great, found at Herculaneum; besides several other fine busts and portraits. In the chapel, which occupies one of the wings, is a superb monument to the memory of the first duke and duchess, by Rysbrack. The gardens are spacious and well laid out: at one of the extremities is a fountain, designed from a model of that in the Piazza Navona at Rome. The four

river gods, represented as the guardian genii of the waters, also the horses and the lion, deserve particular attention, as exquisite pieces of sculpture. About the middle of the grand approach is a magnificent bridge of three arches, the water being formed into a lake, which covers a spacious valley, surrounded by an artificial declivity of a considerable depth.

BLENNIUS, the BLENNY, in ichthyology, a genus of fishes belonging to the order of jugulares. Essential characters: the head slants or declines to one side; there are six rays in the membrane of the gills; the body tapers towards the tail; the belly fins have only two blunt bones; and the tail fin is distinct. The most remarkable are, 1. *B. cornutus*, with a simple ray above the eyes, and a single black fin. 2. *B. cristatus*, with a longitudinal bristly crest betwixt the eyes. The above two are natives of the Indies. 3. *B. galeria*, with a transverse membranous crest upon the head, is found in the European seas. 4. *B. gunnellus* has ten black spots on the back fin. It is found in the Atlantic Ocean. 5. *B. orellaris*, with a furrow betwixt the eyes, and a large spot on the back fin. It is found in the European seas. 6. *B. phycis*, with a kind of crested nostrils, a cirrus or beard on the under lip, and a double fin on the back. It has seven rays in the gill membrane; the anus is surrounded with a black ring; and the tail is roundish. The two last are found in the Mediterranean Sea. 7. *B. viviparus* has two tentacula at the mouth. Schonevelde first discovered this species; Sir Robert Sibbald afterwards found it on the Scottish coast. They bring forth 200 or 300 young at a time. Their season of parturition is a little after the depth of winter. Before Midsummer they quit the bay and shores, and retire into the deep, where they are commonly taken.

BLENNORRHEA, from *βλεννα*, mucus, and *ῥεω*, to flow; a gleet; a discharge of mucus from the urethra, arising from weakness.

BLEPHARIES, in anatomy, the hair of the eyelids, or the part on which it grows.

BLEPHARON; *βλεφαρον*, Greek, the eyelid.

BLEPHAROXYSTUM, from *βλεφαρον* and *ξύω*, to scrape off; an instrument for pulling hairs out of the eye-lids.

BLERA, in old records, peat or turf.

BLESS', or	} the Ang.-Sax. <i>lysan</i> , to loosen or slacken. To dissolve; to set free; to soothe; to free from pain of body; anguish of mind; to pacify; to gratify; to confer happiness; to make happy; to prosper; to render successful; to wish happiness to another; to pronounce a benediction upon him; a devout expression of goodwill; to praise; to glorify; to celebrate. To be blessed, in the theological sense, is to be holy and happy; happy in the favor of God; happy in the felicities of heaven.
BLISS',	
BLESS'ED,	
BLESS'EDLY,	
BLESS'EDFUL,	
BLESS'EDNESS,	
BLESS'ER,	
BLESS'ING,	
BLESS'FULNESS.	

And this is the *blessing* wherewith Moses the man of God *blessed* the children of Israel, before his death.

Deuteronomy.

He blessed, and brake, and gave the loaves. *Matt.*
All generations shall call me blessed. *Luke.*

Blessed are the dead which die in the Lord. *Rev.*

He sayde, Friends! I am here and old,
And almost, God wot, on my pities brink;
Upon my soule somewhat most I think,
I have my body folly dispended,
Blessed be God that it shall ben amended.

Chaucer. Canterbury Tales.

Unto us there is one only guide of all agents natural, and he both the creator and worker of all in all, alone to be blessed, adored, and honoured by all for ever.

Hooker.

Many times have I, leaning to yonder palm, admired the blessedness of it, that it could bear love without the sense of pain.

Id.

Earthlier happy is the rose distilled,
Than that, which, withering on the virgin thorn,
Grows, lives, and dies in single blessedness.

Shakspeare.

The quality of mercy is not strained;
It droppeth as the gentle rain of heaven
Upon the place beneath. It is twice blessed;
It blesseth him that gives, and him that takes.

Id.

The person that is called, kneeleth down before the chair, and the father layeth his hand upon his head, or her head, and giveth the blessing.

Bacon.

But blessed be that great power, that hath us blessed
With longer life than earth and heaven can have.

Davies.

———— How hast thou disturbed

Heaven's blessed peace, and into nature brought
Misery uncreated till the crime
Of thy rebellion.

Milton.

This kingdom enjoyed the greatest calm, and the fullest measure of felicity, that any people, in any age, for so long time together, have been blessed with.

Clarendon.

Happy this isle, with such a hero blest;
What virtue dwells not in his loyal breast?

Waller.

In vain with folding arms the youth assayed
To stop her flight, and strain the flying shade;
But she returned no more, to bless his longing eyes.

Dryden.

When thou receivest praise, take it indifferently, and return it to God, the giver of the gift, or blessing of the action.

Taylor.

It is such an one, as, being begun in grace, passes into glory, blessedness, and immortality.

South.

O hospitable Jove! we thus invoke,

Bless to both nations this auspicious hour.

Id.

A just and wise magistrate is a blessing as extensive as the community to which he belongs; a blessing which includes all other blessings whatsoever, that relate to this life.

Atterbury.

Peace to thy gentle shade, and endless rest!

Blest in thy genius, in thy love too blest!

Pope.

Sun!—Didst thou fly thy Maker's pain, or start,

At that enormous load of guilt,

Which bowed His blessed head, o'erwhelmed his cross.

Young.

In His blest life

I see the path, and in His death the price;

And in His great ascent, the proof supreme

Of immortality.

Id.

———— My soul is caught;

Heaven's sovereign blessings, clustering from the cross,

Rush on her, in a throng, and close her round,

The prisoner of amaze.

Id.

That dread shall vanish with the favouring gale,
Which love to-night hath promised to my sail;
No danger daunts the pair his smile hath blest;
Their steps still roving, but their hearts at rest.

Byron. Bride of Abydos.

BLESS (Henry), painter, was born at Bovines near Dinant, 1480. He acquired his skill by the strength of his natural genius, assisted by a diligent study of Patenier's works; and rendered himself eminent, particularly by his landscapes. His best performances were bought by the emperor Rodolph, and are still preserved at Vienna. His style in historical subjects resembled that of the Flemish artists. But he crowded several subjects into one design. Notwithstanding this impropriety his pictures are in great request; they are styled the owl pictures, for he fixed an owl, as his peculiar mark, in each of them. He died in 1550.

BLESSINGTON, a market town of Ireland, in the county of Wicklow, on the Liffey. Before the union it sent two members to the Irish parliament. Distant five miles south-west of Naas, and twenty north-west of Wicklow.

BLETA ALBA, an epithet given by some to the milky urine voided in some disorders of the kidneys, ranked by Paracelsus among the causes of the phthisis.

BLETIA, in botany, a genus of plants of the class gynandria, order monandria. Its essential characters are: cal. and petals distinct: lip sessile, hooded: style unconnected: anth. a terminal deciduous lid. 1. B. Tankervillei. Lady Tankerville's bletia. Lip undivided, with a short spur; leaves radical, elliptic-lanceolate. 2. B. verecunda, tall bletia. Petals converging; lip without a spur; middle lobe broader than long; lateral ones contracted upwards. Stalk more or less branched. Native of the West Indies. 3. B. florida, purple bletia. Petals spreading; lip without a spur; middle lobe somewhat wedge-shaped; lateral ones dilated at the summit; stalk branched. Native of the warmest parts of the West Indies. It is twelve or eighteen inches in height. 4. B. hyacinthia, hyacinthine bletia. Petals lanceolate, spreading; lip without a spur; stem leafy. Native of China. 5. B. capitata, capitate bletia. Lip without a spur; callous internally near the base; stem leafy. Native of the West Indies.

BLETON, or BLETTON (————), a practitioner of the art of rhabdomancy, or the faculty of discovering subterraneous treasures, springs, &c. by means of a rod, who met with many partisans among men of science in Italy, France and Germany. Dr. Ritter, a member of the academy of Munich, advocated the virtues of the hydromantic baguette, which he endeavoured to explain by means of galvanism. After Bleton this faculty, real or supposed, has sometimes been called Bletonism. See BAGUETTE, and *Memoire Physique et Medicinale montrant des Rapports evidens entre les Phenomenes de la Baguette Divinatoire et ceux de Magnetisme et Electricité*. Par M. T.—— (Thouvenel), Paris, 1781, 12mo.

BLETTERIE (John Philip René de la), professor of eloquence at Paris, was born at Rennes in 1696, and died in 1772. His principal works are, 1. The Life of the Emperor Julian, 12mo. Paris, 1735, 1746, and translated into English in 1746. 2. The History of the Emperor Jovian, 2 vols. 12mo. Paris. 1748; abridged by Mr.

Duncombe in *The Select Works of the Emperor Julian*, 2 vols. 8vo. 1789. 3. A Translation of some of the Works of Tacitus, 2 vols. 12mo. Paris, 1755. He also edited Masclef's Hebrew Grammar, &c.

BLEYME, in farriery, an inflammation in the foot of a horse, between the sole and the bone. Bleymes are of three sorts: the first, bred in spoiled wrinkled feet with narrow heels, are usually seated in the inward or weakest quarter; the second infects the gristle, and must be extirpated as in the cure of a quitter-bone; the third is occasioned by small stones and gravel between the shoes and the sole. For a cure, pare the foot, let out the matter, if any, and dress the sore like the prick of a nail.

BLIESCASTEL, a lordship, castle and town of Prussia, in the grand duchy of the Lower Rhine, formerly belonging to the count of Leyen, under the sovereignty of the elector of Treves. The town stands on the river Blies, and has a population of 1300 inhabitants. In 1783 the French were driven out of their camp here by the Prussians, but regained possession of it next day. Five miles west of Deux-Ponts, and ten east of Sarrebruck.

BLIGHIA, in botany, so named in honor of admiral William Bligh. Class octandria, order monogynia. CAL. in five deep segments: PET. five: STYLE none: CAPS. superior, three cells and three valves: SEEDS solitary. B. sapida, akee-tree. Native of Africa, whence it was transported to the West Indies in 1778. The fleshy tunic, or support, of the seed is said to be a delicate article of cookery, resembling the white flesh of a chicken or frog.

BLIGHT, *v. & n.* } The etymology un-
BLIGHT'ED, } known; perhaps, says the
BLIGHT'ING. } Ency. Met. from the Ang.-
Sax. blihtan, belihtan, to alight; to descend; to fall upon; to strike, as with mildew; to blast, to wither; to hinder from fertility.

When you come to the proof once, the first blight of frost shall most infallibly strip you of all your glory.
L'Estrange.

This vapour bears up along with it any noxious mineral steams; it then blasts vegetables, blights corn and fruit, and is sometimes injurious even to men.

Woodward.

I complained to the oldest and best gardeners, who often fell into the same misfortune, and esteemed it some blight of the spring.

Temple.

The Lady Blast, you must understand, has such a particular malignity in her whisper, that it blights like an easterly wind, and withers every reputation that it breathes upon.

Spectator.

My country neighbours do not find it impossible to think of a lame horse they have, or their blighted corn, till they have run over in their minds all blights.

Locke.

But lest harsh care the lover's peace destroy,
And roughly blight the tender buds of joy,
Let reason teach.

Lyttleton.

O smile, ye heavens serene; ye mildews wan,
Ye blighting whirlwinds, spare his balmy prime,
Nor lessen of his life the little span.

Beattie. Minstrel.

What exile from himself can flee?

To zones, though more and more remote,

Still, still pursues where'er I be,

The blight of life—the demon thought.

Byron. Childs Harold.

—— Yes,

Thus pale, cold, dying, thus thou art most fit

To be enfolded to this desolate heart—

A blighted lily on its icy bed. *Maturin. Bertram*

BLIGHT, in husbandry, a disease incident to plants, which affects them variously, the whole plant sometimes perishing by it, and sometimes only the leaves and blossoms, which will be scorched and shrivelled up, the rest remaining green and flourishing. Some have supposed that the blights are usually produced by an easterly wind, bringing vast quantities of insects' eggs along with it, from some distant place; and that these, being lodged upon the surface of the leaves and flowers of fruit trees, cause them to shrivel up and perish. To cure this distemper they advise the burning of wet litter on the windward side of the plants, that the smoke may be carried to them by the wind, which they suppose will destroy the insects and thereby cure the distemper. Others direct the use of tobacco dust, or to wash the trees with water in which tobacco stalks have been infused for twelve hours; which they say will destroy those insects and recover the plants. Pepper dust scattered over the blossoms of fruit-trees, &c. has been recommended as very useful in this case; and there are some that advise the pulling off the leaves that are distempered. The true cause of blight seems to be continued dry easterly winds for several days together, without the intervention of showers, or any morning dew, by which the perspiration in the tender blossom is stopped; and, if it so happens that there is a long continuance of the same weather, it equally affects the tender leaves, whereby their color is changed, and they wither and decay. The best remedy for this distemper is to wash and sprinkle the tree, &c. from time to time with common water; and, if the young shoots seem to be much infected, let them be washed with a woollen cloth, so as to clear them, if possible, from this glutinous matter, that their respiration and perspiration may not be obstructed. This operation ought to be performed early in the day, that the moisture may be exhaled before the cold of the night comes on; nor should it be done when the sun shines very hot. Another cause of blight in spring is sharp hoary frosts, which are often succeeded by hot sunshine in the day-time. These are the most sudden and certain destroyers of the fruits that are known.

BLIN, *v.*

BLIND, *v. & n.*

BLINDING, *n. & adj.*

BLINDFOLD, *v. & adj.*

BLINDLY,

BLINDNESS,

BLINDSIDE,

Ang.-Sax. blind,

blindan, blindian;

Germ. blinden, or

blenden, from the

Ang.-Sax. blinnan, to

stop. Junius, and

after him Tooke and

the Ency. Met. to obstruct the vision; to deprive of sight; applied also to the understanding; want of discernment; foresight. Ignorant, any thing obscure; hard to find, dark and unseen: whatever misleads is said to blind.

I will smite every house of the people with *blindness*.
Zechariah.

Of whose hand have I received any bribe, to *blind* mine eyes therewith? and I will restore it.

When they had *blindfolded* him, they struck him on the face.
Luke.

Right so, a man that long hath *blind* ybe,
He may not sodenly so well ysee,
First when his light is newe come againe,
As he that hath a day or two ysein.

Chaucer. Canterbury Tales.
Full dreadfully he shooke, that all did quake,
And clapt on hys his coloured winges twaine,
That all his meiny it affraide did make :
Tho' *blinding* him againe, his way he forth did take.

Spenser.
The *blinded* god, which hath ye *blindly* smit,
Another arrow hath your love's hart hit. *Id.*
You nimble lightnings, dart your *blinding* flames
Into her scornful eyes! *Shakspeare.*
To grievous and scandalous inconveniences they
make themselves subject, with whom any *blind* or
secret corner is judged a fit house of common prayer.

Hooker.
There be also *blind* fires under stone, which flame
not out; but oil being poured upon them, they flame
out. *Bacon.*

This my long-suffering, and my day of grace,
They who neglect and scorn shall never taste,
But hard be hardened, *blind* he *blinded* more.

Milton.
Those other two, equalled with me in fate,
So were I equalled with them in renown!
Blind Thamyris, and *blind* Maonides;
And Tiresias, and Phineas, prophets old. *Id.*

Where else
Shall I inform my unacquainted feet
In the *blind* mazes of this tangled wood? *Id.*

The *blind* man that governs his steps by feeling, in
defect of eyes, receives advertisement of things
through a staff. *Digby.*

For what are lights to those who *blinded* bee?
Or, who so *blinde*, as they that will not see?
Geo. Withers.

Disguised in all the mask of night,
We left our champion on his flight;
At *blind*-man's buff to grope his way,
In equal fear of night and day. *Hudibras.*

Hardly any thing in our conversation is pure and
genuine; civility casts a *blind* over the duty, under
some customary words. *L'Estrange.*

Oh happiness of *blindness*! Now no beauty
Inflames my lust; no others good my envy,
Or misery my pity; no man's wealth
Draws my respect, nor poverty my scorn.
Denham's Sophy.

A *blind* guide is certainly a great mischief; but a
guide that *blinds* those whom he should lead, is un-
doubtedly a much greater. *South.*

Whensoever we would proceed beyond these simple
ideas, we fall presently into darkness and difficulties,
and can discover nothing farther but our own *blind-*
ness and ignorance. *Locke.*

How ready zeal for interest and party, is to charge
atheism on those, who will not, without examining,
submit, and *blindly* swallow their nonsense. *Id.*

Who *blindfold* walks upon a river's brim,
When he should see, has he deserved to swim?
Dryden.

A postern door, yet unobserved and free,
Joined by the length of a *blind* gallery,
To the king's closet led. *Id.*

All authors to their own defects are *blind*;
Hadst thou but, Janus like, a face behind,
To see the people, what splay mouths they make;
To mark their fingers pointed at thy back. *Id.*

The women will look into the state of the nation
with their own eyes, and be no longer led *blindfold*
by a male legislature. *Addison.*

How have we wandered a long dismal night,
Let through *blind* paths by each deluding light!

Roscommon.
He is too great a lover of himself; this is one of
his *blindnesses*; the best of men, I fear, are not with-
out them. *Swift.*

The state of the controversy between us he endea-
voured, with all his art, to *blind* and confound.

Stillington.
There is no darkness like the cloud of mind
On Grief's vain eye—the *blindest* of the *blind*!
Which may not—dare not see—but turns aside
To blackest shade, nor will endure a guide.

Byron's Corsair.

BLINDES, or BLINDS, in the art of war, a
sort of defence commonly made of osiers, or
branches interwoven, and laid across between two
rows of stakes, about the height of a man, and
four or five feet asunder, used particularly at the
heads of trenches, when they are extended in
front towards the glacis; serving to shelter the
workmen, and prevent their being overlooked by
the enemy.

BLINDING was a species of punishment anciently
inflicted on thieves, adulterers, perjurers,
and others; and from which the ancient Christians
were not exempt. Sometimes lime and vinegar,
or barely scalding vinegar, was poured into the
eyes, till their balls were consumed; sometimes
a rope was twisted round the head till the eyes
started out. In the middle age, they changed
total blindness for a great darkness, or diminu-
tion of sight, which they produced by holding a
red hot iron dish or basin before the eyes, till
their humors were dried, and their coats shrivel-
led up. The inhabitants of the city of Apollonia
executed it on their watch when found asleep.

BLINDING, VOLUNTARY. Democritus, accord-
ing to Plutarch, Cicero, and A. Gellius, put out
his own eyes, that he might be less disturbed in
his mental contemplations, when thus freed from
the distraction of the objects of sight.

BLINDMAN'S BUTT; a play in which some
one is to have his eyes covered, and hunt out the
rest of the company.

BLINDNESS is a deprivation so serious, and
presenting such irresistible claims on our atten-
tion and sympathy, that expedients for the relief
and comfort of that portion of our fellow crea-
tures thus afflicted, have interested the benevolent
of all ages and nations. For the diseases that
produce this malady we refer to the articles EYE,
GUTTA SERENA, and VISION. Our object in the
present paper is to consider what alleviations and
consolations may be offered to the blind; of
what attainments they are capable; and what are
their sensations and opinions on particular sub-
jects, as compared with those of the more favored
portion of mankind.

It has been enquired whether blind persons
suffer, on the whole, any real diminution of the
powers of perception. Their hearing, their touch,
and their smell, are in many instances far more

acute than those of any around them; and with regard to some mental operations, their advantages are obvious, and their powers of memory, reflection, and abstraction of mind, unquestionably superior to those of other individuals. It is also remarkable that they generally exhibit a more than ordinary share of cheerfulness. Traces of ancient opinions upon this appear in the tales, false or true, told of Democritus, who is represented as being proverbially the 'laughing philosopher;' and as having inflicted a voluntary blindness on himself that he might think the more intensely.

But most of these advantages we may be told are the acquisitions of habit urged by necessity—but still they are important alleviations of the lot of the blind; they make the fact highly probable, that in the sum of their enjoyments, as well as of their perceptions, they are more nearly equal to their fellow creatures than superficial minds imagine, and demonstrate the goodness of that Source of all bliss, who is alike to all—invisible. It is almost demonstrable that our great Milton had, notwithstanding his bitter complaints on this account, been less absorbed in

— thoughts that voluntary move
Harmonious numbers, as the wakeful bird
Sings dawning, and in shadiest covert hid,
Tunes her nocturnal note;

and more of the political partisan, had he been more fortunate in this respect. We need not here transcribe those complaints for the tenthousandth time, nor more than allude to the parallel situation of perhaps the greatest poet of antiquity.

Τον περί Μῶνον ἐφίλησε, εἶδ' αὖ ἀγαθὸν τε, κακὸν τε,
Ὀφθαλμῶν μὲν ἄμειρε, εἶδ' αὖ ἥϊεον αἰοήην.
Odys. 1. θ v. 63, 64.

Dear to the muse, who gave his days to flow
With mighty blessings mixed with mighty woe;
In clouds and darkness quenched his visual ray,
Yet gave him power to raise the lofty lay. *Pope.*

In poetry, therefore, however dependent it may seem on the impression of visible objects upon the mind, the blind may ever rank among their fellow sufferers two of the mightiest names. In the highest branches of the mathematics too they have excelled. St. Jerome mentions a Didymus of Alexandria, who 'though blind from his infancy, and therefore ignorant of letters, appeared so great a miracle to the world, as not only to learn logic, but geometry also to perfection—which seems,' adds this father, 'the most of any thing to require the help of sight.' Cicero also states that his preceptor in philosophy, Diodorus, 'professed geometry after he became blind, and described his diagrams accurately to his scholars.' Parallel modern instances of proficiency in these sciences are found in professor Saunderson and Mr. Grenville.

The former seems to have acquired most of his ideas by the sense of feeling, having been deprived of sight at the age of twelve months. This sense became with him most exquisite: for though he abandoned all attempts at distinguishing colors, in a set of Roman medals he could distinguish the genuine from the false, it is said, though they had been counterfeited in such a

manner, as to deceive a connoisseur, who judged of them only by the eye. His sense of feeling was so acute, that he could perceive the least variation in the state of the air; and in a garden where observations were made on the sun, he took notice of every cloud that interrupted the observation, almost as justly as those who could see. He could tell when any thing was held near his face, or when he passed by a tree at no great distance, provided the air was calm, and there was little or no wind, by the different pulses of air upon his face. He also possessed a sensibility of hearing to such a degree, that he could distinguish even the fifth part of a note; and by the quickness of this sense not only discriminated persons with whom he had once conversed so long as to fix in his memory the sound of their voice, but he could judge of the size of a room into which he was introduced, and of his distance from the wall; and if he had ever walked over a pavement in courts, piazzas, &c. which reflected a sound, and was afterwards conducted thither again, he could exactly tell in what part of the walk he was placed, merely by the different notes that reached his ear. Dr. Saunderson, it is well known, was Lucasian professor of mathematics at Cambridge, and invented a palpable arithmetic, minutely described in Diderot's *Letters on the Blind*. It consisted of a square board of a convenient size, divided by parallel lines into a considerable number of smaller squares. Each of these smaller squares, or separate departments, was pierced with nine holes, standing in three parallel rows; and by fixing a pin in one or other of these nine holes, the nine digits were denoted, according to the position of the pin. In order to facilitate his calculation, Saunderson made use of two sizes of pins, a larger and a smaller. The pins with large heads were always placed in the centre holes of the squares; and when they stood alone, without any small pins, they denoted the cypher. The number 1 was denoted by a pin with a small head, placed in the centre of a square; the number 2, by a large pin in the centre, and a small one at the side, in the hole which was first in order; the number 3, by a large pin in the centre, and a small one in the second hole at the side; and so on in order to the number 9. Thus any sum could be expressed in a number of squares, corresponding to the number of its figures. Dr. S. was accustomed to express also by this means his geometrical demonstrations, the pins serving to make angles either alone or with silk threads connecting them.

Mr. Grenville, who had lost his eye-sight, also contrived an arithmetical machine, consisting of a square board full of holes, and ten sets of pegs of different forms, corresponding to the nine digits and cypher. By far the most simple and commodious of these machines, however, seems to be that of Dr. Henry Moyes; of which he has himself inserted an account in the *Ency. Brit.* third edit. He informs us, that when he began to study the principles of arithmetic, he soon found that a person deprived of sight could scarcely proceed in that useful science, without the aid of palpable symbols representing the ten numerical characters; and being then unac-

quainted with Saunderson's method, he embraced the obvious, though, as he afterwards found, imperfect expedient, of cutting into the form of the numerical characters, thin pieces of wood or metal; which being arranged on the surface of a board, by means of a lamina of wax, readily represented any given number. It soon, however, occurred to him, that his notation, consisting of ten species of symbols or characters, was much more complicated than was absolutely necessary; and that any given number might be distinctly expressed by three species of pegs alone, viz. two with heads of the form of a right-angled triangle, and distinguished from each other by having a notch cut in the oblique side or hypotenuse of one of them, their other two sides being, one of them a continuation of the peg, and the other at right angles to it; and the third peg having a head of the form of a square. These pegs were to be stuck into a board of about a foot square, and divided into 376 little squares, by lines which were cut a little into the wood, so as to form a superficial groove. At each angle or intersection of the grooves, a hole was made for the insertion of the pegs. Sixty or seventy of each kind of pegs were necessary, which were placed in a case consisting of three boxes or cells, one for each set.

'Things being thus prepared,' says Dr. M. 'let a peg of the first set (with a plain triangular head) be fixed into the board; and it will acquire four different values, according to its position respecting the calculator. When its sloping side is turned towards the left, it denotes one, or the first digit; when turned upwards, or from the calculator, it denotes two, or the second digit; when turned to the right, it represents three; and when turned downwards, or towards the calculator, it denotes four, or the fourth digit. Five is denoted by a peg of the second set, with a notched triangular head, having its sloping side, or hypotenuse, turned to the left; six, by the same turned upwards; seven, by the same turned to the right; and eight, by the same turned directly down, or towards the body of the calculator. Nine is expressed by a peg of the third set, with a square head, when its edges are divided to right and left; and the same peg expresses the cypher, when its edges are directed up and down.—When it is necessary to express a vulgar fraction, I place the numerator in the groove immediately above, and the denominator in that immediately below the groove in which the integers stand; and, in decimal arithmetic, an empty hole in the integer groove represents the comma or decimal point. By similar breaks, I also denote pounds, shillings, pence, &c.; and by the same expedient, I separate, in division, the divisor and quotient from the dividend. Co-efficients and indices, in algebra and fluxions, are supplied upon similar principles.'

This gentleman lost his sight by the small-pox in his early infancy. He never recollected to have seen: 'but the first traces of memory I have,' says he, 'are in some confused ideas of the solar system.' Possessed of native genius, and ardent in his application, he made rapid advances in various departments of erudition; and not only acquired the fundamental principles of mechanics,

music, and the languages, but likewise entered deeply into the investigation of the profounder sciences, and displayed an acute and general knowledge of geometry, optics, algebra, astronomy, chemistry, and in short of most of the branches of the Newtonian philosophy. Mechanical exercises were the favorite employments of his infant years. At a very early age he made himself acquainted with the use of edged tools so perfectly, that, notwithstanding his entire blindness, he was able to make little wind-mills; and he even constructed a loom with his own hands. 'By a most agreeable intimacy and frequent intercourse which I enjoyed with this accomplished blind gentleman, whilst he resided at Manchester,' says his biographer, Dr. Bew, 'I had an opportunity of repeatedly observing the peculiar manner in which he arranged his ideas and acquired his information. Whenever he was introduced into company, I remarked that he continued some time silent. The sound directed him to judge of the dimensions of the room, and the different voices of the number of persons that were present. His distinctions in these respects were very accurate; and his memory so retentive that he seldom was mistaken. I have known him instantly recognise a person, on first hearing him speak, though more than two years had elapsed since the time of their last meeting. He determined pretty nearly the stature of those he was speaking with by the direction of their voices; and he made tolerable conjectures respecting their tempers and dispositions, by the manner in which they conducted their conversation. It must be observed that this gentleman's eyes were not totally insensible to intense light. The rays refracted through a prism, when sufficiently vivid, produced certain distinguishable effects on them. The red gave him a disagreeable sensation, which he compared to the touch of a saw. As the colors declined in violence the harshness lessened, until the green afforded a sensation that was highly pleasing to him, and which he described as conveying an idea similar to what he felt in running his hand over smooth polished surfaces. Polished surfaces, meandering streams, and gentle declivities, were the figures by which he expressed his ideas of beauty: rugged rocks, irregular points, and boisterous elements, furnished him with expressions for terror and disgust. He excelled in the charms of conversation; was happy in his allusions to visual objects; and discoursed on the nature, composition, and beauty of colors, with pertinence and precision. Dr. Moyes was a striking instance of the power the human soul possesses of finding resources of satisfaction even under the most rigorous calamities. Though involved 'in ever during darkness,' and excluded from the charming views of silent or animated nature; though dependent on an undertaking for the means of his subsistence, the success of which was very precarious; in short, though destitute of other support than his genius, and under the mercenary protection of a person whose integrity he suspected, still Dr. Moyes was generally cheerful, and apparently happy.'

The attempts which have been made to supply the blind with tangible musical characters, or signs, have not been attended with the success

which their delight in that science might have induced us to expect. In Tansure's Musical Grammar it is recommended that the blind should be provided with a smooth board, with ledges of deal glued on it at proper distances, to represent the five lines of the musical staff; with such additional lines as occasion may require. In these ledges, as well as in the intervals between them, a number of holes are to be drilled for the reception of a variety of pegs, intended to indicate the various kinds of notes in music; such as semibreves, minims, crotchets; together with the rests, flats, sharps, bars, &c. In another contrivance for the same purpose, in some asylums of the blind, a stuffed cushion is substituted for the board of Tansure, upon which strings are sewed to represent the musical staff; and the pegs intended to denote the various musical characters are fixed upon sharp pointed wires, by which means they may be stuck into any required part of the cushion.

In 1786 an *Essay on the Education of the Blind* was printed at Paris, under the patronage of the Academy of Sciences. It is the production of M. Haüy, and does him great honor. Here we find a detail of a great variety of expedients by which the blind may be successfully instructed in the mechanic arts, as well as in music, arithmetic, geography, &c., and may even be taught to read, write, and print. In order to instruct the blind in music, at the institution of which M. Haüy communicates the details in this work, musical characters of every necessary form were cast in metal, and so many in number as to represent upon paper, by elevations on its surface, all the possible varieties that occur. In teaching geography, which was the department of M. Weissenbourg and Mad. Paradis, the circumference of countries was marked out by a tenacious and viscid matter, and the different parts of the maps were covered with a kind of sand, mixed with glass in various modes; the order of the towns being distinguished by grains of glass of a greater or less size; or, according to the plan of M. Haüy, the limits of the maps, for the use of the blind, were marked by a small rounded iron wire; and by some difference, either in the form or size of every part of a map, the pupils were assisted in distinguishing one part from another.

The manner in which the blind are taught to write and print is as follows: The pupil, by repeated experiments, having familiarised himself to the forms of the letters as drawn in relief, both in their direct and inverted position, gradually learns to impress them upon strong paper, a little moistened, with the point of a blunt iron pen or stylus, which marks without piercing the paper. By this means the letters become perceptible to the touch, on the one side sunk, and on the other in relief; and thus the blind may be enabled to form and decipher, not only the characters required in common language, but also mathematical diagrams, geographical plans, and all the characters employed in arithmetic, music, &c. In printing, the blind compositor has a box for every letter, on the outside of which is marked, in relief, the peculiar character belonging to each. By this means he is

enabled readily to choose and arrange his types, and when they are set, he makes use of a strong paper, slightly moistened, like that employed in writing, in order to render it more easily susceptible of impressions. Having laid this upon his types, by the operation of the press, or the strokes of a small hammer, he raises an impression upon the paper, which, when dry, is sufficiently obvious to the touch to enable the blind to read by their fingers, and is so durable as to be by no means easily effaced. The types therefore are set, not in the reverse, but in the direct order, so that the characters may appear in relief, in the same order, on the opposite side of the paper. Dr. Blacklock mentions that he was in possession of a copy of M. Haüy's *Essay*, which was printed in the manner now described, and also bound by the blind pupils of the Parisian institution, with great neatness. An English translation of the *Essay* is annexed to the edition of that gentleman's poems, printed at Edinburgh in 4to., in 1793.

Dr. Blacklock was himself amongst the most interesting of modern blind men. We have given (see BLACKLOCK) a sketch of his life already. Deploring the condition of the blind, he furnishes some original expressions, and one of the most powerful passages on this subject in the English language. To the blind, says he, the visible universe is annihilated; he is perfectly conscious of no space but that on which he stands, or to which his extremities can reach. Sound, indeed, gives him some ideas of distant objects; but those ideas are extremely obscure and indistinct. They are obscure, because they consist alone of the objects whose oscillations vibrate in his ear; and do not necessarily suppose any other bodies with which the intermediate space may be occupied, except that which gives the sound alone: they are indistinct, because sounds themselves are frequently ambiguous, and do not uniformly and exclusively indicate their real causes. And though by them the idea of distance in general, or even of some particular distances, may be obtained, yet they never fill the mind with those vast and exalting ideas of extension, which are inspired by ocular perception. For though a clap of thunder, or an explosion of ordnance, may be distinctly heard after they have traversed an immense region of space; yet, when the distance is uncommonly great, it ceases to be indicated by sound; and, therefore, the ideas acquired by auricular experiment, of extension and interval, are extremely confused and inadequate. The living and comprehensive eye darts its instantaneous view over expansive valleys, lofty mountains, protracted rivers, illimitable oceans. It measures, in an indivisible point of time, the mighty space from earth to heaven; or from one star to another. By the assistance of telescopes, its horizon is almost indefinitely extended, its objects prodigiously multiplied, and the sphere of its observation nobly enlarged. By these means, the imagination, inured to vast impressions of distance, can not only recal them in their greatest extent, with as much rapidity as they were at first imbibed, but can multiply them, and add one to another, till all particular boundaries and distances be lost in immensity.

* Thus nature, by profusely irradiating the face of things, and clothing objects in a robe of diversified splendor, not only invites the understanding to expatiate on a theatre so extensive, so diversified, and so attractive; but entertains and inflames the imagination with every possible exhilaration of the sublime or beautiful. The man of light and colors beholds the objects of his attention and curiosity from afar. Taught by experience, he measures their relative distances; distinguishes their qualities, determines their situations, positions, and attitudes; presages what these tokens may import; selects his favorites; traverses in security the space which divides them from him; stops at the point where they are placed; and either obtains them with ease, or immediately perceives the means by which the obstacles that intercept his passage to them may be surmounted. The blind not only may be, but really are, during a considerable period, apprehensive of danger, in every motion towards any place from whence their contracted power of perception can give them no intelligence. All the various modes of delicate proportion; all the beautiful varieties of light and colors, whether exhibited in the works of nature or art; are to them irretrievably lost. Dependent for every thing but mere subsistence, on the good offices of others; obnoxious to injury from every point, which they are neither capacitated to perceive, nor qualified to resist: they are, during the present state of being, rather to be considered as prisoners at large, than citizens of nature. The sedentary life, to which by privation of sight they are destined, relaxes their frame, and subjects them to all the disagreeable sensations which arise from dejection of spirits. Hence the most feeble exertions create lassitude and uneasiness. Hence the native tone of the nervous system, which alone is compatible with health and pleasure, destroyed by inactivity, exasperates and embitters every disagreeable impression. Natural evils, however, are always supportable; they not only arise from blind and undesigned causes, but are either mild in their attacks, or short in their duration; it is the miseries which are inflicted by conscious and reflecting agents alone, that can deserve the name of evils. These excoriate the soul with ineffable poignancy, as expressive of indifference or malignity in those by whom such bitter potions are cruelly administered. The negligence or wantonness, therefore, with which the blind are too frequently treated, is an enormity which God alone has justice to feel, or power to punish.

Excellence in sculpture does not appear to us so remarkable in the blind. The artist of whom Aldrovandus speaks, became blind at twenty years of age, and yet ten years after made a perfect marble statue of Cosmo II. de Medicis: and another of clay, like Urban VIII. Bartholin also tells us of a blind sculptor in Denmark, who distinguished perfectly well, by mere touch, all kinds of wood, and even the colors of them; and De Piles (*Cours de Peint.* p. 329.) of another who thus took the likeness of the duke de Bracciano in a dark cellar, and made a marble statue of king Charles I. with great justness and elegance.

Musical attainments we seem also to expect as a matter of course with the blind; but to teach its theory to others would appear as difficult a task as any that they could undertake. Yet Sir John Hawkins assures us that the blind *Sulinas'* Treatise on the Scientific Principles of Harmony, is equal to any that is extant. As to practical musicians we need only mention the well-known instance of Mr. Stanley, the organist of St. Andrew's, Holborn, and at the Temple. He is said to have been one of the most pleasing and accurate of performers, as well as a very superior composer and instructor. So delicate was his ear that he could accompany with the thorough-bass any lesson which he heard for the first time, thus anticipating the harmony before the chords were sounded.

Authors of good credit mention a very surprising blind guide who used to conduct the merchants through the sands and deserts of Arabia. See *Leo Afric. Descr. Afr. lib. vi. p. 246.* and *Casaub. Treat. of Enthus. c. ii. p. 45.* Dr. Bew, in the *Transact. of the Manchester Society*, mentions an instance not less marvellous in our own country. 'John Metcalf, a native of the neighbourhood of Manchester, where he is well known, became blind at a very early age, so as to be entirely unconscious of light and its various effects. This man passed the younger part of his life as a waggoner, and occasionally as a guide in intricate roads during the night, or when the tracks were covered with snow. Strange as this may appear to those who can see, the employment he has since undertaken is still more extraordinary: it is one of the last to which we could suppose a blind man would ever turn his attention. His present occupation is that of a projector and surveyor of highways in difficult and mountainous parts. With the assistance only of a long staff, I have several times met this man traversing the roads, ascending precipices, exploring valleys, and investigating their several extents, forms, and situations, so as to answer his designs in the best manner. The plans which he designs, and the estimates he makes, are done in a manner peculiar to himself; and which he cannot well convey the meaning of to others. His abilities in this respect are nevertheless so great, that he finds constant employment. Most of the roads over the Peak in Derbyshire, have been altered by his directions; particularly those in the vicinity of Buxton: and he is at this time constructing a new one betwixt Wilmeslow and Congleton, with a view to open a communication to the great London road, without being obliged to pass over the mountains.'

Those of our readers who wish to pursue these extracts, will find an interesting account of a blind French lady, of remarkable acquirements, in the *Annual Register*, 1762. But a more remarkable case of providential compensation for this malady, united with that of deafness, occurred in the practice of Sir Hans Sloane. Of this lady it is said, 'During the privation of her sight and hearing, her touch and her smell became so exquisite, that she could distinguish the different colors of silk and flowers, and was sensible when any stranger was in the room with her. After she became blind, and deaf, and dumb, it was

not easy to contrive any method by which a question could be asked her, and an answer received. This, however, was at last effected, by talking with the fingers, at which she was uncommonly ready. But those who conversed with her in this manner, were obliged to express themselves by touching her hand and fingers, instead of their own. A lady who was nearly related to her, having an apron on, that was embroidered with silk of different colors, asked her, in the manner which has been described, if she could tell what color it was? and after applying her fingers attentively to the figures of the embroidery, she replied, that it was red, and blue, and green; which was true. The same lady having a pink colored ribbon on her head, and being willing still further to satisfy her curiosity and her doubts, asked what color that was? Her cousin, after feeling some time, answered that it was pink color: this answer was yet more astonishing, because it showed not only a power of distinguishing different colors, but different kinds of the same color; the ribbon was not only discovered to be red, but the red was discovered to be of the pale kind called a pink. This unhappy lady, conscious of her own uncommon infirmities, was extremely unwilling to be seen by strangers, and therefore generally retired to her chamber, where none but those of the family were likely to come. The same relation, who had by the experiment of the apron and ribbon discovered the exquisite sensibility of her touch, was soon after convinced by an accident, that her power of smelling was acute and refined in the same highly astonishing degree. Being one day visiting the family, she went up to her cousin's chamber, and after making herself known, she entreated her to go down, and sit with her among the rest of the family, assuring her that there was no other person present; to this she at length consented, and went down to the parlour door; but the moment the door was opened, she turned back, and retired to her own chamber much displeased; alleging that there were strangers in the room, and that an attempt had been made to deceive her; it happened indeed that there were strangers in the room; but they had come in while the lady was above stairs, so that she did not know that they were there. When she had satisfied her cousin of this particular, she was pacified; and being afterwards asked how she knew there were strangers in the room, she answered, by the smell. Her friends she generally distinguished by feeling their hands. A lady, with whom she was very well acquainted, coming in one very hot day, after having walked a mile, presented her hand as usual; she felt it longer than ordinary, and seemed to doubt whose it was; but after spanning the wrist, and measuring the fingers, she said, 'It is Mrs. M., but she is warmer to-day than ever I felt her before.' To amuse herself in the mournful and perpetual solitude and darkness to which her disorder had reduced her, she used to work much at her needle; and her work was uncommonly neat and exact. She used also sometimes to write; the characters were very pretty, the lines all even, and the letters placed at equal distances from each other; but the most astonishing particular

of all, with respect to her writing, is, that she could by some means discover when a letter had by mistake been omitted, and would place it over that part of the word where it should have been inserted, with a caret under it. It being doubted whether she had not some faint remains both of hearing and sight, many experiments were made to ascertain the fact; some of which, when she accidentally discovered them, gave her prodigious uneasiness, on account of her being suspected of insincerity. At length Sir Hans Sloane, after being permitted to satisfy himself by such experiments and observations as he thought proper, pronounced that she was absolutely blind and deaf.

Institutions for the reception and instruction of the blind have long been the honor of London, Liverpool, and Paris. Dr. Guillié has published some modern improvements on the conduct of the latter, with extracts from which, we shall close this article. 'The discovery (says he) of printing books in relief, is one of the most important for the instruction of the blind. It is by the assistance of these books, which have no other inconvenience than that of being bulky, that they are taught the elements of languages, and fix in their minds the beautiful passages of history and morality which they have learnt; for they know much better what they have read, than what they have heard, and we therefore augment as far as our means will admit the library of the blind with works which we think fitted for their instruction. They have already two catechisms, the office for morning and evening, French, Latin, Greek, English, and Italian grammars. One would hardly believe with what rapidity they read in these books, if we did not see it at the public exercises. The use of a thicker ink, or one which would dry and be felt on the paper, has been tried it seems here and failed. By means of these books the blind are even said to teach young people who can see to read, and these in return then become their preceptors in many useful acquirements.

Writing is taught by means of a wide thick board, having a fixed bottom. Upwards there is a parallelogram opening with hinges on the left side, and kept shut on the right by two small copper bolts. An improvement has been lately made, by substituting instead of a wooden bottom a thick silk which receives and retains the traces of the letters from the stilet or pencil; this affords the blind man the advantage of reading what he has written. Mr. Heilman, a blind man, who proposed this improvement, has also contrived a portative portfolio for the blind, by means of which they may write, and read directly with the greatest ease what they have written. This frame is furnished with several movable rods of iron. Below its two great ascending pannels, there is on each side a broad steel spring, stretching from one extremity to the other, fixed at one end by two English screws, and at the other only stopped at pleasure by a turning bolt. It is between these springs and the lower part of the sides of the frame that the paper is placed, which remains immovable under the rods. The mathematics are taught on an improvement of Saunderson's method, by rejecting the symbols

that have merely an arbitrary value. The letters and cyphers which we make use of at present, (says Dr. G.) are in no respect different from the common ones. These cyphers are mounted on a transversal chevron, the fractions are mounted in the same manner, but the upper part of the chevron is hollowed in a square form to receive a movable cylinder in the form of a wedge, by means of which the numerator and denominator are indicated, and then the necessary changes. Strings that may be placed horizontally or vertically, serve to indicate the divisions of the numbers.

'People (he continues) are astonished to see our pupils go through a course of optics as well as those who see, and they admire their sagacity in speaking of dioptries and catoptries. As we do not wish to enjoy an admiration that is unmerited, we must declare that what makes the demonstration of all the phenomena of optics easy to them, is that they reduce every thing to lines. They perceive only palpable points where we see colored prints; for they have not, nor can they have any idea of colors.' Yet the following anecdote approaches to some idea. 'One of the pupils at the institution, translating at a public exercise the first strophe of the second ode of the first book of Horace, was stopped at these words, *et rubente dextera*, &c. by the examiner, who asked him the proper translation of the words *rubente dextera*: the young man translated it, his flaming right hand. Being pressed again to translate literally the epithet *rubente*, he gave the equivalent red. Being asked again what he understood by a red arm, he answered that he did not think, like Locke's blind man, that the color red was like the sound of a trumpet; nevertheless he could form no proper idea of it, but that he had at first translated *rubente*, flaming, because he had been told that fire is red, whence he had concluded, that heat is always accompanied by redness, which determined him to mark the anger of Jupiter by the epithet flaming, because when one is irritated one is hot, and when one is hot, one must be red.'

At an early period of the Paris institution, the pupils of the deaf and dumb school were mixed with them at the same convent, and various successful and unsuccessful attempts were made by each of these interesting groups of children, to communicate with the others. At first when the blind had learnt that the deaf and dumb spoke to each other in the dark, by writing on the back, they conceived that this method might succeed also with them. This new language soon became common to the two families; the deaf and dumb, who found it tiresome to have written on their back what they could see perfectly well, attempted to make the blind write in the air, as they do themselves; this means, which was as long as the former, appeared more uncertain, as the blind wrote ill in that way; they therefore preferred the characters the latter made use of; but as these characters cannot be easily transported, the dumb taught the blind their manual alphabet, and the one by sight and the other by touch, easily found by the inspection of their fingers, the letters that are formed by their different combinations. Nevertheless this

manual alphabet only exhibiting words, slackened conversation amazingly. They felt the want of a more rapid communication, and the blind learnt the theory of the signs of the deaf and dumb: each sign thus representing a thought, the communication was complete. This study was long and tedious, because it supposes a pretty complete knowledge of grammar: but the wish to talk got the better of all these difficulties, and in a few months, the signs being perfectly well known, took place of all the other means till then employed. The exchange between them was performed in the following manner. 'When the blind had to speak to the deaf and dumb, he made the representative signs of his ideas, and these signs more or less exactly made, transmitted to the deaf and dumb the idea of the blind. When the deaf and dumb in his turn wished to make himself understood, he did it in two ways: he stood with his arms stretched out and motionless before the blind person, who took hold of him a little above the wrists, and without squeezing them, followed all the motions they made; or if it happened that the signs were not understood, the blind man put himself in the place of the deaf and dumb, who then took hold of his arms in the same manner, and moving them about as he would have done his own before a person who could see, he filled up the deficiencies of the first operation, and thus completed the series of ideas which he wished to communicate to his companion. 'But the degree of instruction of the scholars not being the same, they could not make use of the signs equally well.' In fact it sometimes became a mournful failure altogether. See DEAF and DUMB. And for the first effects of sight on those who have been couched, See COUCHING.

BLINDNESS, in farriery, a disease incident to horses, especially those of an iron-gray, or dapple-gray color, when ridden too hard, or backed too young. It may be discovered by the walk, which in a blind horse is always unequal, because he dares not set down his feet boldly when led; though if the same horse be mounted by an expert horseman, and if himself be mettled, the fear of the spur will make him go more freely; so that his blindness can hardly be perceived. Another mark of loss of sight is, that upon hearing any body enter the stable, he will prick up his ears, and move them backwards and forwards, being in continual alarm by the least noise. Dr. Lower first showed the ordinary cause of blindness in horses, which is a spongy excrescence, growing in one, sometimes in two, or three places of the uvea, which being at length overgrown, covers the pupil when the horse is brought into the light, though in a dark stable, it dilates again. Horses that lose their sight at certain periods of the moon, are said to be moon-blind.

BLIND RAMPART, *cæcum vallum*, among the ancients, was that beset with sharp stakes, concealed by grass or leaves growing over them.

BLINDWORM, *n. s.* *Cæcilia*; from blind and worm. A small viper, called likewise a slow worm; believed not to be venomous.

The greater slow worm, called also the *blind worm*, is commonly thought to be *blind*, because of the littleness of his eyes. *Greiv.*

You spotted snakes, with double tongue,
Thorny hedgehogs, be not seen;
Newts and *blindworms*, do no wrong;
Come not near our fairy queen. *Shakespeare.*

BLINK', *u. & n.* See *To BLANCH*, and *To BLINK'ERS*, } *BLENC*. To blink, is to
BLINK'ING, } give the eye the twinkling
BLINK'ARD, } motion or apparent action
BLINK'EYED. } of a star; to twinkle; to
wink; to look with the eye partially closed; and as
this is frequently done to avoid, evade, escape,
elude, shun, or shrink from any sudden action
upon the eye; to blench or to blink is consequently
to avoid, or cause to avoid; to evade; to escape;
to elude; to shun, shrink, or start from.—*Ency.*
Met. art. BLINK. It also is used to mean see-
ing obscurely; and for the winking which indi-
cates any thing rather than evasion, or a desire
to avoid.

The swete visage, and amorous *blenking*
Of fair Creside, sometime his own darling. *Chaucer.*

The amorous *blyncks* flee to and fro,
With sugred words that make a show,
That fansie is well pleased withall,
And findes itself content. *Turberville.*
What's here! the portrait of a *blinking* ideot. *Shakespeare.*

Sweet and lovely wall,
Shew me thy chink, to *blink* through with mine eye.
Id. Midsummer Night's Dream.

In some parts we see many glorious and eminent
stars, in others few of any remarkable greatness, and
in some none but *blinkards*, and obscure ones.

Hakewell.

For as with pigmies who best kills the crane,
Among the hungry he that treasures grain,
Among the blind the one-eye'd *blinkard* reigns,
So rules among the drowned he that drains. *Marcell.*

So politick, as if one eye
Upon the other were a spy;
That, to trepan the one to think
The other blind, both strove to *blink*. *Hudibras.*

His figure such as might his soul proclaim;
One eye was *blinking*, and one leg was lame. *Pope.*

This floor let not the vulgar tread,
Who worship only what they dread,
Nor bigots who but one way see,
Through *blinkers* of authority. *Green. The Grotto.*

BLINKS, among ancient sportsmen, denoted
boughs broken down from trees, and thrown in
the way where deer were likely to pass, to hinder
their running, or rather to mark which way the
deer ran, in order to guide the hunter.

BLINKS, in botany. See *MONTIA*.

BLISS', } Sax. *blifre*, from *blifarian*,
BLISS'FUL, } to rejoice. The highest de-
BLISS'FULLY, } gree of happiness; blessed-
BLISS'FULNESS, } ness; felicity; generally
BLISS'LESS, } used of the happiness of
BLISS'EDNESS, } blessed souls. See *To*
BLISS'EDLY. } BLESS.

Ther—as a wedded man in his estat,
Liveth a lif *blisful* and ordinat,
Under the yoke of marriage ybond:
Wel may his herte in joye and *blisse* abound.
Chaucer. Canterbury Tales.

Yet swimming in that sea of *blissful* joy,
He nought forgot. *Faerie Queene.*
A mighty Saviour hath witnessed of himself, I
am the way; the way that leadeth us from misery
into *bliss*. *Hooker.*

Dim sadness did not spare
That time celestial visages; yet mixed
With pity, violated not their *bliss*. *Milton.*
With me
All my redeemed may dwell, in joy and *bliss*. *Id.*
Reaping immortal fruits of joy and love,
Uninterrupted joy, unrivalled love,
In *blissful* solitude. *Id.*
The two saddest ingredients in hell, are depriva-
tion of the *blissful* vision, and confusion of face. *Hammond.*

So peaceful shalt thou end thy *blissful* days,
And steal thyself from life by slow decays. *Pope.*
First in the fields I try the silvan strains;
Nor blush to sport on Windsor's *blissful* plains. *Id.*
Condition, circumstance, is not the thing;
Bliss is the same in subject or in king. *Id.*
Sometimes with Scipio she collects her sail,
And seeks the *blissful* shore of rural ease. *Thomson.*

BLISTER *v. & n.* Dutch *bluyster*; perhaps
blæst, from Ang.-Sax. *blæstan*. To blow, to
puff up as a pustule, or blain. A pustule formed
by raising the cuticle from the cutis and filled
with serous blood. This is sometimes the effect
of disease, of accident, and of design.

In this state she gallops, night by night,
O'er ladies' lips, who strait on kisses dream,
Which oft the angry Mab with *blisters* plagues,
Because their breaths with sweetmeats tainted are
Shakespeare.

Look, here comes one, a gentlewoman of mine,
Who falling in the flaws of her own youth,
Hath *blistered* her report. *Id.*

Such an act
That blurs the grace and blush of modesty;
Calls virtue hypocrite; takes off the rose
From the fair forehead of an innocent love,
And sets a *blister* there. *Id.*

If I prove honeymouth, let my tongue *blister*,
And never to my red-looking anger be
The trumpet any more. *Id.*
Upon the leaves there riseth a tumour like a *blister*. *Bacon.*

I found a great *blister* drawn by the garlick, but had
it cut, which run a good deal of water, but filled again
by next night. *Temple.*
I *blistered* the legs and thighs; but was too late: he
died howling. *Wiseman.*

Embrace thy knees with loathing hands,
Which *blister* when they touch thee. *Dryden.*

Blistering, cupping, bleeding, are seldom of use
but to the idle and intemperate; as all those inward
applications, which are so much in practice among us,
are, for the most part, nothing else but expedients to
make luxury consistent with health. *Spectator.*

BLISTER, in surgery and medicine, vesicato-
rium; epispasticum. 1. The name of a topical
application, *epastrum vesicatorium*, which when
put on the skin raises the cuticle in the form of
a vesicle, filled with serous fluid. Various sub-
stances produce this effect; but the powder of
the cantharis, or blistering fly, is what operates
with most certainty and expedition, and is now
invariably used. It is an established principle,
that where morbid action exists, it may often be
removed from the system by inducing an action

of a different kind in the same or a neighbouring part. On this principle is explained the utility of blisters in local inflammation and spasmodic action, and it regulates their application in pneumonia, gastritis, hepatitis, phrenitis, angina, rheumatism, cholera, and spasmodic affections of the stomach; diseases in which they are employed with the most marked advantage. A similar principle exists with respect to pain; exciting one pain often relieves another. Hence blisters give relief in tooth-ache, and some other painful affections. Lastly, blisters, by their operation, communicate a stimulus to the whole system, and raise the vigor of the circulation. Hence, in part, their utility in fevers, of the typhoid kind, though in such cases they are used with still more advantage to obviate or remove local inflammation.

Practitioners used formerly to mix powder of cantharides with an ointment, and dress the part with this composition. But such a dressing not unfrequently occasioned very painful affections of the bladder, a scalding sensation in making of water, and very afflicting stranguries. The treatment of such complaints consists in removing every particle of the fly from the blistered part, making the patient drink abundantly of mucilaginous drinks, giving emulsions and some doses of camphor. These objections to the employment of salves containing the lytta, for dressing blistered surfaces, led to the use of mezereon, euphorbium, and other irritating substances, which, when incorporated with ointment, form very proper compositions for keeping blisters open, which they do without the inconvenience of irritating the bladder, like the blistering fly. The favorite application, however, for keeping open blisters, is the savine cerate. On the use of the savine cerate, immediately after the cuticle raised by the blister is removed, it should be observed that experience has proved the advantage of using the application lowered by a half or two thirds of the unguentum cereæ. An attention to this direction will produce less irritation and more discharge, than if the savine cerate were used in its full strength. Fomenting the part with flannel, wrung out of warm water, has been found a more easy and preferable way of keeping the blistered surface clean, and fit for the impression of the ointment, than scraping the part, as has been directed by others. An occasional dressing of unguentum resinæ flavæ, is a very useful application for rendering the sore free from an appearance of slough, or rather dense lymph, which has sometimes been so firm in its texture as to be separated by the probe, with as much readiness as the cuticle is detached after blistering. As the discharge diminishes, the strength of the savine dressing should be proportionally increased. The ceratum sabina must be used in a stronger or weaker degree, in proportion to the excitement produced on the patient's skin.

BLITE, in botany. See BLITUM.

BLITH. See BLYN.

BLITHE, } *Belithe, belithesome, belissom,*

BLITH'LY, } *or blithe, blithesome, blissom.*

BLITH'SOME, } *See BLIST. Gay; sprightly;*

BLITH'NESS. } *cheerful; lively; joyous;*

freshness of spirits; the high pulsation of corporeal and mental health, not often possessed, especially by compilers of dictionaries.

Would'st see *blithe* looks, fresh cheeks, beguile

Age? would'st see December smile? *Crashaw.*

We have always one eye fixed upon the countenance of our enemies; and, according to the *blithe* or heavy aspect thereof, our other eye sheweth some other suitable token either of dislike or approbation.

Hooker.

Then sigh not so, but let them go,

And be you *blithe* and bonny! *Shakespeare.*

For that fair female troop thou sawest, that seemed
Of goddesses, so *blithe*, so smooth, so gay;
Yet empty of all good. *Milton.*

To whom the wily adder, *blithe* and glad:

Empress! the way is ready, and not long. *Id.*

And the milkmaid singeth *blithe*,

And the mower whets his scythe. *Id.*

Blither than hare that hath escaped the hounds,
The house prorogued, the chancellor rebounds.

Marvell.

Frosty blasts deface

The *blithsome* year: trees of their shrivelled fruits

Are widowed. *Philips.*

Should he return, that troop, so *blithe* and bold,
Precipitant in fear, would wing their flight. *Pope.*

BLITUM, the Blite: a genus of the digynia order, monandria class of plants; natural order, twelfth, holoracæ: CAL. trifid; no petal: SEED single, included in a berry-shaped calyx. There are three species, viz. 1. *B. capitatum*, with flowers in clustered heads at the joints and crown of the stalks, a native of Spain and Portugal, but has been long preserved in the British gardens, for the beauty of its fruit. 2. *B. Tartaricum* with triangular acutely indented leaves, a native of Tartary. 3. *B. virgatum*, with small heads growing from the sides of the stalks, a native of the south of France and Italy. It seldom grows more than a foot high; the leaves of the same shape with those of the capitatum, but smaller.

BLOAT, *v. & adj.* } Probably from *blow*.

BLOAT'EDNESS. } See BLOW. To swell with wind; to grow turgid; to be swollen with intemperance; turgidity.

The bloat king. *Shakespeare. Hamlet.*

His rude essays

Encourage him, and bloat him up with praise,

That he may get more bulk before he dies. *Dryden.*

I cannot but be troubled to see so many well-shaped innocent virgins bloat up, and waddling up and down like big-bellied women. *Addison.*

If a person of a firm constitution begins to bloat, from being warm grows cold, his fibres grow weak.

Arbuthnot.

Lassitude, laziness, bloatness, and scorbutical spots, are symptoms of weak fibres. *Id.*

Fast by her side a listless maiden pined

With aching head and squeamish heartburnings;

Pale, bloat, cold, she seemed to hate mankind,

Yet loved in secret all forbidden things. *Thomson.*

BLOATED FISH, or BLOATED HERRINGS, in our statutes, are those which are half dried. See Stat. 18 Car. II. c. 2. They are made by steeping them in a peculiar brine, and then hanging them in a chimney to dry.

BLOATING, in medicine, a puffing up of the exterior habit of the body, lodged chiefly in the adipose cells. It is styled by physicians emphysema.

BLOB'BER, *n. s.* From *blob*. A word used in some counties for a bubble.

There swimmeth also in the sea a round slimy substance, called a *blobber*, reputed noisome to the fish.

Carew.

BLOB'BERLIP, *n. s.* From *blob*, or *blobber* and *lip*. A thick lip.

They make a wit of their insipid friend,
His *blobberlips* and beetlebrows commend. *Dryden.*

BLOB'LIPPED, *adj.* } Having swelled or
BLOB'BERLIPPED, } thick lips.

A *blobberlipped* shell, seemeth to be a kind of mussel. *Grew.*

His person deformed to the highest degree; flattened, and *blobberlipped*. *L'Estrange.*

BLOCH (George Castaneus), bishop of Ripen, in Denmark, was born in 1717, and died in 1773. He published *Tentamen Phœnicologicæ Sacra*, &c. 8vo. Hafn. 1767.

BLOCH (Mark Eliezer), a Jew, and a naturalist of Anspach, was born in 1723, and died in 1799. He was the author of *Ichthyologie oder Naturgeschichte der Fische*, 12 vols. 4to. Berlin. 1785; besides a Treatise on the Generation of Worms in the Intestines, and another on the Waters of Pyrmont, &c.

BLOCK', *v. & n.* } From the Ang.-Sax.

BLOCK'ADE, *v. & n.* } lican, belican; to shut;

BLOCK'HEAD, } to close; to shut up; to

BLOCKHEAD'ED, } lock; quoted by the Ency.

BLOCK'HEADLY, } Met. from Somner. A

BLOCK'HEADISM, } block is a piece of timber,

BLOCK'HOUSE, } or other substance,

BLOCK'ISH, } capable of being placed

BLOCK'ISHLY, } any where; to close up

BLOCK'ISHNESS, } an avenue, or to obstruct

BLOCK'LIKE. } ingress, either to include

or exclude. It also is applied to any mass of matter, which in a rude or artificial shape may be used for various manual purposes, and employed in mechanics and naval architecture. Blockhead is metaphorically used to designate a lumpish, stupid, heavy, dull-witted animal of the human species. In this application it would be more correct to drop the *head* as superfluous, and to convert the adjective into the substantive.

——— with blade all burning bright

He smott off his left arme, which like a *block*

Did fall to ground, deprived of native might.

Spenser.

The country is a desert, where the good

Gained inhabits not; born's not understood;

There men become beasts, and prone to all evils;

In cities *blocks*. *Donne.*

What tongueless *blocks* were they, would they not

speak? *Shakspeare. Richard III.*

Rochester water reacheth far within the land, and is under the protection of some *block-houses*.

Raleigh.

Can he ever dream, that the suffering for righteousness' sake is our felicity, when he sees us run so from it, that no crime is *block* enough in our way to stop our flight?

Decay of Piety.

Recommend it to the governor of Abingdon, to send some troops to *block* it up, from infesting the great road.

Clarendon.

The states about them should neither by increase of dominion, nor by *blocking* of trade, have in it their power to hurt or annoy.

Id.

At the instant of his death, having a long beard, after his head was upon the *block*, he gently drew his beard aside, and said, This hath not offended the king. *Bacon.*

Says a *blockheaded* boy, these are villainous creatures. *L'Estrange.*

Small causes are sufficient to make a man uneasy, when great ones are not in the way: for want of a *block*, he will stumble at a straw. *Swift.*

Some have mistaken *blocks* and posts,
For spectres, apparitions, ghosts.

Butler. Hudibras.

We idly sit like stupid *blockheads*,

Our hands committed to our pockets. *Id.*

A *blockhead* rubs his thoughtless skull,
And thanks his stars he was not born a fool.

Pope.

Round the goddess roll

Broad hats and hoods, and caps, a sable shawl;

Thick, and more thick, the black *blockade* extends.

Id.

The enemy was necessitated wholly to abandon the *blockade* of Olivenza. *Tatler.*

Homer's apotheosis consists of a groupe of figures; cut in the same *block* of marble, and rising one above another. *Addison.*

BLON'KET, *n. s.* I suppose for blanket.

Our *blonket* livery's been all too sad

For thilke same reason, when all is yelad

With pleasure. *Spenser.*

BLOCK, in architecture, statuary, &c. a piece of marble from the quarry, before it has received any form.

BLOCK, in carving of wood, is a form made of pear-tree, box, or other hard and close-grained wood, free from knots, on which figures are cut in relievo, with knives, chisels, &c.

BLOCK, in falconry, the perch whereon a bird of prey is kept. It is covered with cloth.

BLOCK, in geography, a small island of the United States, belonging to Rhode Island, lying twenty-one miles S. S. W. of Newport. It was incorporated in 1672, by the name of New Shoreham Township. It is a division of Newport county, and is the most southerly land in the state. The shores abound with great variety of fish.

BLOCK, in mechanic arts, a large piece of solid wood whereon to fasten work, or to fashion it; strength and stability being the requisite properties. In this sense, we say a chopping block; a sugar-finer's block, &c.

BLOCK, MOUNTING, an eminence usually of stone, but in steps or notches, serving as a help to mount on horseback. These were much in use among the ancients, who were unacquainted with stirrups. The Romans erected them at proper stations all along their great roads. See *ANABATHRA*.

BLOCKS, in the navy and marine architecture, are a species of pulley very extensively used for the purposes of forming and regulating tackle, the lifting and removing of guns, anchors and stowage; they are also in use occasionally for other architectural and heavy works. The mechanical power employed is clearly that of the pulley, and the construction of this article having hitherto been very simple, and its appearance homely, it has received a name like the butchers' and the barbers' block, which would

indicate it to come from the hand of nature rather than that of art.

They are designated generally by the number of sheaves, as they are called, i. e. wheels or pulleys, which the shell, or outside, can contain; and hooks, ropes, chains, &c. are attached to them in various ways. The annexed diagrams represent—fig. 1 the single, fig. 2 the double, fig. 3 the treble, and fig. 4 the fourfold blocks, in common use.

Fig. 1.

Fig. 2.

Fig. 3.

Fig. 4.

The single block contains only one sheave, or wheel; a double block, as may be inferred, has sheaves, one below the other; and so on.

The shells of very large blocks are made of separate pieces of wood, as the cheeks of the shell, its partitions, &c. These are called made blocks. The shell is formed of several pieces of elm plank, suited to the cheeks, sheave-holes, and partitions, and is strongly bolted together by three bolts at each end, driven through and riveted, with a washer, at the points.

Blocks are again divided into thick and thin blocks; the former being intended to receive large ropes, and the latter small ones. The following may serve as a general idea of the mode of making the common kind of blocks, in private yards, and in the old way, before the introduction of the block-machinery in our dock-yards:—

The shells being sawn to their length, breadth, and thickness, the corners or angles are sawn off. The workman then gauges, or marks out the size of the sheave-hole in the middle, one-sixteenth larger than the thickness of the sheave, and once the thickness longer than the diameter, for a single-sheaved block. In blocks of two sheaves the partition is kept in the middle, and is one-sixth less than the sheave-hole; each sheave-hole is gauged on the two opposite sides, and in the same manner for blocks with a great number of sheaves. The blocks are then jammed up edgewise, with wedges, in a clave, or frame, and the sheave-holes are made in this manner: the length and breadth are first gauged out, and

holes are bored half way through the block, along the part gauged out, with an auger of the size of the sheave-hole; then the sheave-hole is gauged, and bored on the opposite side in the same manner, so as to meet the opposite holes. Blocks from ten inches and upwards have one hole bored at each end and cut through with a chissel, and the wood is sawed out with a rib-saw. All blocks have the sheave-holes cleared by chissels, and by burrs at the corners. Blocks that are to have iron straps should have the straps fitted on before the wood is cut out of the middle. The hole for the pin is bored through the middle of the block, one-tenth less than the diameter of the pin. The outsides and edges of the shell are next rounded off by the stock-shave, and neatly finished by the spoke-shave. In the royal navy, blocks are left thick upon the edges of the cheeks, but, in merchant-ships, the edges are sometimes thinned off to a small square, and somewhat rounded off.

The scores, which are the grooves to receive the strap, are gauged out along the outside of the cheeks, and tapered in depth from nothing at the pin, to half the thickness of the strap, at the ends of the block, for a single score; and the same on each side of the pin for double scores, which are made when the block is to have double straps. The scores are gauged down across the breast of the block, to half the size of the strap, in order to allow for the serving. After the score is cut, the sheaves are fitted; they are one-tenth thicker than the diameter of the rope intended for running on them, and five times that thickness in diameter. The hole for the pin should be bored through the centre of them by a bit, fixed in the mandrel of a turning lathe, or with a stock and bit, and opened out with an auger, one-sixteenth larger than the pin, that it may easily turn. They are then put in a lathe and turned smooth, and the outer circumference hollowed one-third of its thickness, that the rope may embrace it closely.

The diameter of the pin is the thickness of the sheave, and is turned in a lathe, except its head, which is left octagonal, to prevent its turning in the block; and the pin is driven through the holes in the block and sheaves. After the sheaves are fitted, the inside of the sheave-hole, at one end of the block, is gauged hollow, to admit the rope, and correspond with the sheaves; and a small neat chamfer is taken off the edges. The proportions for single, double, treble, fourfold, and other blocks, are,—the length is eight times the breadth of the sheave-hole, which is one-sixteenth of an inch more than the thickness of the sheave; the thickness of the sheave is one-tenth more than the diameter of the rope it is intended for; and the diameter of the sheave is five times the thickness. The breadth of the block to be six times the thickness of the sheave, and the thickness to be one-half the length, or nearly so. Flat thin blocks must be three-eighths of the length thick; but all blocks having more than one sheave, increase their thickness more, in the above proportion, by the additional number of sheave-holes, and middle parts, or partitions; the thickness of each partition to be one sixth less than the breadth of the sheave-hole. These are the general dimensions, but they sometimes

BLOCKS.
Various Specimens.

Fig. 1.

Fig. 2.

Fig. 8.

Fig. 9.

Fig. 10.

vary, according to the use for which they are intended.

In the shell is fixed the sheave or sheaves, which are circular pieces of wood (usually lignum vitæ), or sometimes brass, or cast metal, with a groove, turned on its edge, for the reception of the rope; and, in the best blocks, called coaked sheaves, the sheave has a brass bush fitted in the centre, with a round hole through it to receive the pin.

The pin, or axis, on which the sheave revolves, is made of lignum vitæ, cocus, or a West India wood, called green-heart; but the best blocks have brass pins. The pin is supported by passing through the sides of the shell of the block, which is made of elm, ash, or other tough wood, with a hole morticed through it, to receive the sheave, and confine it to revolve steadily, though freely, upon its pin, and at the same time keep the rope from getting off the groove in the edge of the sheave. When the block contains two or more sheaves, as many mortises are made. Sometimes the same pin serves all the sheaves, and at other times the sheaves are placed one above the other; having, of course, separate pins.

The strap is a rope, or, in some cases, a band of iron, encompassing the shell of the block, in a notch, or scoring, cut round the block to receive it. The strap terminates in an eye of rope, or hook of iron, by means of which one of the blocks of a tackle is attached to the object upon which it is to act as a mechanical power, while the other block is suspended from some fixed support. The former is called the running-block, and the latter the standing-block.

We can only specify a few of the principal blocks of other descriptions in common use.

Bee Blocks are generally made of elm; they are seven-ninths the length of the bee, and two inches in depth, for every foot in length, and seven-eighths that depth in thickness. They are trimmed square, chamfered on the outside edges, and fitted with a sheave in one end: a hole is cut in the other end, to be fitted with a sheave should the other fail. The sheave-hole is two-sevenths the length of the block, and one-fourth the length of the sheave-hole in breadth, and half the length of the sheave-hole within the end. Bee-blocks are bolted to the bow-sprit at the outer end under the bees, and the bolts serve as the axis, or pin, for the sheave to work on; the fore-topmast stay reeves through the sheave-hole at the foremost end of the starboard bee-block; and the fore-topmast-preventer, or springstay, through the sheave-hole at the after end of the larboard bee-block.

Cat-Blocks are two or three-fold, with an iron strap and a large hook to it, and employed to draw the anchor up to the cathead.

Cheek-Blocks are half shells, bolted against the masthead; the chief bolt serves for the pin of the sheave; they receive the halyards and stays of their respective masts.

Clew-garnet-Blocks have single sheaves, and are suspended from the yards by a strap with two eyes; a lashing surrounds the yard, and passes through the eyes so as to suspend the block beneath the yard: these blocks receive the clew-garnets, or ropes, which haul up the clews of

the sail; this is applied to the main and fore-yard.

Clew-line-Blocks are for the same purpose as the preceding, but applied to the top-sails, top-gallant, and sprit-sails. A great improvement has lately been made in these blocks by Mr. Brunell, inventor of the block machinery at Portsmouth. The old clew-line and clew-garnet blocks, for they are the same except in size, were a single sheaved block, strapped with two eyes, as above; a knot was made in the end of the clew-line, or garnet, just at the place where it was attached to the clew of the sail, to prevent the corner thereof being drawn into the block. This was not effective, and frequent inconvenience arose; for the sail being so constantly in motion, the rope had a great tendency to get entangled with the sail, and drawn over the sheave. The improved block in question is shown in fig. 3. The two holes at *aa* are where the ropes go in and out again. The sheave is situated in the centre of the block, so as to be wholly enclosed, except a mortice at *b*, where the sheave is put in. The strap surrounds the lower part of the block; then both ends pass through a hole in the upper part about *c* crossing each other. They are then formed into an eye, by which the block is suspended from the yard. By this means no accident can happen, as the garnet, or rope, is so enclosed in the block, that it cannot be deranged by any violence, nor the sail be drawn into the block.

D-Blocks are lumps of oak in the form of the letter D, from twelve to sixteen inches long, and eight or ten feet wide. They are bolted to the ship's side in the channels, to receive the lifts, &c.

Deep-sea-line-blocks are small wooden snatch-blocks (see forward), about from nine to eleven inches long.

Fish-Block is hung in a notch at the end of the davit, and serves to haul up the flukes of the anchor to the ship's bow.

Girtline-Blocks, in rigging, the foremast, main, and mizen-mast, are lashed round the masthead, above the top of the cap; one to hang on each side. The girtlines that reeve through them, lead down upon deck, for hoisting the rigging, tops, and crossrees, and the persons employed to place the rigging over the masthead.

A Heart Block is a block of wood, with a large hole in the centre, at the bottom of which are four or five scores round the outside, a groove is cut to admit of a rope, called a stay, &c.

A Heart, is sometimes (fig. 5) used in the merchant service, with a round hole *l*, for the heel of the gib-boom to rest in, which is bevelled for that purpose. The bottom of the heart *m*, is also bevelled according to the steeves of the bow-sprit.

Long-tackle Blocks, have two single sheaves (fig. 6) placed one above the other, in the same shell. The lower sheave is only two thirds the size of the other; it is used in combination with a common single block, to form the long tackle, for loading, or any other purchase. In the Royal Navy and East India service they are used as yard tackles. The rope is reeved through it in the same manner as it would be through a common double block; but it is preferred, where it is convenient, because the strap being in the cen-

ire of the resistance, it hangs more steadily than when the sheaves are on one pin.

The Main-sheet Block, is used for the sheet tackle of the main-sail-booms of small vessels. The pin projects from each side of the block, being, in all, the same length as the block; the fall or rope of the tackle is belayed or twisted round this pin, to stop it. This block is either single or double, and has a hole through the end, to receive its strap.

Monkey Blocks, are sometimes used on the lower yards of small merchant ships, to lead, into the mast or down upon the deck, the running rigging belonging to the sails. Some are only small single blocks, attached, by a strap and iron swivel, to iron straps, which embrace and nail to the yard, the block turning to lead the small running ropes in any direction; others are nearly eight square, with a roller working in the middle, and a wooden saddle beneath, to fit and nail to the yard.

Nine-pin Blocks are in shape something like the nine pins (fig. 7) from which it derives its name, though flattened on the sides, and used to lead the running ropes in an horizontal direction. Their lengths are generally confined to the place in which they are fixed; and this, for the most part, under the cross-pieces of the fore-castle and quarter-deck bits. The breadth of the block, sheave, &c. is governed by the rope, and taper at the ends, to three-eighths of the breadth of the middle: the pins at each end, serving as a vertical axis, are two-thirds of the size of the end, and the thickness is five-eighths of the breadth. These blocks may be turned in a lathe, and flattened after with a spoke-shave.

Shoe Blocks, are two single blocks, cut in a solid piece, transversely to each other, so that the sheave of the upper one lies in a contrary direction to that of the lower one; they serve for legs and falls of the bunt-lines, but are seldom used.

A Shoulder Block (fig. 8) is a large single block, left nearly square at the upper end, and cut sloping in the direction of the sheave. These blocks are used on the lower yard-arms, to lead in the topsail sheets; and, on topsail-yards, to lead in the top-gallant-sheets; and, by means of the shoulder, are kept upright, and prevent the sheets from jamming between the block and the yard; they are also used at the outer end of the boomkins, to lead in the fore-tackle.

Sister Blocks, are similar to two single blocks, and formed out of a solid piece, about twenty inches long, one above the other. Between the blocks is a scoring for a middle seizing; a round head is turned at each end, and hollowed underneath, to contain the end seizings; along the sides, through which the pins are driven, is a groove or scoring, large enough to receive part of the topmast shrouds, in which it is seized. These blocks receive the lifts and reef-tackle pendants of the topsail-yards.

A Snatch Block (fig. 9) has a single sheave, with a notch cut through one of its cheeks, to admit the rope, or fall, to be lifted in and out of the block, without putting its end through first. The strap does not, in this, surround the block, but is put through a hole, bored through the

divided end. The figure is represented with two tails, which may be made up for a hook, a thimble, or eye, according to the situation where it is to be used, which is, generally, for the main, or fore-sheet, blocks of square-rigged vessels.

Snatch Blocks are also (fig. 10) iron bound, terminating at the notched end of the block, with a swivel-hook, or an eye bolt, large enough to receive several turns of lashing, which fastens the block to its fixed support. That part of the strap over the notch, in the side; lifts up with a hinge, and is confined down, when the rope is in the block, by a small pin, put across, through the end of the pin of the sheave, which projects up from the block sufficiently to pass through an eye made in the hinge part of the strap. The strap on the other part of the block is let into the block, and confined by the pin and some nails. These blocks are used for heavy purchases, where a warp, or hawser, is brought to the capstan.

Strap-bound Blocks are single blocks, with a shoulder left on each side, at the upper part, to admit the strap through, a little above the pins. These blocks are used at the clews of the quarter-sails, for the clew-garnets or clew-lines; and, under the yards, the shoulder preserves the strap from chafing.

Thick and Thin, or Quarter Block, is a double block with one sheave thicker than the other, and is used to lead down the topsail-sheets, and intended for the clew lines; a single block would be cheaper and better, as the thin sheave is seldom used for the clew lines, it being found rather to impede than to facilitate their movements.

Voil, or Voyal blocks, are single sheave blocks. The length is ten times the thickness of the sheave-hole, which is three-eighths more than the thickness of the sheave; the thickness of the sheave is one-tenth more than the diameter of the voil; and the diameter of the sheave is seven times the thickness. The breadth of the block should be eight times the thickness of the sheave; and the thickness two-sevenths of the length. This block is double-scored, the sheave is coated with brass, and the pin is iron, and nearly as thick as the sheave. It is used in heaving up the anchor. The voil passes round the gear capstan, and through the block, which is lashed to the main-mast, and the cable is fastened, in a temporary manner, to the voil in several places. It is seldom used, except in the largest ships of the royal navy.

The blocks lashed to a ship's principal yards are: To the lower yards.—The gear block, buntline blocks, lee-line block, lift blocks, and topsail-sheet blocks, strapped together; quarter and slab-line blocks, strapped together; clew-garnet blocks, tricing blocks, preventer-brace blocks; pendant blocks, studding-sail-halyard blocks.

To the topsail-yards.—Buntline and tye-blocks, strapped together; top-gallant-sheet block, and lift block, strapped together; jewel block, and brace-pendant blocks, clew-line blocks, and block to lead down the top-gallant sheets.

To the top-gallant-yards.—Jewel, clew-line, and brace-pendant blocks.

To the mizen-yard.—Jear block, derrick block, signal-halyard block, throat-brail, middle-brail, and coak-brail blocks.

To the cross-jack-yard.—Quarter blocks, jear blocks, and lift and topsail-sheet blocks, strapped together.

To the bowsprit.—The bee block, bolted to the bowsprit at the outer end, under the bees; fore-bow-line blocks, lashed on each side the forestay-collar; fore-topsail-bowline block, lashed to an eye-bolt in the bowsprit-cap.

Block House, in military affairs, is a name sometimes given to a permanent brick or stone fort able to resist cannon shot. Such an one formerly stood on the bridge of Dresden; and it is generally built on a bridge, or on the brink of a precipice or river, serving to command a pass, river, or ford. A wooden fort of this kind is sometimes made to move on wheels or rollers, and is sometimes erected on a vessel, &c. Its design is to defend a party against musketry. There is a model of one constructed by Major Gordon of the Artillery, in the Royal Military Repository at Woolwich. It was made during the late contest with America, of timber felled for the purpose, and squared where it was necessary; it is, however, very strong, and could safely defy any attack except that of cannon.

BLOCK MACHINERY.—The immense demand of blocks for the royal navy, and the importance of having them both accurately and substantially made, induced the British government to patronise, in 1781, the undertaking of the late Mr. Walter Taylor of Southampton, who obtained a patent in that year for an improvement in the construction of the sheaves or pulleys; and the patentee enjoyed, for many years afterwards, the contract for supplying the royal navy with blocks. He manufactured them at wood-mills, on the river Itchen, near Southampton, by means of machinery which was wrought by water.

A Mr. Dunsterville of Plymouth also made improvements in the construction of blocks, to which he adapted machinery wrought by horses;

but he never prosecuted this business on any considerable scale.

In 1801 government found it expedient to erect new wood-mills, for various operations, in the dock-yard at Plymouth, and about this time happily, Mr. Brunell, an American artist of great mechanical skill, had just completed a working model of his block machinery, or a set of contrivances for the entire formation of a block from the inmost pin to the completion of the shell, and the putting the whole together. This model being exhibited at the admiralty, was referred to the inspection of general Sir Samuel Bentham, and, on his recommendation, the artist was immediately taken into the public service.

Mr. Brunell stated that he could effect by his machinery, 1. A greater uniformity of size and construction in all blocks contracted for in sets, or in which the same sorts were required, a circumstance which would increase the quantity of waste wood that might be employed, and increase the difficulty of counterfeiting them. The sheaves or shivers would be so mathematically true, and so exact to each other in their thicknesses and diameters, that every sheave of any particular size would equally fit any shell of the size for which it was intended; and the inconvenience to which ordinary blocks are liable from the friction of the ropes against one, or alternately both, of the sides of the mortices, was proposed to be removed by placing a sheet of metal on the upper part of the mortice, bent to the proper shape by an engine adapted for the purpose. 2. He could add strength where it was wanted, by making the head and bottom more substantial, and less liable to split; and 3. by leaving the wood between the two mortices thicker, he could admit a better bearing for the pins; all of which would be accomplished without requiring any dexterity on the part of the workman, but entirely by the operation of the machinery.

Mr. Brunell's calculation of the saving as to the cost of blocks to the Navy Board, compared with the former contract prices, was as follows:

	Blocks of 3 inch. <i>s. d.</i>	12 inch. <i>s. d.</i>	16 inch. <i>s. d.</i>	21 inch. <i>s. d.</i>
Brunell's prices . .	1 8 $\frac{3}{4}$	4 5	8 11 $\frac{1}{2}$	18 1 $\frac{3}{4}$
Contract prices . .	2 3 $\frac{1}{2}$	6 11 $\frac{1}{2}$	13 6	27 0 $\frac{3}{4}$
Saving in first cost .	0 6 $\frac{3}{4}$	2 6 $\frac{1}{2}$	4 6 $\frac{1}{2}$	8 11

The first and most material parts of this machinery were carried into operation at Plymouth in 1804. The able artist, however, kept adding to them other machines for making dead eyes, trucks, and all manner of block-maker's wares, besides circular and upright saws, lathes, engines for turning pins, rivetting, polishing, &c. till the year 1808, when he considered the whole system to be complete: and from that period it was in incessant occupation to the conclusion of the war, without any thing but the most ordinary and unavoidable repairs being requisite, and with very little attention from Mr. B. himself. They make all the blocks now used in the navy, which may be said to be of not less than 200 sorts and sizes, and consist of forty-four machines, which form

three sets; that is three blocks of different sizes may be proceeding in all their stages at the same time; though in some of these stages one machine may operate upon two, or even ten blocks at the same time. The whole was long set in motion by means of a capital steam-engine, of thirty-two horses' power, erected by Messrs. Boulton and Watt; and the only manual labor required was simply to supply the wood as it is wanted, and to remove the blocks from one part of the machinery to another, till perfectly finished: so that a common laborer could act in this business with very little instruction. To relieve the labor of this engine, a second was afterwards added.

It has been calculated that four men, with the machinery as it now stands, can complete the

shells of as many blocks as fifty men could do by the old method ; and that six men will furnish as many sheaves as before required sixty ; that these ten men, in displacing the labor of 110, can with ease finish in one year from 130,000 to 140,000 blocks of different sorts and sizes, the total value of which cannot be less than £50,000. This is stated to be the average number which was annually made from the year 1808 to the conclusion of the war ; and found to be fully sufficient for supplying the wear and tear of blocks, not only in the naval, but also in the ordnance department.

During the late war 1000 sail of ships were at one time incommision ; a ship of seventy-four guns requiring the following blocks for her equipment :

	No.
Single blocks from 5 to 26 inches . . .	622
Double ditto from 7 to 26 ditto . . .	130
Various other blocks, generally large, and several of them treble } . . .	74
For each of the 74 guns, 6 blocks . . .	444
Total . . .	1270

Besides dead eyes, hearts, parrels, and puttock-plates, all manufactured at the mills . . . } 160

Of all kinds in a 74 gun ship . . . 1430

it follows that probably a million of blocks were in wear, at that period, in these our wooden walls.

To the completion of this machinery, Mr. Brunell, as we have already intimated, gave his whole attention from the month of September 1802 to June 1808, receiving only a daily allowance of one guinea ; when therefore it was in full operation, and ascertained to be so completely national an improvement, it very properly became a question in what manner the author of the invention should be further rewarded. Gen. Bentham suggested that the savings of one year on the contract prices would be a fair remuneration for the time, labor, and ingenuity, bestowed on these machines. It was no easy matter, however, to ascertain with precision what the actual savings amounted to. Mr. Brunell, by estimate made them £21,174.; Mr. Rogers, clerk to general Bentham, by estimate £12,742.; and the general finally . . . £16,621 0 0

Add six years' allowance at one } 2,400 0 0
guinea per day, about . . . }

For the working model . . . 1,000 0 0

And Mr. Brunell received about £20,000 0 0

The whole cost of the steam-engine, machinery, building, interest of money, &c. amounted, it has been said, to £53,000. the net compensation we see for profits, was about £18,000.; therefore the whole expense of the concern was completely cleared in four years ; and the savings of £18,000 on one year's manufactured articles of the value of £50,000, are somewhat more than Brunell had originally calculated.

Every body who visits Portsmouth dock-yard makes a point of visiting the block-machinery ; we therefore think it may be of use to attempt

to follow the process of making a block from the rough wood till the completion of it.

The first wing of the building is occupied by upright and circular saws, used for a variety of purposes not immediately connected with the making of blocks. The only operation connected with it here is that of converting the rough elm or ash timber (most commonly the former), into its proper scantling ; that is to say, squaring it by the upright or straight-cutting saw, and then, by a circular saw, cross-cutting it into a certain number of parallelopipedons, whose lengths may bear the required proportion to the thickness of the log. Some of these are again cut longitudinally, according to the thickness that may be required for the shell of the block, especially those for single and double blocks, which of course are thinner than three and four-fold-blocks. This operation is performed by a ripping-saw ; and the logs thus cut out are then taken into the second wing of the wood-mills, and here commences the process of making

I. THE SHELL, which is performed by the boring machine, or by means of a centre-bit applied to the middle of the shell, and which bores a hole for the centre pin of the sheave, while another bores one, two, or three holes at right angles to the direction of the first, to admit the first stroke of the chisel, and at the same time to serve for the head of the mortice or mortices, according as the intended block is to contain one, two, or three sheaves. When thus bored, the log is carried from hence to the morticing-machine, a most ingenious piece of mechanism. The block being firmly fixed on a movable carriage, the latter is so contrived as to be made to advance to the cutting chisels, which are fixed in a movable frame. Every time the frame with the chisels ascends, the block in its carriage advances a little, so as to present to the chisels a fresh surface of wood to be acted upon at each stroke of their descent ; and this up and down motion is continued with such rapidity that the chisels make from 100 to 130 strokes in a minute, until the proper length has been morticed out ; when, by a boy raising a handle, the machine is stopped precisely when the chisels stand at their greatest elevation. The chips cut are thrust out of the mortice by small pieces of steel attached to and projecting from the back of each chisel. They are each of them besides armed with two cutters, placed at right angles to the edge, called scribers, which mark out the width of the chip to be cut at each stroke. These scribers answer another purpose ; their cutting is so true as to leave the two sides of the mortice so perfectly smooth as to require no further trimming or polishing. The next thing is to remove the block from the morticing-machine to a circular saw, in order to have the four corners taken off, by which operation it is reduced to an octagonal shape. This saw being fixed into a table or bench, the workman has nothing more to do than to slide each log along the surface of the table in the direction of the line marked out for the saw to cut it. A further operation is to place the block upon the shaping-machine. This is thought one of the most effective and striking contrivances in the whole machinery. It consists prin-

cipally of two equal and parallel circular wheels moving on the same axis, to which one of them is firmly fixed, but on which the other is made to slide; so that these two wheels may be placed at any given distance from each other, and blocks of any size admitted between their two rims or peripheries. For this purpose, both rims are divided into ten equal parts, for the reception of ten blocks, which are firmly and immovably fixed between the two wheels. When the double wheel with its ten attached blocks is put in motion, the outer surfaces of the blocks, or those which are farthest from the centre, strike with great violence against the edge of a chisel or gouge fixed in a movable frame, which, being made to slide in a curved direction in the line of the axis, cuts those outward faces of the blocks to their proper curvature, which can be altered in any way the workman pleases, by a contrivance attached to the cutting-tool. As soon as the tool has traversed the whole length of the block, or over the space contained between the two peripheries of the wheels, the machine is thrown out of the gear, and its prodigious velocity checked by a particular contrivance. The ten blocks are then by a single operation, and without removing them, each turned one-fourth part round, and another fourth part of their surface brought outwards, which being exposed to the cutting instrument, traversing in the same direction as before, have the same curvature given to these new surfaces. A third side is then turned outwards, and after that the fourth and last side, when the whole ten blocks are completely shaped, and ten other octagonal logs applied to the peripheries to undergo the same operation. The immense velocity with which these wheels revolve, and the great weight with which their peripheries are loaded, would make it dangerous to the workmen or bye-standers, if by the violence of the centrifugal force any of the blocks should happen to be thrown off from the rim of the wheels; to prevent the possibility of such an accident, an iron cage or guard is placed between the workman and the machine. The shell of the block being now morticed and completely shapen, the last operation is performed by the scoring-machine, which, by means of cutters, scoops out a groove round the longer diameter of the block, deepest at the ends, and vanishing to the central hole for the pin on which the sheave turns. The intention of this groove or channel is to receive the hempen or iron strap which surrounds the block. The only thing that now remains for completing the shell, is the removal of the little roughnesses from the surface, and giving to it a kind of polish, which is done by the hand.

II. OF THE SHEAVES.—The wood of these, as we have said, is generally *lignum vite*; but iron or bell-metal have occasionally been substituted. A kind of porcelain was once introduced as a material, and answered well enough for some particular purposes, but was not be trusted in situations liable to sudden jerks and irregular motions of the block. In the navy sheaves are almost invariably of *lignum vite*; a few perhaps of ebony. The machinery employed for making this part of the block consists of a circular saw

by which the log is cut into plates of the thickness required. These plates are carried to a crown saw which bores the central hole, and at the same time reduces them to a perfect circle of the proper diameter. The sheave thus shaped is next brought to the coaking-machine, a piece of mechanism little inferior in ingenuity to the shaping-machine. The effect of the operation is very curious. A small cutter in traversing round the central hole of the sheave forms a groove for the insertion of the coak or bush, the shape of which is that of three semicircles not concentric with each other, nor with the sheave, but each having a centre equally distant from that of the sheave. The manner in which the cutter traverses from the first to the second, and from this to the third semicircle, after finishing each of them, never fails to attract the notice of visitors. So very exact and accurate is the groove cut for the reception of the metal coak, and so uniform in their shape and size are the latter cast in moulds, that they are invariably found to fit each other so nicely, and without preparation, that the tap of a hammer is sufficient to fix the coak in its place. The coaks are cast with small grooves or channels in the inside of their tubes, which serve to retain the oil or grease, without which it would soon ooze out, and the pin become dry. The sheave, with its coak thus fitted in, is now taken to the drilling-machine, which is kept in constant motion. In casting the coaks a mark is left in the centre of each of the three semicircles. This mark is applied by a boy to the point of the moving drill, which speedily goes through the two coaks and the intermediate wood of the sheave. A copper pin, cut from wire, of the proper length and thickness, is inserted into the holes thus drilled; and the sheave is then taken to the rivetting-hammer, which is something like a small tilt-hammer, and can easily be made to strike on the pin with greater or less velocity, according as the workman presses with more or less force on the treadle. The rivetting being performed, the next operation is that of broaching the central hole on which the sheave turns, by means of a steel drill or cutter. The last process consists in turning a groove for the rope to run in round the periphery of the sheave, and this operation is performed by a lathe, which is so constructed, that while this groove is cutting round the rim of the sheave, another part of the engine is turning smooth the two surfaces or faces of the sheave; and this lathe can be made to adapt itself to sheaves of different diameters. The shell and the sheave being now completed, there remains only the iron pin, which, passing through the two sides of the former, serves as the axis on which the latter turns within the mortice. These pins are also made, turned, and polished by engines for the purpose, so that, with the exception of strapping by rope or iron, the whole block is now completed.

The French, in the dock-yard of Brest, have long been in the practice of making blocks by horse-machinery; but they have not attempted any thing like a shaping-machine, or a substitute for it.

BLOCK, SPRING, an invention of Mr. Hopkinson of Philadelphia, to assist a vessel in sail-

ing. The principles of it are thus explained, in his paper published in the Transactions of the American Philosophical Society:—The masts, yards, and rigging of a ship, receive the first impulses of the wind. All these are in some degree elastic. Every twisted rope is a spiral spring, and every spar capable of being a little bent. But let us suppose that the ropes were all composed of straight strands, that the masts and yards were inflexible, and the sails made of thin light wood: in such a case, I suppose that the vessel, in sailing by the wind, would make but little head-way, whatever the shape of her bottom might be, but would expend the force of the wind in heeling, and slipping to leeward. If this is true, her sailing must be considerably assisted by any means that shall increase the acting spring of her rigging. For this purpose I have contrived what I call a spring block, to be applied to such parts of the rigging as will admit of it with safety and convenience, and where its operations will be most advantageous; but particularly to the sheet-ropes, and if practicable to the dead eyes, in lieu of what are called the chains. In the diagram is a figure of this invention. A, is a block made in the usual manner, having a ring or eye, B, at one end. C, is a spiral spring, linked at one end to the hook, D E, and at the other to the ring F, which is to be annexed by a staple to the timber-head, or by some other means, to the place where it is to be applied. The spring C must be of well tempered steel, and proportioned in strength to the service it is to perform. Within the cavity or pipe, formed by the spiral spring, there must be a chain of suitable strength, called a cheek chain, represented separately at G, connected by links to the hook D E, and ring F. When the spring is not in action, this chain is slack; when the spiral spring is extended by the force of the wind, as far as it can be without danger of injury, the cheek-chain must then begin to bear, to prevent its further extension, and, if strong enough, will be an effectual security against failure.

BLOCK ISLAND, an island off the coast of Connecticut, in North America, and in the state of Rhode Island. It is forty-six miles in length, and its extreme breadth is thirty-eight miles. The southern part of it is in N. lat. $41^{\circ} 8'$.

BLOCK (Daniel), a portrait painter, born at Stettin, in Pomerania, in 1580, who gave such early proofs of genius as induced his parents to place him as a disciple with Jacob Scherer. His extraordinary merit recommended him to the prince of Mecklenburg, who retained him in his service forty-four years. He died in 1611.

BLOCK (Joanna Koerten), was a native of Amsterdam, born in 1650, and celebrated for her beautiful models in wax, her engravings on chrysal and glass, &c. and her copies of paintings in paper, executed with the scissors. For three pieces of this latter description she is said to have refused 1000 florins from the elector palatine; and a sum four times as large from the

empress of Germany, for a trophy similarly cut out. She died in 1715.

BLOCKADE, in the art of war, the blocking up a place, by posting troops at all the avenues leading to it, to keep supplies of men and provisions from getting into it; and by these means proposing to starve it out, without making any regular attacks. To raise a blockade, is to force the troops that keep the place blocked up from their posts.

BLOCK AND BLOCK, in sea language, is a phrase used, when on hauling any tackle, haul-yard, or the like, to which two blocks belong, the two meet and touch; so that they can haul no farther.

BLOCK-BATTERY, in the military art, denotes a wooden battery on four wheels, movable from place to place, whereby to fire en barbe, or over the parapet; sometimes also used in galleries and casements, where room is wanted.

BLOCK-BRUSH, in heraldry, a bunch of kneeholm, or bastard myrtle, formerly used by butchers to clean their blocks. It forms a part of the armorial bearings of the Butchers' Company.

BLOCK-CARRIAGE, in artillery, is a carriage used for the conveyance of mortars and their beds from one place to another.

BLOCKING, in middle age writers, a kind of burial, used for persons who died excommunicated.

BLOCKLAND (Anthony), history and portrait painter, was of a noble family, and born at Montfort in 1532. He was trained under Francis Florus, whose manner he followed. The airs of his heads were noble, and the profiles of his female figures approached near to the taste of Parmigiano. Several of his works are in excellent gusto, particularly a Venus, and the history of Joseph and his Brethren. He died in 1583.

BLOCKSBERG, or **BROKSBERG**, sometimes called the Brocken, Mons Bructerus, a mountain of Hanover, the highest point of the rugged district of Hartz. It is about 3600 feet above the level of the sea, and its summit presents a view of nearly 8000 square miles. Tradition, founded no doubt on the religious ceremonies of the Pagan Germans performed here in ancient times, makes this mountain the resort of all the witches of the north; and the spectre of the Brocken, though a phenomena perfectly natural, is calculated to strike the ignorant peasant with terror, and even to excite surprise in the philosopher. It is seen either in the morning or the evening, when the spectator at the top of the mountain happens to be placed in a right line between the sun and a cloud hovering in the atmosphere at a small distance, and is merely the image of the spectator reflected from the cloud, as from a mirror, but in a magnified and distorted shape.

BLOCKY, among jewellers, an epithet given to a diamond when its sides are too upright, by its table and collet being too large.

BLOEDIT, in mineralogy, a fibrous substance recently analysed by Jahn, and found to consist of sulphate of magnesia, and of soda and water.

BLOEMART (Abraham), painter of landscape, cattle, history, and portraits, was born at Gorcum in 1564, according to Honbraken, but

according to Sandrart, in 1567, and lived mostly at Utrecht. In his youth he imitated the works of Floris, but his own genius proved his principal director. He formed a manner peculiar to himself, making nature his model, particularly in cattle, in which he excelled. He died in 1647. He left four sons all artists.

BLOEMART (Cornelius), the youngest son of the preceding, was born, in 1603, at Utrecht. The first principles of drawing and painting he learned from his father, but his inclination for engraving led him to apply wholly to that pursuit. He first studied under Crispin de Pass, and afterwards went to Rome, where he died in a very advanced age. His manner of engraving was not only quite original, but the source to which we may trace that style in which the greatest French masters excelled. His works are justly held in high estimation. They are very numerous, yet many of them difficult to be procured.

BLOEMEN (John Francis Van), surnamed by the Italians, Orizonti. See ORIZONTI.

BLOEMEN (Norbert Van), brother of the preceding, was a painter of portraits and conversations; but his merit was very inferior to his brother's, although he had a great deal of employment.

BLOEMEN (Peter Van), a celebrated painter, born at Antwerp, was also brother of John Francis, with whom he lived for several years at Rome. As soon as he found himself competently skilled in his art, he returned to his native city, where, in 1699, he was appointed director of the academy. His composition is rich, and his pictures are generally filled with a number of figures. His subjects are military, or Italian fairs, markets, and festivals.

BLOIS, an ancient city of France, in the department of the Loire and Cher, and ci-devant province of Blaisois, seated on the Loire, in one of the most agreeable districts of France. The castle is its great ornament. At first view, it seems to be two distinct buildings, but it is joined by a passage cut out of the rock. Joining this, on the west side, is the tower of Chateau Regnaud, which may be seen twenty miles distant. That part of the castle which was built by the duke of Orleans, in 1632, is a superb edifice, but unfinished. It was the birth place of Louis XII., and the scene where the duke of Guise and his brother the cardinal were assassinated, in 1587, by order of Henry III.; Catherine de Medicis, also died here in 1589. The court before it, where the church of St. Saviour is built, is very large, and was formerly used for tournaments. On all the gates of the city there was formerly an image of the Virgin Mary, who it was believed, freed the natives from the plague in 1631. The cathedral, the Jesuits' church and college, and the Episcopal palace are handsome buildings. But the bishopric, which was last filled by the celebrated Gregoire, has been suppressed. About three-fourths of a mile from the city, the water runs down the clefts of a rock into a large aqueduct, supposed to be of Roman construction, by which it is conveyed into a reservoir near the walls, and thence distributed by leaden pipes through the city. The trade of Blois is chiefly in wine and brandy; but the inhabitants also

make some serges and stuffs, and excellent watches, and hardware goods. It is situated thirty-six miles south-west of Orleans.

BLOMBERG (Barbara), a young lady of quality in Ratisbon, mistress of the emperor Charles V., and the mother of his natural son, the celebrated Don John of Austria.

BLOMEFIELD (Francis), an English clergyman and topographical writer, was the author of *Collectanea Cantabrigiensia*, or *Collections relating to Cambridge University, Town, and County, Norwich*, 1750, 4to; and of *An Essay towards a Topographical History of the County of Norfolk*; continued by the Rev. Charles Parkin, Fersfield, 1739-1775, 5 vols. folio; reprinted in 11 vols. 8vo, in 1805-1810. He was rector of Fersfield in Norfolk, and died in 1755 or 1756.

BLOND (Christopher Le), painter of portraits in miniature, and various subjects on paper, was born in 1670. He became first known at Rome in 1716, as painter to Count Martinetz, and, at the solicitation of Overbeke, went to Amsterdam, where he was employed to paint portraits for bracelets, snuff-boxes, &c. After spending some years in the Low Countries, he came to England, and commenced a new method of painting mezzotinto plates in colors. He had another merit with which few inventors begin, for he communicated his secret in a thin quarto, entitled *Coloritto*, or *The Harmony of Coloring in Painting reduced to Mechanical Practice, under easy Precepts and Infallible Rules*. Le Blond next set on foot a project for copying the cartoons of Raphael in tapestry, and made drawings from the pictures for that purpose. Houses were built and looms erected at the Mulberry Ground at Chelsea; but the expenses being too great, or the contributions not being equal to his expectations, the scheme was suddenly defeated, and Le Blond disappeared, to the no small dissatisfaction of those who were engaged with him. From hence he went to Paris, where he died in 1740, in an hospital. He was author of a treatise in French, on *Ideal Beauty*.

BLONDEL (David), a protestant minister, distinguished by his skill in history, was born at Chalons sur Marne, and admitted minister at a synod of the isle of France, in 1614. He was afterwards made an honorary professor with a suitable pension, by the national synod of Charenton. On the death of Vossius, he was chosen professor of history in Amsterdam, whither he went in 1650. He wrote, 1. *A Defence of the Reformed Churches of France*. 2. *A Work against the Decretal Epistles*. 3. *De Episcopis et Presbyteris*; 4. *Pseudo Isidorus*; 5. *A Treatise of the Sybils*, wherein he proves their oracles false; 6. *A Treatise concerning Pope Joan*, wherein he offended some of his protestant friends, by discrediting the story of the female pope; 7. *De Formula Regnante Christo*; 8. *Considerations Politiques et Religieuses*; on the war between the republics of England and Holland, and some other pieces. Bayle informs us that he had a singular way of studying: he lay on the floor, and had around him the necessary books for the work in hand. He died in 1655, aged sixty-four.

BLOMDEL (Francis), regius professor of mathematics and architecture at Paris, was employed in several negociations, arrived at the dignity of marshal de camp and counsellor of state, and was appointed to teach the dauphin mathematics, he was also made member of the academy of Sciences, and director of the Academy of Architecture. He died at Paris in 1686, aged sixty-eight. He wrote, 1. Notes on Savot's Architecture; 2. A Course of Mathematics; 3. Architecture Française, 2 vols. fol. 1772; 4. Cours d'Architecture Civile, 9 vols. 8vo. a work, the second part of which appeared in 1773, being left unfinished at his death; 5. A Treatise on Fortification, &c.

BLONDUS (Flavius), an historian born at Froli, in Italy, in 1388, was secretary to Eugenius IV. and other popes. He wrote, 1. Romæ Instauratæ Lib. iiii., dedicated to Eugene IV. 2. Romæ Triumphantis Lib. X, dedicated to Pius II. 3. Italiæ Illustratæ Lib. viii. 4. De Origine et Gestis Venetorum; besides three decades of a general history of Rome, the MS. of which is still preserved in the library of Modena.

BLOOD, *v. & n.*

BLOOD'Y, *n. & adj.*

BLOOD'INESS,

BLOOD'ILY,

BLOOD'LESS,

BLOOD'ROUND,

BLOOD'BOLTERED,

BLOOD'HOT,

BLOOD'LET, *v.*

BLOOD'LETTER,

BLOOD'GUILTINESS,

BLOOD'SHED,

BLOOD'SHOT,

BLOOD'SUCKER,

BLOOD'THIRSTY,

BLOOD'YFLUX,

BLOOD'YMINDED,

BLOOD'VESEL.

See BLEED. The red liquor that circulates in the veins and arteries. Progeny; family; kindred; descent; high extraction; the corporeal part of man. Sometimes applied to the temper of the mind; to that which is the life; and to every agent and instrument by which the life may be affected.

But flesh, with the life thereof, which is the *blood* thereof, shall you not eat. *Genesis.*

The voice of thy brother's *blood* crieth unto me from the ground. *Id. iv. 10.*

He washed his garments in wine, and his clothes in the *blood* of grapes. *Id. xlix. 11.*

When wicked men have slain a righteous person in his own house, upon his bed, shall I not therefore now require his *blood* at your hand? *2 Samuel iv. 11.*

Flesh and *blood* hath not revealed it unto thee, but my Father which is in heaven. *Matt. xvi. 17.*

Of kinges *blood* of Perse is she descended, I say not that she hadde most fairenesae, But of hire shape she might not be amended.

Chaucer. Canterbury Tales.

He red, and measured many a sad verse, That horreur gan the virgin's hart to perse, And her faire locks up stared stiffe on end, Hearing him those same *bloody* lines reherse, And, all the while he red, she did extend Her sword high over him, if aught he did offend,

Spenser.

Full many mischiefs follow cruel wrath; Abhorred *bloodshed*, and tumultuous strife, Unnearly murder, and unthrifty seath. *Faerie Queene.*

And high advancing his *blood-thirsty* blade, Struck one of those deformed heads. *Id.*

And were there rightful cause of difference, Yet were it not better, fair it to accord, Than with *bloodguiltiness* to heap offence, And mortal vengeance join to crime abhorred? *Id.*
I am a gentleman of *blood* and breeding. *Shakspeare.*
It will have *blood*; they say, *blood* will have *blood*. *Id.*

As many and as well-born *bloods* as those Stand in his face, to contradict his claim. *Id.*

We will no more meet, no more see one another: But yet thou art my flesh, my *blood*, my daughter. *Id.*
The *blood-boltered* Banquo smiles upon me. *Id. Macbeth.*

I grant him *bloody*, Luxurious, avaricious, false, deceitful. *Id.*
Thou *bloodier* villain

Than terms can give thee out. *Id.*

God keep the prince from all the pack of you; A knot you are of damned *blood-suckers*. *Id. Richard III.*

Shall prove a deadly *bloodshed* but a jest, Exemplary by this heinous spectacle. *Id. King John.*

By continual martial exercises, without *blood*, she made them perfect in that *bloody* art. *Sidney.*

The nobility cried out upon him, that he was a *bloodsucker*, a murderer, and a parricide. *Hayward.*

Before you let *blood*, deliberate upon it, and well consider all circumstances belonging to it.

Burton. Anatomy of Melancholy.

So when the never-settled Scythian Removes his dwelling in an empty vain: When now the sun hath half his journey ran, His horse he *bloods*, and pricks a trembling vein; So from the wound quenches his thirsty heat: Yet worse; this fiend makes his own flesh his meat: Monster! the ravenous bear his kind will never eat.

Fletcher. Purple Island.

The news put divers young *bloods* into such a fury, as the ambassadors were not, without peril, to be outraged. *Bacon.*

When the faculties intellectual are in vigour, not drenched, or, as it were, *blooded* by the affections.

Id. Apothegms.

War brings ruin where it should amend; But beauty, with a *bloodless* conquest, finds A welcome sovereignty in rudest minds. *Waller.*

A man, under the transports of a vehement rage, passes a different judgment upon murder and *bloodshed*, from what he does when his revenge is over.

South.

A crow lay battering upon a muscle, and could not, for his *blood*, break the shell to come at the fish.

L'Estrange.

The *bloody* fact Will be avenged; and the other's faith approved Lose no reward; though here thou see him die, Rolling in dust and gore. *Milton's Paradise Lost.*

Though they should wash their guilty hands In this warm life *blood*, which doth part From thine, and wound me to the heart, Yet could they not be clean: their stain Is dyed in such a purple grain. *Marvell.*

Will you, great sir, that glory blot, In cold *blood*, which you gained in hot? *Hudibras.*

Hear this, hear this, thou tribune of the people! Thou zealous, public *bloodhound*, hear and melt! *Dryden.*

This day the poet, *bloodily* inclined, Has made me die, full sore against my mind. *Id.*

Then all approach the slain with vast surprise, And scarce secure, reach out their spears afar, And *blood* their points, to prove their partnership in war. *Id. Fables.*

And, though the villain 'scape awhile, he feels
Slow vengeance, like a *bloodhound*, at his heels. *Swift*.
This mischief, in aneurism, proceedeth from the
ignorance of the *blood-letter*, who, not considering the
error committed in letting *blood*, binds up the arm
carelessly. *Wiseman*.

Cold, by retarding the motion of the blood, and
suppressing perspiration, produces giddiness, sleep-
iness, pains in the bowels, looseness, *bloody fluxes*.

Arbutnot on Air.
The chyle is not perfectly assimilated into blood
by its circulation through the lungs, as is known by
experiments in *blood-letting*. *Id. On Aliments*.

And that the winds their bellowing throats would
try,
When reddening clouds reflect his *bloodshot* eye.

Garth.
He was *blooded* up to his elbows by a couple of
Moors, whom he butchered with his own imperial
hands. *Addison*.

The skins of the forehead were extremely tough
and thick, and had not in them any *blood-vessel*, that
we were able to discover. *Id. Spectator*.

A good piece of bread first to be eaten, will gain
time to warm the beer *blood-hot*, which then he may
drink safely. *Locke*.

It will manifest itself by its *bloodiness*; yet some-
times the skull is so thin as not to admit of any.

Sharp's Surgery.
Did not the painted kings of India greet
Our queen, and lay their sceptres at her feet?
Chiefs, who full bowls of hostile *blood* had quaffed,
Famed for the javelin and envenomed shaft,
Whose haughty brows made savages adore,
Nor bowed to less than stars or sun before. *Tickell*.

The heart contracts four thousand times in one
hour; from which it follows that there pass through
the heart every hour four thousand ounces, or three
hundred and fifty pounds of *blood*. Now the whole
mass of *blood* is said to be about twenty-five pounds;
so that a quantity of *blood*, equal to the whole mass
of *blood*, passes through the heart fourteen times in
one hour; which is about once every four minutes.

Paley.

BLOOD; the fluid contained in the arteries and
veins. While circulating in these vessels it ap-
pears homogeneous and uniform, but when taken
from these it very shortly separates into distinct
parts. In the first instance, a vapor exhales
from extravasated blood which has a peculiar
smell; but this exhalation, when condensed into
a liquid, differs very little from mere water.
Soon a film appears on the surface of the blood,
which is preparatory to the separation of the mass
into a firm red substance called the *cruur*, and a
yellowish liquid or serum. The first is resolvable
again into two parts, viz. the red globules
and the fibrin, or what has been called the coa-
gulable lymph; this coagulable lymph appearing
on the surface of the crassamentum, in greater
or less quantity, both, as the blood may have
been more or less tardy in separation, and as it
may contain more or less of fibrin; the properties
of this lymph differing very little from those of
the fibrin, which is obtained from muscular fibre;
and which, indeed, is regarded as the essence of
muscular fibre. Fibrin, then, exists in the
largest proportions under conditions of high
health; and, in individuals of different species,
the quantity of this ingredient has been said to
bear a relation to the ferocity and strength of
the animal.

The red globules of the blood were first
accurately examined by Mr. Hewson; it is a
curious fact respecting these, that although they
appear readily to dissolve in water, and thus im-
part their color to the solvent, they still retain,
under this solution, their globular shape, and
thus remain colorless globules. The diameter of
these globules has been stated so low as from
1-4000th to 1-6000th part of an inch. According
to some they become elliptical in order to accom-
modate themselves to the decreasing diameter of
the vessels they have to pass through. Prevost
and Dumas state that the elliptical form of the
globules is common to birds, and to the cold
blooded animals; while in the mammalia they
are always spherical. These last physiologists
remark, that the size of the globule varies from
 $\frac{1}{3750}$ of an English inch in man, the dog, pig, &c.
to $\frac{1}{7500}$ in the she-goat.

There has been much controversy respecting
the principle upon which the color of the blood
depends. Berzelius and others have ascribed it
to the oxide of iron entering into its composition;
while Dr. Wills, and subsequently Mr. Brande
and Vauquelin, have attributed it, and apparently
with much more correctness, to an animal sub-
stance of a peculiar nature. Mr. B., when inves-
tigating the coloring matter of the blood distin-
ctly from its crassamentum, did not find it to
contain a greater proportion of iron than the
other principles; the theory, then, says a modern
chemist, which accounts for the red color of the
fluid in question, by the presence of iron, may be
considered as completely set aside; and the
same chemist, Dr. Henry, gives, from Vauquelin,
the following method of obtaining, in a separate
form, this coloring matter.

Let the coagulum of blood, well drained upon
a hair-sieve, be digested in four times its weight
of sulphuric acid, diluted with a double propor-
tion of water, at the temperature of 160° of
Fahrenheit for five or six hours. Filter the
liquor while yet hot, and wash the residuum with
a quantity of hot water, equal in weight to the
acid which has been employed. Concentrate
the liquor to half its bulk; then add pure ammo-
nia till there remain only a slight excess of acid.
After having agitated the liquor allow it to stand,
and a purple sediment will be deposited. This
sediment is to be washed with distilled water till
the washings cease to precipitate the nitrate of
baryte. It may then be drained on filtering
paper, and dried at a very gentle heat.

The serum or watery portion of the blood is
differently stated, as to its composition, by dif-
ferent chemists; and it is probable that much
variation actually takes place according to the
different circumstances of the individual from
whom it has been taken. Its specific gravity is
about 1.030. When exposed to heat it is con-
verted into coagulated albumen, from which, by
pressure, a small quantity of a saline liquor may
be made to ooze, which is distinctly called the
serosity of the blood. This last consists, accord-
ing to Berzelius, of water, of soda holding albu-
men in solution, of muriates of soda and potash,
of acetate of soda, and an animal matter always
accompanying the last ingredient, forming, toge-
ther, the muco-extractive matter of Marcet. Dr.

Bostock and Marcet could discover no albumen in the serosity of the blood, but only the mucro-extractive or uncoagulable matter just mentioned.

Serum, evaporated by a heat below that which coagulates it, yields a semi-transparent substance resembling amber, the insoluble part of which is albuminous; and it is important to observe that the mineral acids, in their action upon serum, produce insoluble compounds, which resemble fibrin treated in the same way. Hence it has been inferred, that albumen and fibrin are nearly one and the same principle. Upon the whole, we may, perhaps, receive the following analysis of Berzelius as presenting a pretty correct account of the contents of the serum generally; it differs very little from one given by Dr. Marcet.

Water	905.0
Albumen	80.0
Muriate of potash and soda	6.0
Lactate of soda with animal matter (the mucro-extractive matter of Marcet).	4.0
Soda and phosphate of soda with do.	4.1
Loss	0.9
	<hr/>
	1000.0

While the solid part consists of the coloring matter and fibrin, and albumen in the proportions, according to Berzelius, of sixty-four of the former to thirty-six of the latter in 100. The coloring matter yielding by incineration the following residue:—

Oxide of iron	50.0
Sulphosphate of ditto	7.5
Phosphate of lime with magnesia.	6.0
Lime	20.0
Carbonic acid and loss	16.5
	<hr/>
	100.0

It is thought by Berzelius that the coloring matter rather contains the bases of these substances than the substances themselves; and the same products may be obtained, he says, by incineration from the mere albuminous portion of the crassamentum, with the exception of iron; a result which still leads this last chemist to infer that a ferruginous principle has to do with the impartation of color; an effect which, according to him, 'though not depending on the presence merely of an oxide of iron, may be produced by a compound of which that oxide is an essential part.'

It has been well observed by Magendie, in his recently published *Elements of Physiology*, that 'the respective relations in the quantity of serum and cruor, coloring matter and fibrin, are variable according to an infinity of circumstances; and this variability ought ever to be taken into account when experiments are instituted either upon the whole mass of blood or on its separate parts.

The fluidity of the blood while circulating, and its coagulation when separated from its appropriate vessels, have constituted a subject of physiological speculation and enquiry. It was natural to suppose that the constant motion

which circulation implies caused this homogeneous and fluid condition, but that this is not at any rate a full explanation of the fact is proved by isolating a portion of the vascular system from the general mass; by thus causing the blood in the vessel so isolated, to be at rest; which, notwithstanding this quietude, maintains for a length of time the character and appearance of circulating fluid; while, on the other hand, coagulation takes place in blood separated from its vessels, even though the mass be agitated during the process of extravasation.

The phenomenon, then, is to be explained by, or rather referred to, vital action, and not to motion abstractedly; we say referred to, inasmuch as the announcement of a law must always be regarded as a different thing from the physical explanation of a fact. John Hunter overlooked this distinction, and thus fell into error when he assumed the vitality of the blood, and talked of the stimulus of necessity: all his positions and reasonings on this head, however ingenious and plausible, being reducible to the truism that the blood coagulates because it must coagulate.

In a fluid of such importance as the blood, it will readily be inferred that many material changes are constantly going on, both of a physical and chemical kind, so as to modify constitutional temperaments, regulate the condition of health, and influence morbid affections; these changes, however, have not hitherto been ascertained with any thing like a precision sufficient to authorise inferences as to the connexion of such and such variations with such and such maladies. Indeed the seemingly innocuous nature of the blood, while the frame is under the influence of the most noxious poisons, is a striking fact in the animal economy. It has, for example, been ascertained that the flesh, and, a fortiori, the blood, of an animal that is laboring under hydrophobia, and which animal, by its saliva, is capable of inoculating another with the specific disease, may be eaten with impunity.

Again, puncture the veins of an individual who is the subject of small-pox, take blood from that subject and mix it with the blood of another, you will not by this process impart the sickness; an impartation which every one knows to be effected with facility by a very minute portion of the matter taken from the pustules that characterise the disorder.

In conformity with the same principle, it is found that the blood of a patient, laboring under diabetes, does not yield the saccharine principle to the chemical experimenter, notwithstanding that the very essence of this distemper consists in the copious separation of sugar from the blood by the action of the kidneys. But, for further information on these interesting points, and for the modifications of which the facts are susceptible, we must refer the reader to the several articles of *MEDICINE, PHYSIOLOGY, PATHOLOGY, and SECRETION*. Under the words *RESPIRATION* and *PERSPIRATION* we shall likewise have to consider the color and temperature of the blood, in their connexion with exterior and interior circumstance.

We shall conclude the present article by remarking that there have been very different estimates

formed with respect to the average quantity of blood contained in the body. Some have calculated it at 100 pounds, while others have rated it so low as thirty. From this last to forty, or a little more, the average may, perhaps, be correctly taken of the quantity of blood contained in the human system at the adult period. Man, it is said, has a considerably larger proportion of blood, relatively to his size and weight, than the inferior animals.

BLOOD, IN DIET. As a species of food, it has been disputed whether blood really affords any nourishment or not. The best judges, however, are now generally agreed that it is nutritious; and though out of the body, like the white of an egg, it is very insoluble, yet, like that too in the body it is commonly of easy digestion. It is, however, highly alkaline in hot climates; on which account alone the prohibition of it to the Israelites was very proper. Even in this country, when blood was used as food in great quantity, the scurvy was more frequent than at other times. In some countries we are told of barbarians who were accustomed to intoxicate themselves by drinking the warm blood of animals.

The eating of blood was prohibited to Noah, Gen. ix. 3, 4, and to the Jews, Lev. xvii. 10—14. In the latter instance principally, it has been said, with a view to its use in sacrifices, or as a token of respect to the altar, at which the blood of every victim was presented before God. Indeed this is expressly stated to be the reason on one occasion. The prohibition was repeated by the apostles at the council of Jerusalem, Acts xv. and confirmed and defended, we are told, by all the fathers, except St. Augustin; the universal practice both of the eastern and western churches being to avoid the eating of it till his time. In many churches, even of the west, this was the case much longer. The question is, whether the apostolic precept to abstain from blood, was only a temporary deference to the weakness of the Jewish converts, or a perpetual precept founded on moral principles, and consequently still obligatory? The former opinion is that of the majority of modern critics, though the advocates for the latter urge, that blood was prohibited with the original grant of animal food to man; that the prohibition is joined with that of fornication, which is an immorality; and that nothing like an express repeal of the apostolic decision can be found.

Two respectable controversialists upon another subject, the Rev. R. Hall of Bristol, and Rev. Jos. Kinghorn of Norwich, have lately taken the opposite sides of this question also. Mr. Hall says of the insinuation respecting abstaining from blood: 'I have not the smallest doubt that it is of perpetual force, however little it may be regarded in modern practice. The precept was invariably observed by the faithful from the time of Noah; it resulted from the solemn and unanimous decision of the apostles, and is of more ancient origin than any other Christian institute.' Reply to the Rev. Jos. Kinghorn, in vindication of the practice of Free Communion, pp. 50, 51. Mr. Kinghorn quotes the learned Spencer as expressing his opinion that the Gentile Christians

are required to abstain from pollutions of idols, and from fornication, and from things strangled, and from blood, because they were the causes, the attendants, and the signs of idolatry.' He considers the Noahic precept, after Geddes and other Hebrew critics, as intended to forbid 'eating the flesh with the blood of the animal while alive,' or before the creature was properly slain. He then alleges the express permission of the law (Deut. xiv. 21.) for Gentiles to eat of any thing that died of itself, i. e. with the blood in it, as a proof that there could be no immorality in the practice. It would certainly seem clear, according to this, that the Ethiopian eunuch, or any other Gentile Christian, might have innocently eaten of such food, if so disposed, before the decision of the apostolic council.

BLOOD, USES OF, IN RELIGION. The blood of victims was anciently the portion of the gods; and accordingly was poured or sprinkled on the altar in oblation to them. The priests made another use of blood, viz. for divination. The streaming of blood from the earth, fire, and the like, was held a prodigy or omen of evil. The Roman priests were not unacquainted with the use of blood in miracles; they had the fluxes of blood from images, ready to serve a turn; witness that said to have streamed from the statue of Minerva at Modena, before the battle at that place. But we know not whether in this their successors have not gone beyond them. How many relations in ecclesiastical writers of Madonnas, crucifixes, and wafers, bleeding! The liquefaction of the blood of St. Januarius at Naples, repeated annually for so many ages, seems to transcend, by far all the frauds of the Grecian or Roman priesthood. But the chemists at last divulged the secret; and M. Neuman at Berlin, performed the miracle of the liquefaction of dried blood, with all the circumstances of the Neapolitan miracle. We shall not occupy our pages with the profuse fables of the Franciscans and Dominicans, respecting our Saviour's blood. But Matt. Paris assures us, that Henry II. summoned his nobles and prelates to celebrate the feast of St. Edward in St. Peter's church, chiefly pro veneratione sancti sanguinis Christi nuper adepti, 'in veneration of the holy blood of Christ lately acquired.' And various other British monasteries pretended to be possessed of this profitable relic.

BLOOD, in farriery, denotes a distemper in the back of a horse, which makes him in going draw his head aside, or after him; the cure is by slitting the length of two joints under the tail, and thus letting the beast bleed plentifully.

BLOOD, in law, is distinguished, as either half, or whole blood. 1. Half blood is applied to persons descended from one common ancestor, either on the father's or mother's side, by two different marriages. 2. Whole blood is a person descended from the same couple of ancestors.

BLOOD (Thomas), commonly called colonel Blood: was a disbanded officer of Oliver Cromwell's, who first distinguished himself by engaging in a conspiracy to surprise the castle of Dublin; which was defeated by the vigilance of the duke of Ormond. Escaping to England, he meditated revenge against that nobleman, and

actually seized him one night in his coach in St. James's-street, and bound him on horseback behind one of his associates, resolving to hang him at Tyburn, with a paper pinned to his breast; but when they reached the fields, the duke threw himself and the assassin, to whom he was fastened, to the ground; and while they were struggling, he was rescued by his servants. The authors of this attempt were not, however, then discovered. After living a considerable time among the malcontents in Ireland, and afterwards in Holland, he returned to England, with recommendations to the republican party; went to Scotland, where he contributed much to the breaking out of the insurrection; and was present in the action of Pentland Hills on the 27th of November, 1666. He returned to England, where he rescued his friend Captain Mason from a party of soldiers, who were conducting him to his trial. In 1671 Blood formed a design of carrying off the crown and regalia from the tower; and was very near succeeding. He had bound and wounded Edwards, the keeper of the jewel office, and had actually left the tower with his prey; but was overtaken and seized, with some of his associates. When questioned, he frankly avowed the enterprize; but refused to discover his accomplices. 'The fear of death, he said, should never engage him either to deny a guilt, or betray a friend.' These extraordinary circumstances made him the general subject of conversation; and King Charles II. was moved with an idle curiosity to see and speak with a person so noted for his courage and his crimes. Blood wanted not address to improve this opportunity of obtaining a pardon. He told the king that he had been engaged, with others, in a design to kill him with a carbine above Battersea, where his majesty often went to bathe; but that when he had taken his stand among the reeds for that purpose, he found his heart checked with an awe of majesty; and he not only relented himself, but diverted his associates from their purpose. That he had long ago brought himself to an entire indifference about life, which he now considered lost; but that his associates had bound themselves by the strictest oaths to revenge the death of any of their confederacy; and that no precaution nor power could secure any one from the effects of their resolutions. Whether these considerations excited fear or admiration in the king, Blood secured his object—a pardon; and Charles is said to have carried his kindness still farther, and to have granted him an estate of £500 a year in Ireland. He even encouraged his attendance about his person, and while old Edwards, who had bravely ventured his life, and had been wounded in defending the crown and regalia, was forgotten and neglected, this man, who deserved to be hanged, became a kind of favorite. Blood enjoyed his pension about ten years, when being charged with fixing a scandalous imputation on the duke of Buckingham, he was again thrown into prison; yet, though the damages were laid at £10,000, this adventurer found bail. He died, however, soon after, on the 24th of August, 1680.

BLOOD, FIELD OF. See ACELDAMA.

BLOOD-HOUND, in zoology, the canis sagax of

Linnaeus (see CANIS), le chien courant of Buffon, the slow hound of the Scots. The hound or dog, with long, smooth, and pendulous ears. • It was a dog of great use, and in high esteem with our ancestors; and was employed to recover any game that had escaped wounded from the hunter, or been killed and stolen out of the forest. It was remarkable for the acuteness of its smell, tracing the lost beast by the blood it had spilt; whence the name is derived. This species could, with the utmost certainty, discover the thief by following his footsteps, let the distance of his flight be ever so great, and through the most secret and thickest coverts: nor would it cease its pursuit till it had taken the felon. They were likewise used by Wallace and Bruce during the civil wars. The poetical historians of the two heroes frequently relate very curious passages on this subject; of the service these dogs were to their masters, and the escapes they had from those of the enemy. The blood-hound was in great request on the confines of England and Scotland; where the borderers were continually preying on the herds and flocks of their neighbours. The true kind was large, strong, muscular, broad-breasted, of a stern countenance, of a deep tan-color, and generally marked with a black spot above each eye.

BLOOD-LETTING, the operation of bleeding, or letting blood. Under this term is comprehended every artificial discharge of blood made with a view to cure or prevent a disease. Blood-letting is divided into general and topical. As examples of the former, venæsection and arteriotomy may be mentioned; and of the latter, the application of leeches, cupping-glasses, and scarification.

BLOOD-RED HEAT, the last degree of heat given by smiths to iron in the forge.

BLOOD-RUNNING ITCH, in farriery, a disease in a horse, proceeding from an inflammation of the blood by over heating, hard riding, or other severe labor; which, getting between the skin and flesh, makes the beast rub and bite himself; and, if not cured, sometimes turns to a highly infectious mange.

BLOOD, SALAMANDER'S, the redness remaining in the receiver, after distilling the spirit of nitre.

BLOOD, SATYRIUM, a ruddy liquor produced from the roots of satyrium, baked with bread, and liquefied, as it were, into blood, by a long digestion.

BLOOD-SHOT. See OPHTHALMIA.

BLOOD-SNAKE, the English name of the hæmorrhus.

BLOOD-SPAVIN. See FARRIERY.

BLOOD, SPITTING OF, or hæmoptoe. See MEDICINE.

BLOOD-STONE. See HELIOTROPE.

BLOOD-VESELS. See ANATOMY.

BLOODY FLUX. See MEDICINE.

BLOOM, v. & n. } Germ. *blume*; Dutch, *bloem*; Goth. *bloma*; Ang., *bloom'ing*, }
Sax. *blosm*, *blosmian*

Skinner thinks from *blæn*, to swell; to break out, as the flower which precedes the fruit. Wachter, from *blazen*, to blow; to breathe out odors. Somner gives *blotsmian*, to germinate;

to flourish; that is to bud; to blossom; to bear flowers. *Ency. Met.* Bloom carries with it the idea of freshness as well as fragrance; whatever has the bloom upon it, is in its loveliest, freshest state; pure; untouched; untainted: thus it is applied, figuratively, to youth in its vigor; to beauty in its prime; to intellectual and moral excellencies in their state of unsophisticated maturity.

The rod of Aaron for the house of Levi was budded, and brought forth buds, and *bloomed* blossoms, and yielded almonds. *Numbers xvii. 8.*

Rites and customs, now superstitious, when the strength of virtuous, devout, or charitable affection *bloomed* them, no man could justly have condemned as evil. *Hooker.*

It is a common experience, that if you do not pull off some blossoms the first time a tree *bloometh*, it will blossom itself to death. *Bacon's Nat. Hist.*

How nature paints her colours, how the bee Sits on her *bloom*, extracting liquid sweet. *Milton.*

O nightingale! that on yon *bloomy* spray Warblest at eve, when all the woods are still *Id.*

Beauty, like the fair Hesperian tree Laden with *blooming* gold, had need the guard Of dragon-watch with unenchanted eye, To save her blossoms and defend her fruit From the rash hand of bold incontinence. *Id. Comus.*

Departing spring could only stay to shed Her *bloomy* beauties on the genial bed, But left the manly summer in her stead. *Dryden.*

Were I no queen, did you my beauty weigh, My youth in *bloom*, your age in its decay. *Id. Aurengzebe.*

The *bloom* of opening flowers, unsullied beauty, Softness, and sweetest innocence she wears And looks like nature in the world's first spring. *Rowe's Tamerlaine.*

Oh she is all perfection! All that the *blooming* earth can send forth fair; All that the gaudy heavens could drop down glorious. *Lee's Theodosius.*

Hear how the birds, on every *bloomy* spray, With joyous musick wake the dawning day. *Pope.*

Pleasures arc like poppies spread, You seize the flower, its *bloom* is shed. *Burns.*

One spot exists—which ever *blooms*, Even in that deadly grove. *Byron. Bride of Abydos.*

Bloom, in the iron-works, has yet to undergo many hammerings before it become iron fit for the smith's use, and be made what they call the ancony. See ANCONY.

Bloom, HALF, a round mass of metal, which comes out of the finery of an iron work.

BLOOMFIELD (Robert), an English poet, was born in 1766, at Honington, near Bury St. Edmund's, in Suffolk, where his father was a tailor; and his mother, who became a widow shortly after our poet's birth, kept a village school. Being taught to read by her, at the age of eleven he was taken into the employ of his uncle, a farmer, and engaged for a year or two in the labors of husbandry; after this, the delicacy of his constitution induced his elder brother, who was a shoemaker in London, to bring him to the metropolis, and teach him that trade, at which he worked for several years. Being fond of reading books of amusement, and especially poetry, he at an early age began to exercise his

talents in making verses, some of which he sent to the newspapers. At length he produced a poem of considerable extent, entitled, 'The Farmer's Boy,' describing the occupations of the husbandman through the four seasons of the year. This piece was shown in manuscript to booksellers and others, from whom it attracted little attention, till it fell into the hands of Capel Lofft, Esq., of Troston, near Bury, who, on perusal, was so much struck with its beauties, that he immediately corrected and prepared it for the press, and shortly after published it with notes, and a prefatory account of the author, from which the preceding facts are derived. Both the poem and the poet now became the objects of general curiosity and applause. His book passed through many editions in a short time, and Messrs. Vernon and Hood, by whom it was published, acted with considerable liberality to the author. The duke of Grafton became his patron, and bestowed on him a small annuity, and appointed him under-sealer in the seal-office; but this situation he was forced to resign on account of ill health. He then again worked at his trade as a shoemaker, and employed himself in constructing Æolian harps. He also published *Wild Flowers*, and two or three other volumes of poetry, which must have added to his emoluments; but engaging in the book-trade, he became a bankrupt; and to add to his difficulties, in the latter part of his life, he was afflicted with violent head-aches, and became nearly blind. At length he left the metropolis, and went to Shefford in Bedfordshire, for the benefit of his health. He, however, was gradually reduced to such a state of nervous irritability, that apprehensions were entertained of his becoming insane. His death took place August 19th 1823. His last production, *Hazlewood-Hall*, a Village Drama, appeared shortly before his decease. But his literary reputation will always rest principally on his first work, which, under the disadvantageous circumstances of its composition, must be considered an extraordinary performance.

BLOOT (Peter), a Flemish painter, whose works are seldom seen in Britain: nor are they easily purchased abroad, being highly esteemed and carefully preserved in private collections. His subjects were boors drinking, feasting, dancing, &c. He died in 1667.

BLORE, *n. s.* from blow. Act of blowing; blast: an expressive word, but not used.

Out rushed, with an unmeasured roar, Those two winds, tumbling clouds in heaps; ushers to either's *blow*. *Chapman's Iliad.*

BLOSSOM, *v. & n.* } See BLOOM. To put BLOSSOMED, } forth flowers; to have BLOSSOMY. } the hue, the sweetness, the freshness of flowers newly blown. We generally call those flowers blossoms, which are not much regarded in themselves, but as a token of some following production.

Although the fig-tree shall not *blossom*, neither shall fruit be in the vines, yet will I rejoice in the Lord. *Habb. iii. 17.*

Lo how the trees grenyth that naked wer, and nothing Bare this month afore; but their sommer clothing

Lo how Nature maketh for them everichone !
And as many as ther be he forgetteih none !
Lo how the season of the yere and Averell shoures,
Doeth the bushin burgyn out blossoms and floures.
Chaucer. Canterbury Tales.

Long worke it were
Here to account the endlesse progeny
Of all the weeds that bud and blossom there.
Spenser.

The blossom which my braunch of youth did beare
With breathed sighes is blown away and blasted. *Id.*

This is the state of man : to-day he puts forth
The tender leaves of hope ; to-morrow blossoms,
And bears his blushing honours thick upon him.
Shakespeare. Henry VIII.

Cold news for me :
Thus are my blossoms blasted in the bud,
And caterpillars eat my leaves away.
Id. Henry IV.

The pulling off many of the blossoms of a fruit tree,
doth make the fruit fairer. *Bacon's Natural History.*

To his green years your censure you would suit,
Not blast the blossom, but expect the fruit. *Dryden.*

It called Narcissa long before her hour ;
It called her, tender soul, by break of bliss,
From the first blossom,—from the buds of joy ;
Those few our noxious fate unblasted leaves
In this inclement cline of human life. *Young.*

BLOT, *v. & n.* } *Fr. blottir* ; *Ang.-Sax. be-*
BLOT'ING. } *hlidan*. Be-hlot is the regu-
lar past tense and past participle ; hence our
English blot, which is literally to cover. Tooke
observes, and the Metropolitana after him, that
'a blot upon any thing extends just so far as
that thing is covered, and no farther' To render
illegible by covering. It is figuratively used
to express any mark of disgrace, any stigma that
may be fixed upon a particular action, or a ge-
neral character.

A lie is a foul blot in a man ; yet it is continually
in the mouth of the untaught. *Ecl. xx. 24.*

And sad repentance used to embay
His body in salt water smarting sore,
The filthy blotches of sin to wash away. *Spenser.*

Amongst all knights he blotted was with blame,
And counted but a recreant knight with endless
shame. *Id.*

What foul disgrace is this
To so faire ladie, as ye seeme in sight,
To blot your beautie, that unblemisht is,
With so foule blame as breach of faith once plight,
Or change of love for any world's delight. *Id.*

Make known,
It is no vicious blot, murder, or foulness,
That hath deprived me. *Shakespeare. King Lear.*

You that are king
Have caused him, by new act of parliament,
To blot out me, and put his own son in.
Id. Henry VI.

Unknit that threatening unkind brow ;
It blots thy beauty, as frost bites the meads,
Confounds thy fame. *Id. Taming of the Shrew.*

I remember, the players have often mentioned it
as an honour to Shakespeare, that in his writing
(whatsoever he penned) he never blotted a line. My
answer hath been, would he had blotted a thousand.
Ben Jonson.

Powers that erst in heaven sat on thrones ;
Though of their names in heavenly records now
Be no memorial, blotted out and rased
By their rebellion from the books of life. *Milton.*

He sung how earth blots the moon's gilded wane,
Whilst foolish men beat sounding brass in vaine.
Cowley.

Let flames on your unlucky papers prey,
Your wars, your loves, your praises, be forgot,
And make of all an universal blot.
Dryden. Juvenal.

O Bertram, oh no more my foe, but brother !
One act like this blots out a thousand crimes.
Dryden.

My guilt thy growing virtues did defame ;
My blackness blotted thy unblemished name.
Id. Æneid.

These simple ideas, offered to the mind, the under-
standing can no more refuse, nor alter, nor blot out,
than a mirror can refuse, alter, or obliterate, the
images which the objects produce. *Locke.*

For mercy's sake restrain thy hand,
Blot not thy innocence with guiltless blood.
Rowe.

For thee I would my dearest friend resign,
And from my heart blot every name but thine. *Id.*
Even copious Dryden wanted, or forgot,
The last and greatest art, the art to blot. *Pope.*

A man of the most understanding will find it im-
possible to make the best use of it, while he writes in
constraint, perpetually softening, correcting, or blotting
out expressions. *Swift.*

A disappointed hope, a blot of honour, a stain of
conscience, an unfortunate love, will serve the turn.
Temple.

BLOTCH, *v. & n.* From the *Ang.-Sax.*
blodig, that is, bloody ; for instance, a bloody
tumor : or from blase, a blaze, which it resem-
bles in its fiery appearance, and its burning heat.
Skinner, as quoted by the Metropolitana.

The one might be employed in healing those
blotches and tumours which break out in the body,
while the other is sweetening the blood and rectifying
the constitution. *Spectator.*

Spots and blotches, of several colours and figures,
straggling over the body ; some are red, others yell-
ow, or black. *Harey.*

To BLOTE, *v. a.* To smoke, or dry by the
smoke ; as bloted herrings, or red herrings.

BLOTED CHINA-WARE, a sort of china,
loaded with color in an irregular manner. This
pleases some, but it is a defective sort of ware,
the large blotches of colors having been only
laid on to cover the blemishes of the first baking.

BLOTELING, or BLOOTELING (*Abraham*), a
designer and engraver of Amsterdam, flourished
about 1670. From the style of his etchings,
which have great merit, he is supposed to have
frequented the school of the *Visschers*.

BLOUNT (Sir Henry), an English writer,
born at Tittenhanger, in Hertfordshire, in 1602.
After a regular education, he set out on his tra-
vels in 1634 ; and, becoming acquainted with a
janissary at Venice, accompanied him into the
Turkish dominions. Having been abroad two
years, he returned and published a relation of his
travels in the Levant, which went through se-
veral editions. He was knighted by Charles I.
and was at the battle of Edge-hill ; but after the
king's death was employed by the parliament
and by Cromwell. After the Restoration he
was high sheriff of Hertfordshire. He published,
1. An account of his Travels. 2. Six Comedies
written by John Lilly, under the title of Court
Comedies. 3. The Exchange Walk, a satire ;

and 4. An Epistle in praise of Tobacco He died October 9th 1682.

BLOUNT (Sir Thomas Pope), Bart., eldest son of Sir Henry, was born at Upper Holloway, in Middlesex, September 12th 1649. He distinguished himself as a lover of liberty, a sincere friend to his country, and a true patron of learning. He was made a baronet by Charles II., in whose reign he represented St Alban's in two parliaments, and was knight of the shire in three parliaments after the Revolution. He wrote in Latin, 1. A Critique on the most celebrated Writers. 2. Essays on several subjects. 3. A Natural History, extracted out of the best modern writers. He died June 30th 1697, in the forty-eighth year of his age.

BLOUNT (Charles), younger brother of Sir Thomas, wrote *Anima Mundi*; or, An Historical Narration of the Opinions of the Ancients, concerning Man's Soul after this Life, according to unenlightened Nature, which gave great offence, and was complained of to the bishop of London. But the work which rendered him most known, was, his translation of Philostratus's *Life of Apollonius Tyanæus*, published in 1680; which was soon suppressed. He published another work of the same kind the same year, called *Great is Diana of the Ephesians*, &c. in which, under color of exposing superstition, he struck at revelation. In 1684 he printed *An Introduction to Polite Literature*. In the warmth of his zeal for the Revolution, he wrote a pamphlet to prove king William and queen Mary conquerors; which was condemned to be burnt by both houses of parliament. The close of his life was very unhappy. After the death of his wife, he became enamoured of her sister, whose only objection was their prior connexion by marriage; yet the lady agreed to abide by the decision of competent divines: on which he stated a case as that of a third person, with great learning and address; but the archbishop of Canterbury and other divines decided against him. He shot himself in 1693.

BLOUNT (Thomas), a learned English barrister, of the seventeenth century, born at Bordesley in Worcestershire, had not an university education; but by strength of genius and great application wrote, 1. *The Academy of Eloquence*, or *Complete English Rhetoric*, 12mo. 1654, often reprinted. 2. *Glossographia*, or a Dictionary of Hard Words, 8vo. London, 1656, of which there were at least five editions. 3. *The Lamps of the Law*, and *the Lights of the Gospel*, 8vo. *ibid.* 1658. 4. *Boscobel*, the first part in 1660, the second in 1681. 5. *A Law Dictionary*, fol. *ibid.* 1671. 6. *Fragmenta Antiquitatis*, or *Ancient Tenures of Land*, &c. 8vo. 1679 and 1784, which has been lately reprinted in 4to. 7. *A Catalogue of the Catholics who lost their Lives in the King's Cause*, during the Civil War, printed at the end of lord Castlemain's Catholic Apology. 8. *A Pedigree of the Blounts*, printed in the *Complete Gentleman*, 1661. He died in 1679.

BLOUNTSVILLE, a post town of the United States, in North Carolina. It is thirty miles S.S.E. of Halifax, and 413 from Philadelphia.

BLOW', *v.* } Ang.-Sax. *blawan*, to cast
BLOW'ER, } forth; to send out air, with vio-
BLOW'ING, } lence, and noise; when natural
BLOW'S. } breathing is accelerated, it becomes puffing and blowing; when the air is stirred beyond the zephyr which plays with the summer beam it becomes wind; and we say the wind blows. To blow always implies effort; the *Metropolitana* says excess. Query?

The priests shall blow with the trumpet. *Joshua*.
When ye blow an alarm, then the camps that lie on the east parts shall go forward. *Numbers*.

Blow the trumpet among the nations. *Jeremiah*.
I have created the smith that bloweth the coals.

Isaiah.

A fire not blown shall consume him. *Job*

At his sight the mountains are shaken, and at his will the south wind bloweth. *Eccles. xliii. 16*.

His sea horses did seeme to snort amayne,
And from their nosethrilles blow the brynie stream,
That made the sparkling waves to smoke agayne
And flame with gold; but the white fomy creame
Did shine with silver and shoot forth his beame.

Spenser.

Here's Mrs. Page at the door, sweating and blowing, and looking wildly. *Shakspeare*.

Rather at Nilus' mud

Lay me stark naked, and let the water-flies

Blow me into abhorring. *Id.*

When icicles hang by the wall,

And Dick the shepherd blows his nail,

And Tom bears logs into the hall,

And milk comes frozen home in pail. *Id.*

A plague of sighing and grief! it blows a man up like a bladder. *Id.*

Your breath first kindled the dead coal of war,

And brought in matter that should feed this fire.

And now 'tis far too huge to be blown out

With that same weak wind which enkindles it. *Id.*

No blown ambition doth our arms incite,

But love, dear love, and our aged father's right.

Id. King Lear.

Blow winds and crack your cheeks! rage! blow!

You cataracts, and hurricanoes, spout

Till you have drenched our steeples, drowned the cocks! *Id.*

All the sparks of virtue, which nature had kindled in them, were so blown to give forth their uttermost heat, that justly it may be affirmed, they inflamed the affections of all that knew them. *Sidney*.

Where the bright Seraphim in burning row,

Their loud uplifted angel trumpets blow. *Milton*.

His praise, ye winds, that from four quarters blow

Breathe soft or loud; and wave your tops ye pines,
With every plant in sign of worship wave. *Id.*

What if the breath that kindled those grim fires,

Awaked should blow them into sevenfold rage,
And plunge us into flame. *Id.*

Fair daughter, blow away those mists and clouds,

And let thy eyes shine forth in their full lustre.

Denham.

These primitive heirs of the Christian church could not so easily blow off the doctrine of passive obedience.

South.

Says the satyr, if you have gotten a trick of blowing hot and cold out of the same mouth, I've e'en done with ye. *L'Estrange*.

It blew a terrible tempest at sea once, and there was one seaman praying. *Id.*

If it blows a happy gale, we must set up all our sails; though it sometimes happens that our natural heat is more powerful than our care and correctness.

Dryden.

Their chief *blown* up in air, and waves expired,
To which his pride presumed to give the law. *Id.*

The trumpets sleep, while cheerful horns are *blown*,
And arms employed on birds and beasts alone.

Pope.

On the next day, some of the enemy's magazines
blew up; and it was thought they were destroyed on
purpose by some of their men. *Tatler.*

Ye too, ye winds! that now begin to *blow*

With boisterous sweep, I raise my voice to you.

Thomson's Seasons.

BLOW', *v. & n.* } Ang.-Sax. blowan, to blow.
BLOW'ING, *n.* } To bloom, blossom, or bear
BLOW'ERS. } flowers; to bud; to burgeon;
to spring; to flourish.—*Summer.*

The first age was by ancient historians called
Golden; ambition and covetousness being as then
but green, and newly grown up, the seeds and ef-
fects whereof were as yet but potential, and in the
blowth and bud. *Raleigh.*

Tulips are generally divided into three classes, ac-
cording to their seasons of flowering. But there is
no occasion for making any more distinctions than
two, viz. early and late *blowers*. *Miller.*

We lose the prime to mark how spring
Our tender plants, how *blows* the citron grove,
What drops the myrrh, and what the balmy reed.

Milton.

This royal fair
Shall, when the blossom of her beauty's *blown*,
See her great brother on the British throne.

Waller.

Fair is the king-cup that in meadow *blows*;
Fair is the daisy that beside her grows. *Gay.*

For thee Idume's spicy forests *blow*,
And seeds of gold in Ophir's mountains glow.

Pope.

For me, when I forget the daring theme,
Whether the blossom *blows*, the Summer ray
Russets the plain, inspiring Autumn gleams,
Or Winter rises in the blackening East,
Be my tongue mute, may Fancy paint no more,
And, dead to joy, my heart forget to beat. *Thomson.*

No flowers embalmed the air, but one white rose,
Which on the tenth of June by instinct *blows*,
By instinct *blows* at morn, and, when the shades
Of drizzly eve prevail, by instinct fades.

Churchill. The Prophecy of Famine.

BLOW', } Dutch *blowce*. The act of
BLOW'GEVER, } striking; a stroke; a sudden,
impetuous, injurious, assault; a hit, a knock, a
stroke; figuratively, any calamity that comes in a
moment; any act of hostility: a sudden event;
the stroke of the king of terrors; death.

The tyrant thundered his thicke *blowes* so fast,
That through the yron walls their way they rent,
And even to the vitall parts they past,
Ne ought could they endure, but all they cleft or brast. *Id.*

Our Lord Jesus might bothe have destroyed the
wicked byshop, and also have letted this *blowgeuer*.

Udall. John, chap. xxviii.

A most poor man, made tame to fortune's *blows*,
Who by the art of known and feeling sorrows
Am pregnant to good pity. *Id. King Lear.*

Be most abated captives to some nation
Than won you without *blows*. *Shakspeare.*

A woman's tongue,
That gives not half so great a *blow* to the ear,
As will a chestnut. *Id. Taming of the Shrew.*

But to turn tail, or run away,
And without *blows* give up the day,
Or to surrender ere the assault,
That's no man's fortune, but his fault.

Butler's Hudibras.

Assuage your thirst of blood, and strike the *blow*.

Dryden.

Every year they gain a victory, and a town; but
if they are once defeated they lose a province at a
blow. *Id.*

Unarmed if I should go,
What hope of mercy from this dreadful foe,
But woman-like to fall, and fall without a *blow*? *Pope.*

Words of great contempt commonly finding a re-
turn of equal scorn, blows were fastened upon the
most pragmatical of the crew. *Clarendon.*

To all but thee in fits he seemed to go,
And it was my ministry to deal the *blow*. *Parnell.*

Such dire achievements sings the bard that tells
Of pulfrey'd dames, bold knights, and magic spells—
Where whole brigades one champion's arms o'er-
throw,

And cleave a giant at a random *blow*;
Slay paynims vile that force the fair, and tame
The goblin's fury and the dragon's flame. *Tieckell.*

But first, ere came the rallying host to *blows*,
And rank to rank, and hand to hand oppose,
Gulnare and all her haram handmaids freed,
Safe in the dome of one who held their creed,
By Conrad's mandate safely were bestowed,
And dried those tears for life and fame that flowed.

Byron's Corsair.

Blow, in fencing, differs from a thrust, as the
former is given by striking, the latter by pushing.

Blow, in law. See BATTERY.

BLOW, MILITARY, that given with a sword on
the neck or shoulder of a candidate for knight-
hood, in the ceremony of dubbing him. It
seems to have taken its rise from the ancient ce-
remony of manumission. In giving the blow,
the prince used the formula, *Esto bonus miles*,
'Be a valiant soldier'; upon which the party
rose a complete knight, and qualified to bear
arms in his own right.

BLOW (Dr. John), a musician and composer,
was a native of Collingham in Nottinghamshire.
Upon the death of Purcell, in 1695, he became
organist of Westminster Abbey, and in 1699
composer to the king. Blow was a composer of
anthems while a chapel-boy, and distinguished
by Charles II. for his merit. He composed at
that early period that beautiful song, 'Go per-
jured man.' He set to music an ode for St. Ce-
cilia's day in 1684, the words by Mr. Oldham,
published with one of Purcell. He also pub-
lished a work entitled *Amphion Anglicus*, in
1700, in imitation of Purcell's *Orpheus Britan-
nicus*, and containing compositions for one, two,
three, and four voices, with a thorough bass for
the organ, harpsichord, &c. He likewise pub-
lished a collection of lessons for the harpsichord,
and Dryden's ode on the death of Purcell.
There are also extant of his composition various
hymns printed in the *Harmonia Sacra*, and a
great number of catches. He died in 1708.

BLOWING, a ceremony in the ancient admi-
nistration of baptism, whereby the catechumen,
upon rehearsing the renunciation, blew three
blasts with his mouth, to signify that he rejected
the devil. Something like this is still retained

in the Russian church. The priest who administers baptism, is enjoined to blow thrice on the child's face, making the sign of the cross and pronouncing the words, *exi ab eo Satan*.

BLOWING, in gardening, the action of flowers, whereby they open and display their leaves. The regular blowing season is in the spring; though some plants have other extraordinary times and manners of blowing, as the Glastonbury thorn. Some flowers also, as the tulip, close every evening, and blow again in the morning. Annual plants blow sooner or later, as their seeds are put into the ground; whence the curious in gardening sow some every month in summer, and have a constant succession of flowers. The blowing of roses may be retarded by shearing of the buds as they expand.

BLOWING OF FIRE-ARMS, is when the vent or touch-hole is run or gullied, and becomes wide, so that the powder will flame out.

BLOWING OF GLASS, one of the methods of forming various kinds of works in the glass manufacture. It is performed by dipping the point of an iron blowing-pipe into melted glass, and blowing through it with the mouth, according to the circumstances of the glass to be blown. See GLASS.

BLOWING OF TIN, denotes the melting of its ore, after being first burnt, to destroy its mundic.

BLOWING MACHINES, in the arts and manufactures, are improved bellows or instruments for producing the strongest continued current of air, for a given purpose, or for facilitating the combustion of fuel, and the production of heat.

For the common bellows which bears the greatest resemblance to lungs, see BELLOWS. It was a very early contrivance for artificial blowing. The blast, however, in this machine, is not continuous, but in puffs; or at intervals of time required for the air to enter through the valve; the blowing interval being as the areas of the apertures to the filling interval. This was for some time attempted to be remedied by employing two bellows which blew alternately, the blowing of one taking place while the other was filling. To this succeeded the invention of what are called double bellows, which was a valuable acquisition in the art of blowing. We have only to take a third board exactly of the shape of the two belonging to the single bellows, and connect it with the lower board by a piece of leather similar to that of the single bellows, making two cavities exactly similar, and separated by the lower board of the single bellows, which now becomes the middle board of the double. The third board we shall now call the lower board. This latter has a valve in it exactly similar to the first, which still retains its place in the new construction. The middle board is now fixed in a horizontal position, the pipe being placed to the fire to be blown. The lower board is held down by a weight, which keeps the lower cavity constantly full of air, and the top board has a weight laid upon it which presses all the air out of the upper cavity through the pipe. The requisite action by which the blowing is performed, is, first, to lift up the lower board. This forces the air from the lower into the upper cavity, the valve in the middle

board preventing its return. The weight on the upper board now presses the air with a uniform blast through the pipe. During this time the lower board descends, which fills the lower cavity with air from the atmosphere. This again rises, and gives its contents to the upper cavity, and thence through the nose-pipe. Hence we see that irregular puffing blast, which belongs to the single bellows, is here confined to the lower board only, which supplies air to the upper cavity, while the upper board is constantly pressing uniformly upon the air in it. But this does not completely obviate the irregularity of the blast. So long as the lower board is not in action, the pressure of the upper board being uniform, the blast is the same. Every time, however, the bottom board rises to force the air into the upper cavity, an extra pressure is given to the air in the upper cavity, and a temporary puff is produced. In the application of bellows to the smith's forge, the continued blast was of less importance than in the blast-furnaces applied to the smelting or refining of ores. The single bellows are at present almost exclusively employed by anchor-smiths and cutlers, while the blacksmith and most others use double bellows, which are doubtless better.

In France and on the Continent, where bellows have been wholly formed of wood, instead of the flexible sides of leather, they consist of two boxes, each open on one side, and the one being just capable of containing the other. The outer box being placed with the mouth upwards, the other is made to descend into it, with the mouth downwards; the latter being capable of moving up and down, while the other remained fixed. In the bottom of the fixed box is a valve like the common bellows, and a pipe on the same level, to let out the blast. The change of capacity, by the motion of this box, causes the blast, and with less waste of power than that occasioned by the bending of the leather in the common bellows.

A machine of this kind appears in our plate **BLOWING MACHINES**, figs. 1, 2, 3. A B C P E F, fig. 1, is a wooden box, which has its top and two sides flat or straight, and the end, B A E, formed into an arched or cylindrical surface, of which the line F P at the other end is the axis. This box is open below, and receives within it the shallow box K H G M, &c. fig. 2, which exactly fills it. The line F P of the one coincides with F P of the other, and along these lines is a set of hinges, on which the upper box turns as it rises and sinks; the lower box is made fast to a frame sunk in the ground. A pipe or tube, Q Q, proceeds from the end of it and terminates at the furnace, where it ends in a small pipe called a tuyere. This lower box is open above, and has in its bottom two large valves, V V, opening inwards. The conducting pipe is also sometimes furnished with a valve opening outwards, to prevent burning coals from being sucked into the bellows when the upper box is drawn up. The joint along P F is made tight by thin leather nailed along it. The sides and ends of the fixed box are made to fit the sides and curved end of the upper box, so that this last can be raised and lowered round the joint

F P without sensible friction; and yet without suffering much air to escape; but as this would not be sufficiently air tight, by reason of the shrinking and warping of the wood, a farther contrivance is had recourse to. A slender lath of wood divided into several joints, and covered on the outer edge by soft leather, is laid along the upper edges of the sides and ends of the lower box. This lath is so broad that when its inner edge is even with the inside of the box, its outer edge projects about an inch. It is kept in this position by a number of steel wires, which are driven into the bottom of the box and stand up touching the sides. By these means the laths are pressed close to the sides, and curved end of the movable box, and the spring wires yield to all their inequalities. A bar of wood, R S, is fixed to the upper board, by which it is either raised by machinery, to sink again by its own weight (having an additional load laid on it), or it is forced down by a crank or wiper of the machinery, and afterwards raised by the same. The operation here is precisely the same as in the common household bellows. When the board is lifted up, the air enters by the valves V V, fig. 3, and is afterwards expelled at the pipe Q Q. These machines, used in the larger metallurgic operations of mining countries, and throughout the continent, are sometimes of very great size, and are made capable of expelling ninety cubic feet of air at one stroke, repeated eight times in a minute.

English blowing machines have been chiefly improved by means of a piston and cylinder, the latter commonly of iron, but sometimes composed of wood on the plan of coopers' work. The piston is surrounded with a broad strap of thick soft leather, and stuffed similarly to that of the steam engine. The cylinder is furnished with one or more large valves in the side or bottom, by which the air enters when the piston is drawn upwards, and is expelled of course when it goes down: this action driving it along a large pipe which terminates in a small orifice connected with the furnace, and sometimes with a wind cellar or reservoir of air, which supplies forges, &c. by means of a cock. The piston in these cases is raised by water or other works; and sometimes two or more are working at a time to ensure a uniform blast.

The blowing machine of Chastillon consists of two cylinders, A, B, fig. 4, loaded with weights, which are suspended from the two extremities of a lever, or beam, moving about a central fulcrum E. From the top of each there is a large flexible pipe, which are both united in H, whence a pipe I I T leads to the tuyere. There are valves at G and H opening upwards, into the flexible pipes; and other valves, L, M, adjoining to them, in the top of each cylinder, opening inwards, but kept shut by a slight spring. Motion is given to the lever by a machine, which may of course have water, wind, or steam, for its impelling agent. The operation of this engine is evident: when the cylinder A is descending, the water entering at its bottom compresses the air, and forces it along the pipe F I I K T. In the mean time the cylinder B is rising, the air finding an entrance through the valve M: having reached the top, it begins to descend, and the other to ascend, and thus the

blast is rendered nearly continuous, but certainly not so equable as is desirable in most cases. An improvement upon this construction has been introduced at the Patent Iron Cable Manufactory of Messrs. Brunton and Co. Commercial Road; where, instead of the flexible pipe K H T, a pipe is standing up a little above the surface of the water under each cylinder; through which the air is made to pass by the compression caused by the descent of each cylinder; the air also passing into a general reservoir or wind chest, is kept constantly under a given pressure and led to any required point. The lever to which the cylinders are suspended, is attached immediately to the beam of a small steam engine applied wholly to this purpose, and thus the utmost uniformity of action is secured. Each of these is, in fact, a species of hydraulic bellows. The extensive use of coal in smelting iron, first rendered it necessary in this country to construct durable machines, capable of affording a powerful and constant blast. The first cylinders of magnitude used as blowing machines were erected by Mr. John Smeaton, in 1760, at the Carron Iron Works. The pumps were wrought alternately by a water wheel, having four cranks upon its axis, each of which moved the piston of a cylinder, which had a stroke of four feet six inches; the diameter of each cylinder being also four feet six inches. Where a fall of water could not be obtained, steam engines were employed to work the pumps. A water regulator has been introduced of late years, connected with a double acting blowing cylinder, wrought by a steam engine.

A machine of this kind, of large dimensions, is represented in fig. 5. It is wrought by a steam engine of thirty-five horse power, with a steam cylinder of thirty-three inches diameter, acting with a seven feet stroke. On the opposite end of the beam from the steam cylinder is jointed the rod D, which is turned exceedingly true, so as to move through the stuffing box without allowing any air to escape, and without any unnecessary friction. A quantity of hemp is placed round the rod in the box *aa*, which forms part of the lid of the cylinder, and is held tight by the iron nuts *b, b*. The piston is fitted to the lower end of the rod D, and is packed with leather so as to fill exactly the internal diameter of the cylinder A A. To this cylinder are fixed four necks, B, F, G, H; two of which, B, F, contain the suction valves, by which the air enters the cylinder, while the other two contain the forcing valves, through which the air is expelled at every elevation and depression of the piston into the chambers I, K, and through the pipes L, M, into the regulating receiver O P, which is of the form of a parallelepipedon, or an inverted box without the lid, and is immersed in a cistern R S, filled with water. Let us suppose that the piston is at the bottom of the cylinder A A, and begins to be raised by the engine. The air above the piston will obviously be condensed, and forcing open the hanging valves in the neck G, will rush through them into the pipe L, and thence into the receiver O P. While the piston thus rises and condenses the air above it, there is a vacuum below the piston, and the external air rushes through the valves in the neck F, and fills the space below the piston. When the piston descends

Fig. 2.

Fig. 3.

Fig. 4.

Fig. 6.

Fig. 5.

BLOWING MACHINE.

Fig. 1.

Fig. 3.

Fig. 4.

Fig. 2.

from the top to the bottom of the cylinder, the air below it is condensed, and forced through the valves in the neck H into the pipe L, and thence into the receiver OP, while the space above the piston is a vacuum, and is instantly filled by the rush of the external air through the valves in the neck B. This operation is repeated at every stroke of the engine; the cylinder full of air, which is inhaled at the necks B and F, being forced through the opposite necks G and H. When the piston reaches the top or bottom of the cylinder, there would evidently be a short cessation in the blast of air that passes into the furnace, were it not for the regulating receiver OP. When the air is forced into this receiver, the water within it is pushed out or displaced, and rises in the cistern, so that the surface of the water in the cistern is often six, seven, or eight feet higher than the surface of the water in the receiver. The air in the receiver, therefore, is pressed upwards by a column of water, six, seven, or eight feet high, so that if there should be any intermission in the supply of air from the cylinder, the blast will be kept up by the extrusion of the air in the receiver. The receiver OP, as shown in the figure, is composed of a great number of cast iron plates, united by screws and flanches. Its size in the drawing is purposely diminished, in order to comprise it within the limits of the plate. The general size is forty feet in length, twelve feet in depth, and twelve feet in breadth. The water cistern is then forty-seven feet long, fourteen feet deep, and nineteen feet broad. The receiver is supported upon blocks of wood and masonry; its lower edge being two feet from the floor of the cistern, to allow a free passage for the water. The buoyancy of the receiver is overcome by a great quantity of masonry placed upon the top of it; but we have omitted this in the figure, for the purpose of showing the manner of uniting the plates of which it is composed.

A valve, loaded with a weight, is placed at T in the horizontal pipe. The weight is sufficient to keep the valve shut when the engine works with a proper velocity; but when it works too hard, the excess of air will escape through the valve. When this happens, the velocity of the engine must be diminished.

The horizontal pipe NM, after bending downwards, is divided into two branches X, Y, which, by a series of pipes, convey the air round the furnace, so as to introduce the blast at opposite sides of the hearth; a practice which is now pretty generally followed.

The cylinder AA is made of cast iron, with a flanch at each end. The upper necks G, B, are cast in the same piece with it, but the lower ones, H, F, are screwed to the under flanch of the cylinder. The valves within the necks B and F open inwards. They are made of leather, covered with plates of iron, and are screwed, by a projecting part of the leather, against the external plate, *a*, of the chamber, so as to cover three corresponding apertures in the plate (see fig. 2), *x*, *y*, which is screwed to the neck by a number of bolts, shown in the figure. This plate is removed when the valves require any material repairs; but any trifling adjustments may be made, by

the workman's thrusting his hand through one of the valves to repair the adjacent one. The plates which carry the valves in the chambers I, K, are not movable; but apertures are left above to give access to the valves. These apertures, when the engine is at work, are covered by the lids *h*, *h*, which are fixed down by screws at each end.

The piston is rendered air-tight by means of a ring of leather screwed on the upper and one on the under side of the piston, which, in consequence of their elasticity, press gently against the inside of the cylinder. In order to renew these rings when worn out, there is a hole in the lid, and another in the bottom of the cylinder, sufficient to admit a man for that purpose. In some cases a movable lid in the piston.

The cylinder is held down by four large bolts, two of which are seen in the figure at *d*, *d*, passing through a massive pier of brickwork or masonry, sufficiently stable to keep the cylinder steadily in its place. The cistern RS is placed at a much greater distance from the cylinder than is represented in the figure, lest the tremulous motion produced by the violent concussion of the included air should make the cistern leak. An accident of this nature ought to be carefully prevented; as the water which escapes may insinuate itself into the sand of the casting-house, and occasion the most perilous explosions, when the hot metal is introduced into the moulds.

The internal diameter of the cylinder AA is five feet two inches, and the stroke seven feet. It is capable of blowing one furnace, when working at the rate of six strokes per minute.

But the blowing machine lately erected at the smithery in his Majesty's dock-yard, Woolwich, is perhaps the most powerful and most complete in the kingdom. It is equal to the supply of air for forty forge fires, amongst which are those for forging anchors, iron knees, and other heavy smithery works. It is represented in our plate II. BLOWING MACHINE; fig. 1, being a perspective view of the engine, and figs. 2, 3, and 4, elevations and sections of the blowing cylinders. The part seen in fig. 1, is only that which appears above the level of the floor. The other part is below, and may be seen in figs. 2, 3, and 4. The length of the cylinders is five feet five inches, of which two feet four inches appear above the floor; the interior diameter of each cylinder is four feet eight inches, and the length of the stroke is also four feet eight inches; which is repeated in each of the three cylinders A, B, C, twenty times per minute, which corresponds to an expulsion of nearly 5000 cubic feet of air per minute. The fourth cylinder, D, is used only to regulate the pressure, as will be explained below.

The motion communicated to the piston rods is so contrived, that while one piston rod is at its highest point, another is half way down, or up, and the other quite down. A large iron wind-chest, twenty-two feet five inches in length, is placed on proper stone supports or pillars in the cellar below, and upon this are fixed the four cylinders A, B, C, D, the latter being open to the chest at its bottom, but the others are closed. From this chest, under the cylinder C, proceeds the main eduction pipe, shown in the elevations, figs. 3 and 4, and from this branch pipes proceed

to the several forges, each pipe near the forge being furnished with a cock, so that the blast may be turned off or on at pleasure.

In fig. 3 will be seen a short cylinder behind the eduction pipe, in which is a valve shown more particularly in fig. 2, where the section is made to pass through the axis both of the valve cylinder and blowing cylinder; the former elevation being at right angles to the principal axis of the machine, and that in fig. 4, parallel to the same, neither of which therefore embrace the valve cylinder, which is placed somewhat on one side.

On the principal axis, fig. 1, are seen three eccentric wheels, furnished with iron straps, fig. 3, which are connected with the lever under the wind chest, seen in fig. 3, at E: and these wheels are so arranged, in respect to the corresponding crank, that when the piston of any cylinder is either above or below, the lever, fig. 3, is horizontal, and the valve *a* then exactly closes the hole *h*, fig. 2. When the piston in this figure begins to ascend; the end, E, of the lever, fig. 3, continues to ascend also, and the other end, F, descends, and being connected with the valve rod at G, fig. 2, this also descends, and thereby opens a communication between the interior of the cylinder and the atmosphere, which former thus receives a fresh supply of air. This valve continues to descend till the piston is half way up; it then begins to ascend till the piston is at its highest point, when the valve has again exactly the position shown in the figure. The piston now descends, but the valve rod still continues to ascend, and thereby opens a communication between the cylinder and wind chest, into which latter the air is forced by the action of the piston. When this latter is half way down, the valve rod has reached its highest point, and then continues to descend with the piston till the latter is down, when the hole *h* is again covered with the valve, and the whole is situated as at first, to have the process again repeated as above described. By these means the cylinders are successively opened to the atmosphere, and then to the wind chest, and a constant influx of air is produced. To preserve a steady action in the valve rods, they are made to pass through guards level with the floor, as shown in figs. 1 and 2. The cylinder, D, has no bottom, being open to the wind-chest, and its piston, which weighs 700 lbs. serves only to regulate the pressure, which amounts to about one-fourth lb. per square inch. When the pressure exceeds this, the piston rises and opens a safety valve connected with this cylinder at the back, not seen in our drawing, but the operation of which will be easily conceived. The form of the bottom of the cylinder, shown in fig. 2, is peculiar only to that particular section, the other part of the bottom is perfectly flat, its purpose is to furnish a communication with the valve cylinder.

BLOWING SNAKE, in zoology, a name given in Virginia to a species of serpent, resembling the European viper, but considerably larger, and remarkable for inflating and extending the surface of its head before it bites. Its wound is fatal.

BLOW-PIPE, the blow-pipe has become in

chemistry, mineralogy, &c. so extremely useful an instrument, as to form an essential article in the laboratory. It is employed to raise an intense heat by the flame of a lamp or candle, and operates by rapidly and strongly throwing a current of air through the flame, against the object to be heated. The blow-pipe is capable of heating a small object in a manner that would be difficult to heat a large quantity of the same substance in the most powerful furnaces; with this advantage also that the process is much more under the inspection of the operator. We refer to **LABORATORY** for an account of the more scientific inventions and improvements of this kind.

The blow-pipe of artificers, consists of a conical metal tube, regularly tapering from the size convenient to be held in the mouth to that of a small pin: The small end is bent with a regular curvature, so as to be nearly at right angles to the main tube. This pipe being held in the mouth, and a regular stream of air discharged through it into the flame of a candle, the flame is projected sideways into a long conical spiracle of fire, which is of a blue color at its root, or the part where it joins the flame; farther on it is of a yellow cast, growing more and more faint towards the extreme point. The object to be heated is held so that the flame strikes upon it; or, if it is large, it should be placed upon a piece of charcoal, which reverberates the flame forcibly on all sides of the object, and at the same time maintains the heat by its own combustion. This instrument is very effective in the hands of a skilful operator. 'There is an artifice, says Dr. Ure in the blowing through this pipe, which is more difficult to describe than to acquire. The effect intended to be produced is a continual stream of air for many minutes, if necessary, without ceasing. This is done by applying the tongue to the roof of the mouth, so as to interrupt the communication between the mouth and the passage of the nostrils; by which means the operator is at liberty to breathe through the nostrils, at the same time that by the muscles of the lips he forces a continual stream of air from the anterior part of the mouth through the blow-pipe. When the mouth begins to be empty, it is replenished by the lungs in an instant, while the tongue is withdrawn from the roof of the mouth, and replaced again in the same manner as in pronouncing the monosyllable *tut*. In this way the stream may be continued for a long time without any fatigue, if the flame be not urged too impetuously, and even in this case no other fatigue is felt than that of the muscles of the lips. A wax candle, of a moderate size, but thicker wick than they are usually made with, is the most convenient for occasional experiments; but a tallow candle will do very well. The candle should be snuffed rather short, and the wick turned on one side toward the object, so that a part of it should lie horizontally. The stream of air must be blown along this horizontal part, as near as may be without striking the wick. If the flame be ragged and irregular, it is a proof that the hole is not round and smooth; and if the flame have a cavity through it, the aperture of the pipe is too large. When the

hole is of a proper figure, and duly proportioned, the flame consists of a neat luminous blue cone, surrounded by another flame of a more faint and indistinct appearance. The strongest heat is at the point of the inner flame.'

BLOW-PIPE, in anatomy, is a straight hollow brass tube, of an elongated conical form, about six inches in length, and open at both ends. The large end is three-tenths of an inch in diameter, the smaller is of the size of a needle's point. It is used for blowing air into the collapsed vessels of a dead subject, in order to ascertain the course of them.

BLOWZE, } One who by exposure to
BLOW'ZED, } wind and weather has a ruddy
BLOW'ZY, } and coarse complexion; an appearance of boisterous health; unfeminine.

I had rather marry a fair one, and put it to the hazard, than be troubled with a blowze; but do thou as thou wilt, I speake only of myselfe.

Burton. *Anat. of Mel.*

I protest I do not like to see my daughters trudging up to their pews all *blowzed* and red with walking, and looking for all the world as if they had been winners of a smock race.

Goldsmith.

BLUB', } From *bleb*; Germ. *blaen*.
BLUB'BER, v. & n. } to inflate; to swell; to
BLUBBER'ING. } tumify. To blubber is to indulge in unseemly violent weeping, so as to distend the cheeks and inflame the eyes; the precise idea is distension.

Fair streams represent unto me my *blubbered* face; let tears procure your stay.

Sidney.

The wild wood gods, arrived in the place,
There find the virgin doleful, desolate,
With ruffled raiment, and fair *blubbered* face,
As her outrageous foe had left her late.

Faerie Queene.

Even so lies she

Blubbering and weeping, weeping and *blubbering*.

Shakspeare. *Romeo and Juliet.*

A thief came to a boy that was *blubbering* by the side of a well and asked what he cried for.

L'Estrange.

Soon as Glumdalclitch missed her pleasing care,
She wept, she *blubbered*, and she tore her hair.

Swift.

Thou sing with him, thou hooby! never pipe
Was so profaned, to touch that *blubbered* lip.

Dryden.

Tired with the search, not finding what she seeks,
With cruel blows she pounds her *blubbered* cheeks.

Id.

Dear Chloe how *blubbered* is that pretty face,
Thy cheek all on fire, and thy hair all uncured,
Pri'thee quit this caprice; and (as old Falstaff says)
Let us e'en talk a little like folks of this world.

Prior.

The maudling hero, like a puling boy
Robbed of his play-thing, on the plains of Troy,
Had never *blubbered* at Patroclus' tomb.

Churchill.

BLUBBER is the fat of whales and other large sea animals, whereof train oil is made. It is properly the adeps of the animal: it lies immediately under the skin, and over the muscular flesh. In the porpoise, it is firm and full of fibres, and invests the body about an inch thick. In the whale its thickness is ordinarily six inches; but, about the under lip, it is two or three feet thick. The whole quantity yielded by one of these animals ordinarily amounts to forty or fifty, sometimes eighty hundred weight, or even more.

BLUBBER, SEA. See *MEDUSA* and *URTICA*.

BLUCHER (Gebhard Lebrecht Von), a celebrated Prussian general, was born at Rostock, in 1742. At the age of fourteen he entered the Swedish service, but being taken prisoner he transferred his services to Prussia. After the seven years' war he resigned his commission in disgust, and devoted himself to agriculture, but was recalled to his old regiment as major, by William II. and fought at the head of it till the battle of Leystadt, September 18th 1794, when he was made major-general. In 1806 he took possession of Erfurt and Muhlhausen, and after the battle of Jena made an extraordinary retreat through Lubeck, by which he drew the French across the Oder. On the taking of Lubeck he was obliged to capitulate, but was soon exchanged for marshal Victor. He was now employed in the war department, till the renewal of hostilities against France in 1813, when he displayed the utmost activity and courage for the deliverance of Europe. At Lutzen the order of St. George was given to him by the emperor Alexander, and on the 26th of August he defeated Macdonald at Katsbach. The glorious victory of Leipzig was in a great degree owing to his exertions; and he pursued the flying enemy across the Rhine with such celerity as to be called by the Russians 'Marshal Forwards.' After the battle of Montmartre, on the 31st of March, he would have severely retaliated the wrongs of Berlin upon Paris, had he not been restrained by the allied sovereigns, whom he accompanied to England, and was received with enthusiasm. His military glory attained its height at the battle of Waterloo. In a preceding engagement he had been defeated, his horse shot under him, and a whole regiment had charged and been repulsed over his person. After this great victory, to which he contributed by bringing up the Prussian forces towards the close of the battle, he was created prince of Wahlstadt, and received several additional orders of knighthood. Falling ill at Kriblowitz in 1819, the king of Prussia visited him repeatedly during his last sickness, which carried him off on the 12th of September in that year.

BLUE', } Sax. *blæo*; Fr. *bleu*. One
BLUE'LY, } of the seven original colors.
BLUE'NESS, } So says Johnson; but he
BLU'ISH, } attempts not either the ety-
BLUISH'NESS, } mology or the definition.
BLU'EYED, } It seems to be derived from
BLUE'HAired, } the Ang.-Sax. *bleo*, to
BLUE'SWOLLEN, } blow; on which the writer
BLUE'VEINED. } in the *Encyclopædia* *Metropolitana* has ventured a very ingenious, and as it should seem satisfactory conjecture:—

'may not the blue, formerly blew sky, be the blew-en, or blown skye,—the sky from which the clouds are blown, dispersed. Vossius derives *cæruleus* from *cælum*. As other colors take their name from that by which they are produced, may not blue, the color of the clear sky after wind, derive its name from this circumstance.' The blowing color; the color exposed to view by the dispersion of the clouds; the blew-en, or blown sky.

Happily I him spide,
Where in a bush he did him hide,
With wings of purple and blew.

Spenser. Shepherd's Calendar.

The *bleu* in black, the green in gray is tinct. *Id.*

There is gold, and here

My *bluest* veins to kiss ; a hand that kings
Have lipt and trembled kissing. *Shakespeare.*

Where fires thou findest unranked, and hearths un-
sweet,

There pinch the maids as *blue* as bilberry. *Id.*

O coward conscience how dost thou afflict me !

The lights burn *blue*. Is it not dead midnight ? *Id.*

Cold fearful drops stand on my trembling flesh.

Side sleeves and skirts, round underborne with a
bluish tinsel. *Id.*

These *blue-reined* violets whereon we lean,
Never can blab, nor know they what we mean. *Id.*

Why else this double object in our sight
Of flight pursued in the air, and over the ground,
One way the self-same hour ? why in the east
Darkness ere day's mid course, and morning light
More orient in yon western cloud, that draws
O'er the *blue* firmament a radiant white,
And slow descends, with something heavenly fraught ?

Milton. Paradise Lost.

This isle,

The greatest and the best of all the main,
He quarters to his *blue-haired* deities. *Id. Comus.*

In a moment our liquor may be deprived of its
blueness, and restored to it again by the affusion of a
few drops of liquor. *Boyle on Colours.*

At last, as far as I could cast my eyes
Upon the sea, somewhat, methought, did rise
Like *bluish* mists. *Dryden.*

Nor to the temple was she gone, to move
With prayers the *blue-eyed* progeny of Jove. *Id.*

Why does one climate and one soil endure
The blushing poppy with a crimson hue,
Yet leave the lilly pale, and tinge the violet *blue* ?

Prior.

There was scarce any other colour sensible besides
red and *blue* ; only the *blues*, and principally the se-
cond *blue*, inclined a little to green. *Newton.*

This esquire he dropped his pen full soon,
While as the light burnt *bluely*. *Swift.*

Rise, then, fair *blue-eyed* maid, rise and discover
Thy silver brow, and meet thy golden lover.

Crashaw.

I could make, with crude copper, a solution with-
out the *bluishness* that is wont to accompany its vulgar
solutions. *Boyle.*

Here, in full light, the russet plains extend ;
There, wrapt in clouds, the *bluish* hills ascend. *Pope.*

Deep in the grove, beneath the secret shade,
A various wreath of odorous flowers she made ;
Gay motleyed pinks and sweet jonquils she chose,
The violet *blue*, that on the moss-bank grows ;
All sweet to sense, the flaunting rose was there :
The finished chaplet well adorned her hair.

Collins' Eclogues.

In vain she [Circassia] boasts her fairiest of the
fair,

Their eyes' *blue* languish, and their golden hair ;
Their eyes, in tears, their fruitless grief must send ;
Those hairs, the Tartar's cruel hand shall rend. *Id.*

Long Pity let the nations view

The sky-worn robes of tenderest *blue*,
And eyes of dewy light. *Id. Ode to Pity.*

Look, how he laughs, and stretches out his arm,
And opens wide his *blue* eyes upon thine
To hail his father ; while his little form
Flutters, as winged with joy. *Byron.*

BLUE is one of the seven colors into which the
rays of light divide when refracted through a glass
prism. For an account of the particular struc-
ture of bodies by which they appear of a blue
color, see CHROMATICS.

BLUE ASHES, *Cendre blue*, Fr. by corruption,
Saunders blue, much used in water-colors ; but
in oil they grow greenish, being of the nature of
verdigris. They are found in the form of a soft
stone, in places where there are copper mines,
and water only is used in levigating them, to re-
duce them to a fine powder. This kind of blue
ought to be used in works to be seen by candle
light, as in scene painting ; for though a great
deal of white is mixed with it, it appears very
beautiful, notwithstanding it has a greenish cast.

BLUE-BOTTLE, *n. s.* cyanus ; from blue
and bottle ; a flower of the bell-shape ; a species
of bottleflower ; a fly with a large blue belly.

If you put *bluebottles*, or other blue flowers, into an
ant-hill, they will be stained with red : because the
ants thrust their stings, and instil into them their
stinging liquor. *Ray.*

Say, sire of insects, mighty Sol,

A fly upon the chariot pole

Cries out, What *bluebottle* alive

Did ever with such fury drive ? *Prior.*

BLUE CAP, an English name for a peculiar
species of fish of the salmon kind, distinguished
by a broad blue spot on the head, whence
they have their name. These seem not to breed
with us ; but appear in our rivers only at certain
seasons, when there have been violent north
winds. This fish is seldom found single ; so
that the fishermen rejoice at their taking one of
them, as they expect a large shoal of them at hand.

BLUE HILLS, a range of mountains in New
England, whose first ridge in New Hampshire
passes through Rochester, Barrington, and Not-
tingham.

BLUE JAPAN.—Take gum-water, and white
lead, a sufficient quantity ; grind them well upon
porphyry : then take isinglass size, and the finest
and best smalt, sufficient quantities : mix them
well, and add, of the white-lead, before ground,
so much as may give it a sufficient body. Mix
all these together to the consistence of a paint.

BLUE MOUNTAINS, a range of mountains in
the island of New Holland, north-west of the
British settlement at Port Jackson. 2. A chain
of mountains longitudinally intersecting the
island of Java. 3. A range of mountains in
Northampton county, Pennsylvania, which extend
from south-west to north-east, and a short way
across the Delaware. 4. A range of mountains
which run from south-east to north-west, through
Surrey county, in the island of Jamaica.

BLUE RIDGE, the easternmost ridge of the Al-
legany mountains, in Pennsylvania and Virginia,
about 130 miles from the Atlantic, and rising to
the height of 4000 feet above the level of the
sea ; thickly covered with large trees to the very
summit. Some of the mountains are rugged and
stony ; in others the soil is found to be rich and
fertile. See ALLEGANY.

BLUE, LACMUS or LITMUS. This is a beautiful
blue, made of lacmus in the following manner :
Take an ounce of lacmus, and boil it in a pint
of small beer wort, till the color is as strong as

you would have it; then pour off the liquor into a gallipot, and let it cool for use.

BLUE, PRUSSIAN, is considerably in use among painters, though inferior to the ultramarine blue. The following process for making the finest sort of Prussian blue with quicklime, is given in the History of the Academy of Sciences at Paris for the year 1756:—

Take 3lbs. of ox's blood, dried and reduced into a kind of small scales, an equal quantity of quicklime newly baked, 2lbs. of red tartar, and 1lb. 8oz. of saltpetre; pulverise the whole grossly and put it into a crucible, placed in the midst of a great furnace, and give it a gradual fire. After four hours, when the matter is reduced into a kind of paste which emits no more smoke, and is equally red, throw it by spoonfuls into two pails of boiling water; and, having filtrated the lixivium, mix it with a solution of 6lbs. of alum, and 1lb. 8oz. of green vitriol. This operation will yield but 7oz. of fecula; but its beauty will make sufficient amends for the small quantity.

BLUE, SAXON, a dye made by dissolving indigo in oil of vitriol, by which the indigo becomes of a much more lively color.

BLUE STONE, or POWDER, used in washing of linen, is the same with smalt, either in the lump or powdered. When the smalt is taken from the pot, it is thrown into a large vessel of cold water: this makes it more tractable, and easily powdered.

BLUE, ULTRAMARINE (beyond sea), from its being first brought into Europe out of India and Persia; one of the richest and most valuable colors used in painting, is prepared from lapis lazuli, by first calcining the stone in an iron pot; then grinding it very fine on porphyry; mixing it up with a paste made of wax, pitch, mastich, turpentine, and oil; and at last washing the paste well in clear water, to separate the coloring part from the rest, which precipitates to the bottom, in form of a subtle, beautiful, blue powder. The water is then poured off, and the powder dried in the sun.

BLUFF, } Bluntless; coarseness;
BLUFFNESS, } roughness of manner.

Like those whom stature did to crowns prefer,
Black-browed and *bluff*, like Homer's Jupiter. *Dryden*.

BLUFF-HEADED, among sailors is applied to a ship that has an upright stern.

BLUING, the act or art of communicating a blue color to bodies otherwise destitute thereof. Laundresses blue their linen with smalt; dyers their stuffs and wools with woad or indigo.

BLUING OF IRON, a method of beautifying that metal sometimes practised; for mourning buckles, swords, and the like. The manner is this: Take a piece of grind-stone or whet-stone, and rub hard on the work, to take off the black scurf from it: then heat it in the fire; and as it grows hot, the color changes by degrees, coming first to light, then to a darker gold color, and lastly to a blue. Sometimes also they grind indigo and sallad-oil together; and rub the mixture on the work with a woollen rag, while it is heating, leaving it to cool of itself.

BLUNDER, v. & n. } Dutch, *blunderer*;
BLUNDERER, } perhaps, says Dr.
BLUNDERINGLY, } Johnson, from blind.
BLUNDERHEAD. } The blind miss their

way; stumble; mistake; and were not their infirmity known, would thus expose themselves to contempt. To blunder is to act in the common affairs of life, as a stranger to a country would act in the dark, and as a blind man conducts himself without a guide; a blunderer is one who betrays great want, or obliquity of understanding, by the silly and barefaced mistakes into which he is constantly falling; a blunderer is a fool of the stupid class.

We *blunder*, ever, and poren in the fire;
And for all that, we faille of our desire.

Chaucer. Cant. Tales.

At the rate of this thick-skulled *blunderhead*, every plow-jobber shall take upon him to read upon divinity.

L'Estrange.

The grandees and giants in knowledge, who laughed at all besides themselves as barbarous and insignificant, yet *blundered* and stumbled about their principal concern.

South.

He seems to understand no difference between titles of respect and acts of worship; between expressions of esteem and devotion; between religious and civil worship: for he *blunders* and confounds all these together; and whatever proves one, he thinks proves all the rest.

Stillingfleet.

He who now to sense, now nonsense leaning,
Means not, but *blunders* round about a meaning. *Pope.*

Another sort of judges will decide in favour of an author, or will pronounce him a mere *blunderer*, according to the company they have kept.

Watts.

But how shall I thy endless virtues tell
In which thou dost all other books excel?
No greasy thumbs thy spotless leaf can soil,
Nor crooked dog's-ears thy smooth corners spoil;
In idle pages no errata stand,
To tell the *blunders* of the printer's hand. *Tickell*

He ne'er suspects his want of skill,
But *blunders* on from ill to ill;
And, when he fails of all intent,
Blames only unforeseen event.

Gay's Fables.

What *blundering* puppies are mankind,
In every science always blind. *Id.*

BLUNDERBUSS, n. s. from blunder. A gun that is charged with many bullets, so that, without any exact aim, there is a chance of hitting the mark.

There are *blunderbusses* in every loop-hole, that go off of their own accord at the squeaking of a fiddle.

Dryden.

BLUNDERBUSS, a well-known fire-arm, consisting of a wide, short bore, capable of holding a number of musket-shot or slugs; doing great execution in a crowd.

BLUNT, v. & adj. } The past participle
BLUNTING, } of the Ang-Sax. blinnan, to blin; to stop.
BLUNTISHNESS, } See Tooke. To stop in
BLUNTNESS, } its progress towards a
BLUNTLY, } point or edge; to dull;
BLUNTPOINTE, } to deaden; to render
BLUNTWITTED, } obtuse. Thus it is opposed to whatever is sharp or pointed; smooth, and delicate; when applied to the understanding it indicates dullness, approaching to stupidity; and to manners uncouth; incivility, and abruptness.

If the iron be *blunt*, and he do not wet the edge, then must he put to more strength. *Eccles.*

For weak was my remembrance it to hold,
And bad her tongue that it so *bluntly* told. *Spenser.*

Thanks to that beauty, which can give an edge to the *bluntest* swords. *Sidney.*

His silence grew wit, his *bluntness* integrity, his
beastly ignorance virtuous simplicity. *Id.*

Valentine being gone, I will quickly cross,
By some sly trick, *blunt* Thurio's dull proceeding. *Shakspeare.*

Blunt not his love;
Nor lose the good advantage of his grace
By seeming cold. *Id.*

I can keep honest counsels, mar a curious tale in
telling it, and deliver a plain message *bluntly*. *Id.*
Blunt witte'd lord, ignoble in demeanour. *Id.*

To use too many circumstances, ere one come to
the matter, is wearisome; to use none at all is *blunt*.
Bacon.

Whitehead, a grave divine, was of a *blunt* stoical
nature. One day the queen happened to say, I like
thee the better, because thou livest unmarried. He
answered, Madam, I like you the worse. *Id.*

A man of honest blood,
Who to his wife, before the time assigned
For childbirth came, thus *bluntly* spoke his mind.
Dryden.

So sick'n waning moons too near the sun,
And *blunt* their crescents on the edge of day. *Id.*
Earthy limbs and gross alloy
Blunt not the beams of heaven, and edge of day. *Id.*

He had such things to urge against our marriage,
As, now declared, would *blunt* my sword in battle
And dastardize my courage. *Id.*

Manage dispute with civility; whence some readers
will be assisted to discern a difference betwixt *blunt-*
ness of speech and strength of reason. *Boyle.*

The crafty boy, that had full oft essayed
To pierce my stubborn and resisting breast,
But still the *bluntness* of his darts betrayed. *Suckling.*

The mayor of the town came to seize them in a
blunt manner, alleging a warrant to stop them.
Wotton.

'Tis not enough your counsel still be true:
Blunt truths more mischief than nice falsehoods do.
Pope.

And sorely would the Gallic foeman rue
If subtle poniards, wrapt beneath the cloke,
Could *blunt* the sabre's edge, or clear the cannon's
smoke. *Byron.*

BLUR', *v. & n.* Probably from the Dutch,
blare, a pustule; or blain. or spot: to blur is
to blot; partially to deface; to sully; to stain;
to smear; to disfigure.

Such an act,
That *blurs* the grace and blush of modesty,
Calls virtue hypocrite. *Shakspeare.*

Long is it since I saw him;
But time hath nothing *blurred* those lines of favour,
Which then he wore. *Id.*

Man, once fallen, was nothing but a great *blur*; a
total universal pollution. *South.*

Sarcasms may eclipse thine own,
But cannot *blur* my lost renown. *Hudibras.*

Concerning innate principles, I desire these men to
say, whether they can, or cannot, by education and
custom, be *blurred* and blotted out? *Locke.*

BLURT'. Probably from *blur*, to throw out
hastily: in a bad sense, to cast a reproach in-
considerately and without reflection. But it is
used indifferently for whatever bolts out of the
lips, and is said without consideration.

That name to which every knee bows, both of
things in heaven, and things on earth, and things
under the earth, whether they be angels or devils, re-
quires from you more respect and honour, than to be

idly *blurted* out with every rash and foolish expres-
sion. *Hopkms.*

And yet the truth may lose its grace,
If *blurted* to a person's face;
Especially if what you speak,
Should crimson o'er the glowing cheek. *Lloyd.*

Others cast out bloody and deadly speeches at ran-
dom; and cannot hold, but *blurt* out those words
which afterwards they are forced to eat. *Hakewell.*

They had some belief of a Deity, which they, upon
surprisa! thus *blurt* out. *Government of the Tongue.*

They blush if they *blurt* out, ere well aware,
A swan is white, or Queensbury is fair. *Young.*

BLUSH', *v. & n.* Dut. *blosen*, *blose*; per-
BLUSH'ET, haps from *blasen*, to blow;
BLUSH'FUL, to exhale. Therefore na-
BLUSH'ING, turally applied to the first
BLUSH'LESS, appearance of the colors
BLUSH'Y, in flowers as they disclose

their variety and beauty. To redden or grow
rosy with the vermil tint. Its application, there-
fore, to the effect which emotion of any kind, and
especially modesty, or conscious shame, produces
in the countenance, is very natural. The sudden
rising of color in the cheeks is, from whatever
cause, to blush; hence, too, the word has been
applied to any sudden appearance, or to the first
manifestation of a subject. Thus Locke observes,
'all purely identical propositions, obviously, and
at first *blush*, appear to contain no certain in-
struction in them.'

Amphyon *blush't* as red

As any glowing flame:

And Orpheus durst not shew his face,

But hid his head for shame. *Tuberville.*

This beast had ii horns, like the lambe at a *blush*;
but all counterfet and fals in very deede, for he spake
as did the dragon, the horns of Christ are his high
kingdom in the world. *Bale's Image.*

Hee *blusht* to see another sunne belowe,
Ne durst againe his herie face out shoue. *Spenser.*

Pale and bloodless,
Being all descended to the lab'ring heart,
Which with the heart there cools, and ne'er returneth
To *blush* and beautify the cheek again. *Shakspeare.*

Go to, little *blusht*, for this anan
You'le steal forth a laugh in the shade of your fan.
Ben Jonson.

To-day he puts forth
The tender leaves of hope; to-morrow blossoms,
And bears his *blushing* honours thick upon him. *Id.*
Stratonica entering, moved a *blushy* colour in his
face; but deserting him, he relapsed into paleness
and languor. *Hurvey on Consumptions.*

But here the roses *blush* so rare,
Here the mornings smile so fair,
As if neither cloud, nor wind,
But would be courteous, would be kind.

Crashaw.

Shame causeth *blushing*; *blushing* is the resort of
the blood to the face; although *blushing* will be seen
in the whole breast, yet that is but in passage to the
face. *Bacon.*

To the nuptial bower
I led her *blushing* like the morn; all Heaven,
And happy constellations, on that hour
Shed their selectest influence. *Milton.*

Small is the worth
Of beauty from the light retired:
Bid her come forth,
Suffer herself to be desired,
And not *blush* so to be admired. *Waller.*

From every blush that kindles in thy cheeks,
Ten thousand little loves and graces spring
To revel in the roses. *Rowe. Tamerlane.*
The virgin's wish, without her fears, impart;
Excuse the blush, and pour out all the heart. *Pope.*
Along those blushing borders, bright with dew. *Thomson.*

Won by the charm
Of goodness irresistible, and all
In sweet disorder lost, she blushed consent. *Id.*

BLUSHING is generally excited by a sense of shame, from consciousness of some failing or imperfection. It is supposed to be produced from a sympathy between the nerves which branch from the brain to the eye, ear, muscles of the lips, cheeks, &c.

BLUSTER, *v. & n.* From *blast, blasthan*,
BLUSTERER, } to blow; to roar boisterously,
BLUSTERING, } as a violent
BLUSTEROUS. } wind; the voice of the storm: hence the term is applied to manners rude and uncourteous; to language loud, vociferous and threatening, accompanied with corresponding gestures. A blusterer is a bully, who is more formidable for his noise than his courage; one who puffs, swaggers, and looks big. The Pistol of all generations.—See *Shakespeare. Henry IV. Part II.*

Earth his uncouth mother was,
And blustering Æolus his boasted sire. *Spenser.*
So now he storms with many a sturdy stoure;
So now his blustering blast each coast doth scour. *Id.*

He bloweth and blustereth out at last his abominable
blasphemy against the blessed Sacraments of Christ.

Sir Thomas More.
Spare thy Athenian cradle, and those kin,
Which in the bluster of thy wrath must fall
With those that have offended. *Shakespeare.*

The skies look grimly,
And threaten present blusters. *Id.*

My heart's too big to bear this, says a blustering fellow;
I'll destroy myself. Sir, says the gentleman, here's a dagger at your service;
so the humour went off. *L'Estrange.*

A coward makes a great deal more bluster than a man of honour. *Id.*

To the winds they set
Their corners; when with bluster to confound
Sea, air, and shore. *Milton.*

The ancient heroes were illustrious
For being benign, and not blusterous. *Hudibras.*
Either he must sink to a downright confession, or must huff and bluster, till perhaps he raise a counter-storm. *Government of the Tongue.*

Virgil had the majesty of a lawful prince, and Statius only the blustering of a tyrant. *Dryden.*

There let him reign the jailor of the wind;
With hoarse commands his breathing subjects call,
And boast and bluster in his empty hall. *Id.*

So by the brazen trumpet's bluster,
Troops of all tongues and nations muster. *Swift.*

BLVTH, a parish and market-town of Nottinghamshire, in the hundred of Basset-Law, three miles south from Bawtry, and 151 N. N. W. from London. The church is a spacious and handsome structure. It had formerly a strong castle, a priory of Benedictine monks, and an hospital for lepers; but there are now no remains of either. It is a vicarage in the patronage of Trinity College, Cambridge. Market on Wednesday.

BLYTHER, a river of England, which runs into the German Ocean, near Southwold, in the county of Suffolk. 2. A river of England, which runs into the Tame, in the county of Warwick. 3. A river of England, which runs into the sea at Blythe, in the county of Northumberland. 4. A river of England, which rises in the county of Stafford, near Cheadle, and runs into the Trent.

BO, a cluster of six or seven islands in the Eastern seas, lying E. S. E. of the southern extremity of Gilolo. The most western is five or six miles round, low, and flat, the second somewhat higher, and the third the largest of the group. They are well inhabited, and supply navigators with abundance of cocoa-nuts, dried fish and salt. Long. 126° 25' E, lat. 1° 17' S.

BOA, or BOAE-ARUM, in ancient geography, an island on the coast of Illyricum, over against Tragurium, a place of banishment for condemned persons, now called Bua, an island in the Adriatic, joined to the continent and to Tragurium, now Trau, by a bridge.

BOA, in zoology, a genus of the order serpentes, class amphibia. The characters are, that the belly and tail are both furnished with scuta; no rattle. There are ten species, viz.

1. B. constrictor, has 240 scuta on the belly, and sixty on the tail. This is an immense animal: often thirty-six feet in length; the body is very thick, of a dusky white color, and its back is interspersed with twenty-four large pale irregular spots; the tail is of a darker color; and the sides are beautifully variegated with pale spots. The head is covered with small scales, and has no broad laminæ betwixt the eyes, but has a black belt behind them. The tongue is fleshy, and very little forked. Above the eyes, on each side, the head rises high. The scales of this serpent are all very small, roundish and smooth. The Indians, who adore this monstrous animal, use the skin for clothes, on account of its smoothness and beauty. There are several of these skins preserved, and to be seen in the different museums of Europe. The flesh is eaten by the Indians and Negroes of Africa. It frequents caves and thick forests, where it conceals itself, and suddenly darts out upon strangers, wild beasts, &c. When it chooses a tree for its watching-place, it supports itself by twisting its tail round the trunk or a branch, and darts down upon sheep, goats, tigers, or any animal that comes within its reach, twists itself several times round their body, and by the vast force of its circular muscles bruises and breaks all their bones. After the bones are broken, it licks the skin of the animal all over, besmearing it with a glutinous kind of saliva. This operation is intended to facilitate deglutition, and is a preparation for swallowing the whole animal. If it be a stag, or any horned animal, it begins to swallow the feet first, and gradually sucks in the body, and last of all the head. After this serpent has swallowed a stag or a tiger, it is unable for some days to move; the hunters who are well acquainted with this circumstance, always take this opportunity of destroying it. 2. B. canina, has 203 scuta on the belly, and seventy-seven on the tail; it is greenish and variegated with white belts. It is a native of America, lodges in the hollow trunks

of trees, and is about four feet long, and as thick as the small of the arm. 3. *B. cenchria*, has 256 scuta on the belly, and fifty-seven on the tail. It is of a yellow color, with white eye-like spots. It is a native of Surinam. 4. *B. constrictrix*, has 150 scuta on the belly, and forty on the tail: the head is broad, very convex, and has vesicles containing poison in the mouth, but no fang; the body is ash-colored, interspersed with large dusky spots; and the tail is about one-third of the length of the body. This serpent is found in Carolina. 5. *B. enydris*, has 270 scuta on the belly, and 105 on the tail. The color is a dusky white, and the teeth of the lower jaw very long. It is a native of America. 6. *B. hortulana*, has 290 scuta on the belly, and 128 on the tail. It is of a pale color, interspersed with livid wedge-like spots. It is a native of America. 7. *B. murina*, has 254 scuta on the belly, and sixty-five on the tail. The color of it is a light blue, and round spots on the back. It is a native of America. 8. *B. ophias*, has 281 scuta on the belly, and eighty-four on the tail; the color is nearly the same with that of the constrictor, but browner. 9. *B. scytale* has 250 scuta on the belly, and seventy on the tail. The body is ash-colored and bluish, with round black spots on the back, and black lateral rings edged with white. It is a native of America; and, like the constrictor, though not so long, twists itself about sheep, goats, &c. and swallows them whole. 10. *B. fasciata*; fasciated boa. Plates of the belly 233; of the tail thirty-six. Inhabiting India; color yellow, marked with numerous blue transverse bands, continued at equal distances throughout the whole length of the animal. The bite of this snake is poisonous in a high degree.

BOADICEA, or **VOADICEA**, a valiant British queen in the time of the emperor Nero, wife to Prasutagus, king of the Iceni in Britain, who by will left the emperor and his own daughters his co-heirs, in expectation by that means of procuring Nero's protection for his family; but he was no sooner dead, than the emperor's officers seized all. Boadicea opposing these unjust proceedings, they ordered her to be publicly scourged, and her daughters to be violated by the soldiers. The Britons now took arms, to the number of 120,000, with Boadicea at their head; and made a general and bloody massacre of about 80,000 Romans. The whole province of Britain would have been lost, if Suetonius Paulinus had not hastened from the isle of Mona to London with 10,000 men. A second battle was fought with great valor and doubtful success, till at last victory inclined to the Romans. Boadicea, who had behaved with all the bravery imaginable, either died of chagrin or was poisoned, A. D. 61.

BOAE-ARUM. See **Boa**.

BOANERGES, from כני רעש, Syr; a title given by our Saviour to the apostles James and John, and explained by the context, Mark, iii. 17, to signify Sons of Thunder, οἱ υἱοὶ τοῦ βρονθῆς. It seems, says Parkhurst, ad. verb. to be the Galilean pronunciation of the Hebrew כני רעש properly signifies a violent trembling, a commotion, and may therefore be

well rendered by βροντή, thunder, which is a violent commotion in the air. When our Saviour thus named the sons of Zebedee he seems plainly to have had an eye to that prophecy of Hag. i. xi. 6. 'Yet once and I will shake (מֵרַעַשׁ) the heavens and the earth,' which is applied by the apostle to the Hebrews, xii. 26, to the great alteration made in the economy of religion by the publication of the gospel. The name imports therefore that James and John should be eminent instruments in accomplishing the great change, and should, like thunder or an earthquake, mightily bear down all opposition by their inspired preaching. Parkhurst compares with this title the image used by Virgil, who calls the Scipios. *Æna. vi. 642, duo fulmina belli.*

BOAR, } Sax. barn. Dut. *beer*, the male
BOARISH. } swine. Boarish is brutish, savage, vulgar, and cruel.

To fly the *boar*, before the *boar* pursues,
 Were to incense the *boar* to follow us.

Shakespeare.

Wherefore to Dover?

GLOU. Because I would not see thy cruel nails
 Pluck out his poor old eyes; nor thy fierce sister
 In his anointed flesh stick boarish fangs. *Id.*

She sped the *boar* away.

His eyeballs glare with fire, suffused with blood;
 His neck shoots up a thickest thorny wood;
 His bristled back a trench impaled appears.

Dryden.

BOAR, in zoology. See **Sus**.

BOAR, WILD, among huntsmen, has several names, according to its different ages: the first year it is called a pig of the saunder, the second it is called a hog, the third a hog-steer, and the fourth a boar; when leaving the saunder he is called a singler or sangler. The boar generally lives to twenty-five or thirty years, if he escapes accidents. The huntsmen abroad generally kill the boar with their swords or spears: but great caution is necessary in making the blows; for he is very apt to catch them upon his snout or tusks; and if wounded and not killed, he will attack the huntsman in the most furious manner. The place to give the wound with the spear is either between the eyes in the middle of the forehead, or in the shoulder. When the animal makes at the hunter there is no escape but by courage and address; if he flies he is sure to be overtaken and killed. If he makes doubles and windings he is to be watched very cautiously, for he will attempt getting hold of the spear in his mouth; when nothing can save the huntsman but another person attacking him behind. Were it not for the forks of the boar-spears that make it impossible to press forward upon them, the huntsman who gives the creature his death's wound would seldom escape falling a sacrifice to his revenge. The modern way of boar-hunting is generally to despatch the creature by all the huntsmen striking him at once: but the ancient Roman way was, for a person on foot, armed with a spear, to keep him at bay; and in this case the boar would run of himself upon the spear to come at the huntsman, and push forward till the spear pierced him through. The hinder claws of a boar are called guards. In the corn he is said to feed, in the meadows or fallow-

fields to rout, worm, or fern; in a close to graze. The boar is farrowed with as many teeth as he will ever have; his teeth increasing only in bigness, not in number: among these there are four called tushes, or tusks; the two highest of which do not hurt when he strikes, but serve only to whet the other two lowest, with which the beast defends himself, and frequently kills, as being greater and longer than the rest. Among the Romans boar's flesh was a delicacy; a whole one has been sometimes served up as a dish of state. Sometimes the boar was the military ensign in lieu of the eagle.

BOAR'-SPEAR, *n. s.* From boar and spear. A spear used in hunting the boar.

And in her hand a sharp *boar-spear* she held,
And at her back a bow and quiver gay,
Stuffed with steel-headed darts. *Faerie Queene.*

Eschion threw the first, but missed his mark,
And struck his *boar-spear* on a maple bark. *Dryden.*

BOARD', *v. & n.* } *Ang.-Sax.* brædan.
BOARD'ER, } *Junius and Tooke*, as
BOARD'ING. } quoted by the *Ency.*

Met. agree that 'board,' by the omission of the letter *r*, is from broad.' A board is a plank of wood. A table is composed of several of these, and is therefore called a board. To board is to put boards together for a covering, either as a floor, a roof, or a deck of a ship. Boarding is connected with all of these: to get into a ship, either peaceably or by assault, is to get on board. A table, and its entertainment, are both denominated board. Persons sitting at a table to transact business in their corporate capacity, are also termed a board. To board is likewise to be a boarder at the table of another. To make the first attempt upon a man, to surprise him by accosting him. Boarding-house is a house of public, or more private entertainment. Board-wages are wages allowed to servants to supply their own provisions; and boarding-school is a school where the pupils live with the teacher.

With the saw they Sundered trees in boards and planks. *Ruleigh.*

That we might not part,
As we at first did *board* with thee,
Now thou would'st taste our misery. *Herbert.*

I *boarded* the king's ship: now on the beak,
Now in the waste, the deck, in every cabin,
I flamed amazement. *Shakspeare.*

In bed he slept not, for my urging it;
At board he fed not, for my urging it. *Id.*
Sure, unless he knew some strain in me, that I
knew not myself, he would never have *boarded* me in
this fury. *Id.*

Away, I do beseech you both, away,
I'll *board* him presently. *Id. Hamlet.*

Soon after which, three hundred lords he slew,
Of British blood, all sitting at his *board*. *Faerie Queene.*

Whom, thus at gaze, the palmer 'gan to board
With goodly reason, and thus fair bespake. *Id.*

They learn what associates and correspondents
they had, and how far every one is engaged, and
what new ones they meant afterwards to try or *board*.
Bacon's Henry VII.

I wish the king would be pleased sometimes to be
present at that *board*; it adds a majesty to it. *Bacon.*

VOL. IV.

Whatever Earth, all bearing mother, yields
In India East or West, or middle shore
In Pontus or the Punie coast, or where
Alcinous reigned, fruits of all kinds, in coat
Rough or smooth rind, or bearded husk or shell,
She gathers tribute large, and on the *board*
Heaps with unsparing hand. *Milton.*

Both better acquainted with affairs, than any other
who sat then at that *board*. *Clarendon.*

What more than madness reigns,
When one short sitting many hundreds drains;
And not enough is left him to supply
Board-wages, or a footman's livery. *Dryden.*

Now *board* to *board* the rival vessels row,
The billows lave the skies, and ocean groans below. *Id.*

May every god his friendly aid afford;
Pan guard thy flock, and Ceres bless thy *board*. *Prior.*

Our captain thought his ship in so great danger,
that he confessed himself to a capuchin, who was on
board. *Addison.*

A blockhead, with melodious voice,
In *boarding-schools* can have his choice. *Swift.*

Having thus *boarded* the whole room, the edges of
some boards lie higher than the next board. There-
fore they peruse the whole floor; and, where they
find any irregularities, plane them off.

Mozon's Mechanical Exercises.
We are several of us, gentlemen and ladies, who
board in the same house; and, after dinner, one of
our company stands up, and reads your paper to us
all. *Spectator.*

BOARD, in gaming, is applied to a machine,
or frame, used in certain games, as a draught-
board, a chess-board, &c.

BOARD, in the language of seamen, admits of
various significations, according to the words
conjoined with it. Thus, 1. A good board; a
ship is said to make a good board when she gets
up much to windward, or advances much at one
tack, and sails upon a straight line. 2. A long
board is when the ship stands a great way off
before she tacks. 3. Board and board is when
two ships come so near as to touch one ano-
ther, or when they lie side by side. 4. A
short board is when she stands off a little. 5.
Back board, the same with *ASTERN*. 6. To
board it up, is to beat it up, sometimes upon
one tack, and sometimes upon another. 7. To
go on board, or to go a-board, signifies to go into
the ship. 8. To make a board is to turn to
windward, and the longer your boards are, the
more you work into the wind. 9. To slip off
the board is to slip down by the ship's side. 10.
Weather board, the windward side.

BOARD OF AGRICULTURE. See *AGRICUL-
TURE*.

The **BOARD OF CONTROL** was first instituted
in 1784, by stat. 24 Geo. III. sess. 2, c. 25, with
a view of directing and aiding the East India
Company, in the executive government of India,
and establishing a power of control in this
kingdom. This board was further established
and regulated by the stat. 33 Geo. III. c. 52,
the operation of which commenced in India on
the 1st of February 1794. By the former act
six persons were to be nominated by the king,
as commissioners for the affairs of India; but by
the latter, the number, instead of being limited to

to six privy-counsellors, is indefinite, depending upon the king's pleasure; of which number the two principal secretaries of state, and the chancellor of the exchequer are to be three; and his majesty, if he pleases, may add to the list two commissioners, not of the privy-council; and the person first named in the king's commission is to be president. The king may give £5000 a year among such of the commissioners as he pleases; which, together with the salary of the secretary and officers, and other expenses of the board, are to be paid by the India Company; the whole not to exceed £16,000 per annum. The members of this board, and their officers, are sworn to execute the several powers and trusts reposed in them, without favor or affection, prejudice or malice. Three commissioners must be present to form a board. The powers of the board are to superintend, direct, and control all acts, operations, and concerns, which relate to the civil and military government, and revenues, of the British territorial possessions in India, subject to certain restrictions. They and their officers are to have access to the papers and records of the Company, and to be furnished with copies or extracts of such of them as shall be required. They are also to be furnished with copies of all proceedings of general courts, and courts of directors, within eight days, and with copies of all despatches from abroad, relating to matters of government or revenue, immediately after their arrival. No orders on these subjects are to be sent by the Company to India, until approved by the board; and when the commissioners vary or expunge any part of the despatches proposed by the directors, they are to give their reasons; and all despatches are to be returned to the court of directors in fourteen days. The directors may state their objections to any alterations, and the commissioners are to re-consider them; and if they interfere with what the directors deem matter of commerce, the directors may apply to the king in council to determine betwixt them. But the board is restricted from the appointment of any of the Company's servants. If the directors, on being called upon to propose despatches on any subject relating to government or revenue, shall fail to do so within fourteen days, the board may originate their own despatches on that subject. The board is not to authorise an increase of salaries, or any allowance or gratuity to be granted to persons employed in the Company's service, except the same shall be first proposed by the Company; and their intention and reasons for such grant are to be certified to both houses of parliament, thirty days before the salary can commence. The directors are to appoint three of their members to be a committee of secrecy, through whom despatches, relating to government, war, peace, or treaties, may be sent to or received from India. This committee, and their clerks, are to be sworn to secrecy. Orders of directors, concerning the government or revenues of India, once approved by the board, are not subject to revocation by the general court of proprietors. See EAST INDIA COMPANY.

BOARD OF GREEN CLOTH, was a court of jus-

tice, formerly held in the counting house of the king's household, for taking cognizance of all matters of government within the court. It had also the authority of preserving the peace for twelve miles round the king's court wherever it should be, excepting at London. It was abolished in 1782.

BOARD OF TRADE, bureau de commerce; an office in the French polity, established in 1723, composed of eight persons of knowledge in arts, commerce, navigation, and manufactures; it was their duty to inspect plans of public advantage; to promote, by liberal rewards, the full and complete disclosure of discoveries in the arts, and manufactures; and thus to facilitate the circulation of useful facts, in every channel of industry.

THE BOARD OF TRADE AND PLANTATIONS was established in England by king William III., for settling all disputes and regulations relating to commerce and colonies. Before this time matters of commerce had been generally referred to a fluctuating committee of the privy council. A permanent board was now therefore established, but finally abolished in 1780.

BOARD-WAGES, a certain annual or stipulated sum allowed to household servants for maintenance. Board-wages, granted to the menial officers and servants of the crown, commenced in 1629, when the necessities of king Charles obliged him to retrench the expense of his household, by abolishing the greatest part of the daily tables in his palace, eighty in number, and substituting a fixed allowance in their room.

BOARDING, in a naval engagement, a desperate and furious assault made by the men of one ship on those of another. It may be performed in different places of the ship, according to their circumstances and situation, by the assailant detaching a number of men armed with pikes, pistols, cutlasses, &c. on the decks of his antagonist. This, however, is rarely attempted by king's ships, which generally decide the combat without grappling; but it is often practiced by privateers, who, bearing down on their opponent's quarter or broadside, drop a shell from the bowsprit, which projects over the enemy's deck, and, in the midst of the confusion thus occasioned, rush aboard, and easily overpower all opposition.

BOARDING-PIKE, a pike made use of in boarding ships during an engagement.

BOARIA LAPPA, or **LAPPAGO**, a name given by the ancient Romans to the fruit or rough balls of the common aparine or cleavers. Pliny calls it lappæ boarie, or lappæ caninæ, and sometimes canarie.

BOARULA, in ornithology, a species of motacilla, called in England the gray wagtail. The color of this bird is cinereous above, yellow beneath; tail-feathers dark, and pale at the edges. This is an European bird, and, like the rest of the wagtail tribe, frequents watery places.

BOAS, in entomology, a species of scarabæus, inhabiting Sierra Leone. Thorax retuse, excavated, bidentated; horn of the head recurved and simple.

BOAST', v. & n. Cotgrave derives it from
BOAST'ER, the French *bosse*, which he
BOAST'FUL, explains, swollen; risen;
BOAST'ING, puffed up. Any thing
BOAST'INGLY, raised on a surface, and
BOAST'IVE, which is itself hollow, and
BOAST'LESS, without substance; some-

thing tumid and inflated. This at once gives us the origin and the meaning of the word in its general acceptation. To boast is to swell above our natural dimensions; is to be the subject of a moral disease, which, as it increases in magnitude, diminishes the health and vigor of the patient. A boaster is a self-complacent manufacturer of lies to set off his own imaginary greatness; who forms a very exaggerated estimate of himself, and labors to deceive others on the same subject, and to the same amount; used, as it sometimes is, in the sense of glorying in others, it is not reprehensible.

Let not him that putteth on his harness, *boast* himself as he that putteth it off. *Kings'.*

Confounded be all them that serve graven images, that *boast* themselves of idols. *Psaln xevii. 7.*

They that trust in their wealth, and *boast* themselves in the multitude of their riches.

Psaln xlix. 6.

Thus with your mouth you have *boasted* against me, and multiplied your words against me.

Ezek. xxxv. 13.

Thou, that makest thy *boast* of the law, through breaking the law dishonourest thou God?

Romans ii. 23.

For I know the forwardness of your mind, for which I *boast* of you to them of Macedonia.

1 Cor. ix. 2.

For if I have *boasted* any thing to him of you, I am not ashamed.

2 Cor. vii. 14.

And is the *boast* of that proud ladies' threat,

That menaced me from the field to beat,

Now brought to this?

Spenser.

My sentence is for open war: of wiles,

More unexpert I *boast* not: then let those

Contrive who need, or when they need, not now.

Milton.

The spirits beneath,

Whom I seduced, *boasting* I could subdue

The? Omnipotent.

Id.

Neither do the spirits damned

Lose all their virtue, lest bad men should *boast*

Their specious deeds.

Id.

If they vouchsafed to give God the praise of his goodness; yet they did it only, in order to *boast* the interest they had in them.

Atterbury.

We look on it as a pitch of impiety, *boastingly* to avow our sins; and it deserves to be considered, whether this kind of confessing them, have not some affinity with it.

Decay of Piety.

No more delays, vain *boaster*! but begin!

I prophecy beforehand I shall win:

I'll teach you how to brag another time.

Dryden.

He the proud *boasters* sent, with stern assault,

Down to the realms of night.

Philips.

Boastful, and rough, your first son is a squire;

The next a tradesman, meek, and much a liar.

Pope.

Not Tyro, nor Mycene, match her name,

Nor great Alcmena, the proud *boasts* of fame.

Id.

The world is more apt to find fault than to commend; the *boast* will probably be censured, when the great action that occasioned it is forgotten.

Spectator.

The *boast* of heraldry, the pomp of power,
 And all that beauty, all that wealth e'er gave,
 Await, alike the' inevitable hour;
 The paths of glory lead but to the grave.

Gray's Elegy.

Kingdoms, by thee so sickly greatness grown,
Boast of a florid vigour not their own.

Goldsmith. Deserted Village.

BOAT', From the Germ. *batten*; to
BOAT'MAN, thrust; to dash; to drive along.
BOAT'SWAIN, So says Wachter, as quoted by
BOAT'LIKE, the Ency. Met. Ang.-Sax.
BOAT'WISE, bate or bat. This derivation

refers more to the manner of conducting this species of vessel through the water, than to the nature of the thing itself. But perhaps that which distinguishes a boat from all other nautical craft, is its comparative diminutiveness, and its being impelled along by oars rather than by sails filled with wind. Yet the boatswain is an officer that is not required in such boats, at least according to the present duties allotted to that personage. Formerly the servant, the swain or swein, who managed the oars, received this appellation.

I do not think that any one nation, the Syrian excepted, to whom the knowledge of the ark came, did find out at once the device of either ship or *boat*, in which they durst venture themselves upon the seas.

Raleigh's Essays.

Where the remote Bermudas ride

In the' ocean's bosom unespied;

From a small *boat* that roved along,

The listening winds received this song.

Marvell.

Boatmen through the crystal water show,

To wondering passengers, the walls below.

Dryden.

That booby Phaon only was unkind,

An ill-bred *boatman*, rough as waves and wind.

Prior.

Sometimes the meanest *boatswain* may help to preserve the ship from sinking.

Houell's Preeminence of Parliament.

Reef topsails, reef, the *boatswain* calls again.

Falconer's Shipwreck.

Hark to the *boatswain's* call, the cheering cry!

While through the seamen's hands the tackle glides.

Byron.

Another morn—another bids them seek,

And shout his name till echo waxeth weak;

Mount—grotto—cavern—valley searched in vain,

They find on shore a sea-*boat's* broken chain—

Their hope revives.

Byron. Corsair.

BOATS. The construction, machinery, and even the names of boats, are very different, according to the various purposes for which they are calculated, and the services on which they are to be employed. Thus they are occasionally slight or strong, sharp or flat-bottomed, open or decked, plain or ornamented; as they may be designed for swiftness or burden, for deep or shallow water, for sailing in a harbour or at sea, and for convenience or pleasure.

The *Long-Boat* is the largest boat that usually accompanies a ship, is generally furnished with a mast and sails, and may be armed and equipped for cruising short distances, against merchant-ships of the enemy, or smugglers, or for impressing seamen, &c.; her principal employ, however, is to bring heavy stores or provisions

on board, and also to go up small rivers to fetch water, wood, &c.

The *Launch* is a boat which of late years has greatly superseded the use of the long boat; it is longer, more flat-bottomed, and, by rowing a greater number of oars, is better adapted for going up narrow and shallow rivers. See the article *LAUNCH*.

The *Barge* is a long, narrow, light boat, employed to carry the principal sea-officers, as admirals, and captains of ships of war, on shore, and are very unfit for sea. See the article *BARGE*.

A *Pinnace* resembles a barge, but is smaller, never rowing more than eight oars; whereas, a barge never rows less than ten. The pinnace is for the accommodation of the lieutenants, &c.

The *Cutters of a ship* are broader, deeper, and shorter, than the barge or pinnace; they are fitter for sailing, and commonly employed in carrying light stores, provisions, passengers, &c. to and from the ships. In the structure of this sort of boats, the lower edge of every plank in the side over-lays the upper edge of the plank below it, which is called clinch-work. They are generally rowed with six oars, sometimes only with four; in which case they are termed jolly-boats.

Yachts are something less than cutters, nearly of the same form, and used for similar services. Of all the small boats, a Norway yawl seems to be the best calculated for a high sea, as it will often venture out to a great distance from the coast of that country, when a stout ship can hardly carry any sail.

A *Gig* is a long narrow boat used for expedition, generally rowed with six or eight oars, and is mostly the private property of the captain or commander.

The *Jolly-Boat* is a smaller boat than a yawl, kept on board ships for going on shore, and other light work.

The above more particularly belong to ships of war; as merchant-ships seldom have more than two, viz. a long boat and a yawl; when they have a third it is generally calculated for the countries to which they trade, and varies in its construction accordingly.

A *Wherry* is a light sharp boat, used in a river or harbour for carrying passengers from place to place. The wherries allowed to ply about London, are either scullers, which means a single person with two oars, or two persons rowing with each an oar. The Portsmouth wherries are built broader and larger than those on the Thames, and allowed to be a very safe description of boats, and will often keep the sea when those of a larger class are obliged to run into port: they have frequently been known to cross the channel to France with safety, at different seasons of the year, and seldom meet with any accident.

A *Punt* is a sort of oblong flat-bottomed boat, nearly resembling a floating stage used by shipwrights and calkers, for breaching, calking, or repairing a ship's bottom, and is chiefly used for one person to go on shore in from small vessels. It is also frequently used to go after wild-fowl during the winter season, when they

hover about the coasts. The boatman is furnished with a long musket, fixed in the bow of the boat, and generally steers with a scull in the stern, while he lays on his back in the bottom of the boat; he takes the advantage of the tide to go down on the birds, and fires, without taking any particular aim, as the flock are rising out of the water, by which means he frequently brings down a great many.

A *Moses* is a flat-bottomed boat, used in the West Indies for bringing off hogsheds of sugar from the sea-beach to the shipping which are anchored in the roads, and is termed single or double according to its size.

A *Felucca* is a large and strong passage-boat, used in the Mediterranean, having from ten to sixteen banks of oars. The natives of Barbary often employ boats of this sort as cruisers.

The Society of Arts voted the gold medal in the year 1807 to Mr. Christopher Wilson, Richard Street, Commercial Road, London for a secure sailing-boat, which is described in Vol. XXV. of the Society's Transactions as Mr. Wilson's Neutral-built-self-balanced-boat.

Mr. Wilson claims two distinct improvements, viz. the neutral mode of building, and the application of the hollow sides or balance bodies. The first of these improvements relates to boats, barges, &c. in general; the other to such boats only as are designed for despatch, safety, or pleasure. But with respect to these claims, it is but justice to state, that he has been anticipated in them both. Mr. Boswell, to whom the navy is much indebted for many useful hints, had a boat built in June 1803, the internal framing of which was precisely the same as in that of Mr. Wilson's; and the only difference was, that, instead of having slips laid on the inside of the seams with blair or other calking, they were rivetted on without, and the seams calked. This boat was exhibited in London, and a description of it published in No. LXII. of the Repertory of Arts, New Series, &c. The second improvement claimed by Mr. Wilson, is essentially the same as that for which Mr. Lionel Lukin obtained a patent in the year 1785, the specification of which was published in the Repertory of Arts, Vol. III. First Series.

The difficulties and danger of passing a bar in stormy weather, and of landing troops on a beach, when there is much surf, or a great swell, have given rise to various experiments, to prevent boats being swamped or stove; and among others, that of applying air trunks to boats built in the common way, agreeably to a plan lately proposed to the admiralty by Vice Admiral Hunter, who, after forty years experience in different parts of the world, strongly recommends it as the very best possible method yet thought of, to prevent boats sinking in case of being struck by a heavy sea, or filled in going through a surf. This plan is simple and practicable for preventing the loss of lives when a boat is sent from her ship in bad weather; or when troops are to be carried in boats through broken water, which may occasion their shipping enough to fill or swamp the boat in deep water; and the Admiral is of opinion, that if every ship, whether in his Majesty's or merchant's service, were to have at all

Liri

Fig. 2.

Fig. 1.

Fig. 3

Fig. 3.

Fig. 7.

times a set of these trunks ready to apply, when they have occasion to use their boats in bad weather, many valuable lives would be saved.

To those acquainted with the force of a heavy sea, it must appear much more difficult to prevent a boat from being stove, than from being sunk. A mechanic has suggested that a much greater degree of stability might be given to our common boats or small vessels, and that they might be made to resist the shock of the waves, by diminishing their centre of gravity at the instant such a measure was found necessary, which would greatly augment their general gravity and resistance. He proposes, that in the vertical plane of the boat's centre of gravity, there be placed a rod of iron, formed of several fillets of the same metal: at the extremity of this rod let there be fixed a weight of iron or lead, the specific gravity of which may be in proportion to the effect required to result from it. When there is no occasion for employing this weight, it might be contained in a place made in the bottom, or keel, of the vessel, which part might be easily appropriated for that purpose, without the weight occasioning any embarrassment or friction.

The rod might be secured by an apparatus very easily made; and it might be provided with teeth, by which it could be manœuvred by a crane, by means of a single handle; the weight might be made to descend to the depth of eighteen, twenty, or twenty-four inches, beneath the lower plane of the keel; and it will appear evident that the descent of this weight must cause a difference in the power of the boat's resistance against the efforts of the waves. See the *LIFE BOAT*, below.

Trim the BOAT, is an order to sit in the boat in such a manner as that she shall float upright in the water, without leaning to either side.

To bale the BOAT is to throw or scoop out the water that may have got in her bottom, by leakage or otherwise.

Moor the BOAT, is an order to fasten a boat with two ropes, so as that the one shall counteract the other, and keep her in a steady position.

BOAT'S CREW are the men appointed to man any particular boat, as the barge's crew, cutter's crew, &c.

BOAT, LIFE. The life-boat is a modern invention of the utmost consequence to the lives and safety of seafaring persons.

The construction of a boat for the preservation of lives from ships driven on the shores of this kingdom, was originally suggested by the subscribers to the News Room at the Law House, South Shields, in 1789; who, from situation, were the more immediate spectators of the destruction inevitably attending vessels and their crews coming on the sand at the south entrance of Tynemouth Haven.

In September, 1789, the ship *Adventure*, of Newcastle, was stranded on the Herd Sands, on the south side of Tynemouth Haven, in the midst of the most tremendous breakers; and all the crew dropped from the rigging, one by one, in the presence of thousands of spectators; not one of whom could be prevailed on by any reward

to venture out to her assistance in any boat of the common construction. On this melancholy occasion the gentlemen of South Shields called a meeting of the inhabitants, and premiums were instantly offered for plans of a boat which should be the best calculated to brave the dangers of the sea, particularly of broken water. Many proposals were accordingly offered, but the preference was given unanimously to Mr. Greathead's, who was immediately directed to build a boat at the expense of the committee. This boat went off on the 30th of January, 1790, and so well has it answered, and even exceeded, every expectation, in the most tremendous sea, that during the last twenty-five years not less than 300 lives have been saved at the entrance of the Tyne alone, which otherwise must have been lost.

The principle of Mr. Greathead's boat appears to have been suggested by the following simple fact:—Take a spheroid, and divide it into quarters; each quarter is elliptical, and nearly resembles the half of a wooden bowl, having a curvature with projecting ends; this, thrown into the sea or broken water, cannot be upset or lie with the bottom upwards. The length of the boat is thirty feet; the breadth ten feet; the depth, from the top of the gunwale to the lower part of the keel in midships, three feet three inches; from the gunwale to the platform (within), two feet four inches; from the top of the stems (both ends being similar) to the horizontal line of the bottom of the keel, five feet nine inches. The keel is a plank of three inches thick, of a proportionate breadth in midships, narrowing gradually towards the ends, to the breadth of the stems at the bottom, and forming a great convexity downwards.

The stems are segments of a circle, with considerable rakes. The bottom section, to the floor-heads is a curve fore and aft, with the sweep of the keel.

The floor timber has a small rise curving from the keel to the floor-heads. A bilge plank is wrought in on each side, next the floor-heads, with a double rabbet or groove, of a similar thickness with the keel; and on the outside of this are fixed two bilgetrees, corresponding nearly with the level of the keel.

The ends of the bottom section form that fine kind of entrance observable in the lower part of the bow of the fishing-boat called a coble, much used in the North. From this part to the top of the stem it is more elliptical, forming a considerable projection.

The sides, from the floor-heads to the top of the gunwale, flaunch off on each side, in proportion to above half the breadth of the floor. The breadth is continued far forwards towards the ends, leaving a sufficient length of straight side at the top. The sheer is regular along the straight side, and more elevated towards the ends. The gunwale fixed to the outside is three inches thick. The sides, from the under part of the gunwale, along the whole length of the regular sheer, extending twenty-one feet six inches, are cased with layers of cork to the depth of sixteen inches downwards; and the thickness of this casing of cork being four inches, it projects at the top a little without the gunwale. The cork

on the outside is secured with thin plate, or slips of copper, and the boat is fastened with copper nails.

The thwarts, or seats, are five in number, double banked; consequently, the boat may be rowed with ten oars.

The thwarts are firmly stanchioned. The side oars are short, with iron tholes and rope gromets, so that the rower can pull either way. The boat is steered with an oar at each end; and the steering oar is one-third longer than the rowing oar.

The platform placed at the bottom, within the boat, is horizontal, the length of the midships, and elevated at the ends for the convenience of the steersman, to give him a greater power with the oar. The internal part of the boat, next the sides, from the under part of the thwarts down to the platform, is cased with cork; the whole quantity of which, affixed to the life-boat, is nearly seven hundred weight. The cork indisputably contributes much to the buoyancy of the boat, is a good defence in going along-side a vessel, and is of principal use in keeping the boat in an erect position in the sea, or rather for giving her a very lively and quick disposition to recover from any sudden cant or lurch, which she may receive from the stroke of a heavy wave. But, exclusively of the cork, the admirable construction of this boat gives it a decided pre-eminence. The ends being similar the boat can be rowed either way, and this peculiarity of form assists her in rising over the waves. The curvature of the keel and bottom facilitates her movement in turning, and contributes to the ease of the steerage, as a single stroke of the steering oar has an immediate effect, the boat moving as upon a centre. The fine entrance below is of use in dividing the waves, when rowing against them; and, combined with the convexity of the bottom, and the elliptical form of the stem, admits her to rise with wonderful buoyancy in a high sea, and to launch forward with rapidity, without shipping any water, when a common boat would be in danger of being filled. The flaunching or spreading form of the boat, from her floor-heads to the gunwale, gives her a considerable bearing; and the continuation of the breadth well forward, is a great support to her in the sea; and it has been found, by experience, that boats of this construction are the best sea-boats for rowing against turbulent waves.

The internal shallowness of the boat from the gunwale down to the platform, the convexity of the form, and the bulk of cork within, leave a very diminished space for the water to occupy; so that the life-boat, when filled with water, contains a considerable less quantity than the common boat, and is in no danger either of sinking or upsetting.

It may be presumed by some, that in cases of high wind, agitated sea, and broken waves, a boat of such bulk could not prevail against them by the force of oars; but the life-boat, from her peculiar form, may be rowed a-head, when the attempt in other boats would fail. Boats of the common form, adapted for speed, are of course put in motion with a small power; but for want of buoyancy and bearing, are over-run by the

waves and sunk, when impelled against them; and boats constructed for burden meet with too much resistance from the wind and sea when opposed to them, and cannot, in such cases, be rowed from the shore to a ship in distress.

Mr. Greathead gives the following instructions for the management of the life-boat:—The boats in general of this description, are painted white on the outside; this color more immediately engaging the eye of the spectator, when rising from the hollow of the sea, than any other. The bottom of the boat is at first varnished (which will take paint afterwards), for the more minute inspection of purchasers. The oars she is equipped with are made of fir of the best quality; having found, by experience, that a rove ash oar, that will dress clean and light, is too pliant among the breakers; and when strong and heavy, from rowing double-banked, the purchase being short, sooner exhausts the rower; which renders the fir oar, when made stiff, preferable.

In the management of the boat she requires twelve men to work her; that is, five men on each side, rowing double-banked, with an oar slung over an iron thole, with a gromet (as provided), so as to enable the rower to pull either way, and one man at each end to steer her, and to be ready at the opposite end to take the steer oar when wanted. As, from the construction of the boat, she is always in a position to be rowed either way, without turning the boat: when manned the person who steers her should be well acquainted with the course of the tides, in order to take every possible advantage; the best method, if the direction will admit of it, is to head the sea.

The steersman should keep his eye fixed upon the wave or breaker, and encourage the rowers to give way as the boat rises to it, being then aided by the force of the oars, she launches over it with vast rapidity, without shipping any water. It is necessary to observe, that there is often a strong reflux of sea, occasioned by the stranded wrecks, which requires both dispatch and care in the people employed, that the boat be not damaged. When the wreck is reached, if the wind blows to the land, the boat will come in shore without any other effort than steering.

The particular construction of this boat will be best understood by referring to our plate, **LIFE-BOAT**, where fig. 1, represents a cross section of the boat.

F F, the outside coatings of cork.

G G, the inside cork filling.

II II, the outside planks of the boat.

I, one of the stems of the boat.

K, the keel.

N N, the timber-heads.

V, the thwarts, or rowers's seats.

R, one of the stanchions under the thwarts, each being thus firmly supported.

S, a section of the gang-board, which crosses the thwarts, and forms the passage from one end of the boat to the other.

T, the floor-heads, or platform for the rower's feet.

U U, the two bilge pieces, nearly level with the keel.

w w, the gunwales.

x, a ring-bolt for the head-fast, there being another also at the other end.

y, platform for the steersman.

Fig. 2 is a Longitudinal Section of the Life Boat.

E E E, the sheer or curve of the boat.

I I, the two sterns or ends.

K, the keel.

L L, the aprons, to strengthen the stems.

M M, the sheets, or place for passengers.

N N, timber-heads or boat-fastenings.

O O O O, the tholes, on which the oars are hung by gromets.

T, the flooring under the rowers' feet.

Fig. 3. Plan of a Truck or Carriage, with four Wheels, to convey the Boat to and from the Sea.

a, an oblong frame of wood, consisting of two long pieces, hollowed a little, to admit the body of the boat, and secured by the cross-pieces, b b.

c c c c, four low wheels, each sunk or hollowed in the middle, to run better upon a rail-way or timber-road.

d d, two indents made in the side-timbers, that the bottom of the boat may be firm therein.

e e, two small rollers, movable in the cross-timbers, for the keel of the boat to slide upon.

f f, two long rollers, one at each end of the frame, to assist in raising the boat upon, or sliding it off, the truck or carriage.

Fig. 4. A, the copper bolt, with one end entered into the wood previous to fixing the tube.

B, a piece of timber or ship's side, into which the bolt is intended to be driven.

Fig. 5. c c c c, the parts of the iron tube fastened together, ready to be put on the bolt A.

D D D D, iron or brass rings, with thumb-screws placed over the joints of the tube, to hold them firm together.

E E E E, the thumb-screws, which keep the rings and tube firm in their proper places.

F, two points formed on the lower ring; they are to stick into the timber, and to enable the tube to be held firm in its place.

Fig. 6. Shows the separation of the parts of the tube, which is effected by slackening the thumb-screws and rings. To put them together, you slide the rings over the joints, placed as close as possible; then, by tightening the thumb-screws, you will have them firm together, and may continue the tube to any length, from one foot to whatever number is required.

Fig. 7. G H, two steel punches or drifts, to be placed on the head of the copper bolt, within the tube, whilst driving. The blow given upon the punch drives forward the bolt. The shortest of them should be used first, and, when driven nearly to its head, should be taken out of the tube and the longer punch applied in its place.

The life-boat is generally kept in a boat-house close to the beach, where it rests on four low wheels, or trucks, concave, for rolling on oars or spars laid on the sand, so as to run out at a moment's notice. But, where the way over which she must be dragged is rough, and the safety of her frame would be endangered, another expedient is adopted. This consists of two wheels, twelve feet in diameter, with a movable

arched axis, to which a pole is fixed for a lever. The boat is suspended between the wheels, under the axis; towards each extremity of which is an iron pin. When the pole is perpendicularly elevated, the upper part of the axis becomes depressed, and a pair of rope slings encompassing the boat, being fixed to the iron pins, she is raised with great facility by means of the pole, which is then fastened down to her stern. There are commonly two crews, each consisting of twelve men, employed to navigate the life-boat, to whom rewards are distributed according to the success of their enterprise.

On the first alarm of a vessel in danger, the life-boat immediately puts to sea; when some experienced steady person takes the command. Her head should be kept to the sea, and she must possess an accelerated velocity to meet the wave. Great caution is to be observed in approaching a wreck, where the reflux of the waves is often productive of danger, and it is considered safest to go to the lee quarter. This, however, depends on circumstances. See *Greathead's Report of the Evidence respecting the Invention of the Life-Boat*.—*Transactions of the Society of Arts*, Vol. X. XX. and XXV.

After the value of the invention had been acknowledged by the presentation of a gold medallion to Mr. Greathead, by the Society of Arts, as also one by the Royal Humane Society, and various gratuities in money, Parliament, on the 9th of June 1802, unanimously voted him £1200. The committee of Underwriters, likewise, at Lloyd's Coffee-house in London, having voted Mr. Greathead 100 guineas, appropriated £2000 of their funds for the purpose of encouraging the building of life-boats on different parts of the coasts of the kingdom. Life-boats have been sent from Britain, on the order of the Emperor of Russia, who signified his approbation by presenting the inventor with a diamond ring, and by the Kings of Prussia, Denmark, and those of other states.

Previous to Mr. Greathead's invention, a patent was granted to Mr. Lionel Lukin, a coachmaker in London, for 'an improvement in the construction of boats and small vessels, which will neither sink nor upset.' The essence of the invention rests on the propriety and practice of out riggers, well known to the natives of the South Sea Islands. Projecting gunwales are built to vessels of the ordinary construction, sloping from the top of the common gunwale towards the water, so as not to interrupt the oars in rowing; and from the extreme projection returning to the side in a faint curve, at a suitable distance above the water-line. These projecting gunwales are very small at stem and stern, and gradually increase to the requisite dimensions; and they may either be solid, consisting of light substances, of cork, or hollow. In the inside of the vessel at stem and stern, and at the sides where projecting gunwales are unnecessary, as also under the seats and thwarts, are to be enclosures or bulk-heads, water-tight, or filled with substances specifically lighter than water. 'By this means,' the inventor observes, 'the boat or vessel will be so much lighter than the body of the water it must displace in sinking,

that it will with safety carry more than its common burden, though the remaining space should by any accident be filled with water. To give stability to the vessel, the inventor further proposes to affix a false keel of cast iron or other metal along the centre of the real one. The patent granted to Mr. Lukin is dated in 1785. It has not been discovered that he obtained any honorary reward for his invention; but, in the year 1807, a gold medal was voted by the Society for the Encouragement of Arts, to Mr. Christopher Wilson, for a secure sailing-boat, or life-boat, which is balanced exactly according to Mr. Lukin's device, by empty projecting gunwales. For a particular description of this boat, which is called the neutral-built self-balanced boat, see the article *BOAT*.

Captain G. W. Manby, of the Royal Navy, has observed in his Essay on the Preservation of shipwrecked Persons, that the simplest method of giving the properties of preservation to any boat, is to well lash empty casks securely to it, so as to give it buoyancy; and, for the advantage of keeping it in an upright position, when launching from a flat shore or beaching, it should have bilge boards of equal depth with the keel, which likewise resists its upsetting; and a stout projecting rope, with swellings upon it, surrounding its gunwale, would serve as a fender to prevent its being stove. See the article *SHIPWRECK*.

Metallic Life-Boat. A metallic life-boat, on pneumatic and hydrostatic principles, that will neither sink nor upset, yet serve all the ordinary purposes of ships' boats, either for rowing or sailing was lately tried at London-bridge, on the ebb-tide, during the time of the greatest fall, with her crew on board, and filled with water; when she passed through with the greatest safety, and discharged a considerable portion of the water purposely put into her. These life-boats are described as being made of malleable iron, lead, and tin; one of twenty feet long and six feet wide, drawing only ten inches water, with twenty-five persons; and possessing valves that, without pumping or personal aid, discharge all the water from them; which valves act occasionally as pneumatic or air valves: they are hydrostatically ballasted with confined water, taken in or put out at pleasure; and are remarkably buoyant and lively in agitated water.

BOAT, to BALE, or FREE THE BOAT, in navigation, is to fling out the water. To find the boat is to save her from beating against the sides of the ship. To moor the boat, to fasten it with ropes. To trim the boat is to keep her even. To wind the boat is to bring her head about.

BOAT-BELL. See *CANCROMA*.

BOAT-FLY, notonecta, a water insect, whose back is shaped like the bottom of a boat; the hind legs, which are thrice as long as the fore, aptly enough resembling a pair of oars. Accordingly, contrary to all other creatures, he swims, says Moullet, on his back. See *NOTONECTA*.

BOAT-HOOK, an iron hook, with a sharp point on the hinder part of it, fixed on a long pole, used in bringing it to, or pushing it from any other boat, ship, &c.

BOATION. Lat. *boare*. The roar or bel-

lowing of an ox: any roaring, or loud sounding noise.

BOAT-ROPE, the rope by which the boat is fastened to the stern of the ship.

BOATSWAIN, an officer on board a ship, who has charge of all her rigging, ropes, cables, anchors, sails, flags, colors, pendants, &c. He also takes care of the long-boat and its furniture, and steers her either by himself or his mate. He calls out the several gangs and companies to the execution of their watches, works, and spells; and he is also a kind of provost-marshal, seizes and punishes all offenders that are sentenced by the captain or court-martial of the whole fleet. It is the duty of the boatswain particularly to direct what relates to the rigging of a ship, after she is equipped from a royal dock-yard. He ought to take care that the blocks and running ropes are regularly placed, so as to answer the purposes for which they are intended; and that the sails are properly fitted to their yards and stays, well furled or reefed when occasion requires. It is likewise his office to assist with his mates in the necessary business of the ship, and to relieve the watch when it expires; and he is ordered by his instructions to perform his duty with as little noise as possible.

BOATSWAIN'S MATE has the peculiar command of the long-boat, for the setting forth of anchors, weighing or fetching home an anchor, warping, towing, or mooring; and is to give an account of his store.

BOAZ, the son of Salmon, by Rahab the harlot, of Jericho, the second husband of Ruth, and great grandfather of David. Also a name given by Solomon to one of the principal pillars of the temple.

BOB, v. & n. Of uncertain etymology. *BOB'CHERRY,* Skinner deduces it from Span. *BOE'TAIL,* *bobo*, foolish. A bob formerly *BOB'WIG,* signified a mock or jeer. It is now usually applied to any short jerking action. The verb also means to cut, as a cut tail is a bobtail; to beat, to drub, to bang; to play backwards and forwards; to play loosely against any thing; any thing pendant, which when stirred by the air, or any other motion, dangles, and jerks to and fro. Shakspeare and L'Estrange employ it in the sense of cheating, and gaining by fraud. Bob is a technical term used among ringers.

Wete ye not wher stondeth a litel toun,
Which that yeleped is *bob-up-and-down*,
Under the blec in Canterbury way.

Chaucer. Canterbury Tales.

I am sharply taunted, yea sometimes with pinches,
nips, and bobs. *Ascham's Schoolmaster.*

Those bastard Britons whom our fathers
Have in their own land beaten, *bobbed*, and thumped.
Shakspeare.

Avant you curs!

Be thy mouth or black or white,
Or *bobtail* tike, or trundle tail,

Tom will make him weep and wail.

I have *bobbed* his brain more than he has beat my
bones. *Id.*

Live Roderigo,

He calls me to a restitution large,
Of gold and jewels that I *bobbed* from him,
As gifts to Desdemona. *Id.*

There was a *bobtailed* cur cried in a gazette,
and one that found him brought him home to his
master. *L'Estrange.*

You may tell her,
I'm rich in jewels, rings, and *bobbing* pearls,
Plucked from Moors' ears. *Dryden.*

The gaudy gossip, when she's set agog,
In jewels drest, and at each ear a *bob*. *Id.*

Bobcherry teaches at once two noble virtues, pa-
tience and constancy; the first, in adhering to the
pursuit of one end; the latter, in bearing a disap-
pointment. *Arbuthnot and Pope.*

A young fellow riding towards us full gallop, with
a *bobwig* and a black silken bag tied to it, stopt short
at the coach, to ask us how far the judges were be-
hind. *Spectator.*

When Tom to Cambridge first was sent,
A plain brown *bob* he wore;
Read much, and looked as though he meant
To be a fop no more. *Shenstone.*

BOBARTIA, in botany, a genus of the di-
gynia order, and triandria class of plants; rank-
ing in the natural method under the fourth
order gramina. CAL. imbricated: COR. a bivalve
glume, above the receptacles of the fruit. Of
this genus there is only one species known, which
is a native of the Indies.

BOB'BIN. Fr. *bobine*. A quill for a spin-
ning wheel; also a skain of gold or silver thread.
—*Cotgrave.*

I'm sure I always loed consign Con's hazle eyes,
and her pretty long fingers, that she twists this way
and that, over the haspicalls like a parcel of *bobbins*.
Goldsmith.

BOBBING, among fishermen, a manner of
catching eels, thus performed: scour well some
large worms, and with a needle run a twisted
silk through them from end to end, taking so
many as that they may wrap about a board a dozen
times at least: then tie them fast with the two
ends of the silk, which done, fasten all to a strong
cord, and fix on a plummet about three-quarters
of a pound weight, and make the cord fast to a
strong pole. Let this lie at the bottom till you
feel the eels tug lustily at the bait, and when
they have swallowed it sufficiently, gently draw
up the rope to the top, and bring them ashore.

BOBBINS are turned in the form of a cy-
linder, with a little border jutting out at each
end, bored through to receive a small iron pivot.
They serve to spin with the spinning-wheel, or
to wind worsted, hair, cotton, silk, gold, and
silver.

BOBILEE, a town and fortress of Hindostan,
in the circar of Cicacole, famous for sustaining
an attack of the French in 1757, under M.
Bussy. The fortress, which was of a square
form, extended about 200 feet on each side. The
rampart and parapet were covered by a shed of
strong thatch, supported by posts; the eaves of
this shed projecting over the battlement, and af-
fording shelter to those on the rampart, which it
guards against the sun and rain. An area of
500 yards or more, in every direction round the
fort, is preserved clear, of which the circum-
ference joins the high wood, which is kept thick,
three or four miles in breadth, around this
centre. Few of these forts permit more than
one path through the woods, which is com-

manded at every turn by breast-works. The en-
trance of the path from without is defended by a
wall exactly similar in construction and strength
to one of the sides of the fort; having its round
towers at the ends, and the square projection in
the middle.

Such were the defences of Bobilee, which will
serve as a general specimen of the Indian po-
lygar forts, against which M. Bussy marched
with 750 Europeans, of whom 250 were horse,
four field-pieces, and 11,000 peons and sepoy,
the army of Vizeram Rauze, who commanded
them in person.

'The attack commenced,' says Mr. Hamilton,
'at break of day on the 24th of January, 1757,
with the field-pieces against the four towers; and
by nine o'clock several of the battlements were
broken. All the leading parties of the four di-
visions then advanced at the same time with
scaling ladders; but, after much endeavour for
an hour, not a man had been able to gain the
rampart, and many had fallen wounded. Other
parties followed with little success, until all were
so fatigued, that a cessation was ordered; during
which the field-pieces, having beaten down more
of the parapet, gave the second attack greater
advantage; but the ardor of the defence in-
creased with the danger. The garrison fought
with the indignant ferocity of wild beasts, de-
fending their dens and families; several of them
stood, as in defiance, on the top of the battle-
ments, and endeavoured to grapple with the first
ascendants, hoping with them to twist the lad-
ders down, and this failing, stabbed with their
lances; but, being wholly exposed, were easily
shot by aim from the rear of the escalade. The
assailants admired, for no Europeans had seen,
such excess of courage in the natives of Hin-
dostan, and continually offered quarter, which
was always answered by menace and intention
of death; not a man had gained the rampart at
two in the afternoon, when another cessation of
attack ensued. On this, Rangaroo assembled
the principal men, and told them there was no
hopes of maintaining the fort; and that it was
immediately necessary to preserve their wives and
children from the violation of the Europeans, and
the still more ignominious authority of Vizeram
Rauze.

'A number, called without distinction, were
allotted to the work. They proceeded every
man with his lance, a torch, and a poniard, to
the habitations in the middle of the fort, to which
they set fire indiscriminately, plying the flame
with straw prepared with tutch or brimstone; and
every man stabbed, without remorse, the woman
or child, whichever attempted to escape the
flame and suffocation. The massacre being
finished, those who accomplished it, returned
like men agitated by the furies, to die themselves
on the walls.

'Mr. Law, who commanded one of the divi-
sions, observed, while looking at the conflagra-
tion, that the number of defenders was consider-
ably diminished, and advanced again to the
attack. After several ladders had failed, a few
grenadiers got over the parapet, and maintained
their footing in the tower, until more secured
the possession. Rangaroo, hastening to the de-

fence of the tower, was killed by a musket-ball. His fall increased the desperation of his friends, who crowding to revenge his death, left other parts of the rampart bare. The other divisions of the French troops having advanced, numbers on all sides got over the parapet without opposition; nevertheless, none of the defenders quitted the rampart, or would accept quarter, but each advancing against or struggling with an antagonist, would resign his poniard only with his death.

*The slaughter of the conflict being over, another much more dreadful presented itself in the area below. The transport of victory lost all its joy; all gazed on each other with silent astonishment and remorse, and the fiercest could not refuse a tear to the destruction spread before them. Four of the soldiers of Kangaroo on seeing him fall, concealed themselves in an unfrequented part of the fort until the night was far advanced, when they dropped down from the walls, and speaking the same language, passed unsuspected through the quarters of Vizeram Rauze. They concealed themselves in the thicket, and in the third night after, two of them crawled into the tent of Vizeram Rauze, and stabbed him in thirty-two places, and were immediately cut to pieces. Had they failed, the other two remaining in the forest, were bound by the same oath to perform the deed or perish in the attempt. *Orme, &c.* Distant thirty-two miles west of Cicacole.

BOBINGEN, a market town of the Bavarian States, in the circle of the Upper Danube, district of Goggingen, with 1400 inhabitants. Nine miles south of Augsburg.

BOBISATIO, or BOCCDISATIO, in music, denotes the using of the seven syllables, bo, ce, di, ga, lo, ma, ni, to express the seven musical notes in lieu of the six introduced by Aretine, ut, re, mi, fa, sol, la, as has been sometimes done by the Netherland and German musicians since the beginning of the seventeenth century, to avoid the mutation necessary in the use of the latter.

BOBRAWA, Upper and Lower, two market towns of Moravia, in the circle of Brunn, twenty-six miles north-west of Brunn.

BOBROBA, a market town of Austrian Galicia, in the circle of Sandecz, on the river Biala, on the borders of the circle of Jaslow.

BOB-STAY, a rope used to confine the bowsprit downward to the stem, or cut-water. The use of the bob-stay is, to draw down the bowsprit, and keep it steady; and to counteract the force of the stays of the fore-mast, which draw it upwards.

BOCA DEL TORO, a channel of the Spanish main, which enters into Almirante Bay, east of the island of Bocaloro. Long. $82^{\circ} 3' W.$, lat. $9^{\circ} 6' N.$

BOCALIEU, a small island near the east coast of Newfoundland.

BOCALORO, an island of the Spanish main, near the coast of Veragua, at the entrance into Almirante Bay, about thirty miles in circumference. Long. $82^{\circ} 16' W.$, lat. $9^{\circ} 12' N.$

BOCANUM, in ancient geography, a town of Mauritania Tingitana, to the south of Mount Atlas, supposed to be Morocco.

BOCARDIO, in logic, the fifth mode of the first figure of syllogisms, wherein the first proposition is particular and negative; the second, universal and affirmative; and the third, or conclusion, particular and negative. Thus:

Boc Some animal is not man.

Ar Every animal has a principle of sensation.

Bo Therefore something has a principle of sensation that is not man.

BOCAS, Dos, Rio DE, a large river of Brazil, South America. It rises in the country of the Bacares and Cariputangas Indians, and joins the Tajipurú. After its junction, the two rivers run in different directions, the latter towards the north, until it falls into the Amazons, a little before this river enters the sea, and the Dos Bocas towards the east, until it falls into the Tocantins. The two rivers, in their course, enclose the island of Joannes, which is nearly of a triangular figure, and which divides the great stream of the Amazons into the two mouths, by which it disembogues itself into the sea.

BOCAT, a fine valley of Syria, in which are situated the ruins of BALBEC, which see.

BOCAULT'S BAY, a bay in the Straits of Magellan, on the coast of Patagonia, in which Bougainville anchored in 1767. Long. of the anchoring place $71^{\circ} 6' W.$

BOCCA, in glass-making, the round hole in the working furnace, by which the metal is taken out of the great pots, and by which the pots are put into the furnace. This is to be stopped by a cover made of earth and brick, and removable at pleasure, to preserve the eyes of the workman from the violence of the heat.

BOCCACIO (John), one of the most celebrated and learned of Italian writers, was born in Tuscany in 1313. His father first placed him with a merchant, and soon after with a professor of the canon law. Still, however, he thought of nothing but poetry. In the prosecution of his studies generally, however, he sought the best masters, and, not having an income sufficient for his expenses, was particularly indebted to Petrarch both for money and books. He became early a great admirer of the Greek language, and procured a Latin translation of Homer to be made for his own use. The republic of Florence honored him with the freedom of that city; and employed him in public affairs, particularly to negotiate the return of Petrarch: but this poet not only refused the application, but persuaded Boccacio also to retire from Florence, on account of the factions which prevailed. Having quitted Florence, he went to several places in Italy, and stopped at last at the court of Robert, king of Naples; where, conceiving a violent affection for that prince's natural daughter, he remained a considerable time. He also made a long stay in Sicily, where he was in great favor with queen Joan. He returned to Florence when the troubles were appeased: but being averse from the course of life he must have followed there, he finally retired to Cortaldo. His great application to study here brought on an illness, of which he died in 1376. He wrote, 1. *De Genealogia Deorum*. 2. *De Montium, Sylvarum, Fluviorum, &c. nominibus*. 3. *De claris Mulieribus*. 4. *De casibus Virorum et Fœminarum*.

rum illustrium, which work was translated into English by Lydgate. 5. *Ecolægæ*. The Italian poems are, 6. *La Teseide*. 7. *Il Filostrato*. 8. *Amoroso Visione*. 9. *Nimfale Fiesolano*. 10. *Rime*. His productions in Italian prose are, 11. *L'Amorosa Fiametta*. 12. *Il Filocopo*. 13. *Nimfale d'Ameto*. 14. *L'Urbano*. 15. *Origine vita et Costumi di Dante*. 16. *Il Corbaccio*, a satire. 17. *Commento sopra la Commedia di Dante*. But his *Il Decamerone*, a collection of a hundred stories or novels, feigned to have been related in ten days, has been the chief basis of his modern fame; though it is said not a little to have corrupted the morals of its female readers. Petrarch thought this composition contained so many charms that he translated it into Latin; and it is a very curious and striking picture of the manners of the times, and the frauds and licentiousness of priests and monks; the language is eminently elegant and pure for the period. This work has passed through innumerable editions, a copy of the first of which, that of Valdafer, in 1471, was knocked down at the duke of Roxburgh's sale to the duke of Marlborough for £2260.

BOCCALE, or **BOCAL**, a liquid measure used at Rome, answering to what is called a bottle among us, being equivalent to about an English quart. Seven boccales and a half make a rubbia.

BOCCALINI (Trajan), a celebrated satirical writer, born at Rome, who, in the beginning of the seventeenth century, obtained the admiration of all Italy, by his refined and delicate criticisms. Sovereign princes did not escape the lash of his satire. The cardinals Borghese and Gaetan having declared themselves his protectors, he published his *Ragguagli di Parnasso*, and *La Segretaria di Apollo*, which is the continuation of the former. These works were received by the public with uncommon applause. He at length printed his *Pietra di Parangone*; wherein he attacked the court of Spain, exposing its designs against the liberties of Italy. The Spaniards complained of him in form, and resolved to be revenged. Boccacalini retired to Venice, but was there assassinated in a very strange manner. He lodged with a friend, who having risen early one morning, left Boccacalini in bed: a minute after, some armed men entered his chamber, and gave him so many blows with bags full of sand, that they left him for dead; so that his friend returning some time after, found him speechless. Great search was made at Venice for the murderers, but, though they were never discovered, it was universally believed that they were employed by the court of Spain.

BOCCARELLA, in the glass manufacture, a small hole or aperture of the furnace, one of which is placed on each side the bocca, almost horizontally with it. Out of them the servitors take colored or finer metal from the filing pot.

BOCCHUS, a king of Mauritania, who delivered Jugurtha in fetters to Sylla.

BOCCIARDI (Clemente), called Clementone, history and portrait painter, born at Genoa in 1620, was the disciple of Bernardo Strozzi, and afterwards studied at Rome. By an excellent genius, and industrious application, he united and blended the antique and modern gusto, in a

style that exhibited both gracefulness and strength. Most of his works, except his portraits, which were lively, natural, and graceful, are in the chapels of Genoa, Pisa, and other cities of Italy.

BOCCONI (Sylvio), a celebrated natural historian, born at Palermo in Sicily. After he had gone through the usual course of studies, he was ordained priest, and entered into the Cistercian order, when he changed his name Paul into Sylvio. In pursuit of his favorite study, natural history, he travelled through Malta, Italy, the Low Countries, England, France, Germany, Poland, &c.; and in 1696, was admitted a member of the academy of Virtuosi in Germany. Upon his return to Sicily, he retired to a convent near Palermo, where he died in 1704, aged seventy-one, leaving many curious works on botany and other subjects. His *Observations on Natural History* were published in French at Amsterdam 1674, and in Dutch 1744.

BOCCONIA, greater tree celandine: a genus of the monogynia order and dodecandria class, natural order twenty-seventh, rhædæa: *cal.* is diphyllous: *cor.* none: *styl.* bifid: the berry dry, and monospermous. *B. frutescens* is esteemed for the beauty of its large foliage. It is very common in Jamaica and other warm parts of America, where it grows to the height of ten or twelve feet, having a straight trunk as large as a man's arm, and covered with a white smooth bark. *B. cordata* has the leaves cordate, a little lobed. A native of China. *Panicle* elongated, with single, not divided branches: *cal.* white, as in the preceding species, but larger: *stam.* about twenty-four: *styl.* none: *stig.* bilamellated sessile.

BOCCORE, in natural history, first or early fruit. We are informed by Pliny, in his *Natural History*, book xvi. chap. 26, that the fig-tree bore two kinds of fruits, at different periods; the first, which was named boccore, came before the leaves; after that, the leaves; and the true fig followed them. This name is still given to the first or early produce by the Algerines and Tunisians, and was formerly used in Palestine. See *Nalum*, chap. iii. ver. 12; and the miracle of Christ, as recorded by Mark and Matthew.

BOCHART (Matthew), a learned protestant divine of the seventeenth century, was minister of Alençon, and author of, 1. *A Treatise against Relics*. 2. *Another against the Sacrifice of the Mass*, printed at Geneva in 1658. 3. *A Dialogue on the Difficulties which the Missionaries raised against the Protestants of France*. This work led the Elector Palatine to attempt the reunion of the Lutherans and Calvinists at Augsburg. 4. *Diallacticon*, a work containing a plan for that purpose; dedicated to the Elector, and printed at Sedan in 1662. Some have confounded this author with his cousin Samuel.

BOCHART (Samuel), one of the most learned men in the seventeenth century, was born at Rouen in Normandy, and studied successively at Paris under Thomas Dempster, at Sedan, Saumur, and the university of Oxford. Hence he went to Leyden, where he applied himself to oriental learning, under Erpenius and Ludolf. He was a great proficient in the oriental languages, and many

years pastor of a protestant church at Caen, where he was also tutor to Wentworth Dillon, earl of Roscommon. In the castle of Caen he distinguished himself by his public disputations with father Veron, held in presence of a great number of Catholics and Protestants. His reputation was increased in 1646, by the publication of the two parts of his *Geographia Sacra*, entitled *Phaleg* and *Canaan*; as well as by his *Hierozoicon*, printed at London in 1675. This treats de *Animalibus Sacre Scripturæ*. In 1652 the queen of Sweden invited him to Stockholm, where she gave him many proofs of her esteem. At his return to Caen he died suddenly, while he was speaking in the academy, on the 16th of May 1667, aged seventy-eight. A complete edition of his works was published in Holland, in 2 vols. folio, 1712. His death gave occasion to the following epitaph:—

Scilicet hæc cuique est data sors æquissima, talis
Ut sit Mors, qualis vita peracta fuit.
Musarum in gremio teneris qui vixit ab annis
Musarum in gremio debuit ille mori.

To him it was appointed, by an equal lot, that his death should resemble his life. He, who from his tender years had lived in the bosom of the Muses, ought also in the bosom of the Muses to die.

BOCCHETTA, *LA*, a narrow pass and ridge of the Appennines, which separates Genoa from Lombardy. It is very narrow, and of difficult passage; for, though the distance from Novi to Genoa is not more than thirty miles, it often requires fourteen hours to travel from the one place to the other. This pass was formerly considered as the key to the Genoese territory, and defended by redoubts; but the Imperialists forced their way through it in 1746, and the French effected the same object in 1796. The neighbourhood is noted for yielding a beautiful superfine stone variegated with marble.

BOCHIM, in ancient geography, a place where the Hebrews assembled after Joshua's death, supposed to have been near Shiloh. *Judg.* ii. 1—10.

BOCHIUS, or *Bocqu* (John), a Latin poet, born at Brussels, in 1555. He travelled into Italy, Germany, Poland, and Muscovy, and at his return became secretary to the duke of Parma. During his journey from Smolensko to Moscow and Livonia his feet were so severely frost bitten, that amputation was ordered; but the Czar, John Basilides, coming with an army to ravage the country, Bochius fled as fast as he could, and being overtaken, stripped, and beaten by the Russians, the exercise restored the use of his limbs. He died in 1609. The critics in the Netherlands set so great a value on his poetry, that they gave him the name of the Belgic Virgil. He wrote, 1. *De Belgii Principatu*. 2. *Parodia Heroica Psalmorum Davidicorum*. 3. *Observationes Physicæ, Ethicæ, Politicæ, et Historicæ*, in *Psalmos*. 4. *Vita Davidis*. 5. *Orationes*. 6. *Poemata*.

BOCHINA, a town of Austrian Galicia, noted for its salt mines. These have been worked ever since 1261, and seem still to be inexhaustible, employing a vast number of workmen, and

yielding annually about 900,000 quintals of salt. The town is situated on the road from Lemberg to Cracow, twenty miles east of the latter city, and contains about 3200 inhabitants, who are chiefly employed in the mines. Alabaster is obtained in the neighbourhood.

BOCKHOLDT (John), a pretended prophet among the Anabaptists of Germany, in the beginning of the sixteenth century. He was a journeyman tailor of Leyden, one of Munzer's followers, and an associate of Matthias, who also pretended to the gift of prophecy. These two fanatics, in 1533, established a numerous party at Munster. Having made themselves masters of the city, they deposed the magistrates, confiscated the estates of such as had escaped, and deposited the wealth they amassed together in a public treasury for common use. They made preparations of every kind for the defence of the city; and sent out emissaries to the Anabaptists in the Low Countries, inviting them to assemble at Munster, which was now dignified with the name of Mount Sion, that from hence they might be deputed to reduce all the nations of the earth under their dominion. Matthias, who was the first in command, was soon cut off in an act of phrensy, by the bishop of Munster's army; and was succeeded by Bockholdt, who was proclaimed by a special designation of Heaven, as he pretended, king of Sion, and invested with legislative powers like those of Moses. The extravagances of Bockholdt were too numerous to be recited; it will be sufficient to add, that the city of Munster was taken after a long siege and an obstinate resistance, and Bockholdt the mock monarch punished with an ignominious death. See **ANABAPTISTS**.

BOCKHOLT, or **BOCHOLT**, a town and bailiage of Prussia, situate in the grand duchy of the Lower Rhine, principality of Munster, on the borders of Cleves, and containing three parishes, and the large village of Weerd, with a population of about 1200 inhabitants. The town of Bocholt is seated on the river Aa, has 2600 inhabitants, and furnishes good grain, brandy, cotton, and silk; in the neighbourhood there are valuable iron mines. In 1802 both the town and bailiwick were granted as an indemnity to the prince of Salms, and, after forming part of the French empire, came to Prussia with the rest of the principality in 1815. Thirty-six miles W. S. W. of Munster, and twenty-four east of Cleves.

BOCK-LANDS, in the time of the Saxons, were what we now call freehold lands, held by persons of rank, by charter or deed in writing. It was distinguished from folkland, or copyhold land, held by the common people without any written deed.

BODDAERTI, in ichthyology, a species of goby, found in the Indian Ocean. The body is bluish-brown, beneath pale yellow, convex shape, tapering in a slight degree towards the tail, and covered with small soft scales.

BODE, *v. & n.* } *Ang.-Sax.* bodian. To
Bo'DEN, *v.* } make known; to manifest;
Bo'DE'WORD, } to announce; to portend;
Bo'DE'MENT, } to foreshow; to exhibit a
Bo'DING. } sign or token, either of future good, or ill. In the first sense it is used by our elder writers, as in R. Brunne, 'The

bode came to the king,' is simply the news came; it was made known.

There was the dove, with her eyen so meke;
The jelous swan, ayenst his deth that singeth;
The oule eke, that of deth the *bode* he bringeth
Chaucer. Assemblie of Fowles.

This *bodes* some strange eruption to our state.

Hamlet.

This foolish, dreaming, superstitious girl
Makes all these *bodements*. *Shakespeare.*

Macbeth shall never vanquished be, until
Great Birnam wood to Dunsinane's high hill
Shall come against him—

That will never be:

Sweet *bodements*, good.

Id.

I have seen them,
Like *boding* owls, creep into tods of ivy
And hoot their fears to one another nightly.

Beaumont's Bonduca.

other harm

Those terrors which thou speak'st of did me none;
I never feared they could, though noising loud
And threatening nigh; what they can do as signs
Betokening, or ill *boding*, I contemn
As false portents, not sent from God, but thee.

Milton.

You have opposed their false policy with true and
great wisdom; what they *boded* would be a mischief
to us, you are providing shall be one of our principal
strengths.

Spratt's Sermons.

It happened once, a *boding* prodigy! *Dryden.*

If fiery red his glowing globe descends,
High winds and furious tempests he portends;
But, if his cheeks are swoln with livid blue,
He *bodes* wet weather by his watery hue. *Id.*

Sir, give me leave to say, whatever now

The omen prove, it *boded* well to you. *Id.*

That raven on yon left-hand oak

(Curse on his ill-betiding croak)

Bodes me no good.

Gay's Fables.

Bat cawing rooks and kites that swim sublime

In still repeated circles, screaming loud

The jay, the pie, and e'en the *boding* owl,

That hails the rising moon, have charms for me.

Courper's Task.

BODGE, *v. & n.* A word in Shakespeare, which is perhaps corrupted from boggle. To boggle; to stop; to fail; to make bungling work; a low unskilful tailor is commonly called a botcher. Bodge and botch are nearly the same word; the difference seems to be only in their pronunciation and orthography.

With this we charged again; but out, alas!

We *bodged* again: as I have seen a swan,

With bootless labour, swim against the tide.

Shakespeare.

BODIANUS (Portuguese bodiano), in ichthyology, a sea fish like the tench. Bloch, Lacép. Cuv. Schneid., Bodian, belonging to the family of percoides, and order acanthopterygii. Its generic character is, preopercle neither spined nor serrated; opercle having one or more spines. Lacépède subdivides this genus into two; 1st. such as have the tail forked or divided, and 2d. such as have it round and single. Cuvier has, however, preferred the number of the spines to form a subdivision on. These are always placed at the posterior margin of the opercle which is loose; and Cuvier does not consider

that any possess more than three spines. The species are, *B. guttatus*, Bloch; *B. Jacob* Evertson, Lacép. ican-ocara of the Japanese; ganimin of the Malays, Jew fish, Brown, with three spines. The general size is from twelve to eighteen inches, but Bloch believes that the Jew fish, described by Brown in his History of Jamaica, and which measured six feet in length, belongs to this species. It has the dorsal, caudal, and anal fins partly covered with small scales, of a yellowish color, and edged with violet. *B. benak*, Bloch, Lacép.; *B. zebra*, Shaw; striped bodian, also with three spines, and, *B. louti*. Lacép.; *perca louti*, Linn.; *louti* of the Arabs, about two feet long. Also, *B. miniatus*, schneid *perca miniata*, Forsk.; *zarban* of the Arabs. Of a cochineal red color spotted with blue, native of the red sea. With two spines: *B. argenteus*, Bloch; silver bodian. Body oblong, and covered with small silvery scales; the fins are yellow, and the tail edged with blue. It has been taken in the Mediterranean. *B. sebæ*, Schneid.; *perca oblonga*, Seba; *seba bodian*. Body round, head marked with eight or nine brownish zones. With one spine: *B. aya*, Bloch, Lacép.; *B. ruber*, Schneid; *acara aya* of the Brasilians, red bodian. General color red, the back of a deep crimson, the belly silvery. *B. marginatus*, Bloch; *B. apua*, Lacép; *parati apua* of the Brasilians, marginated bodian. *B. striatus*, Schneid; striated bodian. *B. macrocephalus*, Lacép.; great-headed bodian.

BO'DICE, *n. s.* From bodies. Stays; a waistcoat quilted with whalebone, worn by women.

Her *bodice* halfway she unlaced;

About his arms she slyly cast

The silken band, and held him fast. *Prior.*

This consideration should keep ignorant nurses and *bodice* makers from meddling.

BODIN (John), a native of Angers, one of the ablest men in France in the sixteenth century, famous for his Method of History, his Republic, and other works. He was in great favor with Henry III. who imprisoned John de Serre for writing an injurious piece against Bodin, and forbade him upon pain of death to publish it. But his favor was not of long continuance. The duke of Alençon, however, gave him several employments; and carried him to England with him as one of his counsellors, where he had the pleasure to see his book, de Republica, read publicly in the University of Cambridge, having been translated from the French into Latin. In the Ragguagli of Boccacini he is condemned, as an atheist, to the fire, for having said that liberty of conscience ought to be granted to sectaries. Upon the death of the duke of Alençon, Bodin retired to Laon, where he married. He had an office in the presidial of the city; and in Charles IX's time, was the king's solicitor with a commission for the forests of Normandy. He died of the plague at Laon, in 1596.

BOD'KIN, *n. s.* Boddiken, or small body.—*Skinner.* A diminutive of body; a small sharp instrument; a dirk; an instrument with an eye, resembling a common needle, blunted at the point, and used to draw a thread or ribbon through a loop; an implement formerly used to dress the hair.

Then dorste no wight clepen hire but dame :
Was non so hardy, that went by the way,
That with hire dorste rage, or, ones play
But if he wol be slain, of Simekin,
With parade, or with knif or *bodekin*.

Chaucer. Canterbury Tales.

Each of them had *bodkins* in their hands, where-
with continually they pricked him. *Sidney.*

Now meet thy fate, incensed Belinda cried,
And drew her deadly *bodkin* from her side ;
The same, his ancient personage to deck,
Her great great grandsire wore about his neck,
In three seal rings ; which, after melted down,
Formed a vast buckle for his widow's gown :
Her infant grand-dame's whistle next it grew,
The bells she jingled and the whistle blew ;
Then in a *bodkin* graced her mother's hairs,
Which long she wore, and now Belinda wears.

Pope's Rape of the Lock.

If I had stuck him with my *bodkin*, and behaved
myself like a man, since he wont treat me like a
woman, I had, I think, served him right. *Spectator.*

BODLEIAN LIBRARY, in literature, a library
in Oxford, called after its founder, Sir Thomas
Bodley, which is noted throughout Europe, for
its immense collection of valuable books and
manuscripts.

BODLEY (Sir Thomas), founder of the Bodleian
library at Oxford, was born at Exeter, in 1544.
When he was about twelve years of age, his
father, being a Protestant, was obliged to leave
the kingdom. He settled at Geneva with his
family, and continued there till the death of queen
Mary. In that university, then in its infancy,
young Bodley studied the learned languages,
&c. under several eminent professors. On the
accession of queen Elizabeth, he returned with
his father to England, and was soon after entered
of Magdalen College, Oxford. In 1563 he took
his degree of B.A. and the year following was
admitted fellow of Merton. In 1565 he read
a Greek lecture in the hall of that college ; in
1566 he took his degree of M.A. and read nat-
ural philosophy in the public schools. In 1569
he was one of the proctors of the university, and
for some time officiated as public orator. In
1576 he quitted Oxford, and made the tour of
Europe, but returned to his college after four years
absence. He became gentleman-usher to queen
Elizabeth, in 1563 ; and in 1565 married the
widow of Mr. Ball, a lady of fortune. He was
soon after sent ambassador to the king of Den-
mark, and other German princes. He was next
charged with an important commission to Henry
III. of France ; and in 1588 went ambassador
to the United Provinces, where he continued till
1597. On his return to England, finding his
preferment obstructed by the jarring interests of
Burleigh and Essex, he retired from court, and
could never afterwards be prevailed upon to
accept of any employment. He now began the
foundation of the Bodleian library, which was
completed in 1599. Soon after the accession of
king James I. he received the honor of knighthood,
and died in 1612. He was buried in Merton
College. His monument is of a black and white
marble, on which stands his effigy in a scholar's
gown, surrounded with books. At the four cor-
ners are the emblematical figures of grammar,

rhetoric, music, and arithmetic. Sir Thomas
was a polite scholar, an able statesman, and a
worthy man. Granger observes, that he merited
much as a man of letters, but incomparably more
in the ample provision he made for literature, and
that his library is a mausoleum which will per-
petuate his memory as long as books themselves
endure. Sir Thomas wrote his own life to the
year 1609, which in 1703 with the first draught
of the statues, and his letters, were published by
Hearne, from the originals in the Bodleian.

BODMIN, a borough town of Cornwall,
where the summer assizes are held, seated in a
bottom between two hills, which renders the air
unwholesome. It consists chiefly of one street,
and the many decayed houses show that it has
once been a place of greater note. It has a
mayor, sends two members to parliament, and
manufactures serge. It had formerly the privi-
lege of the coinage of tin. It is said to be the
only open borough in the county, and lies thirty-
two miles north-east of Falmouth. Population
about 3000.

BODON, the ancient Viminacium, a fortified
town of Bulgaria in European Turkey, with an
archbishop's see. It is seated on the Danube,
twenty-six miles west of Widdin.

BODUNGEN, GREAT, a market town and
castle of Saxony, on the river Bode, in the prin-
cipality of Schwartzburg-Sondershausen. Here
are some woollen manufactures, and a potash-
work. Five miles north of Bleicheroda.

BOD'Y, *v. & n.* Sax. *bodig*. It ori-
ginally signified the
BOD'IED, } height or stature of a
BOD'ILESS, } man. It is however a
BOD'ILY, *adj. & adv.* } word of most extensive
BOD'Y-GUARD. } and various application. It is applied to the
material substance of an animal opposed to the
immaterial soul ; to the entire person ; to matter
as opposed to spirit ; to the trunk of an animal
or a tree, as distinguished from the limbs or
branches ; to reality as opposed to mere rep-
resentation ; to the main substance, the mass
of any thing ; to a collected number of men
united for any common purpose. To body, body
forth, and embody, is to impart substantial form
and shape ; to clothe ideas in words ; to give
to airy nothing a local habitation and a name ;
to give to spirit a corporeal dwelling.

All the valiant men arose, and went all night, and
took the *body* of Saul, and the *bodies* of his sons, from
the wall. *Samuel.*

Take no thought for your life, what ye shall eat,
or what ye shall drink ; nor yet for your *body*, what
ye shall put on. *Matthew.*

A shadow of things to come ; but the *body* is of
Christ. *Colossians.*

Over all, this strength of *body* and worldly hardi-
nesse causeth, full oft, to many, peril and mischance.
Chaucer. Canterbury Tales.

So every spirit, as it is most pure,
And hath in it the more of heavenly light,
So it the fairer *bodie* doth procure
To habit in, and it more fairly dignit
With chit'rull grace and amiable sight ;
For, of the soule, the *bodie*, forme doth take ;
For soule is forme, and doth the *bodie* make.
Spenser's Hydnos.

Surely, a wise *body's* part it were not to put out his fire, because his foolish neighbour, from whom he borrowed wherewith to kindle it, might say, were it not for me thou wouldst freeze. *Hooker.*

There is in the knowledge both of God and man this certainty, that life and death have divided between them the whole *body* of mankind. *Id.*

Of such as resorted to our Saviour Christ, being present on earth, there came not any unto him with better success, for the benefit of their souls' everlasting happiness, than they whose *bodily* necessities gave occasion of seeking relief. *Id.*

A deflowered maid!

And by an eminent *body* that enforced

The law against it. *Shakspeare.*

'Tis a passing shame,

That I, unworthy *body* as I am,

Should censure thus on lovely gentlemen. *Id.*

This is the very coinage of our brain;

This *bodiless* creation ecstasy

Is very cunning in. *Id.*

Whatever hath been thought on in this state,

That could be brought to *bodily* act, ere Rome
Had circumvention. *Id.*

As imagination *bodies* forth

The forms of things unknown, the poet's pen

Turns them to shape. *Id.*

Thence sent rich merchandizes by boat to Babylon; from whence, by the *body* of Euphrates, as far as it bended westward; and, afterward, by a branch thereof. *Raleigh.*

All philosophers impute the miseries of the *body*
to the soul. *Burton's Anat. Mel.*

God saw,

Surveying his great work, that it was good:

For of celestial *bodies* first the sun,

A mighty sphere he framed, unlightsome first,

Though of ethereal mould. *Milton.*

From these corporeal nutriments perhaps

Your *bodies* may at last turn all to spirit,

Improved by tract of time, and winged, ascend

Ethereal, as we, or may at choice

Here or in heavenly paradises dwell. *Id.*

All civility and reason obliged every *body* to submit.

Clarendon.

The van of the king's army was led by the general and Wilmot; in the *body* was the king and the prince; and the rear consisted of one thousand foot, commanded under colonel Thelwell. *Id.*

There were so many disaffected persons of the nobility, that there might a *body* start up for the king. *Id.*

Virtue atones for *bodily* defects; beauty is nothing worth, without a mind. *L'Estrange.*

Even a metalline *body*, and therefore much more a vegetable or animal, may, by fire, be turned into water. *Boyle.*

These are but shadows,

Phantoms *bodiless* and vain,

Empty visions of the brain. *Swift.*

I shall now mention a particular wherein your whole *body* will be certainly against me, and the laity, almost to a man, on my side. *Id.*

Nothing was more common, than to hear that reverend *body* charged with what is inconsistent; despised for their poverty, and hated for their riches. *Id.*

As clearness of the *bodily* eye doth dispose it for a quicker sight; so doth freedom from lust and passion dispose us for the most perfect acts of reason. *Tillotson.*

This city has navigable rivers, that run up into the *body* of Italy; they might supply many countries with fish. *Addison.*

I am informed, that several asses are kept in *body-cloaths*, and sweated every morning upon the heath. *Id.*

When pigmies pretend to form themselves into a *body*, it is time for us, who are men of figure, to look about us. *Id. Guardian.*

It is his human nature, in which the godhead dwells *bodily*, that is advanced to these honours, and to this empire. *Watts.*

Know then whatever cheerful and serene

Supports the mind, supports the *body* too.

Armstrong's Art of Preserving Health.

But ah! what woes remain! life rolls apace,

And that incurable disease old age,

In youthful *bodies* more severely felt,

More sternly active shakes their blasted prime. *Id.*

BODY, as distinguished from the soul, becomes the subject of ANATOMY, which see. The height of the human body has been said to be different in different parts of the day. It ceases to grow in height, when the bones are arrived at a degree of firmness and rigidity, which will not allow of a farther extension by the effort of the heart and motion of the blood.

BODY, in painting, or To bear a body, signifies that the colors are of such a nature as to be capable of being ground fine, and mixing with the oil entirely, so as to seem only a very thick oil of the same color.

BODY, in physics, an extended solid substance, of itself utterly passive and inactive, indifferent either to motion or rest.

BODY, in the art of war, a number of forces, horse and foot united, and marching under one commander.

BODY, in the menage. A horse is chiefly said to have a good body when he is full in the flank. If the last of the short ribs be at a considerable distance from the haunch bone, although such horses may for a time have pretty good bodies, yet, if they are much labored, they will lose them; and these are properly the horses that have no flank. It is also a general rule that a man should not buy a light-bodied horse, and one that is fiery, because he will soon destroy himself.

BOEBERA, in botany, a genus of plants. Class syngenesia; order polygamia: CAL. double; the outer many-leaved; inner eight-leaved: receptacle naked: down simple. One species only.—*B. chrysanthemoides*. A Mexican plant; erect, branched; leaves pinnate; with toothed leaflets; flowers yellow.

BOECE, or *BOETHIUS* (Hector), a Scottish historian, was born at Dundee about A.D. 1470, and studied with applause in the university of Paris, where he became acquainted with Erasmus, and laid the foundation of a friendship which was honorable to him. In 1500 he was recalled to Aberdeen by bishop Elphinston, who made him principal of that university. Gratitude for this promotion engaged him to write, with particular attention, the Life of that prelate. It appeared in his history of the diocese of Aberdeen; and may be considered, perhaps, as the most valuable portion of that work. His History of Scotland, a more useful undertaking, was first published in 1526. In 1574 it underwent a second impression, and was enriched with the eighteenth book and a part of the nineteenth. A farther continua-

tion of it was executed by Joannes Ferrerius Pedemontanus. Boece died about A.D. 1550. He has been compared, and not without reason, to Geoffrey of Monmouth. He had a propensity to fable and exaggeration: a fault, for which the elegance of his expression does not compensate. His judgment was not equal to his genius: and his fictions as a historian are a contrast to his probity as a man. John Ballenden, archdeacon of Murray, translated his history into the Scottish language at the desire of James V. This translation William Harrison converted, though with imperfections, into English; and his associate Hollingshed published his work in his Chronicle, with additions and improvements by the ingenious Francis Thynne.

BOECLER (John Henry), a German critic and historian, was born in 1611, at Cronheim, in Franconia, and died in 1692, leaving among his works, 1. Editions of Herodian, 8vo.; Suetonius, 4to. 1647; Manilius, 4to. 1655; Terence, 8vo. 1657; Cornelius Nepos, 12mo., Ultraj., 1665; Polybius, 4to. 1666, 1670, 1680; also part of Tacitus, Paterculus, Virgil, Herodotus, and Ovid, &c. 2. *De Jure Gallie in Lotharingiam*, 4to. 3. *Dissertatio de Scriptoribus Græcis et Latinis*, &c. 8vo. *ibid.* 1674. 4. *Bibliographia-Historico-Politico-Philologica*, 8vo. 1677. 5. *Historia Belli-Sueco-Danici, annis 1643—1645*, 8vo., Holm., 1676; Argentorat. 1679. 6. *Historia Universalis*, &c. 8vo. *ibid.* 1680. 7. *Notitia Sacri Imperii Romani*, 8vo. *ibid.* 1681. 8. *De Rebus Sæculi post Christum XVI. Liber Memorialis*, 8vo., Kiel, 1697. 9. *Bibliographia Critica*, 8vo. Leips. 1715.

BOEDGEROENS, a chain of small islands, in a spacious bay of the South Pacific Ocean, near the north coast of New Guinea. Long. 135° 33' E., lat. 2° 25' S.

BOEDROMIA, in antiquity, solemn feasts held at Athens, in memory of the succour brought by Ion to the Athenians, when invaded by Eumolpus son of Neptune, in the reign of Erechtheus. But, according to Plutarch, the Boedromia were celebrated in memory of the victory obtained by Theseus over the Amazons, in the month Boedromion.

BOEDROMION, in chronology, the third month of the Athenian year, answering to the latter part of August and beginning of September.

BOEHMEN (Jacob), called the Teutonic philosopher, was a noted visionary of the seventeenth century, born in a village of Germany, near Gorlitz, in 1575. He was bred a shoemaker; and, marrying, supported a large family by this occupation; until, after amusing himself with chemistry, a visionary turn of mind, heated by sermons and German divinity, overpowered his common sense, and produced raptures and notions of divine illumination. These he first gave to the world in 1612, by a treatise entitled *Aurora, or the Rising of the Sun*, which being censured by the magistrates of Gorlitz, he remained silent for six years: but improving that interval by pursuing the flights of his imagination, he resumed his pen; and resolving to redeem the time lost, he, in the remaining six years of his life, published above twenty books, which greatly needed what he concluded with, A Table

of Principles, or Key to his Writings. This appeared in 1624, and he did not long survive it. He died early in the morning of the 18th of November in that year. Boehmen has not been without numerous admirers both in Germany and England; among whom was the famous William Law, author of *Christian Perfection*, &c. who published an English edition of Jacob Boehmen's works in 2 vols. 4to.

BOEHMERIA, in botany, a genus of plants, class monœcia, order tetrandria. Male: cal. four-parted; no cor. Female: no cal. crowded scales, between each of which is an obovate gem: style one; sepal single and compressed. Species five: West Indian or American plants.

BEOTIA, an ancient kingdom of Greece, founded or rather restored by Cadmus, and so named by him from the ox which is said to have directed him to the place where he built the capital of his new kingdom, better known afterwards by the name of Thebes. Its original names were Aonia, Mesapia, Ogygia, and Cadmeis, and it forms at present a part of Livadia. This country is celebrated as the birth-place of Pindar, Hesiod, and Plutarch, &c.; and its fountains, particularly the Helicon, as the seat of the Muses. Its ancient medals are distinguished generally by the shield called Scutum Beoticum, frequently bearing also the figure of Neptune, who was particularly honored there. As the inhabitants were more generally distinguished as a nation by the name of Thebans, we refer to the article THEBES for their history, &c.

BOERHAAVE (Herman), one of the greatest physicians, as well as the best of men, that any age has ever produced, was born in 1688 at Voorhout, a village near Leyden. At the age of sixteen he found himself without parents, protection, advice, or fortune. He had already studied theology and the other ecclesiastical sciences, with the design of devoting himself to a clerical life; but the science of nature, which had equally engaged his attention, soon engrossed his whole time. This illustrious person, whose name afterwards spread throughout the world, and who left at his death above £200,000, could at that time barely live by his labors, and was compelled to teach the mathematics to obtain his bread. But in 1693, being admitted M.D., he began practice; and his merit being at length discovered, many powerful friends patronised him, and procured him three professorships in the university of Leyden: viz. those of medicine, chemistry, and botany. The Academy of Sciences at Paris, and the Royal Society at London, invited him to become one of their members. He communicated to each his discoveries in chemistry, and his fame was now rapidly diffused throughout Europe. The city of Leyden became in his time the school of Europe for chemistry, as well as medicine and botany. When Peter the Great went to Holland in 1715, to instruct himself in maritime affairs, he also attended Boerhaave, and his reputation is said to have spread as far as China: where a Mandarin wrote to him with this inscription, 'To the illustrious Boerhaave, physician in

Europe;' and the letter came regularly to him. It has been affirmed, that, from the time of Hippocrates, no physician has more justly merited the esteem of his contemporaries, and the thanks of posterity, than Boerhaave. His piety, and the qualities of his heart, also deserve commendation. It was his daily practice through life, as soon as he rose in the morning, which was generally very early, to retire for an hour to prayer and meditation on the Scriptures. He often told his friends, when they asked him how it was possible for him to go through so much fatigue, that it was this which gave him spirit and vigor in the business of the day. The health of the body, he said, must be promoted by the tranquillity of the mind; and that he knew of nothing which could support himself, or his fellow-creatures, amidst the various distresses of life, but a well-grounded confidence in the Supreme Being. This he strongly exemplified in his own severe illness in 1722, by which the course of his lectures as well as his practice was long interrupted. He was for five months confined to his bed by the gout, until he determined to try whether the juice of fumitory, endive, or succory, taken thrice a day in a large quantity (viz. above half a pint each dose), might not contribute to his relief; and by a perseverance in this method he recovered. Boerhaave never regarded calumny or detraction, nor ever thought it necessary to confute them. 'They are sparks,' said he, 'which, if you do not blow, will go out of themselves. The surest remedy against scandal, is to live it down by a perseverance in well doing.' Being once asked by a friend, who had often admired his patience under great provocations, whether he knew what it was to be angry, and by what means he had so entirely suppressed that impetuous and ungovernable passion; he answered, with the utmost frankness and sincerity, that he was naturally quick of resentment; but that he had, by daily prayer and meditation, at length attained a mastery over himself. About the middle of the year 1737 he felt the first approaches of the illness which brought him to the grave, viz. a disorder in his breast, which at times threatened him with immediate suffocation, and terminated in an universal dropsy. During this lingering illness, however, his firmness did not forsake him; he neither intermitted the necessary cares of life, nor the proper preparations for his death, which took place the 23d day of September, 1738, in the seventieth year of his age. The city of Leyden has raised a monument in the church of St. Peter, Salutifero Boerhavi genio sacrum. It consists of an urn upon a pedestal of black marble: six heads, four of which represent the four ages of life, and two the sciences in which Boerhaave excelled, from a group issuing between the urn and its supporters. The capital of this basis is decorated with a drapery of white marble, in which the artist has shown the different emblems of disorders and their remedies. Above, upon the surface of the pedestal, is the medallion of Boerhaave: at the extremity of the frame, a ribbon displays the favorite motto of this learned man; *Simplex sigillum veri*, 'Truth unarrayed.' He wrote, 1. *Institutiones Medicæ*; 2. *Aphorismi de Cognoscendis et Curandis Mor-*

bis; 3. *Institutiones et Experimenta Chemicæ*; 4. *Libellus de Materia Medica, et Remediorum Formulæ quæ Serviant Aphorismis*; 5. *Elementa Chemicæ*; 6. *De studio Hippocratico*; 7. *De Usu Ratiocinii Mechanici in Medicina*; 8. *De Comparando certo in Physicis*; 9. *De Vita Bernardi Albani*; 10 and 11. *Indices Plantarum in horto Lugd. Bat.*; 12. *De Fabrica Glandularum*; 13 and 14. *Atrocium Morborum Historiæ*; 14. *De Lue Aphrodisiaca, &c.*

BOERHAAVIA, a genus of the monogynia order, belonging to the monandria class of plants: CAL. none: COR. monopetalous, campanulated, and plaited: SEED one, naked. There are twelve species, all natives of the West Indies. Some of their plants rise five or six feet high, but most of them only eighteen inches or two feet. The principal are: *B. esceta* of the West Indies, with ovate undulate leaves, and white corolla with five reddish stripes. *B. excelsa*, with a longer stem, and longer purple flowers.

BOERNERIANUS CODEX, in biblical history, a MS. of part of the New Testament, noted G, in the second part of Wetstein's New Testament. It belonged to Dr. C. F. Boerner, was collated by Kuster, and described in the preface to his edition of Mill's Greek Testament. It contains the epistles of St. Paul, that to the Hebrews excepted, which was formerly rejected by the church of Rome; it is written in Greek and Latin, according to one of those versions which were in use before the time of Jerome. The Latin is interlined between the Greek, written over the text, of which it is a translation. That it is an ancient MS. appears, says Michaelis, from the form of the characters, and the want of accents and marks of aspiration. From the correspondence of the letters *r*, *s*, and *t*, in the Latin translation, to that form which is found in the Anglo-Saxon alphabet, it is inferred that this MS. was written in the west of Europe, probably between the eighth and twelfth centuries. This MS. is preserved at present in the electoral library at Dresden.

BOETES, small guns made of wrought or cast iron, which are laid in a vertical position, after they have been loaded with gunpowder, and then plugged up with a wooden stopper. These guns are let off, like other pieces of ordnance, by applying the match to the bottom of the box. The train, along which the fire is conveyed, consists of gunpowder with bran, in order to secure the latter from moisture.

BOETHICUS, in entomology, a species of hesperia, inhabiting India. The wings are tailed, bluish-brown, pale ash color beneath, and undulated with whitish; a double ocellar spot in the anal angle.

BOETHIUS (Hector). See **BOECE**.

BOETHIUS, or **BOETIUS** (Flavius Anicius Manlius Torquatus Severinus), a prose as well as political writer of the sixth century, descended of one of the noblest families in Rome. He was born about the period when Augustulus, whose fears had induced him to a resignation of the empire, was banished, and Odoacer king of the Herulians began to reign in Italy, viz. about A. D. 479. Boetius's father dying while he was an infant, his relations undertook the care of his edu-

cation. His excellent parts were soon discovered ; and to enrich his mind with the study of philosophy, as well as to perfect him in the Greek language, he was sent to Athens. Returning young to Rome, he was soon distinguished and promoted to the principal dignities in the state, and at length to the consulate. Though living in great affluence and splendor, he studied theology, mathematics, ethics, and logic ; and his success in each of these branches appears from his works still extant. At this time Theodoric the Goth had attempted to ravage Campania ; and it was owing to the vigilance and resolution of Boetius that that country was preserved from destruction. At length, Theodoric, having murdered Odoacer, became king of Italy, where he governed thirty-three years with prudence and moderation, during which time Boetius possessed a large share of his esteem and confidence. Justin, emperor of the East, now made an edict condemning all the Arians, except the Goths, to perpetual banishment from the eastern empire : in this edict Hormisdas bishop of Rome, and the senate, concurred. But Theodoric, who was an Arian, was extremely troubled at it, and conceived an aversion against the senate for the share they had borne in this proscription. Of this disposition in the king, three men of profligate lives and desperate fortunes, Gaudentius, Opilio, and Basilus, took advantage ; and entertaining a secret desire of revenge against Boetius, for having been instrumental in the dismissal of Basilus, they accused him of several crimes ; such as the stifling a charge, which was to involve the whole senate in the guilt of treason : and an attempt, by dethroning the king, to restore the liberty of Italy ; and, lastly, they suggested that, to acquire the honors he possessed, Boetius had recourse to magical art. He was at this time at a distance from Rome ; however, Theodoric transmitted the complaint to the senate, enforcing it with a suggestion that the safety, as well of the people as the prince, was rendered very precarious by this supposed design to exterminate the Goths : and the senate, without summoning him to his defence, condemned Boetius to death. The king, however, mitigated the sentence to banishment. Ticinum, now Pavia, in Italy, became the place of his exile ; and here, separated from his relations, who had not been permitted to follow him, he endeavoured to derive from philosophy those comforts which it was capable of affording, and composed that valuable discourse, entitled *De Consolatione Philosophiæ*. About two years after his banishment, Boetius was beheaded in prison by the command of Theodoric. His tomb is to be seen in the church of St. Augustine, at Pavia. The extensive learning and eloquence of this great man are conspicuous in his works, which seem to have been collected with great care ; an edition of them was printed at Venice, in one volume folio, in 1499. In 1570 Glareanus, of Basil, collated that with several MSS., and published it, with a few various readings in the margin. His chief performance, *De Consolatione Philosophiæ*, is well known in the learned world. Our Saxon king Alfred, whose reign, though happy upon the whole, was attended with great vicissitudes of fortune, had recourse to it at a

time when his distresses compelled him to seek retirement ; and, that he might the better impress upon his mind the noble sentiments inculcated in it, he made a complete translation of it into the Saxon language. Camden relates that queen Elizabeth also, during the time of her confinement by her sister Mary, read, and afterwards translated it into very elegant English. Boetius is also the most considerable of all the Latin writers on music ; his treatise *De Musica* supplied for some centuries the want of those Greek MSS. which were supposed to have been lost.

BOFFRAND (German), a celebrated French architect, was the son of a sculptor by a sister of the famous Quinault, and born at Nantes in 1667. He was trained under Hardouin Mansard, who trusted him with the execution of his greatest works. His manner of building approached to that of Palladio. He was employed by many German princes, and constructed a number of bridges, &c. He was admitted into the French academy, and wrote a book on the principles of architecture, with an account of the various plans, elevations, &c. of the principal works he had executed. He was a man of a disinterested spirit, and pleasing manners. He died at Paris in 1755, aged eighty-eight.

BOG', *v. & n.* } Dutch, *boogen* ; Irish, *bog* ;
 BOG'GY, } Fr. *bague*. That which gives
 BOG'LAND, } way to pressure ; a ground too
 BOG'TROTTER. } soft to bear the weight of any
 body ; marshy ; swampy. Ang.-Sax. *bugan*, to
 bow ; to bend ; to yield.

Through fire and through flame, through ford and whirlpool, o'er *bog* and quagmire. *Shakspeare.*

A gulf profound ! as that Serbonian *bog*,
 Betwixt Damietta and mount Casius old.

Milton.

All unawares,
 Fluttering his pennons vain, plumb down he drops
 Ten thousand fathom deep ; and to this hour
 Down had been falling, had not, by ill chance,
 The strong rebuff of some tumultuous cloud,
 Instinct with fire and nitre, hurried him
 As many miles aloft : that fury stay'd,
 Quenched in a *boggy* syrtis, neither sea,
 Nor good dry land ; nigh foundered on he fares,
 Treading the crude consistence half on foot,
 Half flying ; behoves him now both oar and sail,

Milton.

He walks upon *bogs* and whirlpools ; wheresoever
 he treads, he sinks. *South.*

Learn from so great a wit, a land of *bogs*,
 With ditches fenced, a heaven fat with fogs. *Dryden.*

He is drawn, by a sort of ignis fatuus, into *bogs*
 and mire almost every day of his life. *Watts.*

Bog properly signifies a quagmire covered with grass, but not solid enough to support the weight of the body, in which sense it differs only from marshes or fens, as a part from the whole. These soft masses of earth have been sometimes known to move out of their place. There was an instance of this in the year 1697, about Charleville, in the county of Limerick. A noise was heard for some time under ground like that of thunder at a great distance ; and soon after this the earth of a large bog in the neighbourhood began to move, and a hill situated in the middle of it stood no longer above the level of the rest, but sunk flat.

Not only the bog itself moved, but the neighbouring pasture-lands also, though separated by a large and deep ditch, partook of the motion for a considerable time, the surface of the moving earth rising into a sort of waves, but without breaking up or bursting any where. The pasture-lands rose very high, and were carried on in the same motion till they rested upon a neighbouring meadow, the whole surface of which they covered, remaining sixteen feet deep upon it. The whole quantity of the bog was torn from its former seat and left great gaps in the earth where it had joined, which threw up foul water, and very stinking vapors. *Phil. Trans.* No. 233.

BOGALCUND, a district of Hindostan, in the province of Gundwana; bounded on the west by the British possessions in Bundelcund; on the east by the territory of Manwas; and watered by the rivers Soane, Bichanuddy, and Behennuddy. It lies in about the 25° N. lat. and 82° E. long. Its exact dimensions, though not ascertained, appear to be considerable. It is in great part fertile, and well cultivated with wheat, barley, and peas; the natives have also numerous herds of black cattle, and large flocks of sheep, and it is traversed by good roads. Its access from Allahabad, to which it was annexed by Aurengzebe, is by a pass called Sohagee Ghaut, long, steep, and difficult, having at its extremity a strong redoubt. From hence Bogalcund is quite table-land. The inhabitants, called Bogals, Bogheleis, or Boghels, are reported to have migrated hither from Guzerat many centuries ago, and gradually to have encroached on their neighbours. They consist of five different tribes, acknowledging the same government, but without admitting an equal control, or paying the like obedience to it. Part, or the whole, profess the Mahommedan religion, and many temples are to be seen here. Three of these tribes follow a practice, too general in the east, of destroying their infant daughters. The chief town is Rewah, which is a populous place, situate on the small river Bichanuddy, rising twenty miles eastward, and joined by the Behanuddy just above the town. The streams run immediately under a large fort in the capital, which includes the residence of the rajah, and the houses of the most respectable inhabitants. It stands in lat. 24° 37' N., and 81° 25' east longitude; distant 126 miles north-east of Benares. Bogalcund has its own independent rajahs, who formerly exercised considerable influence over India affairs, and have afforded an asylum to some of the most powerful princes of the East in adversity. Here the family of Humayoon, emperor of the Moguls, retired from Delhi, on a usurpation of his throne in 1542, and the great Acber, his son, was born soon after. The empress having arrived was taken immediately, we are told, in labor; but the astrologers having determined that the child, to be fortunate, must be born a little later, the mother was actually suspended by the legs two hours to retard the birth!

BOGGLE, *v.* & *n.* } Johnson says from
BOG'GLER, } Dutch, *bogil*, a spectre;
BOG'GLISH, } a bugbear; a phantom;
but he does not tell us how *bogil* obtained this meaning. We are inclined to the etymology of

Skinner, adopted by the Ency. Met., that boggle is the diminutive of bog, and that its definition is, to stick in the mud; laboring in vain to disembarass yourself; to proceed as if every moment sinking in a bog, or apprehensive of it: hence to boggle is to attempt a thing clumsily; to be perplexed and to hesitate. The idea of a spectre or bugbear connected with the bog, is probably derived from the luminous vapors and exhalations which are general in bogs, and which often assume fantastic shapes, sufficient to alarm and terrify the ignorant rustic who may approach them at night.

You *boggle* shrewdly; every feather starts you.

Shakspeare.

You have been a *boggler* ever.

Id.

And never *boggle* to restore

The members you deliver o'er,

Upon demand.

Hudibras.

Nature, that rude, and in her first essay,
Stood *boggling* at the roughness of the way,
Udd to the road, unknowing to return,
Goes boldly on, and loves the path when worn.

Dryden.

The well-shaped changeling is a man that has a rational soul, say you? Make the ears a little longer, and more pointed, and the nose a little flatter than ordinary, and then you begin to *boggle*.

Locke.

BOGIN (John Baptist), a native of Turin, was born in 1701. At seventeen he was made a doctor of laws, and in 1730, Victor Amadeus raised him to be high chancellor. Under Charles Emmanuel he also filled several high offices with distinguished talent and success. Piedmont and Sardinia are indebted to him for many useful institutions. He was however dismissed after the death of Charles Emmanuel. He died in 1784.

BOGLION **BOGLIUNO**, or **BULLION**, a market town of Austria, in the province of Istria, county of Mitterburg, situated in a hilly country where abounds in corn, oil, and wine. Twenty-seven miles S. S. E. of Trieste.

BOGLIPORE, or **BRAGELPORE**, a considerable district of the province of Bahar, Hindostan. It is nearly equally divided by the Ganges, and part of it is very productive. About the year 1780, Mr. Cleveland, a British judge and collector, first introduced civilisation among them. The country abounds with tigers, and other wild animals; very fine honey is also found.

BOGLIPORE, the capital of the above district, on the south bank of a branch of the Ganges, is about two miles from that river. It is handsome and flourishing, being the residence of all the civil officers, and has an extensive manufacture of mixed silk and cotton cloths.

BOGMARUS, or **VOGMERE**, in ichthyology, the Virgin of the Gulphs, so called by Schneider, a genus of fishes, of the order acanthopterygii, family tanioides. Its characters are: dorsal fin extends along the whole back; the pectoral fins are small; and the tail consists of four radii. No anal or ventral fins. The species are 1. *B. islandicus*, about four feet long, with the body long and compressed, covered with deciduous silvery scales; the vertex parallel with the back, broad above the nostrils, and keel-shaped near the spine: from the middle the body begins to diminish, and terminates in a sharp tail. 2. *B.*

lanceolatus, Cuv.; regalec lanceolé, Lacep.; lance-tailed vogmere. This fish is described by Lacépède in his genus regalecus, but it cannot belong to that as it does not possess any ventral fins.

BOGODUCHOW, a considerable town of Charkov, in European Russia. The occupation of the inhabitants is the tanning of leather; the population 6800. Here are held six yearly markets. Eighty-four miles N. N.W. of Charkov.

BOGOMILI, or **BOGARMITÉ**, in church history, a sect of heretics, which arose about the year 1179. They held that the use of churches, of the sacrament of the Lord's Supper, and all prayer, except the Lord's Prayer, ought to be abolished; that the baptism of Catholics is imperfect; that the persons of the Trinity are unequal; and that they oftentimes made themselves visible to those of their sect.

BOGORODITZK, a town of Russia, in Europe, the capital of a circle in the government of Toula. It consists of eight principal and six cross-streets, and has an imperial castle, with a garden, four churches, 400 houses, and 5000 inhabitants, sixteen miles east of Toula, and 456 S. S. E. of St. Petersburg.

BOGOTA, **Rio Dr.**, or **FUCHA**, a large river of South America, in the kingdom of New Granada, rising near the city of Santa Fè. After watering the elevated plain on which that city stands it forms the cataract of Tequendama. A little above the fall, the river is about 140 feet wide, but it suddenly contracts to the width of forty feet before it reaches the crevice. Here, by a kind of double bound, the water is precipitated downwards nearly 600 feet perpendicular; from the yawning gulf, a column of vapor rises like a thick cloud, and may be seen at Santa Fè, a distance of fifteen miles.

BOGOTA is also a river in the kingdom of Quito, which unites itself with the Santiago and San Miguel, before they form the port of Limona in the Pacific Ocean.

BOGWANGOLA, a large and flourishing town of Bengal, in the district of Moorsshedabad, on the south bank of the Ganges, which encroaches upon it rapidly; the houses are therefore entirely constructed of wood, bamboos, and mats. It is chiefly inhabited by the agents of the merchants of Moorsshedabad, and is the depot of great part of the commodities destined to or from that city during the dry season.

BOHADDIN, or **BOU-A-LDYN**, an eminent Arabian writer and statesman, better known in the East under the appellation of Ibn Sjeeddad, the son of Sjeeddad. He was born at Mossul in the year 539 of the Hegira, 1145 A. D., and became early eminent in the study of the Koran, as well as that of jurisprudence. At the age of twenty-seven, he became repeater or lecturer at Bagdad; and soon after professor in a College founded at Mossul. In 1187, he made the pilgrimage to Mecca, and proceeded to visit Jerusalem and Hebron. In passing through Damascus, he was sent for by the sultan Saladin, then waging war against the enemies of the faith. He, therefore, composed a treatise on The Laws and Discipline of Sacred War; and made a collection of all the passages in the Koran and books

of traditions, in which the extermination of infidels is recommended. This work, on his return, he presented to Saladin, who received it with great favor. Bohaddin afterwards wrote several works on Jurisprudence, Morals, and Divinity; and finally, a Life of Saladin, of which the learned Schultens published an excellent edition in folio, at Leyden, 1732.

BOHAR, in ichthyology, a species of sciæna, a native of Arabia. The color is red, lineated, and clouded with white. The body is of an oblong form, and covered with smooth scales; there are two large spots on the back, which disappear after the fish is dead. There are two short cirri: in the upper jaw two subulate teeth, projecting beyond the lower. The lateral line runs nearer to the back. Dorsal and anal fins rounded behind, and the unarmed part of both scaled, the spines of the latter growing gradually larger: ventral connected by an intermediate membrane. Tail bifid.

BOHÈMIA, an ancient kingdom of the Austrian empire, in the centre of Germany, so called from the Boii, a branch of the Celts, who passed from Gaul into Germany about 600 years before the Christian era. Having proceeded to the frontiers of Quadi and Sarmatia, they settled themselves in that part of the ancient Hercynian forest, under their leader Segovesus. About the period of the birth of Christ, they were conquered by the Marcomanni, who held the country till the sixth century, when they were driven out by the Slavonians, under a leader named Czechow, after whom the Bohemians still call themselves Czechowians, and their country Czechy. Some writers state that they at this time received the knowledge of Christianity.

Bohemia is situated between latitude 48° 30' and 51° 5', and bounded by Saxony and Silesia on the north, Bavaria and Austria Proper on the west and south, and Moravia on the east. It is of an oval figure, comprising about 20,245 square English miles, and a population, according to the latest enumeration, of 3,203,300 individuals, or about 158 persons to each square mile. It once included, besides the present kingdom, Moravia, Silesia, and Lusatia. In 1751 Bohemia was divided into sixteen circles, exclusive of Prague, which ranks as a separate district, each of which derives its name from its chief town. The following was their extent and population in 1811:—

Circles.	Square miles.	Population.
Prague, district of	55	81,966
1. Beraun	1406	131,770
2. Biczow	1053	195,117
3. Budweis	1670	169,025
4. Buntzlau	1617	313,592
5. Chrudim	1362	241,786
6. Czaslau	1298	178,259
7. Elbogen	1000	188,472
8. Kaurzim	1037	142,805
9. Klattau	872	139,265
10. Königsgrätz	1287	262,802
11. Leutmeritz	1349	291,138
12. Pilsen	1596	168,943
13. Prachin	1830	209,416
14. Rakonitz	1064	133,015
15. Saatz	819	118,086
16. Tabor	1277	159,639

The Moidau, flowing from north to south, divides Bohemia into two parts, and, passing the capital, falls into the Elbe. Werner thinks that the site of this kingdom was once occupied by a great inland sea, the waters of which finally forced their way through the rocky pass by which the Elbe now passes the Bohemian frontier into Saxony. This is at the present time its principal river, receiving in its course the tributary streams of the Moldau, the Aupa, the Crelitz, the Orlitz, the Dobrawa, the Iser, and the Eger. The surface of Bohemia is one general and continued declivity towards the centre. Round the north-east frontier stretch the Sudetic chain and the Riesengebürge; the mountains of Moravia encompass it on the south and south-east; the Bohmerwald (a part of the ancient Sylva Hercynia), rises on the west, and the Erzgebürge on the north. No stagnant waters or marshy lands, are found. Its immense margin of mountains is composed of granite, upon which mica, gneiss, slate, porphyry, and other primitive rocks are deposited; on which again, rest limestone, sandstone, floatz, and other species of later formation. The highest summits of the Bohmerwald are covered with a kind of brushwood; but the upper parts of Riesengebürge are almost bare, and the snow remains in hollows during the whole year. The loftiest and most naked branch of this chain is called, in German, Riesengebürge, the mountains of the giants. The Sudetes are a noble rampart of mountains, surmounted by mountains placed almost transversely. Their principal masses are composed of granite, round which, as a nucleus, are formed strata of porphyry, and mica and clay slate. On the south-east the granite disappears, and the mountains dwindle. This intermediate chain, which connects the Sudetes with the Carpathian Alps, is called by a general name Moravian Hills, or Gezenkergebürge, lowered mountains. The mountains of Carlesberg and Maunhast gird Bohemia on the south, and touch, on the west, the hills named the Forest of Bohemia (Bohmer-Wald), which are much less elevated than the Sudetes, and are clothed with verdure to the top. At the western extremity of Bohemia, the Fichtelgebürge, or mountain of pines, rises to the height of 3630 Rhenish feet, and forms a common centre to the three chains which separate Franconia from Saxony, as well as Bohemia from Saxony and Bavaria. Between Saxony and Bohemia, run the mountains named Erzgebürge, or metallic mountains, which join the Sudetes in Lusatia. On the Saxony side, these mountains rise to the height of 3600 or 3700 feet above the level of the sea. On the Bohemian side, they present a great number of basaltic elevations ending in peaks, which give a most beautiful and picturesque finish to this part of the scenery.

The climate of Bohemia is said to be delightful; and the spring season of Italy itself not more enchanting. Neither summer nor winter occur in extremes; the same mountains that shelter it from winds, afford those salubrious streams which refresh and fertilise every thing around them. The soil of its noble plains is also extremely fertile, supplying not only its numerous population, but the greater part of

Silesia and Saxony, with grain. Hops, flax, and hemp, are also grown in considerable quantities; as well as many kinds of superior fruit. The first of these articles is nowhere excelled: and vineyards, upon a small scale, are interspersed through the country. From the Statement of the Extent and Produce of arable lands in Austria, made by M. Blumenbach in 1816, it appears that the extent of arable land in this country is 2,828,437 joch, and taking away one-third as fallow land, 1,835,618 joch remain, whence the average of each joch will be at least thirteen metzen. The joch is about an English acre and a half, and a metzen $1\frac{3}{4}$ Winchester bushels; by dividing, therefore, $22\frac{3}{4}$ by $1\frac{3}{4}$, we shall have $15\frac{1}{2}$ bushels as the average produce of each English acre. The entire yearly average, from 1785, has been 1,874,241 metzen of wheat, 10,067,145 metzen of rye, 4,149,429 metzen of barley, and 8,278,546 metzen of oats. The extent of the Bohemian vineyards is stated by this writer at about 4408 joch, and the produce at rather less than six eimers per joch, which gives 26,443 eimers for the whole produce. M. Blumenbach states the average return for the above period to have been annually 26,326 eimers. Now, the eimer being equal to fifteen English wine gallons, this is only about sixty gallons, or less than a hoghead for each English acre.

Excellent cattle are bred here, and very valuable horses. The breed of sheep also has been decidedly improving of late years, but their numbers seem to be decreasing. In 1813 they stood thus:—

Oxen	257,779
Cows	617,476
Horses	119,122
Sheep	1,090,241

The whole produce of the Austrian empire in the last article of stock not being more than 2,669,627. Here are also vast herds of swine, and domestic and wild fowl, and all sorts of game in abundance.

The minerals of Bohemia are also important. Gold has been found in various parts, but has not been worked with much success. The richest silver mines were once at Kuttenburg, but these are now inundated. From Joachimstahl, the district of Elnbogen, and the circles of Pilsen and Prachin, are yielded about 2400 marks, of eight ounces, annually. Of iron, diffused through the mountains of Bohemia, 200,000 quintals; a little copper and lead from Elnbogen, and valuable tin from Bohemia proper. The revenue of the mine production, altogether, is taken at about £100,000 yearly, a million florins of Vienna. Other minerals afforded by the country are, antimony, arsenic, bismuth, cobalt, zinc, sulphur, and black and brown coal. Alum is also abundant, and in some parts limestone, and porcelain clay. There are also rich quarries of beautiful marble, especially at Tesin in the circle of Beraun. Jasper is found in considerable quantities, as well as alabaster, asbestos, serpentine. Several gems are found in Bohemia, viz. sapphire, topaz, precious garnet, hyacinth, and pyrope. The sapphires are small, and of but little value; the topazes scarcely equal those of Saxony; the pre-

cious garnet has a good fire and water; the hyacinths are small, and not fit for the purposes of jewellery; and the pyrope, (the carbo pyropus of the ancients), is remarkable for its fine deep blood-red color and great transparency, and is in high estimation. Very fine agates also occur.

Linen is an article of much importance in Austria; and Bohemia and Moravia are the principal seats of the manufacture. In the year 1801 the number of spinners of flax in Bohemia alone, amounted to 230,000; the weavers to 85,000; and, by the calculations made in 1808, they appeared to be increasing. The manufactures include, in addition to linen, woollens, cottons, silks, cambrics, thread, laces, hats, paper, ribbands, stockings, hardware, porcelain, mirrors, fire-arms, and tin works of all descriptions. The commerce of Bohemia is fettered by the soccage of the towns, and the want of great points of concentration; still there are few countries where the balance of trade is more uniformly favorable. It is said, that there is also another circumstance extremely prejudicial to the interests of the natives; the disproportionate number of Jews, and, in some districts, of Greeks and Armenians, who have engrossed almost all the trade of the country. 'It is a demonstrable and notorious fact,' says Schreyer, in his work on the Commerce and Manufactures of Bohemia, 'that in every town, and in every place where the Jews are established, the Christian tradesmen are reduced to the most wretched condition, and that the Jews have enriched themselves at their expense. The traffic is principally in its own manufactures, and the countries to which Bohemia principally exports, are Austria, Spain, Portugal, Italy and Turkey. The elegance of its cut glass ware, we should here add, occasions such a demand for it, that it is sent not only to most of the European nations, but to America. There is a chamber of commerce resident at Prague, subordinate to that of Vienna. This chamber consists of a president, who is, at the same time, a privy counsellor, of six counsellors, and some other officers. Subordinate to them are eight inspectors of the provinces, who make regular tours through the districts assigned them, examine the various factories, and give in a report of them to the chamber.

No part of the Austrian dominions, except perhaps some parts of Italy, is equally populous. The number of inhabitants in 1789, amounted to 2,852,463; in 1811 to 3,137,495: of the latter number 1,429,725 were males, and 1,684,543 females; yet it is asserted, and desolate towns, castles, and villages, confirm the account but too well, that Bohemia is in this respect inferior to what she was in former days, before religious and political persecution drove thousands of her inhabitants from their homes.

The emperor of Austria is at present king of Bohemia, and the general government consists of six courts. 1. The Council of Regency, or great Royal Council, which consists of the supreme Judge, or Burggrave of Bohemia, with eighteen Lieutenants of the king, and other assessors. 2. The superior Chamber of Justice in which the Grand Master of the kingdom presides. 3. The Chamber of fiefs. 4. The new Tribunal,

for judging the appeals of the German vassals, having a president, vice-president, and other officers. 5. The Royal Chamber of finances, under the superintendence of a president and vice-president; and the Chancery, which always follows the Court, and is consequently established at Vienna. The States or Legislative body, consist of the nobles, clergy, and deputies, from several towns, which meet annually at Prague, the capital, rather to receive the orders of the Court than to enact any legislative measures. There are also Courts of Justice established in each of the circles, with the privilege of appeal to the High supreme Court at Prague.

The Bohemian nobility are not numerous, but are on the whole in better circumstances than in other parts of Germany: there are reckoned ten princes, 110 counts, 82 barons, and 238 knights. The peace establishment of the army consists of between 50,000 and 60,000 men; all matters relative to which, are under the management of a military tribunal instituted at Prague. The annual revenue is about £2,000,000 English money. The number of towns in the whole kingdom was, in 1811, 266, burghs 295, villages and farms 11,892, houses 521,700: there are also 41 decayed towns and villages, and 516 ruined castles. Its only mercantile towns are Prague and Toeplitz, which see.

The inhabitants are in general brave, handsome, and active; bearing a general resemblance both in appearance, manner, and language, to the Poles. Dubravius, bishop of Olmutz, in the sixteenth century, thus strikingly describes them:—As this land is under the influence of the lion, so its inhabitants have the qualities of that noble animal. Their high breast, their sparkling eyes, their long and thick hair, their vigorous limbs, their strength, their courage, their resistance to obstacles, every circumstance shows evidently that the lion is their star, as he is their emblem.' They are beyond comparison the best of the imperial troops. The language is a dialect of the Slavonic, nearly allied to the Polish, but containing more words of German origin. They formerly used the Russian character, but Latin has been now in use for many centuries. The Austrian government has made frequent attempts to supplant the Bohemian by the German language, particularly by the appointment of German teachers in the schools; but though German is the language of all the courts and public business, and spoken in all the towns, the Bohemian must still be considered as prevailing.

The Roman Catholic is the established religion, and after the banishment of the Hussites and Protestants in the fifteenth and seventeenth centuries, was almost the only one in the kingdom, except that of the Jews. It was not indeed till the edict of toleration passed by Joseph II. in 1781, that the Protestants here declared their numbers, or enjoyed the free exercise of their worship. The total number of dissenters from the church of Rome is now about 100,000, of whom 46,000 are Jews, 34,000 Calvinists, 11,000 Lutherans, and the remnant of the Greek church and other persuasions. The Jews have synagogues in several places, an university at Prague, and eighteen rabbins stationed in dif-

ferent parts of the country. The Catholic church is under the archbishop of Prague, who has for suffragans the bishops of Leutmeritz, Konigsgratz, and Budweis; and is ex-officio legate of the apostolic see.

While Christianity, as we have seen, is supposed to have been first introduced into Bohemia about the sixth century; the inhabitants seem to have had but an imperfect acquaintance with it till the middle of the ninth, when the Greek religion and customs were adopted by them, and continued to be maintained until Bolislaus the Good re-established the Romish domination. Bohemia will ever be famous in the annals of Protestantism. Here the reformation of church abuses was nobly begun in the fourteenth and fifteen centuries, by John Huss and Jerome of Prague; and these courageous champions of the primitive faith were brought to the stake, at the council of Constance in 1415. Their adherents were at the same time put under the ban of the empire, and a bloody war ensued. Previously to the great reduction of monastic institutions made in the Austrian dominions by Joseph II. there were in Bohemia no less than 165 of these foundations, whereof only about one half now remain. The establishments for education and literature have, on the other hand, been greatly augmented and improved. In 1785 there was erected an Academy of Sciences and an university at Prague, as well as fifteen academies for youth in different parts of the kingdom: there are more-over twenty high schools, above 2200 town and country schools, 200 schools of industry, and forty ladies' schools. An Agricultural Society was established in 1766, and there are several other institutions for the promotion of the arts, particularly music, in which the Bohemians have been long celebrated.

The greatest disadvantage of this beautiful country, is the extreme depression of its peasantry, and the entire want of a middle class of society. Latterly the peasantry of the imperial domains have been liberated from their old feudal thralldom, and it is hoped, that the Bohemian nobles may gradually be induced, by their own evident interest, to follow the example of their sovereign: but generally the whole of its inhabitants are divided into the abject poor, or the petty kings of the land. See *Raymond's Tableau Statistique de la Monarchie Autrichienne*, 1809; *Riesbeck's and Neale's Travels*; and *Hassel's Staats und Address-Handbuch der Teutschen Bundes-Staaten*, 1816, &c.

BOHEMIA, a short navigable river of the United States, in the eastern shore of Maryland. It rises near the divisional line of the state of Delaware, and, after running west about six miles, turns W. N. W. and falls into the Elk, about four miles above Turkey-point.

BOHEMIAN BRETHREN, a sect of Christian reformers which sprung up in Bohemia in 1467. They treated the church of Rome as the whore predicted in the Revelation; and rejected the sacrament of the Romish church; and chose laymen for their ministers; they held the Scriptures to be the only rule of faith, and kept no festivals but Christmas, Easter, and Whitsuntide. In 1504 they were accused by the Catholics to

king Ladislaus II. who forbade them to hold any meetings either private or public. When Luther declared himself against the church of Rome, the Bohemian brethren endeavoured to join his party. At first that reformer showed a great aversion to them; but the Bohemians sending their deputies to him in 1523, with a full account of their doctrines, he acknowledged that they were a society of Christians, whose doctrine came nearest to the purity of the gospel. They published another confession of faith in 1535, in which they renounced anabaptism, which they at first practised: upon which a union was concluded with the Lutherans.

BOHMERWALD, the Bohemian forest, a ridge of mountains in Germany, penetrating Bavaria Proper on the west, and Passau. It separates the former from the Upper Palatinate, and is almost entirely covered with wood, particularly on the Bohemia side. Here are also a number of iron works, glass houses, &c. The highest points are the Arber and Rachelberg.

BOHOL, or Bool, one of the southern Philippine isles, discovered by Magellan, 1621. It is about thirty-two miles in length, and twenty in breadth, and has been said to yield some gold. The chief town is Loboe. Distant ninety miles north of Mindanao.

BOHUN (Edmund), was born at Ringsfield, Suffolk, and was a member of Queen's College, Cambridge, but quitted the university, on the breaking out of the plague in 1666, without taking a degree. He entered at the Temple, and in 1675 took out his *dedimus* as a magistrate for the county of Suffolk, but having rendered himself obnoxious to James II. that monarch removed him from the commission. On the accession of William and Mary his name was replaced. His works are, *A Defence of king Charles II's Declaration*, 4to; another of Sir R. Filmer against Algernon Sydney, and a preface to the former author's *Patriarcha*, in 8vo; two dictionaries, one *Geographical*, in 8vo, the other *Historical, Geographical, and Poetical*, in folio; *The Justice of Peace's Calling*, 8vo; a *History of the Desertion*, &c. 8vo, 1689; *A Life of Bishop Jewel*, and a *Character of Queen Elizabeth*, both in 8vo. He also wrote a *Treatise on the doctrine of Passive Obedience*, in 4to., and translated Puffendorf's *Germany*, Sleidan's *History of the Reformation*, and Wheare's *Mode of Reading History*. He died some time in the reign of queen Anne.

BOHUS, or BAUS, a government of West Gothland, now forming the greater part of the province of Gotheborg, Sweden. It bears the title of duchy, and extends in length about 112 English miles from the fortress of this name to Frederickshall in Norway; its greatest breadth is eighteen English miles. It is bounded on the east by Elfsborg, and on the west by the Scagerrack, and contains thirteen bailiwicks. It is for the most part level, and diversified by fertile meadows, forests, lakes, and rivers. Of the last, the most considerable is the Gotha-Elf, which falls into the North Sea near Kongelf. The inhabitants maintain themselves by agriculture, the manufacture of salt, fishing (particularly herrings), and a trade in wool, cattle, hides, tallow,

pitch, and lime. It includes the valuable islands of Oroust and Tjoern.

BOII, a people of Gallia Celtica, who inhabited the country extending from the Ligeris, or Loire, to the Elaver, or Allier; whence came the Boii of Gallia Cisalpina, whose migration is related by Livy.

BOILL, *v. & n.* } Fr. *bouillir*; Lat. *bullio*.

BOILING, } To be agitated by heat; to fluctuate with heat; to be fervent or evanescent; to move with an agitation, like that of boiling water; to be in hot liquor; to cook by heated water; to seeth. It is, figuratively, expressive of an animated, ardent, eager state of feeling; speaking, or acting.

Nay, I'll come; if I lose a scruple of this sport let me be *boiled* to death with melancholy. *Shakspeare.*

Fillet of a fenny snake,

In the cauldron *boil* and bake. *Id.*

To try whether seeds be old or new, the sense cannot inform; but if you *boil* them in water, the new seeds will sprout sooner. *Bacon.*

In eggs *boiled* and roasted, into which the water entereth not at all, there is scarce any difference to be discerned. *Id.*

That such alterations of terrestrial matter are not impossible, seems evident from that notable practice of the *boilers* of salt-petre. *Boyle.*

While we perhaps,

Designing or exhorting glorious war,
Caught in a fiery tempest shall be hurled
Each on his rock transixed, the sport and prey
Of racking whirlwinds, or for ever sunk
Under you *boiling* ocean, wrapt in chains;
There to converse in everlasting groans
Unrespite, unpitied, unreprieved,
Ages of hopeless end. *Milton.*

So through the mortal fruit we *boil*

The sugar's uncorrupting oil;
And that which perished while we pull
Is thus preserved clear and full. *Marvell.*
That strength with which my *boiling* youth was
fraught,

When in the vale of Balasar I fought. *Dryden.*

Well I knew

What perils youthful ardour would pursue,
That *boiling* blood would carry thee too far. *Dryden.*

If you live in a rich family, roasting and *boiling* are below the dignity of your office, and which it becomes you to be ignorant of. *Swift.*

Suppose the earth removed and placed nearer to the sun, in the orbit of Mercury, there the whole ocean would *boil* with extremity of heat. *Bentley.*

A few soft words and a kiss, and the good man melts; see how nature works and *boils* over in him. *Congreve.*

Then headlong shoots beneath the dashing tide,

The trembling fins the *boiling* waves divide. *Gay.*
Borne by the outrageous flood

To distance down he rides the ridgy wave,

Or whelmed beneath the *boiling* eddy sinks. *Thomson.*

BOILEAU, **SIEUR DESPREAUX** (Nicholas), the celebrated French poet, was born at Paris in 1636. His relations first designed him for the law, and he was admitted advocate. But he imbibed a strong aversion for the bar, and commenced the study of theology; but he here again could not long endure the chicanery of the school divinity; he therefore renounced the Sorbonne, and devoted himself to the belles lettres. Like a late noble poet of our own country, Boileau

commenced his career as a satirist of his contemporaries, and, at the age of thirty, published a collection of poems, attacking a host of inferior writers. The writers attacked, assailed him in return, and the duke de Montausier, and other moralists, expressed some dislike to the spirit of detraction thus aroused. Our poet now, therefore, assumed the courtier toward that noble personage, and lavished all manner of flattery on the vain-glorious Louis XIV. His ninth satire, *A Son Esprit*, is deemed a master-piece of keenness and polished irony. His satires were followed by his *Art of Poetry*, and, in 1674, by his mock-heroic poem of the *Lutrin*, founded on a trifling dispute between the treasurer and chanter of the holy chapel. These poems thoroughly established his reputation, and secured the good graces of the court, who gave him a pension, and the exclusive privilege of printing his own works. He was also appointed, in conjunction with Racine, royal historiographer. His ode on the taking of Namur was a result of this appointment; but to lyric poetry his genius was not adapted. At court, he now appeared, it is said, with manly freedom, and often ventured upon observations unusually bold. When the king asked his opinion of a few verses which he had composed, 'Nothing, Sire, is impossible to your majesty,' he replied; 'you wished to make bad verses, and you have succeeded.' In 1684 he was received into the French Academy, and the Academy of Inscriptions. He was as remarkable for his integrity, his innocence, and diffusive benevolence, as for the keenness of his satires. He died of a dropsy on the 2d of March, 1711, in the seventy-fifth year of his age. There are two actions recorded of Boileau, which sufficiently prove that this inexorable satirist had a most generous and friendly heart. When Patru, the celebrated advocate, who was ruined by his passion for literature, found himself under the painful necessity of selling his extensive library, and had almost agreed to part with it for a moderate sum, Boileau gave him a much superior price; and, after paying the money, added this condition to the purchase, that Patru should retain, during his life, the possession of the books. The other instance is yet nobler: when it was rumored at court, that the king intended to retrench the pension of Corneille, Boileau hastened to Madam de Montespan, and said, that his sovereign, equitable as he was, could not, without injustice, grant a pension to an author like himself, just ascending Parnassus, and take it from Corneille, who had so long been seated on the summit; that he entreated her, for the honor of the king, to prevail on his majesty rather to strike off his pension, than to withdraw that reward from a man whose title to it was incomparably greater; and that he should more easily console himself under the loss of that distinction, than under the affliction of seeing it taken away from such a poet as Corneille. This magnanimous application had the success which it deserved, and it appears the more noble, that the rival of Corneille was the intimate friend of Boileau. The long unreserved intercourse which subsisted between our poet and Racine was highly beneficial and honorable to both. The

dying farewell of the latter is the most expressive eulogy on the private character of Boileau: 'Je regarde comme un bonheur pour moi, de mourir avant vous,' said the tender Racine, in taking a final leave of his faithful and generous friend.

BOILING, or **EBULLITION**, the bubbling up of any fluid. The term is most commonly applied to that bubbling which happens by the application of fire, though that which ensues on the mixture of an acid and alkali is sometimes also distinguished by the same name. Boiling, in general, is occasioned by the discharge of an elastic fluid through that which is said to boil; and the appearance is the same, whether it is common air, fixed air, or steam, that makes its way through the fluid. The boiling of water is proved by Dr. Hamilton of Dublin, in his Essay on the Ascent of Vapor, to be occasioned by the lowermost particles of the water being heated and rarefied into vapor by reason of the vicinity of the bottom of the containing vessel; in consequence of which, being greatly inferior in specific gravity to the surrounding fluid, they ascend with great velocity, and lacerating and pushing up the body of water in their ascent, give it the tumultuous motion called boiling. That this is occasioned by steam, and not by particles of air or fire, as some have imagined, may be very easily proved in the following manner: let a common drinking glass be filled with hot water, and then inverted into a vessel of the same; as soon as the water in the glass begins to boil, large bubbles will be observed to ascend in the glass, which will displace the water in it, and in a short time there will be a continual bubbling from under its edge; but if the glass is then drawn up, so that its mouth may only touch the water, and a cloth dipt in cold water be applied to the outside, the steam within it will be instantly condensed, and the water will ascend so as to fill it entirely, or very nearly so. See **EVAPORATION**.

BOILING, in the culinary art, is a method of dressing meats by coction in hot water, intended to soften them, and dispose them for easier digestion. The effects of boiling are different according to the kinds and qualities of the water. Pulse boiled in sea water grows harder; mutton boiled in the same becomes softer and tenderer.

BOINITZ, a market town of Hungary, in the circle of Boinitz and county of Neitra. Here is a castle, Catholic church, and, in the suburbs, a warm bath. The circle contains five market towns. Eleven miles W. N. W. of Kremnitz.

BOIS-LE-DUC, a large town of the Netherlands, in Dutch Brabant, situated at the conflux of the Dommel and Aa, which here takes the common name of the Diest. It is called, in Brabant, s'Hertogenbosch, or simply Bosch, which has the same meaning as Bois-le-Duc, namely, the Duke's Wood, the dukes of Brabant being accustomed to take the diversion of the chase in this neighbourhood. Duke Godfrey laid the foundations of the town in the year 1184, which was finished by his son Henry in 1196, and again considerably enlarged in 1453. It is entered by four gates, and surrounded with walls, flanked by seven bastions; and can be insulated at pleasure from the rivers adjacent. It is, besides, protected by the forts of Crevecoeur, Isa-

bella, St. Anthony, and the strong citadel called Papen-Briel. The cathedral, which is dedicated to St. John, and built in 1366, is one of the finest structures in the Netherlands. It had formerly a wooden tower, which could be seen from Antwerp, but was destroyed by lightning in 1584. Four other churches have been converted into warehouses. There were formerly sixteen monasteries here; that of the Jesuits is now the governor's palace, and the rest are suppressed. The population, about 14,000, carry on a considerable trade in corn, manufacturing knives, needles, and bleaching. Bois-le-Duc suffered severely in the religious wars of the sixteenth century, and did not fall finally into the hands of the Dutch till 1629. In September, 1794, an action took place near this town, between the British and French, in which the latter had the advantage, and on the 9th October of the same year the place was invested by Pichegru, and surrendered without much opposition. In January, 1814, it was surrendered to the Prussian army under General Bulow, after a siege of some weeks duration. The bishopric of Bois-le-Duc was founded by pope Paul IV. but is now suppressed. Eighteen miles E. N. E. of Breda, and forty-two S. S. E. of Amsterdam.

BOISSARD (John James), an antiquarian, born at Besançon, the author of several collections of Roman antiquities. He had a great passion for this study; and drew with his own hand plans of all the ancient monuments of Italy. He died at Mentz, October 30th, 1602. His other principal works are, *Theatrum Vitæ Humanæ*; which contains the lives of 198 famous persons, with their portraits. A treatise de *Divinatione et Magicis Præstigiis*. These works are scarce, and esteemed by the antiquarians.

BOISSEAU, a French bushel, being the twelfth part of a septier, and somewhat less than our London peck and a half. A boisseau of wheat weighs twenty pounds; our peck of wheat-meal fourteen.

BOISTOUS ,	} Dutch, <i>bûsen</i> ; Germ. <i>beisin</i> . The Dutch <i>bister</i> or <i>byster</i> is furious; raging; turbulent. The German <i>beisin</i> , to bite like a severe biting north wind: hence boistous and boisterous; and both are applied, says the Ency. Met. to any thing turbulent, tempestuous, stormy, violent; to any thing coarse, rude, and noisy. Spenser uses it in the sense of ponderous and clumsily violent. The adjective is used by Woodward as descriptive of excessive heat.
BOISTOUSLY ,	
BOISTOUSNESS ,	
BOISTEROUS ,	
BOISTEROUSLY ,	
BOISTEROUSNESS .	} pierce through; to bite

I am a boistous man, right thus I say. *Chaucer.*

He on a day in open audience

Ful boistously hath said, hire this sentence. *Id.*

His boisterous club, so buried in the ground,

He could not rearen up again so light,

But that the knight him at advantage found.

Faerie Queene.

By a divine instinct, mens' minds mistrust

Ensuing danger; as by proof we see

The waters swell before a boisterous storm.

Shakspeare.

A sceptre, snatched with an unruly hand,

Must be as boisterously maintained as gained. *Id.*

His sweetness won a more regard
Unto his place, than all the *boisterous* moods
That ignorant greatness practiseth. *Ben Jonson.*

Yet oft in words he spends his *boisterous* threat;
That his hot blood, driven from the native seat,
Leaves his faint coward heart empty of lively heat.
Fletcher's Purple Island.

As good for nothing else, no better service
With those thy *boisterous* locks, no better match
For valour to assail, nor by the sword
Of noble warrior, or so to stain his honour,
But by the barber's razor best subdued.
Milton's Saman Agonistes.

God into the hands of their deliverer
Puts invincible might,
To quell the mighty of the earth, the oppressor,
The brute and *boisterous* force of violent men.
Milton.

As when loud winds a well-grown oak would rend
Up by the roots, this way and that they bend
His reeling trunk, and with a *boisterous* sound
Scatter his leaves, and strew them on the ground.
Waller.

Another faculty of the intellect comes *boisterously*
in, and wakes me from so pleasing a dream. *Saift.*

BOKHARA, a city of Tartary in Asia, and capital of Great Bukharia, situated one days journey to the north of the river Jehun, or Amu. In 1219 it was besieged by Jenghiz Khan. At that time, besides the city-walls, which were very strong, Bokhara had an outward enclosure twelve leagues in compass; which shut in not only the suburbs, but also many pleasant seats and farms watered by the river Soghd, from whence the ancient Sozdiana took its name. The Mogul army arrived before the place in July, and continued the siege during the following winter. In March, 1220, they forced the outer wall. Sultan Mohammed had left in the city a very numerous garrison under the command of three generals, who now made a sally at the head of 20,000 men: but, being repulsed with great loss, their courage failed them; and, returning into the city by one gate, they passed out by another with their families, hoping to escape by the darkness of the night. Their design, however, was discovered, and being pursued by a detachment of 30,000 Moguls, they were overtaken at the Amu, and after a bloody dispute, were almost all cut to pieces. Meantime, Jenghiz Khan, being informed of the confusion into which the city had been thrown by the desertion of the garrison, ordered an attack to be made on all sides simultaneously; but while he was preparing for this, the magistrates and clergy went out and presented him with the keys. Jenghiz Khan granted them their lives, on condition that they discovered all who should be suspected of being in the sultan's interest; which they promised to do upon oath. The young people, however, who were displeased with the surrender, retired with the governor to the castle, which was very strong, and resolved to defend it to the last extremity. Jenghiz Khan, having taken possession of the town, entered on horseback to the great mosque, and taking up the koran threw it under the feet of his horses. Some days after, having assembled the principal people, he addressed them from a pulpit erected for that purpose in his camp, mentioned the per-

fidious behaviour of the sultan towards him, and told them that God had sent him to rid the world of such men. He testified his satisfaction for their having freely furnished his army with necessities; and promised to restrain his soldiers from plundering, but commanded them to deliver up what they had hidden. Notwithstanding their strict compliance with this requisition, the tyrant soon after caused the city to be burnt to the ground, on pretence that some of the sultan's soldiers were concealed in it. The castle surrendered at discretion soon after; and was also demolished. Bokhara continued in ruins for some years, but at length Jenghiz ordered it to be rebuilt. It is now large and populous; and is the residence of a khan, who is altogether despotic. The town is seated on a rising ground, with a slender wall of earth and a dry ditch. The houses are low, built mostly of mud; but the caravansaries and mosques, which are numerous, are all of brick or stone. The bazaars or market places, which have been stately buildings, are, with the trade of the place, greatly decayed. Great numbers of Jews and Arabians frequent this place, though they are much oppressed and frequently deprived of all their property by the khan or his attendants. At best they pay heavy taxes, and it is almost criminal to be rich. The inhabitants are chiefly employed in manufactures of cotton yarn, calico, and soap. The city is a famous school for the Mahommedan priesthood; and the population has been said to amount to 1,100,000. See BUKHARIA, GREAT.

BOL (Ferdinand), a celebrated painter of history and portraits, born at Dort in 1611, and educated at Amsterdam. He studied in the school of the celebrated Rembrandt Gerretsz, and imitated the style of his master with success, both in pictures and engravings. Bol's etchings are bold and free. The lights and shadows in them are broad and powerful, which renders the effect striking; but they want that lightness of touch and admirable taste, which those of Rembrandt possess. Bol died at Dort, the place of his birth, in 1681, aged seventy.

BOLABOLA, or BORABORA, one of the Sandwich isles, about twenty-four miles in circumference. It has a very lofty double peaked mountain in the centre; is almost barren on the east side, but has trees and bushes on the rocky parts of the west. Along the coast is a border of low fertile land, covered with the bread-fruit and cocoa-nut trees, which are also seen on many of the surrounding islets. This is a populous island, but there is only one harbour in it.

BOLCA, MONTE, a hill or mount in the neighbourhood of Verona, in the north of Italy, celebrated for the abundance and remarkable variety of the organic remains which it exhibits, as well as for the striking relations these bear to minerals of volcanic origin. This spot has long attracted the attention of philosophic enquirers; various collections of its petrifications have been made, and a considerable number of laborers occasionally employed in digging and preparing specimens. The formation of this hill is peculiar to itself; it consists of various substances, among which are marble, spar, basalt; coal and amber; marine plants, insects, fishes, and the remains of

terrestrial animals in a state of petrification. Connected with these, we find basaltic columns, scoria, lava, and other volcanic productions. The petrified substances do not lie in horizontal strata, but the masses of stone wherein they are contained are imbedded in the sides of the hill. The stone (in which the fishes are enclosed) is wholly calcareous, of a light color, of a dull though fine grain, and entirely destitute of any crystalline or sparry appearance. Some beds consist of a range of certain species, possessing a considerable similarity; while in others, animals of the most opposite habits, and inhabiting different regions of the globe, as well as different elements of nature, are strangely brought into contact, and confusedly blended in one heterogeneous mass. Corals, shell-fish, sea and river fish of various kinds; insects, bones of different species of birds, remains of elephants, bears, and other quadrupeds, requiring for their existence different climates, are here united in extraordinary assemblage. The *chatodon mesaleucus*, lately taken near the shores of Japan, and in the African seas, has also been found in a perfect state in the rocks of Bolca; as well as the *chatodon argus*, bearing a perfect resemblance to those caught in the rivers and stagnant lakes of India. The American *cimex* has also been discovered here. A young shark, now preserved in a cabinet, merits particular observation. It is only twenty-five inches in length, wanting a small portion of the tail, and four in breadth. The ravenous nature of the animal is disclosed by the contents of its stomach, which exhibit a quantity of sea crabs, in a half digested state. There have also been discovered the skeletons of two fishes imprinted on the same stone; one of which has seized the head of the other, and seems in the act of swallowing it. However desirous we may be to enter into a more minute description of this hill, and to state the various theories that have been proposed to account for its formation, our limits will not permit us, and we must refer our readers to the more extensive works of Bozza, Spada, Pini Testa, and Fortis, as also the *Societas Physicorum Veronensis*, *Ittiolitologia Veronese del Musæo Bozziano*.

BOLD', *v. & adj.* } Ang.-Sax. bald, says
BOLD'EN, } Dr. Johnson; byldan, says
BOLD'FACE, } Tooke; both have nearly the
BOLD'FACED, } same signification: they are
BOLD'HEDE, } applied to the strength and
BOLD'LY, } firmness of a well-com-
BOLD'NESS. } pacted, consolidated build-

ing; to any thing firmly constructed; prominent and powerful, whether in nature or art, as a bold coast; or in statuary, a bold figure. The adjective metaphorically describes what is fearless, dauntless; spirited; courageous; magnanimous; intrepid. It is however frequently used in a bad sense, to signify temerity, and whatever is daring, audacious, and impudent. To bold or bolden, is to inspire, to give confidence.

The wicked flee when no man pursueth; but the righteous are bold as a lion.

Proverbs.

Thou dranke, eke, of his vessels *boldly*,
 Thy wif, eke and thy wenches, sinfully
 Dranke of the same vessels *sondry* wines;

And heried false goddes, cursedly;
 Therefore to thee yshapen ful gret pine is.

Chaucer's Canterbury Tales.

And as she lookt about, she did behold
 How over that same dore was likewise writ,
 Be *bolde*, be *bolde*, and every where be *bolde*;
 That much she mused, yet could not construe it
 By any ridling skill or commune wit.
 At last she spyde at that rowmes upper end
 Another yron door on which was writ,
 Be not too *bold*, whereto though she did bend
 Her earnest minde, yet wist not what it might intend.

Spenser.

That moderation, which useth to suppress *boldness*,
 and to make them conquer that suffer.

Hooker.

Quick inventors, and fair ready speakers, being
boldened with their present abilities to say more, and
 perchance better too, at the sudden for that present,
 than any other can do, use less help of diligence and
 study.

Ascham's Schoolmaster.

I am much too venturous

In tempting of your patience, but am *boldened*

Under your promised pardon.

Shakspeare

I speak to subjects, and a subject speaks,
 Stirred up by heaven thus *boldly* for his king.

Id.

Thus we may *boldly* speak, being strengthened with
 the example of so reverend a prelate.

Hooker.

Wonderful is the case of *boldness* in civil business:
 what first? *Boldness*. What second and third?
Boldness. And yet *boldness* is a child of ignorance and
 baseness, far inferior to other parts.

Bacon.

He looked and saw wide territory spread

Before him, towns, and rural works between,
 Concourse in arms, fierce faces threatening war,
 Giants of mighty bone, and *bold* emprise

Milton.

His distance, though it does not instruct him to
 think wiser than other princes, yet it helps him to
 speak with more *boldness* what he thinks.

Temple.

Boldness is the power to speak or do what we intend,
 before others, without fear or disorder.

Locke.

I can be *bold* to say, that this age is adorned with
 some men of that judgment, that they could open new
 and undiscovered ways to knowledge.

Id.

How now *boldface*! cries an old trot: sirrah, we
 eat our own hens, I'd have you know; what you eat,
 you steal.

L'Estrange.

The figures are *bold* even to temerity.

Cowley.

Which no *bold* tales of gods or monsters swell,
 But human passions, such as with us dwell.

Waller.

The *boldness* of the figures is to be hidden sometimes
 by the address of the poet, that they may work
 their effect upon the mind.

Dryden.

Catachreses and hyperboles are to be used judiciously,
 and placed in poetry, as heightenings and
 shadows in painting, to make the figure *bolder*, and
 cause it to stand off to sight.

Id.

I have seen those silliest of creatures; and, seeing
 their rare works, I have seen enough to confute all the
boldfaced atheists of this age.

Bramhall against Hobbes.

BOLE, in natural history, a viscid earth, less
 coherent, and more friable than clay; more
 readily uniting with water, and more freely sub-
 siding from it; it is soft and unctuous to the
 touch; adheres to the tongue; and by degrees
 melts in the mouth, impressing a light sense of
 astringency. Specific gravity 1.4 to 2. It may be
 polished. If it be immersed in water after it is
 dried, it falls asunder with a crackling noise. It
 occurs in wacke and basalt in Silesia, Hesse,
 and Sienna in Italy, and also in the cliffs of the
 Giant's Causeway. It was formerly much

used in medicine, particularly the Armenian and French. Several of these earths have been commonly made into little cakes or flat masses, and stamped with certain impressions; from which circumstance they received the name of *terre sigillata*, or sealed earths. It is often mixed with honey, and applied to childrens' mouths when afflicted with aphthæ. It forms, like all argillaceous earths, a good tooth-powder, when mixed with some aromatic.

BOLÉ, ARMENIAN, is of a bright red color, with a tinge of yellow. It is one of the hardest and most compact bodies of this class, but not smooth and glossy like the others, but generally of a rough and dusty surface.

BOLÉ, FRENCH, is of a pale red color, variegated with irregular specks of white and yellow. It is much softer than the Armenian, and slightly effervesces with acids.

BOLÉ or BLOIS is yellow, lighter than most of the other yellow earths, and effervesces strongly with acids.

BOLÉ, SILESIAN, is of a pale yellow color, and acids have no sensible effect upon it.

BOLENE, or **BOLÆ**, in natural history, a name given by ancient writers to stones of a roundish figure, marked with several ridges and lines. They are the same with those called *brontia* and *ombria*, both being imagined to fall from the clouds in time of thunder storms; but they are really a common species of *echinitæ*.

BOLESŁAUS, I., king of Poland, was the son of Mieslaus, duke of Poland, who, having embraced Christianity, had desired the title of king from the pope, but was refused it. Boleslaus found more favor with the emperor Otho III., whom he entertained splendidly at Gnesna, during his pilgrimage to visit the relics of St. Adalbert; and who, in return, not only prevailed on pope Sylvester II. to confer the royal dignity upon Boleslaus, but invested him with his own robes, and gave him some of the insignia of the empire, A. D. 1001. Boleslaus was a brave and liberal monarch. He repulsed the Bohemians; chastised the Moravians; punished the idolatrous Prussians, for the murder of St. Adalbert, whose body he redeemed; and re-established Stopoleus, grand duke of Russia, deposed by his brother Jaroslaus. He married Judith, daughter of Geisa duke of Hungary, by whom he had several children, and died A. D. 1025.

BOLETIC ACID. Braconnot was the first to obtain this acid. He extracted it from the expressed juice of the *boletus pseudo ignarius* described below. After boiling the juice, and carefully evaporating it to the consistence of a syrup, he digested it repeatedly in alcohol. What remained he dissolved in water, and from this solution he produced a white precipitate, by dropping nitrate of lead into it. Having washed the precipitate, he exposed it to a current of sulphureted hydrogen gas, and thus engendered two different acids; one a small portion of the phosphoric acid, the other in the form of permanent crystals, was the boletic acid, which was purified by solution in alcohol and recrystallisation. The crystals of boletic acid are prismatic, and of a white color; they require 180 parts of water at 68°, and forty-five parts of alcohol for solution. The aqueous solu-

tion reddens vegetable blues, and precipitates nitrate of lead; it also precipitates the peroxide of iron from its solutions, but not the protoxide. The solutions of nitrate of silver and mercury, when treated with the boletic acid, throw down a white precipitate. This acid unites with alkalies and earths, and thus forms salts which may be named boletates.

BOLETO LICHEN, a name given by M. Jus-sieu to a plant, which partakes of the nature of the morelle and of the liverwort, and which he has accurately described in the *Mem. Acad. des Sciences*, Paris, 1728. This plant has the smell of the common mushroom, and, when young, has a viscous liquid contained under the foldings of its head, which, when the plant is arrived at maturity, dries into the form of an extremely subtle yellow powder, which is the seed.

BOLETUS, in botany, a genus of the order of fungi and cryptogamia class of plants. Linnaeus enumerates fourteen species; Gmelin 107. The following are the most remarkable:—*B. bovinus*, is frequent in woods and pastures. It is generally of a brown color, though sometimes tawny, yellowish brown, reddish brown, deep red, purple, or greenish brown. The flesh is yellow, white, or reddish. The young plants are eaten in Italy, and esteemed a great delicacy. The Germans also account them a dainty, calling them *gombas*, and *brat-bulz*. Cows, deer, sheep, and swine will feed upon this and other boleti, and are sometimes greatly disordered by them. *B. ignarius*, or touchwood spunk, is frequent on the trunks of old trees of all kinds, especially ash. This fungus is made use of in Germany and some parts of England for tinder. The Germans boil it in strong lee, dry it and boil it again in solution of salt-petre. The Laplanders burn it about their habitations, in order to keep off a species of the gadfly, fatal to the young reindeer. *Boletus, acaulis pulvinatus levis*, *poris tenuissimis* of Linnaeus, has been much used by scrofulous as an external styptic. Though still employed on the continent, our surgeons have not much confidence in it. *B. loricis*, the agaric of the shops, grows on old larch trees. It is an irregular spongy substance, extremely light, and of a uniform snowy whiteness. It cuts freely with a knife, and readily crumbles betwixt the fingers into a powder. It has no remarkable smell; its taste is at first sweetish; but on chewing for a short time, it proves acid, bitter, and nauseous. Agaric was formerly in great esteem as a cathartic, but it is now rejected both by the London and Edinburgh Colleges, though it still retains a place in most of the foreign pharmacopæias. Its infusion in water is yellowish, sweet tasted, and reddens vegetable blues. It contains muriate of potash, sulphate of lime, and sulphate of potash. Water boiled on agaric, becomes gelatinous on cooling; and ammonia is exhaled by the addition of lime. Resin of a yellow color, with a bitter-sour taste, may be extracted from it by alcohol. It yields benzoic acid, by Scheele's process. The strong acids act with energy on agaric, and the nitric evolves oxalic acid. Fixed alkalies convert it into a red jelly, which emits an ammoniacal smell. *B. suberosus*, or white cork spunk, grows commonly on

the trunks of birch and willow trees in England. The upper surface is quite white, generally covered with a short strong down, but sometimes smooth. The internal substance is thick, white, tough, light, and spongy, like cork.

BOLEYN (Ann), queen of Henry VIII. of England; memorable in the English history as the first cause of the Reformation, as the mother of queen Elizabeth, under whom it was completely established, and on account of her own sufferings. She was the daughter of Sir Thomas Boleyn, and born in 1507. Being taken into France at seven years of age by Henry VIII's sister, the wife of Louis XII. she remained in the service of queen Claudia, the wife of Francis I. and after the death of that princess, went to the duchess of Alençon. Becoming maid of honor to queen Catharine of Spain, Henry VIII's first wife, that prince fell violently in love with her, and, determining to make her his wife, was induced to set on foot the divorce of Catharine. He married Ann Boleyn privately upon the 14th of November, 1532, and as soon as he perceived that she was pregnant, made his marriage public. She was declared queen of England on Easter-eve, 1533, and crowned the first of June following. On the 7th of September she became the mother of queen Elizabeth; and continued to be much beloved by Henry, till the charms of Jane Seymour fired that tyrant's heart in 1536. Then his love for Ann Boleyn was changed into violent hatred: he believed, or pretended that he believed, her to be unchaste, and caused her to be imprisoned and tried. She was indicted of high treason, as an incontinent queen, according to the statute made in the twenty-sixth year of this reign: so that the law which was made for her and the issue of her marriage, was now made use of to destroy her. She was condemned to be either burnt or beheaded; and underwent the latter punishment on the 19th of May, 1536.

BOLI, a large town of Natolia, in Asiatic Turkey, the capital of a district, and the residence of a governor. It stands in a fertile neighbourhood, which supplies Constantinople with a great quantity of wood. The town is surrounded by a palisade, and contains numerous public edifices. Ruins are also seen in the vicinity, and marble fragments with Greek inscriptions are extant, half way between Boli and Jeredave, or Jerededel, from which it is distant forty miles. Seventy-four miles north-west of Angora, and 140 east of Constantinople.

BOLINGBROKE (Lord Viscount). See **ST. JOHN**.

BOLINGBROKE, a market town of Lincolnshire, in England, of great antiquity, but now in a mean condition. It is twenty-nine miles east of Lincoln. It was the birth-place of Henry IV. thence named Henry of Bolingbroke. It gives title of viscount to the family of St. John. The church was formerly very large, but the greatest part was destroyed in the civil war of Charles I. Market on Wednesday.

BOLKENHAYN, a town and castle, the capital of a circle in the principality of Schweidnitz, Silesia. It contains a Catholic and a Lutheran church, and 1350 inhabitants, who are engaged

in the manufacture and sale of linen. The circle produces abundance of cattle, wood, and pit coal, and contains 60,000 inhabitants. It is enclosed by Bohemia, and the Silesian circles of Schweidnitz, Hirschberg, Jauer, and Striegau. The number of towns is six; villages ninety-four; churches fifty. The town of Bolkenhayn is ten miles north-west of Schweidnitz, and forty south-west of Breslau.

BOLL, *v. & n.* } Germ. *bol*, any thing that
BOLLING. } grows round or globular;
 or whatever is made round by circumvolution;
 by winding or turning on a centre; to rise out;
 to swell out in a round form or shape. See **BALL**
 and **BOWL**.

Ghe ben *bolnum* with pride.

Wicklif. 1 Cor. chap. v.

A little *boll* or cup to sacrifice and offer unto the gods withall. *Holland's Livius.*

Yet Phœbus loves her still, and casting round

Her *bole*, his arms, some little warmth he found.

Dryden. Ovid's Metamorphoses.

The storm for Bertram!—and it hath been with me

Dealt with me branch and *bole*, bared me to the roots.

Maturin's Bertram.

BOLLARDS, large posts set into the ground on each side of a dock. On docking or undocking ships, large blocks are lashed to them; and through these blocks are reeved the transporting hawsers to be brought to the capstans.

BOLLITO, a name by which the Italians call a sea-green color in artificial crystal. To prepare it, put into the furnace a pot filled with forty pounds of good crystal, first carefully boiled and purified, without any manganese: then take twelve ounces of powder of small leaves of copper thrice calcined, and half an ounce of zaffre in powder: mix them and put them at four times into the pot, that they may the better mix with the glass; stirring them well each time of putting in the powder, lest the mixture should swell and run over.

BOLLOS, in the mines of Peru, a name given to the bars of silver procured there from the ore, by the operation of fire and aquafortis.

BOLOGNA, an ancient, rich, and populous city of Italy, the capital of the Bolognese, and the second city of the papal territories. Its ancient name was Felsina. It is five miles in circumference, and contains about 70,000 inhabitants. The streets are narrow, and the carriage roads considerably below the porticoes, or covered footpaths. Its churches and ecclesiastical buildings are the great ornaments of the place. Here is the celebrated leaning tower of Garisenda, which inclines about eight feet from the perpendicular line; and not far from it is the tower of Assinelli, built by Gerardo Assinelli in 1109, and the highest in Italy, except the cupola of St. Peter's at Rome. Its altitude is 371 feet. It is a square tower, ascended by 464 wooden steps, and leans between three and four feet from the perpendicular. In the church of St. Petronius, the coronation of Charles V., by pope Clement VII., took place in 1530. This church is 360 feet long, and 154 broad, with three handsome chapels on each side. It contains a meridian line, drawn in 1653, and renewed in 1695, which is half the length of the church, and

consists of pieces of red and white marble inlaid, about three or four inches broad. Being out of repair in 1776, they were renewed under the direction of M. Zanotti. The gnomon is eighty-three feet high, and a circular image of the sun, seven or eight inches in diameter, is admitted through an aperture in the roof. Another noble public building of Bologna is the Palazzo Pubblico, the residence of the pope's legate, the president of the council, &c. It is in the great market-place, and is of vast magnitude, containing the courts of justice and the arsenal, adorned with numerous statues and paintings. There is a large area in front, in the centre of which is a noble marble fountain. The university, supposed to have been founded in the year 433, by Theodosius, was greatly enlarged by Charlemagne, and is said to have been formerly attended by 10,000 students. It first encouraged the study of the Roman law in modern times, and received in consequence the title of *Mater Studiorum*. Here too was the seat of the celebrated Caracci's school of painting. Bologna is also celebrated in Italian history as the seat of various important families; among whom the Lambertini have ever been eminent, and from them was descended pope Benedict XIV., who presented his native city with his whole library, philosophical instruments, &c. esteemed of great value. A flourishing silk manufacture has been conducted here ever since the middle of the fourteenth century. On the banks of the Reno are established between 300 and 400 mills in constant work. Cloth and silk stuffs are also made; and satins, damasks, taffeta, velvet, gauze, crape, and linen, give occasion to an active trade with Genoa, Leghorn, and Venice. The Academy of Sciences was founded in 1712 by the learned count Marsigli, one of the generals of pope Clement XI. The fertile country around has obtained the appellation of *La Grassa*: here vineyards, separated by rows of elms and mulberry trees, and interspersed with melons, olives, &c. enchant the eye. Tobacco is also cultivated with great success, and the hemp grows to the height of twelve or thirteen feet. The French entered Bologna on the 19th of June, 1796, and made prisoners the cardinal legate and the papal garrison. An armistice, concluded on the twenty-third of that month between the pope and Buonaparte, left the legation of Bologna (otherwise called the *Bolognese*), in the occupation of France; and it was ceded in full, along with Ferrara and Romagna, by the subsequent treaty of Tolentino. Bologna was shortly after declared a free and independent state, in league with Ferrara, Modena, and Reggio; it was subsequently incorporated with the Cisalpine republic. In the campaign of 1799 this city was taken by the Austrian general Klenau, with the valuable magazines of the army of Macdonald; but, after the battle of Marengo, it again fell into the hands of the French, and was created the capital of the department of the Reno. It was restored to the pope in 1815, and is twenty-four miles south-east of Modena, twenty-six south-east of Ferrara, forty-eight north of Florence, and 180 N. N. W. of Rome.

BOLOGNA, or the *Bolognese*, one of the Italian

States, containing about 200,000 inhabitants; it is bounded on the north by Ferrara, on the west by Modena, on the south by the duchy of Tuscany, and on the east by Romagna, and is watered by a great number of small rivers, which render its soil the most fertile perhaps of any in Italy. It produces all sorts of grain and fruits; particularly muscadine grapes, which are in high esteem; and has mines of alum and iron. This country, anciently belonging to the Boii and the Ligures, became in the middle ages a republic, under the protection of the emperors of Germany. After being sold by a faction to the archbishop of Milan, the people shook off the yoke, but in the year 1513 they put themselves under the dominion of the pope, on condition that they should preserve their privileges. The head of the province now is a legate of the pope, who is commonly a cardinal, and is changed every three years; ecclesiastical affairs, however, are subject only to the archbishop.

BOLOGNE, or BOULOGNE. See BOULOGNE.

BOLOGNIAN, or BONONIAN STONE, a phosphoric substance, first discovered near Bologna, in Italy, whence its name. It was supposed to contain some metallic matter, from its great specific gravity; but is now found to be only a compound of mucilage and sulphate of barytes. If sulphate of barytes be first heated to ignition, then finely powdered, and made into a paste with mucilage; and this paste divided into pieces a quarter of an inch thick, and dried in a moderate heat, be exposed to the heat of a wind furnace, by placing them loose in the midst of the charcoal; a pyrophorus will be obtained, which, after a few minutes exposure to the sun's rays, will give light enough in the dark to render the figures on the dial-plate of a watch visible. Mr. Scheffer, in the *Memoirs of the Academy at Stockholm*, for 1753, has communicated some experiments on a stone of this kind from China, which prove that it perfectly agrees with the description given in several books, of a stone called *petuntse* by the Chinese, said to be used in their porcelain manufactures.

BOLSCHERETSK, an important fortress and town of Kamtschatka, formerly the capital of that peninsula. It is situated on the banks of the Bolschaia Reka, twenty miles from its mouth, in a country almost entirely covered with rein-deer moss, whereon vast herds of rein-deer, formerly consisting of 2000 or 3000, belonging to the crown, were pastured. The town is small, consisting of log houses. There is a church here, a court-room, and barracks for the military, and also a number of huts of the Kamtschadales. Bolscheretsk was built in 1701 or 1703, destroyed in 1707, and rebuilt in 1711. The insecurity of the harbour has lately caused the seat of government to be transferred to Nischery Kamtschatka, at a considerable distance.

BOLSENA, LAKE OF, so called after a small town in the neighbourhood, once a bishop's see; called also *Lacus Tarquiniensis*, is about thirty miles in circuit, and surrounded by mountains, covered with noble forests. The whole presents the appearance of a vast amphitheatre, with a margin of towns and villages. The lake contains the two small islands of Martana and Bisentina;

the latter adorned with a fine Franciscan convent. The town of Bolsena is eight miles south of Orvieto, and is known as the spot where the pretended miracle was wrought, which led to the institution of Corpus Christi day in 1252.

BOLSOVER, a market town of Derby, nine miles east from Chesterfield, and 145 from London; containing 1245 inhabitants; it is pleasantly situate on the borders of Nottinghamshire. Here the Danes kept a garrison, and a few of their earth-works are remaining. It has a spacious and magnificent castle, founded by the family of Hastings, earls of Abergavenny, and is noted for the manufacture of tobacco-pipes. Market on Friday.

BOLSTER, *v. & n.* } Ang.-Sax. holster,
BOLSTERED, } bolstre; from boll, a
BOLSTERER, } round or ball, and ster
BOLSTERING, } or stre, straw, a roll of
 straw, used generally for that article which supports and raises the head in bed; a pad or quilt to hinder any pressure, or fill up any vacuity; to bolster is to give artificial support; to uphold; to maintain; to supply for this purpose a temporary expedient: thus to bolster up the credit of an individual, is not to put it into a state of security, or actually to retrieve it, but to afford it insufficient, and in point of justice very questionable, assistance.

We may be made wiser by the publick persuasions grafted in men's minds, so they be used to further the truth, not to *bolster* error. *Hooker.*

It was the way of many to *bolster* up their crazy doating consciences with confidences. *South.*

Mortal eyes do see them *bolster*

More than their own. *Shakspeare. Othello.*

Perhaps some cold bank is her *bolster* now,
 Or 'gainst the rugged bark of some broad elm
 Leans her unpillowed head. *Milton.*

Up goes her hand, and off she slips

The *bolsters* that supply her hips. *Swift.*

This arm shall be a *bolster* for thy head;
 I'll fetch clean straw to make a soldier's bed.

Gay.

BOLSTER, among surgeons, a soft yielding substance, either laid under the head or a broken limb. In this sense, bolsters are contrived for crooked, bunched, and otherwise distorted backs, shoulders, &c.

BOLSWAERT, an ancient town of the Netherlands, in West Friesland, thirteen miles south-west of Leenwarden, and seven S.E. of Harlingen. It has a good port, carrying on an excellent leather and woollen trade. Near the town, which is about two miles in extent, was formerly an abbey of the Cisterians, where the Munster Anabaptists took refuge in 1534, and where William, count of Holland, was buried in the fourteenth century. Population 2800.

BOLSWERT, or **BOLSUERD** (Boetius Adam A.), an engraver at Antwerp, flourished about 1620. He worked with the graver only; and imitated the free open style of the Bolemaris with great success. When he worked from Rubens, he altered that style; and his plates are neater, fuller of color, and more highly finished. The two following are mentioned as capital: 1. The Resurrection of Lazarus, a large upright plate; and the Last Supper, its companion.

BOLSWERT, or **BOLSUERD** (Scheltius A.), was the brother of Boetius Adam, but greatly his superior. He worked entirely with the graver, and never called in the assistance of the point. His general character is thus drawn by Basan: 'We have a large number of prints, which are held in great esteem, by this artist, from various masters; but especially from Rubens, whose pictures he has copied with all possible knowledge, taste, and great effect. The freedom with which this excellent artist handled the graver, the picturesque roughness of etching, which he could imitate without any other assisting instrument, and the ability he possessed of distinguishing the different masses of colors, have always been admired by the connoisseurs, and give him a place in the number of those celebrated engravers, who are desirous of rendering their works as useful as they are agreeable, and of acquiring a reputation as lasting as it is justly merited.'

BOLT, *v. & n.* } Dutch, *boult*; *Βολις*. An
BOLT UPRIGHT, } arrow; a dart; lightning; a
 thunder-bolt; the bar or fastening of a door; a chain; a lock used to secure the legs of felons. To bolt is to throw to; to shoot; to build; to strengthen; to confirm; to send away; to drive out; to rush or cause to rush out; to start out with the quickness of an arrow: metaphorically, to speak without caution; to blurt out any thing precipitately.

Her mouth was sweet as bracket or the meth,

Or hord of apples laid in hay or leth.

Wining she was as is a jolly colt,

Long as a mast and upright as a *bolt*.

Chaucer. Canterbury Tales.

It was upon a holiday,
 When shepheard groomes han leave to play,
 I cast to go a shooting;
 Long wandering up and down the land,
 With bow and *bolts* in either hand,
 For birds in bushes tooting.

Spenser. Shepheard's Calender.

But wise and wary was that noble pere;
 And lightly leaping from so monstrous maine,
 Did fayre avoide the violence him nere;
 It booted nought to thinke such *thunderbolts* to bear.

Spenser.

This Puck seems but a dreaming dolt,
 Still walking like a ragged colt,
 And oft out of a bush doth *bolt*,
 Of purpose to deceive us.

Drayton.

Yet marked I where the *bolt* of Cupid fell;
 It fell upon a little western flower,
 Before milk-white, now purple with love's wound.

Shakspeare.

'Tis not in thee, to oppose the *bolt*
 Against my coming in. *Id.*

It is great
 To do that thing that ends all other deeds,
 Which shackles accidents, and *bolts* up change.

Id.

That I could reach the axle, where the pins are
 Which *bolt* this frame, that I might pull them out!

Ben Jonson.

Oh, I am wounded—not without,
 But angry Cupid *bolting* from her eyes,
 Hath shot himself into me like a flame.

Id. Volpone.

— As a thief to unhoard the cash
Of some rich burgher, whose substantial doors,
Cross-barred and bolted fast, fear no assault;
In at the window climbs, or o'er the tiles;
So clomb this first great thief into God's fold:
So since into his church lewd hirelings climb.

Milton.

I hate when vice can bolt her arguments,
And virtue has no tongue to check her pride. Id.

They erected a fort, and from thence they bolted
like beasts of the forest, sometimes into the forest,
sometimes into the woods and fastnesses, and some-
times back to their den. Bacon.

As the house was all in a flame, out bolts a mouse
from the ruins to save herself. L'Estrange.

I have reflected on those men who, from time to
time, have shot themselves into the world. I have
seen many successions of them; some bolting out
upon the stage with vast applause, and others hissed
off. Dryden.

Singed with the flames, and with the bolts trans-
fixed,

With native earth your blood the monsters mixed. Id.

The bolted gates flew open at the blast;
The storm rushed in, and Arcite stood aghast. Id.

As I stood boltupright upon one end, one of the
ladies burst out. Addison.

Was there no bolt, no punishment above?
No, none is equal to despairing love.

Havard's Scanderbeg.

Sir, this vermin of court reporters, when they are
forced into day upon one point, are sure to burrow in
another; but they shall have no refuge: I will make
them bolt out of all their holes. Burke.

BOLT', v. Germ. *beutelen*, bluter.

BOULTER, } To bolt the bran; to sift

BOULT'ING-HUTCH, } or separate, the fine from

BOULT'ING-TUB. } the coarse, the good from

the bad: hence to examine; to scrutinise with a
view to discrimination; to purify, to purge.

He now had bouted all the flour. Spenser.

In the bolting and sifting of fourteen years of power
and favour, all that came out could not be pure meal.

Wetton.

The fanned snow.
That's bolted by the northern blast twice o'er. Shakspeare.

I cannot bolt this matter to the bran,
As Bradwardin and holy Austin can. Dryden.

It would be well bolted out, whether great refrac-
tions may not be made upon reflections, as upon direct
beams. Bacon.

The judge, or jury, or parties, or the council, or
attornies, propounding questions, beats and bolts out
the truth much better than when the witness delivers
only a formal series. Hale.

Time and nature will bolt out the truth of things
through all disguises. L'Estrange.

BOLT, in architecture, an iron fastening fixed to
doors and windows. They are generally dis-
tinguished into three kinds, viz. plate, round and
spring bolts.

BOLT, in commerce, twenty-eight ells of can-
vas. Also a narrow piece of silk of indefinite
measure.

BOLTS, in gunnery, are of several sorts, as,
bolts, bed, the four bolts that fasten the brackets
of a mortar to the bed. Bolts, bracket, the bolts
that go through the cheeks of a mortar, and by
the help of quoins keep her fixed at the given
elevation. Bolts, prise, the large knobs of iron

on the cheeks of a carriage, which keep the
hand-spoke from sliding, when it is poizing up
the breech of a piece. Bolts, transum, that go
between the cheeks of a gun-carriage, to
strengthen the transums. Bolts, traverse, the
two short bolts that, being put one in each end
of a mortar-carriage, serve to traverse her.

BOLTS, in ship-building, are iron pins, of
which there are several sorts, according to their
different makes and uses.

BOLTS, FEND, or FENDER, made with long and
thick heads, and struck into the uttermost bends
of the ship, to save her sides from bruises.

BOLTS, FORELOCK, have at the end a forelock
of iron driven in to keep them from starting
back.

BOLTS, RAY, have jags or barbs on each side,
to keep them from flying out of their holes.

BOLTS, RING, are for bringing-to the planks,
and those parts to which the breeches and tackle
of the guns are fastened.

BOLTS, in ship-building, are made of copper
or iron, pointed at one end. They vary in
length from two to fifteen feet, and in diameter
from three-quarters to an inch and quarter or more;
receiving particular names according to the parts
of the vessel in which they are driven, by what
is called a monkey. The weight of copper bolts
in an English seventy-four gun ship, is reckoned
at about thirty tons, and the iron bolts for the
upper works weigh not less than forty more. A
superior mode of driving them has lately been
suggested, particularly where they are not of
great weight, by Mr. Phillips' tubes, represented
in the diagram below.

Fig. 1.

Fig. 2.

Fig. 3.

Figs. 1 and 2 are steel punches or drifts, placed
on the head of the copper bolt whilst driving.
Fig. 3 is the iron tube fastened together, ready to
enclose the bolt. Iron rings with screws, *d, e, f, g, h*,
are placed over the joints of the tube to hold
them firmly together; and the points, *F, F*, on the
lower ring are to stick into the timber, in order
to preserve the tube steady in driving. See
Transactions of the Society of Arts, vol. xix.

Very powerful machines are required for the
drawing of bolts in repairing a ship; the most
approved in our dock-yards are Bolton's and
Hookey's.

BOLTING, or BOULTING, among millers, the
act of separating the flour from the bran, by
means of a sieve or bolter.

BOLTING-CLOTH, **BOLSTER-CLOTH**, or **BULTING-CLOTH**, a linen or hair cloth for sifting meal or flour.

BOLTING-MILL, a versatile engine for sifting with more ease and expedition. The cloth round this is called the bolter.

BOLTON-LE-MOOR, a market town of Lancashire, on a stream that joins the Irwell, noted for its extensive manufactures of cotton goods. Between 1781 and 1821, the population had received an increase of 17,000 persons. The Flemings first established the cotton manufacture here, and it retained the pre-eminence in that branch of commerce for a considerable time; and while the trade of Manchester was chiefly in coarse woollens. Here Sir Richard Arkwright was born, and passed great part of his early life. There are several good libraries; and the methodists have a Sunday school, in which more than 1000 children are instructed, gratis, in reading and writing. Long. 2° 15' W., lat. 53° 55' N. By the canal navigation, Bolton communicates with all parts of the kingdom. Besides the original parish church, here is a newly built church, several chapels for dissenters, a Catholic chapel, and a grammar school. Here is also a dispensary, a public library, and news-rooms, besides other useful and charitable institutions. Between this place and Wigan, great quantities of canal coal are found, which, although easily lighted, will hold fire as long as any coal whatever; it is perfectly smooth when parted into pieces, and although of the deepest jet black, will not soil a cambric handkerchief; of this substance turners make snuff-boxes, salts, candlesticks, &c. In the neighbourhood are some medicinal waters. Here the earl of Derby was executed in 1651, for proclaiming king Charles II. It has a good market on Monday, and fairs on July 31st and October 14th, for horses, hardware, goods, &c.; and on the day preceding each, is a fair for horned cattle. The police of the town is conducted by two constables, assisted by the neighbouring magistrates.

BOLTON, or **BOULTON** (Edmund), an ingenious English antiquarian, who lived in the beginning of the seventeenth century. His principal work is his *Nero Cæsar, or Monarchy Depraved*, printed at London in 1624, folio, and adorned with several curious prints of valuable medals. Besides this, he wrote: 1. *An English Translation of Lucius Florus's Roman History*. 2. *Hypercritica, or a rule of judgment for reading or writing our Histories*. 3. *The Elements of Armouries, &c. and some other works*.

BOLTONIA, in botany, a genus of plants; class syngenesia, order polygamia superflua. Ess. ch. receptacle cellular, hemispheric; seed, margin toothed and two-awned: CAL. imbricate: SPECIES, two, natives of North America.

BOLT ROPE, in naval affairs, the rope passing round the sail, to which the edges of it are sewed, to prevent the sail from tearing: the bottom part of it is called the foot-rope; the sides, leeches; and if the sail be oblong or square, the upper part is called the head-rope.

BOLUC BASSI, the chief of a company among the Turks, or a captain over 100 janissaries.

BOLUS; βολος; any medicine, rolled round:

VOL. IV.

that is larger than an ordinary sized pea, and yet not too large to be swallowed.

BOLZAS, in commerce, a kind of ticking brought from the East Indies.

BOMB, *v. & n.*

BOMBARD, *v. & n.*

BOMBARDIER,

BOMBARDMENT,

BOMBKETCH,

BOMBVESSEL,

BOMBILATION,

BOMB'CHEST.

Bombarda, says Vossius, a new word for a new thing; *bombo et ardere*, sound and flame; noise and mischief. A bomb is a murderous machine constructed to vomit out iron balls by the force of gunpowder. To bomb, to bombard, is to besiege and attack with bombs. 'Bombard-pharse,' a compound used by Ben Jonson to imply more sound than sense; sounding or noisy, as a bomb, or bombard. Bombchest, from bomb and chest. A kind of chest filled usually with bombs, and sometimes only with gunpowder, placed under ground, to tear and blow it up in the air, with those who stand on it. Bombketch and bombvessel. A kind of ship strongly built, to bear the shock of a mortar, when bombs are to be fired into a town.

An upper chamber being thought weak, was supported by a pillar of iron, of the bigness of one's arm in the midst; which, if you had struck, would make a little flat noise in the room, but a great *bomb* in the chamber beneath.

Bacon.

How to abate the vigour or silence the *bombilation* of guns, a way is said to be by borax and butter, mixt in a due proportion, which will almost take off the report, and also the force of the charge.

Brown's *Vulgar Errours*.

They planted in divers places twelve great *bombards*, wherewith they threw huge stones into the air, which, falling down, into the city, might break down the houses.

Knolles.

The loud cannon missive iron pours,

And in the slaughtering *bomb* Gradivus roars.

Rowe.

Our king thus trembles at Namur,

Whilst Villeroy, who ne'er afraid is,

To Bruxelles marches on secure,

To *bomb* the monks, and scare the ladies.

Prior.

A medal is struck on the English failing in their attempts on Dunkirk, when they endeavoured to blow up a fort, and *bombard* the town.

Addison.

Genoa is not yet secure from a *bombardment*, though it is not so exposed as formerly.

Id.

Nor could an ordinary fleet, with *bomb-vessels*, hope to succeed against a place that has in its arsenal galleys and men of war.

Id. on Italy.

The *bombardier* tosses his ball sometimes into the midst of the city, with a design to fill all around him with terror and combustion.

Tatler.

From the earliest dawning of policy to this day, the invention of men has been sharpening and improving the mystery of murder, from the first rude essay of clubs and stones, to the perfection of gunnery, cannoneering, *bombarding*, mining.

Burke.

BOMB, a hollow iron ball, or shell, filled with gunpowder, and furnished with a vent for a fusee, or wooden tube, filled with combustible matter, to be thrown out from a mortar; which has its name from the noise it makes. The fusee, being set on fire, burns slowly till it reaches the gunpowder, which goes off at once, bursting the shell to pieces with incredible violence; whence the use of bombs in besieging towns. The

U

largest are about eighteen inches in diameter. By whom they were invented is not known, and the time is uncertain, some fixing it to 1588, and others to 1495. The shell being filled with gunpowder, the fusee is driven into the vent or aperture, within an inch of the head, and fastened with a cement made of quick lime, ashes, brick dust, and steel filings, worked together in a glutinous water; or of four parts of pitch, two of colophony, one of turpentine, and one of wax. This tube is filled with a combustible matter, made of two ounces of nitre, one of sulphur, and three of gunpowder dust, well rammed. To preserve the fusee, they pitch it over, but uncase it when they put it into the mortar, and cover it with gunpowder dust; which, having taken fire by the flash of the powder in the chamber of the mortar, burns all the time the bomb is in the air; and the composition in the bomb being spent, it fires the powder in the bomb, which bursts with great force, blowing up whatever is about it. The great height a bomb goes in the air, and the force with which it falls, makes it go deep into the earth. Bombs may be used without mortar-pieces, as was done by the Venetians at Candia, when the Turks had possessed themselves of the ditch, rolling down bombs upon them along a plank set sloping towards their works, with ledges on the sides to keep the bomb right forward. They are sometimes also buried under ground to blow up. See CAISSON. Bombs were not commonly used till 1634, and then only in the Dutch and Spanish armies. One Malthus, an English engineer, is said to have carried them first into France, where they were used at the siege of Collioure. The French invented a new sort of bombs of vast weight, called comminges. The art of throwing bombs makes a branch of gunnery, founded on the theory of projectiles, and the qualities of gunpowder. See GUNNERY, PROJECTILES, GUNPOWDER, &c.

BOMBA, in zoology, a species of trichoda belonging to the genera of vermes infusoria. This kind is of a changeable form, with a few hairs on the anterior part. It is found abundant in stagnant water; the body is thick, somewhat pellucid, of a yellowish color, and filled with paler molecules.

BOMBARDING, or BOMBARDMENT, the act of assaulting a city or fortress, by throwing shells into it, in order to set fire to and ruin the houses, churches, magazines, &c. and to do other mischief. As one of the effects of the shell results from its weight, it is never discharged as a ball from a cannon, that is, by pointing it at a certain object; but the mortars in England are fixed at an elevation of forty-five degrees; that is, inclined so many degrees from the horizon, that the shell describes a curve, called the military projectile. Some mortars (5½ inch brass) have of late been constructed to fire at different elevations, upon brigadier-general Lawson's principle.

BOMBARDO, a musical instrument of the wind kind, much the same as the bassoon, and used as a bass to the hautboy.

BOMBASIN, † Lat. *bombyx*. Any soft Bombycinous, ‡ or delicate wool adapted for weaving garments; a slight silken stuff for mourning.

In six months after, came the silkworms *bombyces*. Silkworms spin and weave webs like to those of the spiders, and all to please our dainty dames, who thereof make their fine silkes and velvets, formeth their costly garments and superfluous apparell, which are called *bombycina*. *Holland. Plinie.*

BOMBASINE is also applied to stuffs crossed of cotton.

BOMBASIUS (Paul), a native of Bologna, gained esteem by the profession of philology about the beginning of the sixteenth century. He taught Latin and Greek at Naples, and was professor of Greek at Bologna. His abilities induced Cardinal Pucci to make him his secretary, with a good salary. He lived very easy at Rome with the cardinal, till that city was plundered under Clement VII. when he was killed, while endeavoring to get into the castle of St. Angelo. He was an intimate friend and correspondent of Erasmus, who has preserved some of his letters, and gives him a good character.

BOMBAST, *v. n. s. & adj. or* } Of the same
BOM'AST, } origin as bom-
BOM'ASTICK, } basin. Ac-
BOM'ASTRY, } cording to
Johnson, it is a stuff of soft loose texture, used formerly to swell the garment, thence used to signify bulk or show without solidity. Fustian; big words, without meaning.

He, as loving his own pride and purpose,

Evades them with a *bombast* circumstance,
Horribly stuffed with epithets of war. *Shakspeare.*

Not pedants' motley-tongue, soldiers' *bombast*,

Mountebanks' drug-tongue, nor the terms of law,

Are strong enough preparatives to draw

Me to hear this. *Donne.*

Are all the flights of heroick poetry to be concluded *bombast* unnatural, and mere madness, because they are not affected with their excellencies? *Dryden.*

A theatrical, *bombastick*, windy phraseology of heroick virtue blended and mingled up with a worse dissoluteness, and joined to a murderous and savage ferocity, forms the tone and idiom of their language and their manners. *Burke.*

BOMBAST, in composition, is a serious endeavour, by strained description, to raise a low or familiar subject beyond its rank; which, instead of being sublime, never fails to be ridiculous. The mind in some animating passions is indeed apt to magnify its objects beyond natural bounds: but such hyperbolical description has its limits; and, when carried beyond these, it degenerates into burlesque, as in the following examples:

He roared so loud and looked so wondrous grim,
His very shadow durst not follow him.

Ben Johnson, in his *Sejanus* (Act. 5.), makes that proud minister say,

Great and high
The world knows only two, that's Rome and I.
My roof receives me not: 'tis air I tread,
And at each step I feel my advanced head
Knock out a star in heaven.

A writer who has no natural elevation of genius is extremely apt to deviate into bombast. He strains above his genius, and the violent effort he makes, carries him generally beyond the bounds of propriety. But even the best poets sometimes deviate into bombast, or sink into bathos, when they go beyond nature, in aiming at the sublime. See *SUBLIME*.

BOMBAX, in botany, the silk-cotton tree : A genus of the polyandria order, and monodelphia class of plants : natural order seventeenth colum-niferæ : CAL. quinquifid : STAM. five or more ; the capsule is ligneous, quinquelocular, and quinque-valved : the seeds are woolly, and the receptacle pentagonous. The species are six in number. 1. *B. ceiba*, with a prickly stalk, a native of America. 2. *B. heptaphyllum*, with leaves cut into seven parts : the cotton is of a fine purple color. 3. *B. pentandria*, with a smooth stalk, growing naturally in the Indies, where they arrive at a great magnitude, being some of the largest trees in those parts. These plants, being natives of warm climates, must always be kept in a stove. They are raised from seeds, procured in the capsules from the places where they grow naturally. These are to be sown in spring, in pots of light earth, plunged in a substantial hot-bed of dung or tan, where the plants will appear in three or four weeks. They must then be placed separately in small pots, plunging them in the bark-bed, giving them shade and water, and shifting them occasionally into larger pots with fresh earth. Water them plentifully in summer, but moderately in winter. The dark short cotton of the first and third species is used by the poorer inhabitants of those places where such trees grow, to stuff pillows or chairs, but is generally deemed unwholesome to lie upon. The beautiful purple down of the heptaphyllum is spun, wrought into clothes, and worn, without being dyed any other color, by the inhabitants of the Spanish West Indies, where the tree naturally grows. Large piragues, or canoes fit to carry a sail, are made both at Senegal, and in America, of the trunk of the silk-cotton tree, the wood of which is very light, and unfit for any other purpose.

BOMBAX, in entomology, is applied by Lin-næus to such insects as have incumbent wings, and feelers resembling a comb.

BOMBAY, Bom-bahia, Port. i. e. Good Bay, an island on the western coast of India, the seat of one of the English presidencies. It is situated in 18° 58' N. lat., and 72° 38' E. long.; and is about seven miles in length, and twenty-one in circumference. The natives call it Mambei. A narrow arm of the sea separates it from Salsette and the coast of Malabar.

This island was early taken possession of by the Portuguese; and was ceded, in 1662, to the English, as part of the dowry of the Infanta Catharine, on her marriage with Charles II.; but on a squadron being despatched to India, to receive investiture of the island, the Catholic clergy were unwilling that it should be delivered into the hands of heretics, and induced the governor to resist its transfer. Above two years elapsed before this object could be effected, during which period the English squadron buried upwards of 200 of its men in the Swalley roads. At length a treaty was agreed to, by which the inhabitants were to enjoy the free exercise of their religion, with the possession of their estates, under the crown of England; but the revenue of the island being not equal to its expenditure, the king, in 1668, made a full grant of it to the East India Company. Its excellent harbour has

doubtless been the chief recommendation of this island; a thousand ships, it is said, can ride in it, protected from every wind. On the approach of the monsoons, vessels, in other parts of India, are obliged to stand out to sea, in order to prevent inevitable destruction. At this period the harbour of Bombay, and Trincomallee, in the island of Ceylon, are the only ports we possess which are capable of affording a retreat. Near the southern extremity of the island stands the light-house, which is of a circular form. It rises from the sea to the height of 150 feet, and shows a light at the distance of twenty-one miles. Butcher's Island is nearly opposite to Borabay Castle, at a distance of three miles; and about two miles from this is the small but celebrated island of Elephanta. The two small islands of Henery and Kenery are situated at the entrance of the harbour, which is furnished with dock-yards, and an arsenal convenient for building and refitting ships.

The new dock is a magnificent work, both as to design and execution. With all these advantages Bombay is indeed a most important naval arsenal: within these few years ships of from 600 to 1000 tons have been built in its yards, equal to any in the world in durability and beauty of construction. In 1810 the *Minden*, a seventy-four gun ship, was built by the Parsees without any assistance from Europeans. The highest spring tides rise here to the height of seventeen feet, and the height of the ordinary tides is fourteen feet. In consequence of these advantages the dry dock of Bombay has scarcely its equal for size and convenience, having three divisions, with a pair of strong gates to each, so that it is capable of receiving three ships of the line at one time.

Bombay, enjoying from its insular situation the full advantage of the sea breezes, is cooler in point of climate than most parts of the Indian continent. The rains last about four months, and continue with little interruption from about the end of May to the beginning of October. It was formerly reckoned the grave of the English; but is considered more salubrious since the building of a wall to prevent the salt marshes formed by the sea, and by an order that the natives should not manure their cocoa-nut groves with putrid fish. Still many Europeans are attacked, on their first arrival, by the diseases of all warm climates, provoked in many cases by irregularity, against which they cannot be too much guarded. The soil is sterile, and incapable of much improvement, producing nothing but a little rice, cocoa-nuts, and a few Indian fruits.

Under the Portuguese government Bombay is said to have contained about 10,000 inhabitants; Niebuhr informs us, that when he visited it, in 1763, they were estimated at 140,000, although within twenty years they did not amount to 70,000, so that in this short period the number appears to have been more than doubled. In the year 1803 Sir James Mackintosh computed the number of inhabitants at 150,000. These consist of English, Portuguese, Indian Catholics, Hindoos, Parsees (see our article PARSEES for an account of this remarkable sect), Mahomedans of different sects, and some Armenian Christians.

The English have a handsome church; and the establishment of chaplains for their presidency is four in number, but the list is rarely full. The Roman Catholics have a bishop of Bombay; they are numerous, and their churches are sumptuously ornamented. Government, it is said, does not allow the Catholics to exert their zeal for the conversion of the natives, but under great restrictions.

The city of Bombay, about a mile in length, is defended, both towards the land and sea, by very extensive fortifications. The houses are not, in general, either handsome or commodious, having only one floor; but they are not flat roofed, as in the other parts of the East, being covered with tiles in the European manner. The English prefer glass windows, but the other inhabitants form them of small pieces of transparent shells framed in wood. The floors are a composition of lime made from shells, extremely durable and remarkably smooth. The government house is a handsome edifice. A causeway, connecting Bombay with Salsette, is a public work of considerable magnitude, and insures the country a constant supply for the markets; but it has been thought injurious to the harbour. The markets furnish mutton (often lean and hard), excellent fish, game (principally the red-legged partridge), and large frogs, which are in great request among the Portuguese and Chinese, onions, for which they are famous, common and sweet potatoes, inferior cheese, buffalo-beef, butter and milk. Bombay sends to China a large quantity of cotton, sandal-wood, pepper, guns, drugs, pearls, ivory and gems, sharks' fins and edible birds' nests. The ships are generally detained there from July to January. Coffee, barilla, hemp, manufactured goods from Surat, with many of the above articles, are also sent to Europe.

Bombay is the seat of the English government for the coast of Malabar. The council consists of a governor and three members; but they are under the control of the government-general of Bengal, with respect to treaties of peace with the native powers, the making of war or concluding of peace, collecting and applying revenues, levying and employing forces, &c.; and they are required in all cases to obey the orders of the government-general, unless the directors of the Company have sent out contrary orders not known to the government-general, of which, in that case, they are to give the government immediate advice. The regular military and marine corps do not amount to 3000 men; but the whole army forms a body of more than 21,000, chiefly Maharrattas, who retain their own language and customs. The number of the principal civil servants is 106. Besides the governor and council, stationed at the presidency itself, there are magistrates and commercial residents at the chief towns of the different provinces subject to their government. There is one supreme court of judicature held under the recorder; in which the practitioners are three barristers and three attorneys. Besides the capital, the places of some importance on the island are MAZAGONG, FORT SURI, MAHINI, and MALABAR POINT, which see. Its navigable streams are the Tapti, Nerbeda, and Mehindsi.

BOMBELLA, in entomology, a species of bombyx, inhabiting Austria, the wings of which are cinereous, sprinkled with fuscous. This is *Tinea Bombycella* of the Vienna catalogue.

BOMBERG (Daniel), an eminent printer, born at Antwerp. He was the first who printed Hebrew books at Venice. He began with an edition of the Bible in 4to. in 1511: and afterwards printed many others in folio, 4to, and 8vo. He printed a folio edition in 1517, with the commentaries of the rabbins, dedicated to pope Leo X. and another under the inspection of Rabbi Jacob Haiim in 4 vols. folio, in 1525. He also printed three editions of the Talmud, each of which cost him 100,000 crowns. One of these was begun in 1520, and consisted of 11 vols. folio. He brought the art of printing Hebrew books to such perfection, says Mr. Bayle, that the Jews allege, that since his death the Hebrew printing has continually grown worse.

BOMBIC ACID. Acid of the silk-worm. Silk-worms contain, especially when in the state of chrysalis, an acid liquor in a reservoir placed near the anus, which is obtained by expressing their juice in a cloth, and precipitating the muciilage by spirit of wine, and also by infusing the chrysalides in that liquor. This acid is very penetrating, of a yellow amber color, but its nature and combinations are not yet well known.

BOMBINA, in entomology, a large species of curculio, described by Fabricius, as a native of Cayenne. This insect is of a ferruginous brown color, and the wing cases striated, with black elevated tubercles.

BOMBINA, in zoology, a species of rana, or frog, the belly of which is orange, spotted with sky-blue, and the pupil of the eye triangular. Blumenb. This kind appears to be extremely variable in point of color and markings. The triangular form of the pupil of the eye, the most striking criterion of this species, can only be observed in a full light, for when examined in the shade its shape is circular.

BOMB-KETCH, a vessel built for the use of mortars at sea, and furnished with all the apparatus necessary for a vigorous bombardment. Bomb-ketches are built remarkably strong, to sustain the violent shock produced by the discharge of the mortars. The modern bomb-vessels generally carry two ten-inch mortars, four sixty-eight pounders, and six eighteen-pounders caronades: and the mortars may be fired at as low an angle as twenty degrees; their principal intention, at these low angles, being to cover the landing of troops, and protect our coast and harbours. A bomb-ketch is generally from sixty to seventy feet long from stem to stern, and draws eight or nine feet water; carrying two masts, and usually of 100 to 150 tons burden. The tender is generally a brig, on board of which the party of artillery remain till their services are required on board the bomb-vessel.

BOMBUS, in medicine, denotes a murmuring noise, as of wind breaking out of a narrow into a large cavity, frequently heard in the intestines. The bombus heard in the ears, in acute diseases, is laid down by Hippocrates as a sign of death.

BOMBUS, in music, an artificial motion with

the hands, imitating in cadence and harmony the buzzing of bees. The word is originally Greek, and signifies the buz or noise of bees, gnats, and the like. In this sense, *bombus* made one of the species of applause used by ancient auditories.

BOMBYCILLA, in ornithology, wax-wing, a genus of birds detached from the chattering, of the order passeris. Its generic characters are: beak short, slightly depressed: nostrils oval, and covered with small feathers: feet four-toed. There are two species, namely—*B. Bohemica*. Bohemian wax-wing, or chatterer. *B. Carolina*, Carolina wax-wing.

BOMBYLIUS, in entomology, the humble-bee, a genus of insects belonging to the order of diptera. The rostrum is long, bristly and bivalved; the bristles being fixed between the horizontal valves. Mr. Ray reckons nineteen species, but Linneus only five; viz. 1. *B. ater* has red wings, but a little blackish at the base; and green feet. 2. *B. Capensis*, with the wings spotted with black, an ash-colored body, and white behind. It is a native of the Cape of Good Hope. 3. *B. major*, with black wings. 4. *B. medius*, with a yellowish body, white behind, and the wings spotted with yellow. 5. *B. minor*, with unspotted wings. These are natives of Europe.

BOMBYLOPHAGUS, the humble-bee eater, in zoology, the name of a fly of the tipula kind, which is larger and stronger than the common kinds; and, loving honey, it seizes on the humble-bees, and destroys them, in order to get at the bag of honey which they contain. It is of a blackish color in the body; its head is of a bright red, and the eyes very large and prominent. It is chiefly found in mountainous places.

BOMBYX, among ancient naturalists, signifies indifferently either silk or cotton.

BOMBYX, in ancient music, a kind of instrument, which in Aristotle's time, was made of a reed, and, by reason of its length, was difficult to play on: 2. a contrivance of horn for shutting and opening the holes of wind instruments.

BOMBYX, an extensive genus of lepidopterous insects. See **ENTOMOLOGY**.

BOMBYX is also a name given to the silkworm.

BOMILCAR, the son of Hamilcar, a Carthaginian general, who, being suspected of conspiring with Agathocles, was crucified in the midst of Carthage.

BOMMEL, a fortified town of Dutch Guelderland, situated on an island called Bommeler Waard, formed by the Maese and Waal. It contains a population of nearly 3000 inhabitants; but the harbour is obstructed by sand, and its trade has in consequence declined. During the latter part of 1794, and the beginning of 1795, the French several times attempted to cross the Waal, near this town, which, with the adjoining fort of Saint Andrew, fell at this period into their hands. They afterwards drove the allies from their entrenchments at the point of the bayonet. It stands about sixty miles nearly north-east of Antwerp.

BOMMELER WAARD, the insula Batavo-

rum of Cæsar, an island in the Netherlands, formed by the Maese and the Waal, about fifteen miles long, and six broad. Being a strong place, it has often been taken and retaken. In the beginning of the civil wars, a detachment of Spanish troops were surrounded here by a Dutch fleet; the dykes were opened, and the island laid under water. But the troops who took refuge in the citadel were relieved by a sudden frost, which obliged the Dutch to retreat. In 1600 it surrendered to prince Maurice of Orange; in 1672 it was taken by the French, under marshal Turenne, but was abandoned in the following year. It had formerly a governor appointed by the states-general.

BOMONICI, from *βωμος*, an altar, and *νικη*, victory; conquerors at the altar, in Grecian antiquity, young men of Lacedæmon, who contended at the sacrifices of Diana which of them was able to endure the most lashes; being scourged at the altar of the goddess. Plutarch relates that some of them would have endured this discipline the whole day, and even to death itself.

BON, or **BAX**, in botany, a name given by some authors to the tree, the kernel of whose fruit is the coffee. The fruit they call buna.

BONA, by the Moors called Balederna, and by the Arabs blaid-el-Aneb, a sea-port of Algiers, formerly rich and populous, and the capital of the province. It is supposed by some to be the ancient Hippo, the see of St. Austin, and a sea-port built by the Romans; the ruins of which city are seen near. It is now a mean place, poorly built, and thinly inhabited. Bona was taken by the pirate Barbarossa, and joined to Algiers; but as quickly lost, and recovered by its old masters the Tunisians, who did not keep it long; and Charles V. landed in it when he invaded Algiers. This was one of the settlements of the French African Company, established during the reign of Louis XIV. They carried on here a considerable trade: in one year they exported 10,000 quintals of wool, 5000 of wax, 50,000 bullocks' hides, and 100,000 bushels of corn. The annual value of these exports is estimated at £28,575. Bona is also resorted to on account of the coral banks in the vicinity. In 1805 the English obtained the cession of this town, and of these banks, which in 1816 was treacherously taken from them by the Turks, a circumstance that gave rise to the memorable expedition sent against Algiers under lord Exmouth. From a continual discharge of ballast, and a neglect of cleansing, the road for the ships is good for nothing before the town, but a little farther west is deeper. It is sixty-six miles N. N. E. of Constantia.

BONA DEA, in heathen mythology, the good goddess, one of the names of Cybele. Others say, she was a Roman lady, the wife of one Faunus, and famous for her chastity, and that after her death she was deified. Her sacrifices were performed only by matrons; and in so secret a manner, that it was no less than death for any man to be present at the assembly. See **CYBELE**. Cicero reproaches Clodius with having entered into this temple disguised as a singing woman, and having by his presence pol-

luted the mysteries of the good goddess. What kind of mysteries these were, we may learn from Juvenal, Sat. vi. 313.

BONA, in law, from bonus, Lat. good, is variously applied, e. g. 1. *Bona fides*. When a person performs any action, which he believes at the time to be just and lawful, he is said to have acted *bonâ fide*. 2. *Bona gratia* was anciently used respecting divorces, which were brought about amicably for some just reason, with the consent of both parties and without any crime on the part of either; as in cases of old age, disease, barrenness, monachism, captivity, or the like. 3. *Bona mobilia*, movable effects. 4. *Bona notabilia*, such goods as a person dying has in another diocese than that wherein he dies, amounting to the value of £5 at least; in which case the will of the deceased must be proved, or administration granted in the court of the archbishop of the province, unless by composition or custom, any dioceses are authorised to do it, when rated at a greater sum. 5. *Bona patria*, an assize of countrymen or good neighbours, where twelve or more are chosen out of the country to pass upon an assize, being sworn judicially in the presence of the party. 6. *Bona peritura*, perishable goods. By stat. 13. Ed. I. cap. 4. the cargo of a ship that has been cast away shall be kept for a year and a day, and restored to the rightful owner; but if the goods be such as will not endure so long, they are *bona peritura*, which the sheriff is allowed to sell, and to account in money for the value. 7. *Bona vacantia*, goods in which no person can claim a property, such as royal fish, ship-wrecks, treasure-trove, waifs and estrays. These goods by the law of nature, and by the imperial law, belonged to the first occupant or finder; but in the modern constitutions of European governments, they are annexed to the supreme power by the positive laws of the state.

BONARELLI (Gui Ubaldo), an Italian count, was entrusted with several important negotiations, and esteemed an able politician and learned philosopher. He was the author of a fine Italian pastoral, intitled, *Filli di Sciro*. He died at Fano, in 1608, aged 45.

BONARIENSIS, in ornithology, a species of *loxia* or grosbeak. The head and back of the neck blue; body blackish above, yellow beneath; belly and vent yellow. The bill blackish; legs red. This is the marigold grosbeak of Latham, and *noir souci* of Buffon. Also a species of *tanagra*, inhabiting Bonaria; the color black, glossed with violet, and with greenish on the wings and tail. The female is of a brown color, with the head black, and glossed with blue. Also a species of *motacilla*, color black; throat and sides ferruginous; face, chin, middle of the belly, and exterior tail-feathers, white. Buffon calls this *demi-fin noir et roux*. It is the white-chinned warbler of Latham.

BONASIA, in entomology, a species of cicada found in America; the thorax bicornuted, and edged with white; at the base of the wings is a white spot. Also the name of a species of papilio; the wings fuscous, with a common fulvous band; the lower pair spotted at the base with black.

BONASIA, in ornithology, a species of the tetrao.

BONASUS, in zoology, a species of wild ox of the size of the tame kind, but of a thicker body, and having on its neck a mane like that of a horse, and horns very short and crooked. See *GLAMA*.

BONAVENTURA, a sea-port of South America, on the coast of Popayan, in Terra Firma. The climate is very unhealthy.

BONAVENTURE, a learned cardinal, born in Padua, in 1332. He studied at Paris, and joined the order of St. Augustine, of which he was made general in 1377. In 1378 Pope Urban VI. made him cardinal, which engaged him to defend the rights of the church against Francis de Carraris of Padua; and this so enraged that petty despot, that he caused him to be murdered by an arrow, as he passed St. Angelo's bridge at Rome, A. D. 1386. He wrote, 1. *Commentaries on the Epistles of St. John and St. James*. 2. *Lives of the Saints*. 3. *Speculum Mariæ*. 4. *Sermons*, &c.

BONAVENTURE (St.), a celebrated cardinal, originally named John Fidanzo, and called from his works, the seraphic doctor. He was born at Bagnarea in 1221, and became a monk of the order of St. Francis in 1243, a doctor of Paris in 1255, and general of his order in 1256. After the death of Clement IV. the cardinals, disagreeing about the election of a new pope, solemnly engaged to elect him who should be named by Bonaventure, even though it should be himself, but he chose Theobald archdeacon of Liege, who was then in the Holy Land, and took the name of Gregory X. This pope, in return, in 1272, made him cardinal and bishop of Alba, and appointed him to assist at the second general council of Lyons, where he died in 1274. His works, which are chiefly on divinity, were printed at Rome in 8 vols. folio. Bellarmine praises him highly, and even Luther styles him *vir præstantissimus*, a most excellent man. He was canonised by Sixtus IV. in 1482.

BONAVENTURE ISLAND, an island of Lower Canada, in the district of Gaspé, situated about one mile and a half from the coast, near the entrance of Chaleur bay. It is little better than a barren rock; but is resorted to as a fishing place.

BONAVISTA, an island in the Atlantic Ocean, the most easterly and first discovered off the Cape de Verd islands. It is twenty miles long, and thirteen broad; has plenty of goats and cotton, with some indigo; and belongs to Portugal. The inhabitants are remarkable for slothfulness: they have a town and two roads where ships come to an anchor. One of which, called the English road, is handsome and spacious: it has a few rocky shallows, but if these can be avoided, vessels find everywhere from four to thirteen fathoms of water. The other, the Portuguese road, though not quite equal, has the advantage of being nearer the city. The northern side according to Captain Cook, is in long. 22° 59' E., lat. 16° 17' N.

BONAVISTA, CAPE AND BAY OF, on the east side of Newfoundland. The cape lies in W. long. 52° 32', N. lat. 48° 15'; and was discovered by John Cabot, and his son Sebastian, in 1497,

in the service of Henry VII. king of England. The bay is formed by the cape and that of Cape Freels, opening fifteen leagues apart.

BONAWASI, a small town in the province of North Canara, on the confines of the Bednore district. In Hyder's time it contained 500 houses, but is now much reduced. This place is noted by Ptolemy, and is said to have had a dynasty of kings, who ruled 1450 years before the christian era.

BONCIARIUS (Marc Antony), a disciple of Muretus, and a good Latin writer, was born in 1555, near Perugia, where he taught languages. Among his scholars was his own father, originally a shoemaker, who wishing to turn Jesuit at forty-seven years of age, was obliged to acquire some learning from his son. Bonciarius was afflicted with the gout, and at last lost his sight. He died in 1616. He wrote, 1. *De Arte Grammatica*. 2. *Triumphus Augustus*, a poem in 4 books. 3. *Letters*, printed at Marburg in 1604. 4. *Epicurus, sive Dialogus de Antiqua Philosophia*.

BOND, *n. & adj.*

BOND'AGE,

BOND'MAN, or

BOND'SMAN,

BOND'MAID,

BOND'FOLK,

BOND'SERVANT,

BOND'SERVICE,

BOND'SLAVES,

BOND'WOMAN, or

BOND'SWOMAN.

Bond, Sax. bound.

It is written indifferently in many of its senses, bond or band; the past tense and past participle of the verb to bind. Bond is that which fastens or confines; constrains or obliges; forces or compels; it is the massy

chain that galls the limbs of the captive; it is the natural ligaments which hold the parts of the animal frame together; it is the moral power which holds society and societies in voluntary union; it is the tie of duty; the legal instrument by which contracting parties are bound and held in obligation; it is the compulsory power that makes the West India planter a dealer in blood, and the poor African his terrified, degraded, and miserable slave.

And if thy brother, that dwelleth by thee, be waxen poor, and be sold unto thee, thou shalt not compel him to serve as a *bond-servant*.

Leviticus xxv. 39.

Upon those did Solomon levy a tribute of *bond-service*.

Kings.

All her ornaments are taken away; of a free-woman she is become a *bond-slave*. *1 Macc. ii. 11.*

Whether we be Jews or Gentiles, whether we be *bond* or free. *1 Cor. xii. 13.*

Ne lasse flatering in hire word,

That, purely, her simple record

Was found as true as any *bonde*

Or trouthe, of any manes honde.

Chaucer's Boke of the Duchesse.

O great Orgoglio! greatest under skye,

O hold thy mortal hand for ladies' sake;

Hold for my sake, and doe him not to dye,

But vanquish thine eternal *bondslave* make,

And me, thy worthy need, unto thy leman take.

Spenser.

But man, forgetfull of his Maker's grace,

No less than angels, whom he did ensue,

Fell from the hope of promist heavenly place

Into the mouth of death, to sinners dew,

And all his offspring into thralldome threw,

Where they for ever should in *bondes* remaine

Of never dead yet ever dying paine. *Id. Hymnas.*

Amongst the Romans, in making of a *bondman* free, was it not wondered wherefore so great ado should be made? the master to present his slave in some court, to take him by the hand, and not only to say, in the hearing of the publick magistrate, I will that this man become free; but, after those solemn words uttered, to strike him on the cheek, to turn him round, the hair of his head to be shaved off, the magistrate to touch him thrice with a rod; in the end, a cap and a white garment given him. *Hooker.*

Wedding is great Juno's crown;

O blessed *bond* of board and bed! *Shakspeare.*

To be a queen in *bondage* is more vile

Than is a slave in base servility. *Id.*

Go with me to a notary, seal me there

Your single *bond*. *Id.*

There left me, and my man, both bound together;

Till, gnawing with my teeth my *bonds* asunder,

I gained my freedom. *Id.*

Shall I play my freedom at tray trip and become

a *bond-slave*. *Id.*

You only have overthrown me, and in my *bondage* consists my glory. *Sidney.*

Love enjoined such diligence, that no apprentice, no, no *bond-slave*, could ever be, by fear, more ready at all commands, than that young princess was. *Id.*

My lords, the senators,

Are sold for slaves, and their wives for *bondswomen*.

Ben Johnson's Cataline.

There lies he now, bruised with so sore a fall,

To his base *bonds* and loathsome prison thrall,

Whom thousand foes besiege, fenced with frail yield-

ing wall. *Fletcher's Purple Island.*

However I with thee have fixed my lot,

Certain to undergo like doom; if death

Consort with thee, death is to me as life;

So forcible within my heart I feel

The *bond* of Nature draw me to my own,

My own in thee, for what thou art is mine;

Our state cannot be severed, we are one,

One flesh; to lose thee were to lose myself. *Milton.*

Commonly the *bond-slave* is fed by his lord, but here

the lord was fed by his *bond-slave*. *Sir John Davies.*

He must resolve by no means to be enslaved,

and brought under the *bondage* of observing oaths,

which ought to vanish when they stand in competi-

tion with eating and drinking, or taking money. *South.*

What if I ne'er consent to make you mine;

My father's promise ties me not to time;

And *bonds* without a date, they say, are void.

Dryden.

Let any one send his contemplation to the extremities of the universe, and see what conceivable hoops, what *bond* he can imagine, to hold this mass of matter in so close a pressure together. *Locke.*

Observe, in working up the walls, that no side of the house, nor any part of the walls, be brought up three feet above the other, before the next adjoining wall be brought up to it, so that they may be all joined together, and make a good *bond*.

Mortimer's Husbandry.

If she has a struggle for honour, she is in a *bondage* to love; which gives the story its turn that way.

Pope.

O hope, sweet flatterer! thy delusive touch
Sheds on afflicted minds the balm of comfort—
Relieves the load of poverty—sustains

The captive, bending with the weight of *bonds*—

And smooths the pillow of disease and pain.

Glacier's Boudiera.

A day, an hour of virtuous liberty,
Is worth a whole eternity in *bondage*.

Addison's Cato.

Inglorious *bondage*! human nature groans
Beneath a vassalage so vile and cruel,
And its vast body bleeds through every vein.

Blair's Grave.

Death opens the gate of fame, and shuts the gate
of envy after it; it unlooses the chain of the captive,
and puts the *bondsman's* task into another man's
hands.

Sterne.

I have struggled through much discouragement,
and much opposition: much obloquy; much calumny,
for a people with whom I have no tie, but
the common bond of mankind.

Burke.

Hereditary *bondsman*! know ye not

Who would be free themselves must strike the blow.

Byron.

All, all forgotten; and shall man repine
That his frail *bonds* to fleeting life are broke.

Id.

BOND, in law, is a deed whereby the party obliges himself, his heirs, executors, or administrators, to pay a certain sum of money to another at a day appointed. If this be all, the bond is called a simple one, simplex obligation. But there is generally a condition added, that if the obliger does some particular act, the obligation shall be void, or else shall remain in full force: as payment of rent, performance of covenants in a deed, or repayment of a principal sum of money borrowed of the obligee, with interest; which principal sum is usually one-half of the penal sum specified in the bond. In case this condition is not performed, the bond becomes forfeited, or absolute at law, and charges the obliger while living; and after his death the obligation descends upon his heir, who, on defect of personal assets, is bound to discharge it, provided he has real assets by descent as a recompense. If the condition of a bond be impossible at the time of making it, or be to do a thing contrary to some rule of law that is merely positive, or be uncertain, or insensible, the condition alone is void, and the bond shall stand single and unconditional: for it is the folly of the obliger to enter into such an obligation from which he can never be released. If it be to do a thing that is *malum in se*, the obligation itself is void: for the whole is an unlawful contract, and the obligee shall take no advantage from such a transaction. And if the condition be possible at the time of making it, and afterwards becomes impossible by the act of God, the act of law, or the act of the obligee himself, there the penalty of the obligation is saved: for no prudence or foresight of the obligor could guard against such a contingency. On the forfeiture of a bond, or its becoming single, the whole penalty was recoverable at law: but here the courts of equity interposed, and would not permit a man to take more than in conscience he ought, viz. his principal, interest, and expenses, in case the forfeiture accrued by non-payment of money borrowed; the damages sustained upon non-performance of covenants; and the like. And the statute 4 and 5 Ann. c. 16. hath also enacted, in the same spirit of equity, that in case of a bond, conditioned for the payment of money, the payment or tender of the principal sum due, with interest and costs, even though the bond be forfeited and a suit commenced thereon, shall be a full satisfaction and discharge.

BOND, in masonry and brick-laying, is when

bricks or stones are as it were knit and interwoven; and when they say, make good bond, they mean that the joints are not made over, or upon other joints; but reach at least six inches, both within the walls and on the surface, as the art of building requires.

BOND (John), a commentator on Horace and Persius, was born in Somersetshire, in 1550, and educated at Winchester. In 1569 he was entered a student at Oxford. He took his degree of B.A. in 1573, and that of M.A. in 1579; soon after which he was appointed master of the free school at Taunton, Somersetshire. In this employment he continued many years with great reputation, but, being at length weary of his laborious employment, he commenced physician, and became eminent in that capacity. He died in 1612; he wrote, 1. *Commentarii in Poemata Q. Horatii*, 8vo. 2. *Commentarii in sex Satyras Persii*; Lond. 1614, 8vo.

BONDAGE properly signifies the same with slavery, but in old law books is used for villenage. See VILLENAGE. Tenants in bondage paid heriots, and did fealty; they were not to fell trees in their own garden, without licence of the lord.

BONDAGE BY THE FORELOCK (*Bondagium per anteriore crines capitis*), was when a freeman renounced his liberty, and became slave to some great man, which was done by the ceremony of cutting off a lock of hair from the forehead, and delivering it to his lord, denoting that he was to be maintained by him for the future. Such a bondman, if he reclaimed his liberty, or was fugitive from his master, might be drawn again to his servitude by the nose, whence, it is said, the origin of the menace to pull a man by the nose.

BOND-MEN, in Roman antiquity, were of two kinds, the one called *servi*, who were those either bought for money, taken in war, left by succession, or purchased by some other lawful acquisition; the others born of their bond-women, and called *verne*. We may add a third kind, mentioned by Justinian, called *adscripiti* glebe, or *agricensiti*; who were not bound to the person, but to the ground or place, and followed him who had the land. These in our law are called *villains regardants*, as belonging to the manor or place.

BONDOKDAN, in Turkish polity, a title given to the master of the ordnance in the service of the sultan of Egypt. It is derived from the Turkish word *bonduk*, a nut, and applied metaphorically to a musket ball. It was the surname of the Sultan Bibars.

BONDORF, a county of Suabia, belonging formerly to the Benedictine abbey of St. Blasius. It is situated in the Black Forest, and, in 1802, was transferred to the grand prior of Heitersheim; in 1805 to the king of Wirtemberg, and in 1806 to the grand duke of Baden. Including the lordship of Blumeck, it contains 7500 inhabitants, and yields a revenue of about £5000 sterling. It was formerly divided into eight parishes, containing the balliages of Bondorf, Ewatingen, and Bettmaringen. Bondorf, the chief town, has 820 inhabitants, and is the head of the bailiage, in the circle of the Danube, in the Baden dominions. twenty-eight miles north of Zurich, and six N.N.W. of Stuhlingen.

BONDOUN, a kindom on the western side of Africa; bounded on the east by Bambouk, on the south-east and south by Tenda, on the south-west by Woolli, on the west by Foota Terra, and on the north by Kajaaga. It lies between 12° and 14° of N. lat. and between 8° and 11° W. long. The name of its capital is Fatteconda. Its soil is in many places naturally fertile, the face of the country well wooded, and agreeably diversified by gentle inequalities. Without much culture it yields rice and Indian corn in abundance, and its advantages for pasture encourage the breeds of the useful quadrupeds. The inhabitants are of the race of the Foulahs, and profess the Mahommedan faith. Their government is monarchical but not absolute. The lower orders are kept in a state of vassalage by individual proprietors, but the master has not the power of life and death over his slave. Every town or district has a chieftain or governor, who distributes justice and preserves order. Their arts are few and rude, and their efforts principally confined to acquire the means of subsistence. In the towns, however, schools are established for teaching the young, whether born of parents professing the true faith, or of pagans, to read the koran. The commerce of the people of Bondou is considerable, when compared with that of some of the surrounding states, and the necessities of life can be procured in abundance. Mr. Park could purchase a fowl for a button or bit of amber, and for six or eight amber beads he could have bought a bullock. Goats' flesh and mutton were proportionably cheap. Poultry of all kinds, except the turkey, could be found everywhere, and Guinea fowls and partridges abounded in the fields. Their trade consists of slaves, gold-dust, ivory, gums, and perfumes; for which they obtain iron, salt, and trinkets. The king demands a tax from traders, which is considered as heavy.

BOND-SOCOME, an old law term, signifying an obligation to grind at the mill of the lord of the manor. See **THIRLAGE**.

BONDUC, in botany, the name given by Plumier to a genus of plants, characterised by Linnaeus under the name of *guilandina*.

BONE, *v. & n.* } Ang.-Sax. *ban*; Germ. *bein*; Swed. and Dutch, *been*; similar to *Bau-*
BONED, } *view*, to go; to step for-
BONELESS, } ward: hence bone, be-
BO'NY, } cause by virtue of the bones we are enabled to
BONE'ACHE, } walk; to go; to exercise locomotion. Bone-lace
is lace worked or manufactured upon bones.
Bonset, to set a dislocated or fractured bone
into its place.

To make no bones. To make no scruple: a metaphor taken from a dog, who readily swallows meat that has no bones. Bones is used, figuratively, for dice.

We strive, as did the houndes for the *bone*;
They fought all day, and yet her part was none,
Ther came a kyte, while that they were so rothe,
And bare away the *bone* betwixt hem both.

Chaucer's Cant. Tales.

And underneath their feet all scattered lay,
Dead skulls and *bones* of men whose lives had gone
astray.

Spenser.

I have given suck, and know
How tender 'tis to love the babe that milks me.

I would, while it was smiling in my face,
Have pluckt my nipple from his *boneless* gums,
And dasht the brains out.

Shakespeare.

Should God create another Eve, and I
Another rib afford, yet loss of thee
Would never from my heart; no, no, I feel
The link of nature draw me: flesh of flesh,
Bone of my *bone* thou art, and from thy state
Mine never shall be parted, bliss or woe.

Milton.

Puss had a month's mind to be upon the *bones* of
him, but was not willing to pick a quarrel.

L'Estrange.

The learned rabbins of the Jews
Write there's a *bone*, which they call leuz,
I' the rump of man, of such a virtue,
No force in nature can do hurt to.

Butler's Hudibras.

But then my study was to cog the dice,
And dexterously to throw the lucky dice:
To shun ames aec, that swept my stakes away;
And watch the box, for fear they should convey
False *bones*, and put upon me in the play.

Dryden.

Like Æsop's hounds contending for the *bone*,
Each pleaded right, and would be lord alone.

Id.

At present my desire is to have a good *bonesetter*.

Denham.

Unlike to living sounds it came,
Unmixed, unmelodised with breath;
But grinding through some scannell frame,
Creaked from the *bonny* lungs of death.

Langhorne.

Some have amused the dull sad years of life
(Life spent in indolence, and therefore sad.)
With schemes of monumental fame; and sought
By pyramids of mausolean pomp,
Short-lived themselves, to immortalize their bones.

Couper.

BONE is the hardest and most compact part of animal structure; it will be found defined in the article *Anatomy*: 'A uniform substance of a firm texture, without fibres, plates, or cells, but penetrated through by very delicate vessels; capable of being rendered artificially softer or harder, without any abstraction or addition of its substance that is perceptible.' This substance, although apparently different from other portions of the frame, is pretty nearly similar in ultimate composition. 'Bone,' says Richerand, 'deprived of the principle to which it owes its consistence, becomes soft, flexible, and resembles a cartilage which is resolvable by long maceration into a cellular tissue, similar to that of other parts. This tissue contains a pretty considerable number of arteries, veins, and lymphatics. The bones, therefore, are mere cellular parenchymas, whose areolæ contains a crystallised saline substance, which they separate from the blood, and with which they become incrustated, by a power inherent in their tissue, and peculiar to it. This earthy substance may be separated from the other portions of the structure by immersing the bone in nitric acid diluted with a sufficient quantity of water; or the same result may be obtained by inverting the analysis. If a bone be exposed to boiling heat for a few hours in Papin's digester, all its organised parts become dissolved, melt, and furnish a quantity of gelatine, after which there remains only an inorganic saline concretion. The different proportions of the saline to the organised part, vary considerably at different periods of life; the bones of the embryo are at first quite gelatinous. At the period of birth, and during the first years of life, the organic

part of the bone is in greater proportion; the bones are less apt to break, more flexible, possessed of more vitality, and, when fractured, are more speedily and more easily consolidated. In youth the two constituent parts are nearly in equal quantities; in adults the earthy and saline part forms two-thirds of the osseous substance; at last, gradually increasing in quantity, this earthy and saline part displaces, in old people, the part that is organised; hence their bones are weaker and more liable to fracture, and unite less readily. It may be said, therefore, that the quantity of calcareous earth deposited in bones, is in the direct ratio of the age; and that, on the contrary, the energy of the vital faculty of these organs, their flexibility, their elasticity, and their aptitude to become consolidated when their continuity is destroyed by accidents, are in an inverse ratio.

Of what, then, is this saline and earthy matter, which gives compactness and solidity to bone, constituted? Phosphate of lime enters so largely into the composition of the calcareous principle, that this salt has generally been considered its essence; modern chemists have, however, detected several other saline substances in bone, and the following extracts from Dr. Ure's Chemical Dictionary will present the reader with what has been ascertained, in respect to the kind, and proportion of these substances.

'Calced bones,' according to Berzelius, 'are composed in 100 parts of 31.9 phosphate of lime, 3 fluat of lime, 10 lime 1.1 phosphate of magnesia, 2 soda, and 2 carbonic acid, 100 parts of bones by calcination are reduced to 63. Fourcroy and Vauquelin found the following to be the composition of 100 parts of ox bones, 51 solid gelatine, 37.7 phosphate of lime, 10 carbonate of lime, and 1.3 phosphate of magnesia; but Berzelius gives the following as their constituents: 33.3 cartilage, 55.35 phosphate of lime, 3 fluat of lime, 3.85 carbonate of lime, 2.05 phosphate of magnesia, and 2.15 soda, with a little common salt.

About 1.40 of phosphate of magnesia was obtained from the calced bones of fowls by Fourcroy and Vauquelin. When the enamel of teeth, rasped down, is dissolved in muriatic acid, it leaves no albumen like the other bones. Fourcroy and Vauquelin state its components to be 27.1 gelatin and water, 72.9 phosphate of lime. Messrs. Hatchet and Pepys rate its composition at 78 phosphate of lime, 6 carbonate of lime, and 16 water and loss. Berzelius, on the other hand, found only 2 per cent. of combustible matter in teeth. The teeth of adults, by Mr. Pepys, consists of 64 phosphate of lime, 6 carbonate of lime, 20 cartilage, and 10 water or loss.'

The enamel of teeth seems to be free from cartilage, as it dissolves entirely in diluted nitric acid.

Origin and growth of BONES.—In the embryo, the parts that are eventually bone, consist; first, of a gelatinous substance, which next becomes, in some instances, cartilaginous; this change does not at all take place until some time has elapsed from the period of conception; and it is, indeed, doubtful whether the intermediate state of cartilaginous existence has place at all

in those bones which are formed early. According to Beclard and Serres, these last, that is those which are very early formed, pass immediately from their mucous or gelatinous, to their ossific state; or rather, the process of ossific deposit at once commences in this gelatinous condition. This being the case, it would seem, as stated by Dr. Copland in his notes to Richerand's Physiology, that 'cartilage is rather a provisional function, than a stage of ossification; a temporary condition of structure for the purpose of performing the offices of bone, and not a requisite antecedent to the ossific process.'

The mode in which soft yielding parts are converted into the harshness and inflexibility of bone, is exceedingly curious and interesting; to this subject we shall have more especially to advert in the article PHYSIOLOGY, and it may here suffice to state that the calcareous matter is regularly deposited from the vessels which furnish it into cavities and canals that are hollowed for its reception; the ossification commencing in the centre of the matrices, and proceeding towards the surface; the canals into which the ossific matter is deposited, become lined with a vascular membrane, which is evidently organised, for the purpose of assisting in the bony formation; it does not seem to have been quite made out, whether the concreting matter is ejected from its secreting vessels and membranes in a fluid state, or whether the deposit is, ab origine, solid; but it is most probable, as suggested by Beclard, Copland, and others, that the earthy matter is first thrown out into the membrane and cartilage in a fluid form, and that its subsequent solidification arises either from the deposit of a larger proportion of earthy matter, or from an absorption of the vehicle which gives it a fluid condition, or from the joint operation of both these causes.

There is one curious fact with respect to the changes which the progress of ossification implies, and which would seem, in proof, that deposition and absorption are constantly going on in organised bodies, even after the acme may have been obtained of destined formation or structure; it is this, that a tinge will be given even to the internal and central parts of the bones, by taking certain substances into the stomach, mixed with food; and, that this discoloration will gradually disappear when we cease to administer the materials in question. The bones of adult animals, and those most remote from the centre of circulation, will be the longest in undergoing this change, but even in these it is eventually effected. Du Hamel supposed that the bones would become colored and colorless in concentric layers, if an animal were fed, alternately, one week with madder and one without; and he supposed that additional matter was given to bone in the manner that successive layers are effected in the woody parts of trees; but he was mistaken in the fact, and it has been well observed, that the inference he deduced from the supposition is inconsistent with the regular and proportionate bearing that the osseous always maintains with the other portions of the animal frame;—if they increased, according to the hypothesis of Du Hamel, by

successive layers, they would grow, as age advanced, into masses vastly disproportioned to their destination and use.

The union of bones, after fracture, it may here be permitted us just to observe, is in a great measure similar to their first formation. Membranous matrices are first developed by the actions that are set up in the system, and then, into those newly formed membranes, ossific deposits are successively made in the manners above described. The principle upon which the periosteum, or membranous lining of bones, is subservient to their growth and nourishment, will be discussed under the head of *PHYSIOLOGY*.

Bones are extensively employed in the arts. Both in their natural state, and dyed of various colors, they are made into handles of knives and forks, and other articles of turnery. In the article *AMMONIA* it will be found how extensively these substances have been used for the manufacturing of volatile alkali, the coal of which forms bone black; or, if they are afterwards calcined to whiteness in the open air, they constitute the bone ashes of which cupels are made, and which, finely levigated, are used for cleaning articles of paste and some other trinkets, by the name of burnt hartshorn. The shavings of hartshorn, which is a species of bone, afford an elegant jelly; and the shavings of other bones, of which those of the calf are best, are often employed in their stead. On this principal Mr. Proust has recommended an economical use of bones, particularly with a view to improve the subsistence of the soldier; he first chops them into small pieces, throws them into a kettle of boiling water, and lets them boil about a quarter of an hour. When this has stood till it is cold, a quantity of fat, excellent for culinary purposes when fresh, and at any time fit for making candles, may be taken off the liquor. This in some instances amounted to an eighth, and in others, to a fourth of the weight of the bones. After this, the bones may be ground, and boiled in eight or ten times their weight of water, of which that already used may form a part, till about half is wasted, when a very nutritious jelly will be obtained. The boiler should not be of copper, as this metal is easily dissolved by the jelly; and the cover should fit very tight, so that the heat may be greater than that of boiling water, but not equal to that of Papin's digester, which would give it an empyreuma. The bones of meat that has been boiled are nearly as productive as fresh bones; but Dr. Young found that those of meat that had been roasted afforded no jelly, at least, by simmering or gently boiling.

Shells, by which several marine and some land animals are covered, crusts, or the covering of crustaceous animals, such as lobsters &c, horn, an animal matter principally membranous, and cartilage, are substances which, in a sort of graduating succession, hold an intermediate place between the completeness of bony structure, and decidedly fleshy substance. Indeed the link might be extended through ligament, tendon, and membrane into muscle; but to treat of these several substances, either as chemical bodies, or portions of animal organisation, is not the province of the present article: and we have already

stated that in ultimate composition there is not so much difference as might *à priori* be supposed between these different portions of organic totality.

BONE-ACE, a game at cards played thus: the dealer deals out two cards to the first hand, and turns up the third, and so on through all the players, who may be seven, eight, or as many as the cards will permit: he that has the highest card turned up to him, carries the bone; that is, one half of the stake; the other half remaining to be played for. Again, if there be three kings, three queens, three tens, &c. turned up, the eldest hand wins the bone. But the ace of diamonds is bone-ace, and wins all other cards whatever. Thus much for the bone; and as for the other half of the stake, the nearest to thirty-one wins it; and he that turns up or draws thirty-one wins it immediately.

BONE-SETTING, the art of replacing dislocated bones, and of joining the parts of fractured ones. See *SURGERY*, Index.

BONET (Theophilus), an eminent physician, born at Geneva March 15th, 1620. He took his degree of M. D. in 1643, after he had gone through most of the famous universities, and was for some time physician to the duke of Longueville. Meanwhile his skill in his profession obtained him considerable practice; but, being seized with deafness, it obliged him to retire from business. He wrote, 1. *Polyalthes, sive Thesaurus Medico-practicus*, 3 vols. fol.; 2. *Labyrinthi Medici Extricati*; 3. *Medicinæ Septentrionalis Collatitia*; and other works.

BONFADIO, or **BONFADIUS** (James), one of the most elegant writers of the sixteenth century, was born in Italy, at Gazano, near Salo. He was secretary to the cardinal Merinos, and after his death to the cardinal Ghinucci. He afterwards read public lectures on Aristotle's politics, and on rhetoric; and was made historiographer to the republic of Genoa. He applied himself to compose the annals of that state, in which he satirised some great families. This creating him enemies, he was accused of unnatural crimes, and condemned to be burnt. Some say that this sentence was executed; and others that his punishment was changed, and that he was beheaded, A. D. 1550. His History of Genoa is esteemed. We have also some letters, some orations, and Latin and Italian poems of his, which were printed at Bologna, in 1746, 8vo.

BONFELD, a market town of Wirtemberg, in the district of the Lower Neckar, with a fine castle, six miles north-west of Heilbronn.

BONFINIUS (Anthony), flourished in the fifteenth century. He was a native of Ascoli in Italy, and attached himself to the belles lettres. Matthias Corvinus, king of Hungary, having heard of his learning, sent for him, retained him, and settled upon him a pension. He wrote, 1. *A History of Ascoli*; 2. *A Treatise on Virginity and Conjugal Chastity*; 3. *A History of Hungary*; and other works.

BONFIRE, *n. s.* From *bon*, good, Fr. and *fire*. A fire made for some public cause of triumph and exultation.

Ring ye the bells to make it wear away,
And bonfires make all day.

Spenser.

How came so many *bonfires* to be made in queen Mary's days? Why she had abused and deceived her people. *South.*

BONFRERIUS (James), a learned Jesuit, born at Dinant in 1573. He wrote a Commentary on the Pentateuch, and learned notes on the Onomasticon, or description of the places and towns mentioned in the Scripture. He died at Tournay in 1643, aged seventy.

BONGARS, or **BONGARSIAS** (James), a native of Orleans, was one of the most learned men of the sixteenth century. He was for nearly thirty years employed in the most important negotiations of Henry IV. at the courts of the princes of Germany. A zealous protestant; when very young he had courage to write and post up in Rome a spirited answer to a bull of pope Sixtus V. The public is obliged to him for the edition of several authors who had written the History of the Expeditions to the Holy Land; he also published among other works an edition of Justin, in which he restored several passages. He died in 1612, aged fifty-eight.

BONGRACE, *Fr. n. s. bonne grace*. A forehead-cloth, or covering for the forehead. Not now used. *Skinner.*

I have seen her beset all over with emeralds and pearls, ranged in rows about her cawl, her peruke, her *bongrace*, and chaplet. *Hukewill on Providence.*

BONGRACE, in sea language, a frame of old ropes, or junks of cables, laid along the bows, sterns, and sides of ships sailing in cold latitudes, to preserve them from damage by the flakes of ice.

BONI, a considerable state of the island of Celebes. Its present capital is at the head of the Bay of Boni, and the natives are called Bugis; they were converted to the Mahomedan religion about the year 1512, and acquired their present political influence, and their victory over the Macassars of Goa, by the alliance and intrigues of the Dutch, about the latter end of the seventeenth century. See **CELEBES**. The bay, sometimes called Buggis Bay, and Sewa by the natives, is on the south coast of Celebes, extending about 180 miles in length, and 55 or 60 in average breadth. It is environed with towns and villages, but full of rocks and shoals.

BONI, an island in the Eastern Seas, lying off the harbour of Boni, on the north-east coast of Waygeoo, is sandy, low, and woody, inhabited only by a few fishermen.

BONIFACE, I., pope of Rome, was elected A. D. 418, and exerted himself much to establish the supremacy of Rome over the other churches. St. Augustine dedicated to him his book against the Pelagians. He died A. D. 423.

BONIFACE II. governed the papal see only a year and two days. He was elected on the death of Felix IV. A. D. 530, but was opposed by the anti-pope Dioscorus. He appointed Vigilius his successor, but afterwards annulled his appointment, finding Vigilius not popular. He died in 531.

BONIFACE III. was elected A. D. 606, and reigned only eight months and twenty-three days; yet in that short period, by favoring the emperor Phocas, he got the important title of 'universal bishop' exclusively conferred on him-

self and his successors. Alstedius dates the beginning of the reign of the Beast under this pope. He was succeeded by

BONIFACE IV., who obtained the additional favor from Phocas, of converting the famous heathen temple, built by Agrippa, called the Pantheon, into a church. Several literary works are ascribed to him, but they are suspected to be spurious. He died A. D. 614, in the ninth year of his pontificate, and was canonised.

BONIFACE V. was elected pope on the death of Deusdedit, A. D. 618, and was succeeded by Honorius in 626.

BONIFACE VI. was raised to the papal chair on the death of Formosus, A. D. 895, but enjoyed his pontifical dignity only fifteen days.

BONIFACE VII. has the title of anti-pope, because in 974 he caused Benedict VI. to be strangled in prison, and after the election of Benedict VII. removed the treasures of the church to Constantinople. He however returned after the death of Benedict, and caused his successor, John XIV., to be murdered; but died himself soon after, and his body was dragged by the feet about the streets.

BONIFACE VIII. obtained the pontifical dignity in 1294. Alstedius says that 'he entered like a fox, reigned like a lion, and died like a dog.' In 1297 he canonised St. Louis king of France; and in 1300 instituted a jubilee to be held every hundred years following. At this jubilee he dressed himself in his pontifical habit, and the next in imperial robes; telling the emperor Albert's ambassadors that their master's election was of no avail without his authority. He boasted that he was the keeper of the keys of heaven; and caused two drawn swords to be carried before him as emblems of his two-fold authority. He died of fever in 1303.

BONIFACE IX. was elected pope A. D. 1389, on the death of Urban VI., and enjoyed the papal dignity fourteen years and eleven months, but not without competitors; for at this time there was a succession of anti-popes at Avignon for about fifty years, which Roman Catholic writers style 'the grand schism,' and sometimes there were three popes existing at once. He died A. D. 1404.

BONIFACE (St.), an Englishman born at Crediton in Devonshire, and originally named Wilfrid. He preached the gospel among the barbarous nations; and though created archbishop of Mentz by Gregory II. soon after resigned his office to go and preach in East Friesland, where he was martyred by the pagans on the 5th of June, 754. His letters were published by Senarius.

BONIFACIO, a sea-port of Corsica, at the south extremity of the island, from which the straits between Corsica and Sardinia have their name; but the harbour is difficult of access. The chief employment of the inhabitants is in the coast fishery. Population about 3000.

BONIS ARRESTANDIS. See **ARRESTANDIS**.

BONIS, ARRESTO, &c. See **ARRESTO**.

BONIS NON ANOVENDIS, in law, is a writ directed to the sheriffs of London, &c. charging them, that a person against whom judgment is obtained, and prosecuting a writ of error, be not

suffered to remove his goods until the error is determined.

BONN, or **Box**, an ancient and strong city of Prussia, once the residence of the elector of Cologne. It is of great consequence in time of war, from its situation on the Rhine, and was well fortified by the elector, who had a fine palace and beautiful gardens here. It suffered severely from bombardment when garrisoned by the French in 1689, and again in 1703, when it was taken by the duke of Marlborough. In 1717 the greater part of the fortifications were demolished. A valuable cabinet of natural history, collected in 1769, was destroyed by the French in 1794. The academy was instituted in 1777, received the titles and privileges of an university in 1786, and was converted by the French, first into a central school, and afterwards into a *Lyceé*. Bonn was formerly in the French department of the Rhine and Moselle, and lies in an agreeable and fertile country. The population at the end of the last century was stated to be 11,000, one-half of whom were artists and mechanics, and the rest attached to the court of the elector of Cologne, which was held here since the year 1268; it is now not above 9000. The only trade carried on is in the hands of Jews, who are about 200 in number, and live in a single street. The town has four parish churches; that of St. Martin is built in the form of a *rotunda*. The monastic establishments have been mostly suppressed.

BONNA, in ancient geography, one of the fifty citadels built by Drusus on the Rhine; supposed by some to be the same with the *Ara Ubiorum*; now called Bonn.

BONNA, in zoology, a name given by Pliny and others to the *Bonassus*.

BONNAGE, in our old feudal customs, not yet wholly abolished, an obligation on the part of a tenant to cut down, when called upon, part of the proprietor's corn.

BONNEFONS (John), a Latin poet, born at Clermont in Auvergne, and lieutenant-general of Bar sur Seine, acquired great reputation by his *Pancharis*, and other poems. He died in 1614, at the age of sixty.

BONNER (Edmund), bishop of London, of infamous memory, was born at Hanley in Worcestershire, and generally supposed to be the natural son of one Savage, a priest; who was the natural son of Sir John Savage of Clifton, in the same county. Strype, however, says he was assured that Bonner was the legitimate offspring of a poor man, who lived in a cottage known in his day by the name of Bonner's Place. About 1512 he entered student of Broadgate Hall in Oxford, and in 1519 was admitted bachelor of the canon and civil law. About the same time he took orders, and obtained preferment in the diocese of Worcester. In 1526 he was created doctor of canon law. Having acquired the character of a shrewd politician and civilian, he was distinguished by cardinal Wolsey, who made him his commissary for the faculties, and heaped upon him a variety of church preferments. He possessed at one time the livings and preferments of Blaydon and Cherry-Burton in Yorkshire, Ripple in Worcestershire, East Dereham in Nor-

folk, a prebend of St. Paul's, and the archdeaconry of Leicester. Bonner was with the cardinal at Cawood, when he was arrested for high treason. After the death of that minister, he soon insinuated himself into the favor of Henry VIII. who made him one of his chaplains, and employed him in several embassies, particularly to the pope. In 1532 he was sent to Rome with Sir Edward Kame, to answer for the king, whom his holiness had cited to appear in person or by proxy. In 1533 he was again despatched to Clement VII. at Marseilles, upon the excommunication of king Henry on account of his divorce. On this occasion he threatened the pope with so much resolution, that his holiness talked of burning him alive, or throwing him into a cauldron of melted lead; upon which Bonner thought fit to return home. In 1538, being ambassador in France, he was nominated bishop of Hereford; but before consecration was translated to the see of London, and enthroned in April 1540. Henry VIII. died in 1547, while Bonner was ambassador with the emperor Charles V. During this reign he was zealous in his opposition to the pope; and, to please the king, favored the Reformation; but on the accession of young Edward, he refused the oath of supremacy, and was committed to the Fleet; however, he soon thought fit to promise obedience to the laws, and was accordingly released. He continued to comply with the Reformation; but with such manifest neglect and reluctance, that he was twice reprimanded by the privy council, and in 1549, after a long trial, was committed to the Marshalsea, and deprived of his bishopric. The succeeding reign gave him ample opportunity of revenge. Mary was scarce seated on the throne, before Bonner was restored to his bishopric; and soon after appointed vicegerent and president of the convocation. From this time he became the chief instrument of papal cruelty; and is said to have condemned no less than 200 Protestants to the flames in three years. Nor was this monster of a priest more remarkable for his cruelty than his boldness. When queen Elizabeth came to the crown, he had the insolence to meet her, with the rest of the bishops, at Highgate. But in the second year of her reign, refusing to take the oaths of allegiance and supremacy, he was again deprived and committed to the Marshalsea; where he died in 1569, after ten years confinement. There cannot be a stronger instance of the comparative lenity of the protestant church, than its suffering this miscreant to die a natural death. Several pieces were published under his name.

BONNET, *n. s.* Fr. *bonnet*. A covering for the head; a hat; a cap. Bonnet is also applied to certain small sails attached to the larger sails of ships.

This same day the Salamander being under both her corsees and *bonnets*, happened to strike a great whale with her full stemme. *Hakluyt's Voyages.*

Go to them with this *bonnet* in thy hand,
And thus far having stretched it, here be with them,
Thy knee bussing the stones; for, in such business,
Action is eloquence. *Shakspeare. Coriolanus.*

They had not probably the ceremony of vailing their *bonnet* in their salutations; for, in medals, they still have it on their heads. *Addison.*

Next Camus, reverend sire, went footing slow,
His mantle hairy, and his *bonnet* sedge,
Inwrought with figures dim, and on the edge
Like to that sanguine flower, inscribed with woe.

Milton's Lycidas.

BONNET, in fortification, a kind of little ravelin, without any ditch, having a parapet three feet high, anciently placed before the points of the saliant angles of the glacis.

BONNET A PRESIRE, or priest's cap, in fortification, is an outwork, having at the head three saliant angles, and two inwards. It differs from the double tenaille only in this, that its sides, instead of being parallel, are like the queue d'hironde, or swallow's tail, that is, narrowing or drawing close at the gorge, and opening at the head.

BONNET (Chas.) a naturalist and metaphysician, was born at Geneva in 1720. He was intended for the law, but accidentally meeting with the Spectacle de la Nature, of Le Pluche, and Reaumur's Memoirs on Insects, he resolved to devote himself to the study of nature. At the age of twenty he had made several discoveries in entomology, and at twenty-seven he formed his system of vegetable physics. About this time he appeared as a writer in a Treatise on Psychology, which was followed by his Analytical Essay on the Mental Powers. In 1762 and 1764 he published Considerations on Organised Bodies, and also Contemplations of Nature. His last work was Palingenesia, or Thoughts on the Past and Future State of Animal Beings. He was a member of the Royal Society of London, and of several other learned bodies. He died at Geneva May 20th, 1793.

BONNETELLA, in entomology, a species of tineæ. The wings are white, with two little silvery lines, the posterior one of which is waved; a native of Europe.

BONNETIA, in botany, a genus of class polyandria, order monogynia. CAL. five-leaved; PETALS five; CAPS. three-celled, three-valved; SEEDS many. Species but one, a native of Cayenne; a tree with obtuse glabrous leaves, and purple flowers.

BONNEVAL (Claudius Alexander count de), known in the latter part of his life by the name of Osman Bashaw, descended from a family related to the blood-royal of France, entered at the age of sixteen into the service of that crown, and married the daughter of the marshal de Biron. He made the campaign in Flanders in 1690; but soon after left the French army, and entered into the imperial service under prince Eugene, who honored him with an intimate friendship. The intrigues of the marquis de Prié, his inveterate enemy, ruined his credit, however, at the court of Vienna, and caused him to be banished the empire. He then offered his service to the republic of Venice and to Russia; which being declined, his next tender was to the grand seignior, who gladly received him. It was stipulated that he should have a body of 30,000 men at his disposal; that a government should be conferred on him, with the rank of bashaw of three tails, and a salary of 10,000 aspers per day; and that in case of a war he should be commander-in-chief. The first ex-

pedition he engaged in after his arrival at Constantinople was to quell an insurrection of Arabia Petraea, which he effected; and at his return had large offers made him by Khouli Khan, but did not choose to accept them. Some time after, he commanded the Turkish army against the emperor, over whose force he gained a victory on the Danube. But Bonneval on his return, notwithstanding his services, was first imprisoned, and then banished to the island of Chio. The sultan, however, continued his friend; and the evening before his departure made him bashaw-general of the Archipelago, which, with his former appointment of beglerberg of Arabia, rendered him one of the most powerful persons in the Ottoman empire. In this island he found a retirement quite agreeable to his wishes. He did not however long enjoy it, being sent for back, and made topigi or master of the ordnance, a post of great honor and profit. He died in this employment, aged seventy-five, in 1747, and left memoirs of his own life.

BONNY, } A comparatively modern
BONNILEY, } word, not introduced into our
BONNINESS. } earlier lexicons. It is derived, no doubt, from the French, *bon, bonne*. It is now rather a Scottish than an English word, and signifies handsome, beautiful, gay, merry, cheerful, blithe. It seems to be generally used in conversation for plump and healthy.

O *bonnie, bonnie* was hir mouth,
And cherry were hir cheiks,
And clear, clear was her yellow hair
Whereon the reid bluid dreips.

Edom of Gordon, in Percy.

Then sigh not so, but let them go,
And be you blithe and *bonny*. *Shakespeare.*

Match to match I have encountered him,
And made a prey for carrion kites and crows
Even of the *bonny* beast he loved so well. *Id.*

Thus wailed the louts in melancholy strain,
Till *bonny* Susan sped across the plain. *Gay*

How can I busk a *bonny bonny* bride?

How can I busk a winsome marrow?

How love him on the banks of Tweed,
That slew my luvie on the braies of Yarrow.

W. Hamilton's Braes of Yarrow.

Wee, modest, crimson-tipped flower,
Thou's met me in an evil hour;
For I maun crush among the stoure

Thy slender stem,

To spare thee now is past my power,
Thou *bonnie* gem. *Burns.*

BONNY, among miners, a bed of ore, differing only from a squat as being round, whereas the squat is flat. See SQUAT.

BONNYCASTLE (John), late professor of mathematics, at the Royal Military Academy at Woolwich, was born at Whitechurch in Buckinghamshire. Though of respectable parentage, he was chiefly indebted to his own exertions for the extensive knowledge which he acquired. He came to London young, and married, when only nineteen, a lady named Rolt, on whose death, soon after, he became private tutor to the two sons of the earl of Pomfret. After spending two years at Easton in Northamptonshire, he was appointed one of the mathematical masters at Woolwich, where for more than forty years he devoted his time to that important establishment,

and to the composition of his able works on the mathematical science. The Scholar's Guide to Arithmetic was his first production, and has passed through many editions. His Guides to Algebra and Mensuration have also long been ranked among the most useful school-books. He also wrote a Treatise upon Astronomy, 8vo.; the Elements of Geometry, 8vo.; a Treatise on Plane and Spherical Trigonometry, 8vo.; a Treatise on Algebra, 2 vols. 8vo.: and was the author of a translation of Bossut's History of the Mathematics. He also wrote various articles in the early part of Dr. Rees's Cyclopædia, and died at Woolwich, May 15, 1821.

BONO ET MALO, WRIT DE, in law, a special writ of gaol-delivery, anciently used for each particular prisoner.

BONONCINI (Giovanni), an eminent composer of music, who for some time divided the opinions of the cognoscenti of this kingdom with respect to the comparative merits of himself and the great Handel; which gave occasion for the well-known epigram on the disputes between Tweedle dum and Tweedle dee, said to have been written by Swift. An Italian opera was published with Bononcini's name prefixed to it, entitled *Pharmaces*.

BONONIA, an ancient town of Gallia Belgica, supposed to be the Portus Iccius of Cæsar, and the Gessoriacum of Mela. Peutinger's map expressly calls Gessoriacum Bononia. It is now *Borclogne*.

BOXONTA, a town of Italy, in Gallia Cispadana; a name probably given by the Gauls, with reference to the Belgic Bononia. Its ancient name when in the hands of the Tuscans, who were expelled by the Gauls, was *Felsina*. In A.U.C. 563 the Romans led a colony thither; which about the beginning of the Actian war, was increased by Augustus, and was the Colonia Bononiensis of Tacitus. It is now called *Bologna*. See *BOLOGNA*.

BOXONTA, a town of Mæsia Superior, on the Danube; now *Bodon* in Bulgaria.

BOXONTA, a town of Pannonia Inferior, between Mursa to the north-west, and Taurinum to the east.

BOXONTA (John de), a native of Sicily, archdeacon of Palermo, and chaplain to Charles V. He was deputed by the emperor to an assembly of divines, who met in 1553, to decide the question whether the people should be allowed to read the Bible in the native language. Bononia violently espoused the negative side, and the assembly decided accordingly. He published a work on predestination at Louvain in 1555.

BOXONTA STONES. See *BOLOGNIAN*.

BONONIENSIS, in ornithology, the greater lapwing, the *tringa Bononiensis* of Gmelin, and *vanellus Bononiensis* major of Brisson. The legs are ochraceous; head and upper part of the neck chestnut; body black above, beneath white; throat and breast spotted with ferruginous.

BONPLANDIA, in botany, class pentandria, order monogynia. Its generic characters are: CAL. five-toothed: COR. monopetalous, tube longer than the calyx: STAM. five, inclining: PIST. germ superior; STYLE capillary: STIG. bifid: PER. capsule ovate, three-sided: SEEDS three. B. *geminiflora*, an annual plant: a native of Spain.

BONS-HOMMES, or *BOX-HOMMES*, a sort of hermits of St. Augustin, founded by F. de Paula. They were brought over into England in 1283, by Edmund earl of Cornwall, and settled at Ashridge in Bucks, besides which, they had only one house more at Edington in Wiltshire. They followed the rule of St. Austin, and wore a blue habit. The name is said to have arisen from Louis VI. of France, who used to call F. de Paula, prior to the order, *Le bon homme*. Till then they had been called the *Minimi*, or the order of *Grammont*.

BONTIA, or wild olive of Barbadoes, a genus of the angiospermia order, and didynamia class of plants; natural order, fortieth, personate: CAL. is quinquepartite: COR. is bilabiated; inferior lip tripartite and revolute; the drupe is ovate and monospermous, with the apex turned to one side. One species only, viz. *B. daphnoides*, with a yellow corol, having a purple line down the lower lip. This plant is generally cultivated in Barbadoes for hedges and other fences, being of rapid growth, and soon attaining its natural height of about ten feet.

BONVICINO (Alexander), called *Le Moretto*, history and portrait painter, was born at Rovate in 1514. He was a disciple of Titian, but having seen the designs of Raphael, he gave himself up entirely to study those masterpieces of art and genius; which he did with such judgment that he became an exceedingly good painter. His works were eagerly bought up, being admired for the tenderness of the penciling; the correctness and spirited expression of the figures; the neatness of the finishing; and the rich variety of the draperies. He was equally excellent in portrait, and by many was placed in competition with Titian himself. He died in 1564.

BONVOULOIR ISANDS. They are reefs of the archipelago of Louisiade, in the South Pacific Ocean. The French voyagers who sailed in quest of La Perouse, saw some of the natives in two masted canoes, which were well carved, and with steering paddle, or helm, both behind and before. The people were of middle size, and had woolly hair: shy and distrustful, but, unlike most of the southern islanders, testified no particular desire for iron.

BONVS HENRICVS. See *CHENOPODIUM*.

BONZES, Indian priests. The Tonquinese have a pagod or temple in each town; and each pagod has at least two bonzes belonging to it; some have thirty or forty. These bonzes, to distinguish themselves from the laity, wear a chapel about their necks consisting of 100 beads; and carry a staff, at the end of which is a wooden bird. They live upon the alms of the people; yet are very charitably disposed, and maintain several orphans and widows out of their own collections.

BONZES OF CHINA are the priests of the Fohists, or sect of Fohi. It is one of their established tenets, that great rewards are allotted for the righteous, and punishments for the wicked in the next world; and that there are various mansions in which the souls of men will reside, according to their different degrees of merit. But, in order to deserve the favor of Heaven, the bonzes instruct the people to treat the priests

with respect and reverence, to support and maintain them, and to erect temples and monasteries for them. They tell them, that unless they comply with their injunctions they will be cruelly tormented after death, and pass through a disagreeable variety of transmigrations; that they will be changed into mules, asses, rats, mice, &c. The Chinese bonzes, according to F. le Comte, are a gang of dissolute idle fellows. All their aim is to excite people to commiserate their abject condition: to which end they have various impostures. When the common arts of address fail them, they try what public acts of penance will do. Some of them drag heavy chains thirty feet long after them; some sit in the highway knocking their heads against flint stones; others set particular drugs on fire upon their heads; all these are several ways of drawing the attention and exciting the compassion of the people, and they seldom fail of success. F. Navarrete tells us, that the bonzes are obliged to chastity; and that on the 2d of April, 1667, a petty king of Canton had condemned eleven of them to be burnt alive for incontinence. He adds that it was reported of an empress of the last reigning family, who had a particular kindness for the bonzes, that she granted them a dispensation for the use of women during three days. The bonzes of China, according to the same author, are computed at 50,000. It has been observed that there is so strong a likeness between the apparent worship of many of the priests of Fo (see Embassy to China, vol. ii. p. 100) and that which is exhibited in churches of the Roman faith, that a Chinese conveyed into one of the latter, might imagine the votaries he there saw were adoring the deities of his own country. On the altar of a Chinese temple, behind a screen, is frequently a representation which might serve for the Virgin Mary, in the person of 'Shin-moo', or the Sacred Mother, sitting in an alcove with a child in her arms, and rays proceeding from a circle which are called a glory round her head, with tapers burning constantly before her. The long loose gowns of the Ho-shangs, or priests of Fo, bound with cords round the waist, would almost equally suit the friars of the order of St. Francis, the former live like the latter in a state of celibacy, reside together in monasteries, and impose occasionally upon themselves voluntary penance and vigorous abstinence.

BONZES OF JAPAN are, for the generality, gentlemen of the highest extraction; for when a gentleman of quality finds his family grow too numerous, nay, when he has only two sons, he generally makes the youngest a bonze, to prevent all domestic broils and confusions. These priests are dressed in various colors; their apartments are very commodious, and situated in the healthiest parts of the country.

BOOBY, } A word of no certain etymology. }
BOOBY'SU, } logy. Henshaw thinks it a corruption of bull-beef, ridiculously. Skinner imagines it to be derived from Span. *bobo*, foolish. Junius finds bowbard to be an old Scottish word for a coward, a contemptible fellow; from which he naturally deduces booby; but the original of bowbard is not known. Thus

far Dr. Johnson. Instead of bowbard being considered by Junius as an old Scottish word, the Ency. Met. says he derived it from the Greek *Βουβαράς*, as heavy as an ox. Ruddiman derives bowbard from the Latin *hubo*, an owl; both indicating heaviness; dulness; stupidity. The writer of the lexicon department in the Ency. Met. has ventured the following ingenious conjecture: 'The English booby is probably no more than an emphatic repetition of boy, sc. boy, boy; a boy indeed; a mere boy; having none but boyish childish qualities and dispositions; a simpleton. The verb boyed is used by Beaumont and Fletcher in a manner which strongly confirms this supposition. 'Baffled and boyed,' i. e. made a boy; a child; a booby; made a fool of; befooled. There is a sea-fowl, remarkable for its stupidity, called by the sailors a booby. These birds are easily caught; or if they belonged to our own species we should say, 'taken in.' A board is no sooner thrown out upon the surface of the water but the booby souses upon it with such violence as to be instantly stunned and taken. An excellent specimen of a fool.

Young master next must rise to fill him wine,
And starve himself to see the booby dine. *King.*

Where yet was ever found a mother,
Who'd give her booby for another. *Gay.*
BOODII, BOUDDHA, or BUDDHA. See BUDDHA.

BOOK', v. & n.	Sax. <i>boc</i> , supposed from <i>BOC'FUL</i> , wrote on beechen boards; as <i>liber</i> , in Latin, from the rind of a tree. To be well booked, in Gower, is to be well read in books; learned in books; booklearned. To book, in modern usage, is to write into a book. It is variously applied in composition. In books, is familiarily to hold in kind remembrance. Without book, by memory; by repetition; without reading. A book is either a volume, a particular part of a work, or a register; a tradesman's ledger, in which he keeps his accounts.

And in this *böke* were written fables
That clerkes had, in olde tyme,
And other poets put in rhyme
To rede, and for to be in minde
While men loved the law of kinde.
This *böke* ne spake but of such things,
Of queenes lives, and of kinges.
And many other things smale,
Amonge al this I fonde a tale.

Chaucer. Boke of the Duchesse.
Which to requite, the Red-crosse knight him gave
A *booke*, wherein his Saviour's testament
Was writt with golden letters rich and brave;
A worke of wondrous grace, and able soules to save.

Spenser.
See a book of prayer in his hand;
True ornaments to know a holy man.

Shakspeare.
I'll make him yield the crown,
Whose *bookish* rule hath pulled fair England down.

Id.
This civil war of wits were much better used
On Navarre and his *bookmen*; for here 'tis abused. *Id.*

This Armado is a Spaniard that keeps here in court,
A phantasm, a monarch, and one that makes sport
To the prince and his bookmates. *Id.*

I beseech your grace, let it be *booked* with the rest
of this day's deeds; or I will have it in a particular
ballad else, with mine own picture on the top of it. *Id.*

I'm not *bookish*, yet I can read waiting-gentle-
woman in the 'scape. *Id. Winter's Tale.*

They might talk of *booklearning* what they would,
but he never saw more unfeaty fellows than great
clerks. *Sidney.*

Sermons read they abhor in the church; but ser-
mons without *book*, sermons which spend their life in
their birth, and may have public audience but once. *Hooker.*

The modern dedications of *books* and writings as to
patrons is not to be commended; for *books*, such as
are worthy the name of *books*, ought to have no pa-
trons but truth and reason. *Bacon.*

Books must follow sciences, and not sciences *books*. *Id.*

————— ever during dark
Surrounds me, from the cheerful ways of men
Cut off, and for the *book* of knowledge fair
Presented with a universal blank
Of Nature's works, to me expunged and rased,
And Wisdom at one entrance quite shut out. *Milton.*

Neither does it so much require *booklearning* and
scholarship, as good natural sense, to distinguish true
and false, and to discern what is well proved, and
what is not. *Burnet's Theory.*

He made wilful murder high treason; he caused
the marchers to *book* their men, for whom they should
make answer. *Davies on Ireland.*

Whate'er these *booklearned* blockheads say,
Solon's the veriest fool in all the play. *Dryden.*
He will quote passages out of Plato and Pindar, at
his own table, to some *booklearned* companion, with-
out blushing. *Swift.*

The *bookful* blockhead, ignorantly read,
With loads of learned lumber in his head,
With his own tongue still edifies his ears,
And always listening to himself appears. *Pope.*
Among those venerable galleries, and solitary scenes
of the university, I wanted but a black gown, and a
salary, to be as mere a *bookworm* as any there. *Id. Letters.*

I was so much in his *books*, that, at his decease, he
left me the lamp by which he used to write his lucu-
brations. *Addison.*

Xantippe follows her namesake; being married to
a *bookish* man, who has no knowledge of the world. *Spectator.*

The *bookseller* who heard him speak,
And saw him turn a page of Greek,
Thought what a genius have I found. *Gay.*
Books, like friends, should be few and well chosen. *Joineriana, 1772.*

Books are the staple materials of a LIBRARY.
Under the latter head, therefore, we shall present
the reader with the criteria of rare, scarce, and
useful books, together with the best general
mode of arranging them. Here we confine our-
selves to the ancient *materials* and *early forms* of
books.

The Latin words *liber* and *codex*, as well as
our own Anglo-Saxon *boc*, or *book*, clearly in-
dicate the early use of the rind or bark of trees
for the purpose of making books. In the early
part of the first American war some Trans-Atlan-
tic Friends, it is said, were advocates for return-
ing to this, among other primitive customs.

VOL. IV.

They suggested, Dr. Franklin has told us, the
use of the bark of trees for the drawing up of
deeds and contracts to avoid the duty and stamp
upon paper. But their countrymen preferred a
bolder mode of settling the question. The leaves
of trees were, perhaps, a still earlier material of
books; but both kinds of books are in use to this
day among semi-barbarous nations. The Rus-
sians, not long since, discovered a considerable
library of bark books among the Calmuc Tartars:
the leaves were remarkably thick, long, and
narrow, and had been prepared previously to be-
ing written upon, by a double coat of black var-
nish. Copies of the Malay gospels and other books
are frequently brought from the east, written on
long slips of reed or bark, fastened by strings at
each end.

Local circumstances, the progress of the arts,
and the relative importance of the record or in-
formation to be perpetuated, have suggested the
use of a variety of other materials. Among
them are mentioned plates of lead and copper,
hardened clay, slate, horn, stone, and wood.
Josephus speaks of two columns, the one of
stone, the other of brick, on which the children
of Seth wrote their inventions and astronomical
discoveries. Porphyry mentions some pillars,
preserved in Crete, on which the ceremonies
practised by the Corybantes in their sacrifices
were recorded. Hesiod's works, it is said, were
originally written upon tables of lead, and de-
posited in the temple of the Muses, in Boeotia.
The ten commandments, delivered to Moses were
written upon stone we know; and Solon's laws
upon wooden planks. Tables of wood, box, and
ivory, were common among the ancients: when
of wood they were frequently covered with wax,
that people might write upon them with more
ease, or erase what they had written. Hence
the ancient stylus had a pointed and a flat end.
The leaves of the palm-tree were afterwards used
instead of wooden planks, and the finest and
thinnest part of the bark of trees, particularly
of the tilia, phillyrea, papyrus, the lime, the
ash, the maple, and the elm.

Job, while wearied by indefinite calumny, he
wishes his adversary had written a book, is parti-
cularly anxious that his early and remarkable tes-
timonies to the doctrine of a resurrection should
'be graven with an iron pen and lead on the rock
for ever,' as our version expresses it. Pliny
(Nat. Hist. lib. xiii. c. 1.) states that writing
on lead (*plumbulis voluminibus*) was of great
antiquity, and came in practice next after the
writing on barks and leaves of trees: it was
used, he adds, particularly 'in recording public
transactions.' Parkhurst says, I apprehend the
cutting or sculpturing on the rock (Job. xix.
24.) to be here mentioned as a different and
more durable method than even the engraving
on lead. This ancient book, according to the
same critic, probably alludes to the writing on
linen in chap. xxxi. 35, and wearing the record
as a tiara on the head.

Leather was an early animal substitute for the
less durable vegetable materials; the endeavour
to improve it gave rise, doubtless, to the invention
of parchment, on which most of the ancient MSS.
extant are written. See MANUSCRIPT.

X

BOOK-BINDING.—At what period book-binding, in its present form, came into use does not appear to be correctly ascertained. The earliest account we have of books informs us that they consisted of rolls of papyrus or parchment, fastened or strung together, see Books. We learn from Olympiodorus, 'that the Athenians erected a statue to the memory of that man who bound books by means of glue.' These rolls were fastened together, either in the centre or from the end, by means of a boss, upon which the most cunning and curious art was frequently lavished: it is probable that the value or importance of the MS. was sometimes indicated by the style of ornament introduced upon these bosses or fastenings.

Experience must soon have shown the great convenience of folding these sheets of vellum into fours or twos. It appears, however, that the previous method of a long roll continued to the days of Catullus, about forty years before Christ, and even for some time afterward. As soon, however, as the folded form came into use, the necessity of a cover of some description became apparent; and hence gradually arose book-binding in its present shape. These covers were, no doubt, at first a simple leaf of parchment or some other skin; but this, of itself, would soon have been found insufficient, and probably suggested the use of boards, which appear for a long time, to have been made of oak, as numerous specimens of books with oaken covers or boards are now existing, of a date as late as the sixteenth century.

The progress of book-binding, from the simple cover of the ancients to the magnificent style of decoration used by the modern book-binders, is a curious subject, and has never yet been attempted to be described. The earliest ornamented book, of which any account can be traced, is the Book of St. Cuthbert, supposed to have been bound in the middle of the seventh century; it is described by Ethelwold, one of the monks of Lindisfarne, as having been bound with gold and precious stones, *Bib. Dec. Vol. i. p. 1*. This book, consisting of a Latin text of the Gospels on vellum, is now in the British Museum; but the original binding has been replaced by a Russia coating; having, most likely, been despoiled of its ornaments at the period of the Reformation.

The next early specimen, of which we have any notice, is a Latin Psalter of the ninth century; the binding of this volume consists of oaken boards; on the exterior of the first of which is a large brass crucifix, formerly, perhaps, covered or washed with silver, from which it does not appear that at that period the leather or parchment cover was used over the boards. Another MS., supposed to be of the tenth or eleventh century, is also bound with oaken boards, the outside of one of which is inlaid with pieces of carved ivory, which Dr. Dibdin supposes to have been executed at a later period, probably from the piety of some subsequent owner of the book. Another very curious specimen of the twelfth century is thus described in Moule's *Bibliotheca Heraldica*, p. 493:—The original book upon which all our kings, from Henry I. to Edward VI., took the coronation oath, is now in the library of a gentleman in Norfolk. It is

a MS. of the four Evangelists, written on vellum, the form and beauty of the letters nearly approaching to Roman capitals. It appears to have been written and bound for the coronation of Henry I. The original binding, which is still in a perfect state, consists of two oaken boards, nearly an inch thick, fastened together with stout thongs of leather and the corners defended with large bosses of brass. On the right-hand side, as the book is opened, of the outer cover is a crucifix of brass double gilt, which was kissed by the kings upon their inauguration, and the whole is fastened together by a strong clasp of brass, fixed to a broad piece of leather secured with two brass pins. In archbishop Whitgift's Hospital at Croydon, is a folio Bible, printed by Barker, given to the Society by Abraham Hartwell, secretary to the archbishop in the year 1599. This Bible is preserved in a very curiously ornamented cover, with large brass bosses and clasps of the most elaborate workmanship; forming one of the most curious specimens of ancient binding extant. The binding has been repaired, in a wretched and most unfeeling manner, at the expense of Mr. John Lett, of Lambeth, in the year 1813, 214 years after its original binding.

Velvet seems to have been a favorite covering for books at an early period; but of this no notice appears of any specimen earlier than the fourteenth century, when Dr. Dibdin says, it is expressly noticed by Chaucer,

'A twenty bokes clothed in black and red;'

meaning, I presume, 'bound either in black or red velvet; for neither calf, vellum, nor forrell, could be said to be black or red.' *Bib. Decam. vol. ii. p. 447, note.*

Coeval with velvet, silk seems to have been used as a cover for books. Vellum appears to have been introduced for binding in the early part of the fifteenth century, but then was quite plain. About the year 1510 vellum bindings began to be stamped, and there are now existing, in various libraries, some very delicately executed specimens of this stamped binding, totally different from any ornamental decoration that has been produced in modern times. Calf leather appears to have come into use about the same time as vellum; although Dr. D. mentions a specimen of stamped calf binding of the thirteenth century. At the beginning of the sixteenth century all the skill of the workman was lavished in ornamenting the sides, the backs being then quite plain, without even a lettering: the large centre ornaments of the sides, in common use at this time and the following century, are certainly superior, in boldness and beauty of design, to any of modern use. From this period up to the commencement of the present century there does not appear any very material improvement in book-binding; and, during the greater part of the eighteenth century, the art rather retrograded than advanced. A very slight inspection of the work of this period will prove the truth of the assertion, the shape of the books being clumsy, and the ornaments totally devoid of taste. Of late years, however, a spirit of improvement has arisen. The study of the antique has now become general,

and book-binding has fully participated, with other arts, in the advantages which it has imparted.

In order to render the following account intelligible, it will be necessary to begin with a description of the principal tools and implements used in the process of bookbinding.

1. *The Standing Press*.—This must be firmly, as well as conveniently, fixed; it consists of two upright cheeks, about six feet in height, placed about twenty-four inches apart. Between these cheeks, about five inches from the bottom, is placed the bed; and, near the top, the head, containing a box for an iron screw. The bed is about four inches, and the head usually twelve inches in thickness; both are firmly fastened to the cheeks by means of grooves. The swinging board, to which the screw, of about three inches diameter, is fixed, works perpendicularly between the head and bed of the press; and, by means of turning the screw into the box or lowering it, is either raised or depressed. The screw is worked by means of an iron bar, about five feet in length, to which the united strength of four men is frequently applied when the press is filled with books.

2. *The Cutting or Laying Press* consists of two strong cheeks lying horizontally across what is termed the shaving tub, which is a frame for holding the shavings from the edges of the books. It was formerly the practice to place the press across a tub, whence the name. Within the left cheek are cut worms for two wooden screws to work in; these are passed through two opposite holes in the right cheek, and are about two feet in length, having large heads to introduce the press pin, by which the books are pinched between the cheeks. On one side of the left cheek are nailed two slips of wood, about an inch and a half asunder, forming a groove for the plough to run in.

3. *The Plough*.—This, also, consists of two light cheeks, which are drawn together by a single screw in the centre; in one of these cheeks a groove is cut, exactly the thickness of the knife, which is fixed to the plough by means of an iron bolt, passing through the cheek, having a screw at the top to receive a nut; the knife then lies flat upon the cheeks of the cutting press. The mode of using it is as follows: the book intended to be cut being screwed up with a very small portion of the margin above the press, the plough is placed in the groove and opened so as to let the point of the knife clear the book; the head of the screw is then grasped with the right hand and the other end with the left and in this way moved backward and forward with a steady regular motion, at every turn contracting the screw a little, until the knife has passed through the book and removed the parts intended to be cut away.

4. *The Sewing Press*.—The bed is of hard wood, about one inch thick, fifteen inches wide, and about three feet in length; an opening is cut in it extending within a few inches of each end, and about an inch from the front edge; this opening is about three quarters of an inch wide. At both ends of the bed, in a parallel line with the opening, are fixed two wooden screws, furnished with nuts, supporting a bar for fastening the

strings or bands upon which the books are sewed; this bar rises and falls as the nuts are raised or lowered; the bands for sewing the books upon being fastened to the bar, the other end is twisted round small brass keys, introduced into the opening, and when the requisite number are so fixed they are made tight by raising the nuts under the bar.

5. *The Beating-Iron* is a plate or anvil, about five inches thick, and from eighteen inches to two feet square. It is firmly fixed on a piece of timber nearly of the same diameter let into the ground.

6. *The Beating-Hammer* is short and heavy, generally weighing about fourteen pounds; the face of this is perfectly smooth and inclining to convex, the handle being about six inches in length.

7. *The Backing-Hammer* is similar to a shoemaker's hammer, which is well known.

8. *Pressing Boards* are made of beech or hard wood, the small ones about half an inch thick, the larger ones thicker in proportion; these are of course flat, and of various sizes from folio to 12mo.

9. *Cutting Boards* are thin wedges of beech of different lengths.

10. *Backing Boards* are thicker than cutting boards, and the thick edge is bevelled off in order to make the ledge they are intended to form in the back of the book sharp.

TOOLS FOR FINISHING.

11. *Rolls* are used in ornamenting either the sides or backs of books. The roll is a brass wheel, upon the edge of which is cut the figure intended to be impressed on the book; they are of various patterns, from plain lines up to the most elaborate and classical designs, and are mounted on a carriage of iron, made to receive the axle of the roll, and a long wooden handle rested against the shoulder when used.

12. *Pallets* are also of brass, about two inches in length, upon the edge of which the pattern is cut in the same manner as the roll, but are only applicable to the backs of books.

13. *Back Tools* are ornaments of various descriptions, as flowers, crests, coats of arms, &c., cut in brass and fixed in handles about six inches in length.

14. *Alphabets* of all sizes are also cut in brass and fixed in handles, in the same manner as the back tools.

The art of book-binding may be divided into three distinct parts, each part being usually performed by different persons.

1. *Folding*, sewing, and collating.

2. *Forwarding*, or the state of the book from the sewing to the covering.

3. *Finishing*.

The book being given to the binder in sheets, the first process is folding; this, as well as sewing, is done by women, the pages being all placed exactly opposite to each other, and folded by means of an ivory folder: this must be done with considerable care, as, upon it, depends the regular appearance of the margin, absolutely necessary to a well bound book.

The book when folded, is taken by the for-

warder to the beating iron, and being divided into portions of about fifteen sheets, is beaten until it lies firm and smooth, the sheets being repeatedly shifted, so as to present each sheet to the action of the beating hammer; but, when recently printed books are to be bound, this operation must be performed in a very limited degree, otherwise it will cause the ink to set off on the opposite page. The book is then carefully collated by the signatures at the bottom of each sheet, and four leaves of blank paper being placed at each end, the volume is divided into thin parts by pressing boards, and placed in the standing press, where, being firmly screwed down, they are left for some hours. The books when taken out of the press are put three or four together according to the thickness, and the edges of the sheets being brought quite square and even, by striking them smartly on the back and head upon the table or press, are placed between two boards in the cutting press, and five or six grooves are made in the back with a saw, to hold the bands upon which they are to be sewed.

The books are next given to the sewer, and being placed upon the sewing press, with the title page upwards, the bands are fixed to the press, as already described; they are then adjusted so that each cord shall come into a groove in the back of the book. Sometimes where great strength is required, as in Bibles, &c., the bands are made to project upon the back, in which case the sawing is omitted, and the books are sewed with raised bands. The blank paper is then lifted with the left hand, and being turned over is laid on the sewing press against the bands, and the needle being put in near the top with the right hand, is passed out by the left, close to the band; the needle is then inserted on the other side of the band and brought out at the next band, and so on until it is sewed all along: the first sheet of the book is then put on the press, and the needle being put in at the bottom, it is in like manner sewed from bottom to top, but as the back would be too much swollen with the thread, were each sheet sewed throughout (except where the sheets are unusually thick) it is necessary to sew two whole sheets or three half sheets at once, passing from top to bottom, or from tail to head, by taking one stitch in the first sheet, then taking a stitch on another, and returning to the first, a third stitch is given; the second sheet is then opened, the fourth stitch is made; and so on alternately until the end is reached by the *kettle stitch* made beyond the bands: if three half sheets are sewed on, the same method is pursued. When the books are all sewed, the keys are taken out and the strings are drawn through the threads to the proper lengths and cut separate.

The books now pass into the hands of the forwarder, whose first business it is to see that the back is quite square, and no thicker in one part than another; if the books are for extra binding, two leaves of marble or coloured paper are pasted down to the second fly leaf; the upper leaf being left loose to preserve the marble paper from damage in the course of the work. For common binding, the outside two white leaves are pasted together. The backs of the

books are then to be glued, and must dry gradually; the bands are then opened, and scraped away, in order to render the covers smooth when they are let into the boards.

The next process is *backing*, the book being laid on its side, on the press, the back is rounded with the backing hammer, at the same time drawing it over with the hand; it is now placed between the backing boards, the edge of the board being about one-eighth of an inch from the back of the book, and being put into the cutting press, and care being taken that it is quite even, it is well hammered down so as to form the grooves on both sides to hold the boards and render the back quite smooth and firm.

The boards are now to be cut to the proper width, previously to being put to the book; to ascertain which the width of the book is taken by compasses from the groove to the fore-edge, piercing through three or four leaves to ascertain how much must be cut away, allowing for the projection of the boards, which are then cut with the plough; the boards are then placed on each side of the book, and two holes being made with an awl opposite each slip or band, they are fastened to the book by the slips being drawn through the holes, and first well pasted; the ends of the bands are then cut off, nearly close to the board, and being placed on a small anvil, which is screwed into the end of the press for this purpose, are to be beaten flat or knocked down with the backing hammer; the books now in boards, are again pressed in the standing press, and the backs covered with thick paste, which is rubbed off as they stand in the press, with a handful of shavings. The next operation is cutting: the top of the book is marked on the beginning board by a square from the front; the book is placed between two boards, the one at the end of the book being above it, and that at the beginning even with the mark. It is then put into the cutting press with the first board or runner exactly even with the cheek, the part to be cut away projecting above the press; when cut, the book is taken out, and the length to which it is to be cut is ascertained by measuring from the head to the tail with compasses; the boards are then drawn down from the tail to the head, and being adjusted for the size of the square, for both ends, the book is again placed in the cutting press, and the part marked cut away; the fore-edge is next cut, by the back, which is now round, being brought perfectly flat; this is done by introducing two pieces of thin beech, called trindle, between the back of the book and the boards, the ends of the trindle resting on the inside of the boards, and the back of the volume resting on the middle, the boards standing out from the book at right angles, thus  the stem of the letter T representing the book, and the arms the covers; the cutting boards are then placed at each side of the book, and the whole being taken firmly between the palms of the hands, the back is struck smartly two or three times on the press; this brings the volume quite flat: the cutting board at the end of the book is then placed in a line with a mark which has been made with a bodkin, along the front of the board, and that at the beginning about an eighth

of an inch below it; it is now taken in the left hand, and turned up to see that the back is square, as well as sufficiently flattened, and is then placed in the press for cutting; the board at the beginning even with the cheek of the press, and that at the end standing as much above it as the cover is intended to project beyond the book; the leaves are then cut through as already stated.

Coloring or Gilding of the Edges.—For books in common bindings, the edges are merely sprinkled brown, red, or other colors, by a brush beaten against an iron pin.

To marble the edges, the books are dipped in a trough filled with gum water, with the various colors floating upon the surface. This process is never performed by bookbinders, being a separate business.

Gilding the edges is also a distinct trade; the gold is laid on with white of egg, and afterwards burnished.

When the edges are colored or gilt, the books are next *head-banded*. The head-band is a small piece of vellum cut to the size of the square, a part of the board which projects beyond the book. Head-bands are fixed to the top and bottom of the book, silk or cotton thread being twisted round, either of one, two, or three colors. The back of the book is then lined with cartridge or other thick paper, and well dried by a slow fire, being frequently rubbed with a folding-stick to spread the glue. A piece of triple cartridge paper is then cut out exactly the size of the back, and carefully moulded to the shape; and upon this false back four or five pieces of double leather form the bands: the book is now ready for covering. The leather to make the cover is then pasted all over with thick paste, and is drawn over the book, and the edges carefully turned over, the corners being cut off. The bands are then rubbed on each side with the edge of a cutting-board, or other hard piece of wood, to make them square and neat; the book being covered must be left until quite dry, and is then handed over to the finisher.

The first business of the finisher is to rub the edges, squares, and bands, a second time, with a piece of hard wood; the thick edges of the leather inside of the board are now pared away, and, if a set of books, the volumes are arranged in order, to see if the bands are all in a line. The covers are then washed with paste-water. Calf leather, as well as Morocco, is now generally colored in the dressing; if, however, the white leather is used, it is colored brown of various tints, by being washed over with a solution of salt of tartar, or sprinkled with copperas-water: sometimes, if the leather is good, the books are finished quite white, and if done carefully, this has a very chaste and neat appearance. Two pieces of Morocco pared thin, exactly the size of the pannel formed by the bands, are now stuck on the spaces between the bands, generally between the first and second and the second and third; when these are dry the back is again washed with paste-water. It is now glaired three times with white of egg, which must be carefully laid on with a soft sponge, each coat of glaire being allowed to dry before the next is laid

on. As soon as it is dry enough to be touched without smearing, the back is rubbed over with palm oil, and the gold having been cut into strips the width of the back of the book, the edge of the book is laid upon the strip of gold, and the book being carefully taken up, the gold falls over and immediately adheres to the oily matter on the surface of the glaire; in this manner the back is entirely covered with leaf gold, and the tools required for the ornaments being selected are allowed to heat gradually by a charcoal fire. The book being firmly fixed in the press, the tools for the ornaments are stamped on, taking care that the tools are neither too hot nor too cold; as in the former case the brilliancy of the gold will be injured, and in the latter case the impression will not be perfect. The loose gold is then wiped off into a cotton cloth (which being preserved, becomes valuable), and the book is lettered; this is done by taking up the letters singly, and pressing them when warm upon the lettering piece. This requires very great nicety, and can only be done properly after long practice. The letters ought not only to be placed exactly straight, but at regular distances from each other, and each line at its proper distance from the other; the loose gold is now rubbed off, and the back of the book is polished with an iron polisher, the book being fixed in the press and rubbed on the back with the iron heated. The sides of the book are now washed with paste-water, and then glaired three times with white of egg. Common bindings are merely edged round the board with one or two lines of gold, which is done by rubbing the edge of the roll with an oily cloth; the gold being cut into slips the width required, the roll is passed over them, and the oil causes the gold to adhere to it. The roll is then pressed gently and steadily upon the board, and as it moves along the impression is left on the book. For extra work, the pattern being marked out on the side, the gold is laid on in the same manner as for the back, and the tools are worked, and then the loose gold wiped off; the polishing iron is now passed over the book, which is then pressed between pieces of polished horn, tin, or papier-machée boards, to increase and fix the gloss. The edges of the leaves are now burnished with an agate, the book being firmly fixed in the press for the purpose; after this the insides and edges of the boards are polished, and the book is finished.

Blind tooling is done in the same manner, without the use of the gold.

The above is a general outline of the art of book-binding; and, it is presumed, will convey a tolerable idea of the process to such as desire information upon the subject. It is, however, one of those trades that require long and attentive practice to make a skilful workman. Within the memory of the writer of this article, the whole trade has undergone a complete change. About thirty years ago, the general run of binding was what is termed *calf-gilt*, and this was all done one pattern; the sides a running marble, of copperas, and salt of tartar, and the backs white, with colored lettering pieces; the backs were, at that time, quite flat, bands being only used for school-books; and as hollow backs

were almost unknown, the books were made exceedingly stiff, to prevent the leather from wrinkling when they were opened. The marble before mentioned is entirely exploded, except for sheep-bindings. At its invention the greatest caution was used to keep it a secret, and books were obliged to be sent to the inventor to be marbled, at a high price; the process is, however, very simple; but as it is never used in good work, no notice of it is taken in the preceding account; but it may be briefly stated, that after the book is washed and glaired, it is spread open, between two rods, or wands, laying in a slanting position; a wisp, or brush, is dipped in water, which is thrown on coarsely; as it runs

down the book, strong copperas water is thrown on with a brush, beat against an iron bar, an immediately after a small quantity of solution of salt of tartar; as soon as the colors are set, which they do immediately, the book is washed, and it certainly presents a very curious appearance. The general introduction, or rather revival, of bands, has taken place within the last few years; formerly they were considered essential to strength, but are now merely ornamental, being fixed to the cover, which, in order to make the book open more freely, is generally loose from the back of the book, and termed a hollow back.

BOOK-KEEPING.

BOOK-KEEPING is a mercantile term used to denote the method of keeping commercial accounts of all kinds, in such a manner, that a man may thereby know at any time the true state of his affairs with clearness and expedition.

The origin of this art must be considered as coeval with that of commerce, and as Italy, or rather Venice, was the parent of European commerce, the first production on book-keeping, made its appearance at the same place; hence all plans for books that were formed after this model, were said to be arranged according to the Italian, or, as it is commonly called, the Double Entry system; by which is meant, that for every sum carried to the Dr. of any person, or thing, there must be a corresponding sum placed to the Cr. of some other person or thing.

The method of book-keeping which answers these purposes most clearly and concisely is the best. The Italian method, by Double Entry, is generally preferred; at least, it is founded upon the most universal principles, and is the most convenient in extensive and complicated business: and the accountant who understands it, will find little difficulty in following, or even in inventing, other methods that are better accommodated to any particular purpose.

But, as the method by Single Entry has also its advantages, being more convenient for tradesmen, and all others who do not carry on business very extensively, we shall subjoin directions respecting that method; and conclude with an account of the Subsidiary Books, most of which are equally necessary in both methods.

PART I.

OF THE ITALIAN METHOD BY DOUBLE ENTRY.

The Italian method requires three principal books, viz. the Waste Book, Journal, and Ledger.

SECT. I.—OF THE WASTE BOOK.

The waste book, or day book, contains an exact register of all occurrences in business in the same order as they take place. It begins with an inventory of every thing belonging to the owner, a list of the debts due to him, and of the debts he owes to others: It is carried on with a full relation of all the money he receives or

pays; of all the goods he buys or sells; and of every other occurrence in his business. Each article should be entered as soon as the transaction takes place, and should be clearly expressed in the plainest language. It should require no supply from the accountant's memory, but should be fully intelligible to any person, however unacquainted with the business: at the same time, it should be written with all convenient brevity; and, therefore, sometimes refers to invoices and other accounts, for particulars. The accountant's first care should be to have nothing defective or ambiguous; his second, to have nothing superfluous.

The date is written in text on the top of each page. The articles are separated from each other by a line; and the transactions of one day are separated from those of another by a double line, in the middle of which there is a blank space for inserting the day of the month. This book must be kept with the greater care and accuracy, as it contains the materials from which the other books are composed. Besides, it is the book whose authority is trusted to, and which must be exhibited to judges, or arbiters, when an account is disputed. As the journal is filled up from the waste book, and ought to be a fair copy of it; the authority of the latter is esteemed more authentic, unless there be an obvious mistake through hurry; and either of these books is depended on rather than the ledger, which, from its form, is more liable to error, and may be more easily vitiated by a fraudulent design.

As the waste-book contains the whole substance of the business, it may be applied so as to afford any information that can be wanted; but the labor of consulting it would be very great, and much exposed to the risk of omissions. To prevent this inconvenience, the ledger is used, in which the articles are arranged in a methodical order. We shall consider it next; because the journal, though it comes before it in the order of writing, cannot be well understood, till the nature of the ledger be explained.

SECT. II.—OF THE LEDGER.

In the ledger, articles of the same kind are collected together; and, for that purpose, it is divided into many accounts, under which the different branches of business are arranged.

Each account is introduced by a proper title, to explain the nature of the articles it contains; and articles of opposite kinds, which belong to the same account, are placed on the opposite pages of the same folio; for instance, money received on the one side, and money paid on the other; or goods bought on the one side, and goods sold on the other. The left hand page is called the Debtor side of the account, and the right-hand page the Creditor side. The difference between the sums of the Dr. and Cr. side is called the Balance.

Accounts in the ledger are of three kinds.

I. Personal accounts. It is necessary to open an account for every person or company with whom there are any dealings on credit. At opening the books, if they be indebted to the owner, the debt is entered on the Dr.; but, if he be indebted to them, it is entered on the Cr. During the course of the business, goods sold on trust, money paid, and every thing for which they are accountable to him, is entered on the Dr.; but goods bought on trust, money received, and every thing for which he is accountable to them, is entered on the Cr. The balance shows how much they owe him, when the Dr. side is greater; and how much he owes them, when the Cr. side is greater.

II. Real Accounts. By this we understand accounts of property of whatever kind, such as ready money, goods, houses, lands, ships, shares in public companies and the like. The account of ready money is entitled Cash; but those who keep an account with a Banker, generally debit the Firm with monies paid, and credit it with monies drawn out. On the Dr. side, the money on hand at opening the books is entered, and afterwards every article of money received. On the Cr. side, there is entered every article of money paid out; and the balance shows how much ought to be on hand. The sum of the Dr. side of this account is or ought to be always greater than that of the Cr. side.

Accounts of goods are generally ruled with inner columns for entering the quantities. When the books are opened, the goods on hand are entered on the Dr. side of the respective accounts; the quantities being placed in the inner, and the values in the outer column. Goods bought are entered in the same manner, and goods sold are entered on the Cr. side; the quantities and values being placed in the proper columns. Charges laid out on goods are entered on the Dr. side; and, when an incidental advantage arises from them, such as the public bounty, it is entered on the Cr. If the sums of the inner columns on the opposite sides be equal, it shows that the goods are all sold, and then the balance of the money column shows the gain or loss. If the Cr. side be greater, it is gain; if the Dr. side be greater, it is loss. If the quantity in the inner column be greater on the Dr. side, it shows that part of the goods are on hand; and their value must be added to the sum of the Cr. side, in order to determine the gain or loss.

Accounts of ships contain on the Dr. the value of the ship when the books are opened, and all expenses laid out thereon; on the Cr. all freights

received. In like manner, accounts of houses or lands have the value of the subject, and all repairs, or other charges, entered on the Dr. and all rents or other profits received on the Cr. If the subject be sold in whole or in part, the sale is entered on the Cr. And the balance, after valuing the subject (if any) on hand, shows the gain or loss.

III. Accounts of Stock, Profit and Loss, and their subsidiary accounts, which are sometimes called fictitious accounts.

The Stock account contains on the Dr. the amount of the debts which the owner owes when the books are opened; and on the Cr. the amount of ready money, goods, debts, and property of every kind belonging to him: therefore the balance shows what his nett stock is; or, in case of bankruptcy, how much his debts exceed his effects. There is nothing further entered on this account till the books are balanced; and then, if the business has yielded profit, the nett gain is entered on the Cr.; if it has been unsuccessful, the nett loss is entered on the Dr.; after which the balance shows the nett stock at the time the books are closed.

The Profit and Loss account contains every article of gain on the Cr. and every article of loss on the Dr. The balance shows the nett gain or loss, and is transferred to the proper side of the stock account, as mentioned above. This account is partly composed of articles that occur while the accounts are running. For example, legacies received are entered on the Cr.; goods lost or destroyed on the Dr. The rest of the articles are those of gain and loss, arising from the real accounts, which are collected, when the books are balanced.

It has been found convenient to open several Subsidiary Accounts, in order to shorten and methodise that of profit and loss. These contain certain articles of gain or loss, which may be reduced under distinct heads. They are in effect so many parts of the profit and loss account, and their balances are entered on the proper side of that account when the books are closed. Thus,

The *Interest account* contains on the Dr. sums paid or incurred for interest; and on the Cr. sums received, or become due for it.

The *Commission account* contains on the Cr. articles of gain received or owing for trouble in transacting business for others. There are seldom any entries on the Dr.

The *Charges of merchandize* contains on the Dr. all charges paid or incurred on the business, which do not belong to any particular account, as shop-rent, public burdens for trade, clerk's wages, postage, and the like. If any of these should afterwards be charged to some other account, the sum so charged is entered on the Cr.

The *Account of proper expenses* contains on the Dr. money or any thing else, withdrawn from the trade for our private use. There are seldom any entries on the Cr. The amount of this account, as well as the former, is not properly loss; but as it has the same effect in diminishing the stock, it is placed in the same manner to the Dr. of Profit and Loss, or in case of a partnership, to the private account of the party.

Loss by bad debts contains on the Dr. such debts as we reckon desperate; and on the Cr. any of these which may happen to be unexpectedly recovered.

Account of abatements contains on the Dr. discounts allowed by us on payments received; on the Cr. discounts allowed to us on payments made. It is particularly useful in retail business, where discounts are often given, to show how much they amount to.

Insurance account contains on the Cr. premiums received for making insurances; and, on the Dr. losses sustained on the same; there may be several accounts of this kind. Insurances against sea-hazard and fire are the most common. The balance shows the gain or loss which arises from being concerned in insurance.

When goods are received, the transaction is entered on the Dr. of the account of goods. If they are bought for ready money, it is also entered on the Cr. of cash; if on trust, it is entered on the Cr. of the seller; if they be exchanged for other goods, it is entered on the Cr. of the goods delivered; if they be obtained by some profitable business, without any return, it is entered on the Cr. of profit and loss.

When goods are delivered, the transaction is entered on the Cr. of the account of goods; and, if they be sold for ready money, it is also entered on the Dr. of cash; if on credit, it is entered on the Dr. of the purchaser; if exchanged for other goods, it is entered on the Dr. of the goods received; and if they be given gratis, or destroyed, it is entered on the Dr. of profit and loss.

Thus, every article in any account, whether personal or real, or belonging to profit and loss, corresponds to some other article on the opposite of a different account. The same sum is entered on the Dr. of one account and on the Cr. of the other; and it follows from this, that, if all the accounts in the ledger be added, the amount of the sums of the Dr. will be equal to those of the Cr.

SECT. III.—OF THE JOURNAL.

The journal is a fair record of all the transactions compiled from the waste-book, in the same order as they stand there.

When we are to enter any article in the journal, we must consider which account in the ledger it will require to be placed to, both on the Dr. and Cr. and write the former account Dr. to the latter account; then we annex an explanation of the article, and place the sum in the money column.

Example.—(Waste-book). Sold for ready money, 30 yards linen, at 3s. £4 10 —
(Journal). Cash Dr. to Linen Sold 30 yards, at 3s. £4 10 —

Or, if the money be paid into the hands of the banker, the firm will be Dr. and the linen Cr. without carrying it through the cash account; the principal use of which is, that, if a number of small sums are taken in the course of the day, cash may be debited, and, when the amount is paid in at the bankers, he is charged therewith in one line and cash credited in the same way. Here we consider, that the article must be

entered on the Dr. of cash, because money is received; and on the Cr. of linen, because linen is delivered: therefore we write cash Dr. to linen, to which we annex the nature of the transaction. The article thus entered is called a journal post; cash is called the Dr.; linen, the Cr.; the words 'cash Dr. to linen,' the entry; and the words that follow, the narration.

Where a banking account is kept, the payments made by cash or acceptances ought to be kept in a small book, and may be journalised either daily, weekly, or monthly, without passing through the waste-book; the nature of the transaction being stated on the counterpart of the check, or, if it is an acceptance, then bills payable will be debited and the banker's account credited.

The purpose of expressing the article in this form, is to point out the accounts in the ledger, to which it will require to be posted, and thereby enable the accountant to write the ledger with more ease than he could do, if it were filled up immediately from the waste-book. The learner will be able, from this example, to enter any simple article in the journal, providing he knows the accounts to which it should be posted on the Dr. and Cr. of the ledger.

GENERAL RULES FOR JOURNAL ENTRIES.

I. Every thing received, or person accountable to us, is Dr.

II. Every thing delivered, or person to whom we are accountable, is Cr.

As the whole art of writing the journal depends on a proper choice of the Drs. and Crs. we shall give some particular rules for the most common cases, and a few examples for the illustration and practice of each.

Rule I. A thing received is Dr. to the person from whom it is received, when nothing is delivered in return.

Rule II. The person to whom any thing is delivered, is Dr. to the thing delivered, when nothing is received in return.

Rule III. A thing received is Dr. to the thing given for it.

Rule IV. Goods and other real accounts are Dr. for all charges laid out on them. If money be laid out, they are Dr. to cash; if any thing else be delivered, they are Dr. to the thing delivered; if the charge be taken in trust, they are Dr. to the person to whom it is due.

Rule V. When rents of houses or lands, freight of ships, bounties on goods, or any other profits from real accounts are received, cash is Dr. to the account from which the profit arises: if any thing besides money be received, the article received is Dr.: if they remain unpaid, the person who owes them is Dr.

Rule VI. When an article of loss occurs, profit and loss, or some subsidiary account, is Dr. If the loss be paid in ready money, it is Dr. to cash; if it is paid in any thing else, it is Dr. to the thing delivered. If it remain unpaid, it is Dr. to the person to whom it is owing.

Rule VII. When an article of gain occurs, that is not immediately connected with any real account, cash, the article received, or the person

accountable for it, is Dr. to profit and loss, or to some subsidiary account.

Rule VIII. When one person pays money, or delivers any thing else to another on our account, the person who receives it is Dr. to the person who pays it. Thus, (Waste-book.) John Fairney has paid the bank of Scotland, on my account £100 — —

These rules will make the learner acquainted with the form of the journal, and extend to the greatest part of the simple transactions that occur in domestic trade. The technical sense of the words Dr. and Cr. has a kind of analogy to their meaning in common language, but is not precisely the same. Thus, in Ex. Rule VIII. the journal entry is, Bank of Scotland Dr. to John Fairney; by which we are not to understand that the bank is indebted to John Fairney; for a debt between them has no connexion with our business, and therefore ought not to be entered in our books: the meaning of the entry is, that the bank becomes indebted to us by the transactions narrated; and that we become indebted to John Fairney by the same.

The journal should be written by one person, in a fair hand and at leisure hours. The articles are separated, and the titles and dates marked in the same manner as in the waste-book. The entries are written in half text, for ornament and distinction. In the inventory, the designation (or the business, station, and place of residence,) of every person is mentioned; and the same is done the first time that any name occurs in journal entry. At other times, it is sufficient to enter the name without the designation, unless we have dealings with two persons of the same name; in which case, it is always necessary to annex the designation, in order to distinguish them. The narration should be complete, without referring to the waste-book; and so clear, that every person, acquainted with the style of the journal, may understand it with ease. When the post is written, we enter the folio of the journal against the article, on the margin of the waste-book, to show how far the writing of the journal is advanced.

OF THE SUBSIDIARY BOOKS.

Though all merchants accounts may be kept by the waste-book, journal, and ledger, alone; yet men of great business find it convenient, either for abridging these, or for other ends, to use some others, generally called subsidiary or subservient books; the most common of which are the following: viz.

I. The CASH-BOOK is kept in a folio form, like the ledger, and serves to abridge the cash account there. On the left-hand page, or Dr. side, cash is charged Dr. for all the sums received; and on the right-hand page, cash is made Cr. for all the sums paid. Once a-week, or, which is more ordinary, once a-month, this book is posted to the ledger; or, first to the journal, by two entries, viz. cash Dr. to sundries, for all the receipts, and sundries Drs. to cash, for all the payments. By this means the cash account in the ledger will be so far contracted as to consist of twelve lines, viz. one for each month in the year.

II. Book of CHARGES of MERCHANDISE, or PETTY CASH BOOK. This book is only pagged, and designed to abbreviate the cash book. It contains particular charges on goods and voyages; such as carriage, custom, freight, crage, wharfage, &c. also other expenses that affect trade in general; such as, warehouse rent, shop rent, accountant's wages, postage of letters, and the like. At the end of each month the money columns of this book are added up, and the sum carried to the credit side of the cash book.

III. The Book of HOUSE EXPENSES is also pagged, and designed to ease the cash book. It contains all disbursements for family provisions, servants' wages, house rent, apparel, utensils, &c. The money columns of this book are also added up at the end of each month, and the sum transferred to the credit side of the cash book.

IV. The INVOICE BOOK, used chiefly by factors, is pagged, and contains copies of the invoices of goods sent to sea, or of goods received from abroad.

V. The SALES' BOOK is also chiefly used by factors; and into it is posted, from the waste-book, the particular sales of every consigned cargo; by which the several articles of a sale, that lie scattered in the waste-book, are brought together, and represented under one view, and that in a manner more full and minute than in the ledger. This book exhibits the sales of every consignment separately and by themselves: to which are subjoined the respective charges, such as freight, custom, the factor's commission, as also abatements allowed to buyers, &c. whose sum subtracted from the gross amount of sales gives the neat proceeds. From this book, when a cargo is sold off, an account of sales is drawn out, in order to be transmitted to the employer.

VI. The BILL BOOK is intended to furnish a merchant with a ready way of knowing the time when bills become payable to or by him.

VII. LETTER BOOK. It is very imprudent in any person to send away a letter of business, without keeping a copy of it; and therefore, to prevent the bad consequences of such a careless practice, merchants are provided with a large book in folio, into which is copied *verbatim* every letter of business before it be sent off. So that this book, together with the letters received (which must also be carefully kept in files or boxes), makes a complete history of all the dealings that pass betwixt a merchant and his correspondents; which may be very useful on many occasions.

VIII. POCKET BOOK. This is a small book, of a portable size, which a merchant carries in his pocket when business calls him abroad to a tavern, a fair, the country, or other places. In this he sets down the bargains he makes, the expenses he is at, the debts he pays or sums he receives, with every other part of business he transacts while abroad; as also any occurrence or piece of news he thinks worth while to record. And when he comes home, he transfers the things contained in this book, each to their proper places in the waste-book, or books subsidiary.

The above are the subsidiary books most in

use: but a merchant may keep some, and neglect others, or invent more as the nature of his business requires.

SECT. IV.—OF POSTING THE LEDGER.

The first thing to be done in the ledger, is to allot a proper space for each account. The accounts may be either opened in the same order that they occur in the journal; or accounts of the same kind may be placed together; the personal on one part of the ledger, and the real accounts in another. The accounts of Stock, and Profit and Loss, are generally placed at the beginning.

The number of the folio is marked in text at each corner of the top line; and the titles of the accounts are written in text through both folios, if necessary. The word Dr. is prefixed to the title on the left-hand page; and contra Cr. annexed to it on the right-hand page.

An index must be provided, for pointing out the folios where the accounts are opened. The titles of the accounts are entered alphabetically in the index, and the number of the folio annexed. Personal accounts are entered by the first letter of the surname; companies, by the first letter of the surname of the first letter of the first partner; and all other accounts, by the first letter of the first word. The most convenient kind of index is a long book, of twenty-four leaves.

In posting the ledger, first look for the Dr. of the journal post in the index, under the proper letter, which directs to the folio of the ledger where the account is, if it be already opened: if not, you must allot a space for it, write the title, and enter it in the index. Then enter the article on the left-hand page of the account under the title of the former article, by writing the date on the margin, and the name of the creditor on the line, with the word *to* prefixed, and a short narration of the transaction annexed, and inserting the sum in the money column, and the quantity, if it be an account of goods, in the inner column. Then turn to the account of the Cr. of the journal-post, and enter the article in the right-hand page, prefixing the word *by* to the name of the Dr.

This being done, turn to the journal, and mark on the margin the number of the folios to which the article is posted. The figures which point out the reference to the Dr. and Cr. folios should be separated by a line; for example, if the Dr. entry be on the first folio, and the Cr. entry on the eighth, the reference is marked $\frac{1}{8}$. These figures show how far the posting is advanced, and are useful in comparing the books. The figures for dates or references, should be written in a lighter hand, than the figures in the columns for money or quantity. Some prefer entering the folio of the ledger against each account at once, and to make a \checkmark or . before it, when posted into the ledger.

There is often a reference column ruled in the ledger, for pointing out the other entry, corresponding to any article. In this column, the folio of the Cr. entry is marked against the Dr. article, and the folio of the Dr. entry against the Cr. article.

An article in the ledger is generally compre-

hended in one line. The narration should be as full as can be contained in that bounds. If it cannot be narrated completely, the journal is referred to for further particulars, by writing *per Journal* (or *p. J.*), either after an incomplete narration, or immediately after Dr. or Cr. when there is no room for a proper narration. In complex posts, there can seldom be any narration annexed to the single Dr. or the single Cr. The entry is generally *To sundries per J. or, By sundries per J.* If the sense of the whole article can be narrated, it should be done; but it is improper to narrate the first or any other part of the article, and omit the others:—

When the space allotted for an account in the ledger is filled up, the account must be transported to another folio. For this purpose add the columns on both sides, and write against the sum, *Transferred to folio* , inserting the number of the folio where the new account is opened, in the reference column, or on the line, if no reference-column be used.

The books should be written up as frequently as can be done conveniently; so that the journal may keep pace nearly with the waste-book, and the ledger with the journal. Each book should be carefully revised, and compared with the book from which it is posted. In comparing the ledger, observe the following directions.

Begin with the first journal post, and turn to the folio of the ledger where the Dr. is entered, which you are directed to by the marginal reference, and compare the date, entry, and sum. If they correspond, it is well; if not, the ledger must be altered till it correspond with the journal. Then place a dot before the reference figure in the journal, and mark, thus Δ , before the sum in the ledger. Proceed in the same manner to compare the Cr. of the journal post, and all the following posts in their order. The dots in the journal show how far the comparison is advanced, and the marks in the ledger show what articles are compared. The sums of accounts transported should be left blank till the books be compared; as an error in any article will occasion an alteration in the sum.

In correcting errors in the ledger, observe the following rules: I. If an article be omitted, do not attempt to interline it at the place where it should have been; but insert it under the last article, when you discover the omission, and mark a cross \times against it on the margin, and another at the place where it should have been. II. If you discover a mistake immediately when committed, correct it without cancelling any thing, as in this example: *To cash, say, To James Spence received to account.* III. If you have written a line entirely wrong, or in a wrong place, write the word *Error* at the end, prefix a cross, and omit or cancel the sum. IV. Cancel errors, by drawing a line lightly through them, so that the old writing may still be legible; by which it will be evident, that the book has not been vitiated for a fraudulent purpose. The same method should be followed in correcting errors in the journal.

When the comparison of the books is finished, glance over the ledger, to observe if the mark of comparison be affixed to every article.

Because the whole sum of the Dr. side of the ledger should be equal to the whole sum of the Cr., it is proper to try if they correspond. For this purpose, you may add the Dr. of every account, except such as are already balanced, placing the sums in an inner column, and extending them at the end of one or more folios, as you find most convenient, to the outer column : and, as you go along, add the Cr. in the same manner. If the sum total of both sides be equal, it gives a presumption that the books are right ; if they differ there is certainly some mistake. This is called the Trial Balance. The labor bestowed upon it is not lost, as the sums may be reserved for assisting to collect the balances.

SECT. V.—OF BALANCING THE BOOKS.

Before we explain the method of balancing the books, it will be proper to direct the learner how to balance particular accounts. When we settle accounts with any person, and ascertain how much is owing at either hand, it is necessary to balance his account in the ledger, and open a new one, beginning with the sum that was due according to the settlement : and when we clear accounts again, we must go back to that article, and no farther.

If any article be charged on either side, at the time of settling, they must be immediately entered on the waste book ; from which they will pass in course to the journal and ledger ; and a remark must be entered in the waste-book, that the account was settled, and the balance transferred to the proper side of the new account. This remark is transcribed in the journal ; and the ledger account is balanced, when it occurs, in the course of posting.

If the balance be due to you, write on the Cr. By balance due to him to Dr. new account, and insert the sum due to you ; after which the amount of both sides will be equal, or vice versa. Add the account, placing the sums opposite to each other ; and, if the sides be unequal, draw a diagonal line through the vacant space of the shorter side, and close the old account by drawing lines under the sums. Then open the new account immediately under the old one, or in a new folio, if the old one be full, by writing on the Dr., To balance of former account due by him, and vice versa.

Merchants generally balance their books once a year. The design of this operation is, to collect the various branches of their business, diffused through the books, into a concise abstract : to ascertain the gain or loss since the last balance : and exhibit the present state of their affairs. If the business be of such a kind, that most of the branches naturally come to an issue at a certain time of year, that time is the proper one for making the balance. Otherwise the end of the year, or the least busy time, may be chosen.

PART II.

OF BOOK-KEEPING BY SINGLE ENTRY.

Having explained the method of book-keeping by Double Entry, we shall add a few directions for keeping books by Single Entry ; because this method, although less perfect, is yet the simplest

and shortest. It is generally used by shopkeepers, and requires two principal books, a day book and ledger.

The DAY BOOK begins with a list of the debts due to the owner, and of the debts due by him to others. Then every transaction by which new debts are contracted, or former debts discharged, is entered as it occurs with the quantities and prices of goods bought or sold, or other circumstances necessary for explaining the transaction.

When goods are sold on credit we write A. B. [the purchaser] Dr. and then mention the article or articles with the rates and amount. When we pay money we write C. D. [the receiver] Dr. to cash ; when we buy goods, E. F. [the seller] Cr. for the articles purchased ; when we receive money, G. H. [the payer] Cr. by cash.

If debts be discharged or contracted by any other means, the person who becomes indebted to us, or to whom we pay a debt we formerly owed, is entered Dr. and the person to whom we become indebted, or who pays a debt he formerly owed, is entered Cr. and the nature of the transaction explained.

The LEDGER contains an account for every person with whom there are dealings on credit, where the articles for which he is accountable to us, and those for which we are accountable to him, are placed in opposite pages of the same folio ; the Dr. articles on the left-hand pages, and the Cr. articles on the right-hand pages.

To POST THE LEDGER, allot a space for every person or company whose name occurs in the list of debts at the beginning of the day book ; write the title and enter the debts on the proper side, referring to the page of the former ledger, where the account was ; and enter the name in an index prepared as directed PART I ; then proceed to post the articles from the day book in their order, in the accounts of the persons they belong to, allotting a space for the account and writing the title, if it was not opened before. The date of the article is written on the margin ; and the transaction is entered on the Dr. side, when the person is marked Dr. in the day-book, and on the Cr. side, when he is marked Cr. in the day-book.

When a single article is bought or sold, we mention it, with the quantity and rate, in the ledger ; but when several articles are bought or sold at the same time, it is more usual to enter only the sum of the whole, writing To sundries, or By sundries, and referring to the day-book for particulars. The number of the folio, in which each article is posted, is marked on the margin of the day-book. If the space assigned for an account be filled up, it must be transferred to another folio.

Instead of entering the Dr. and Cr. articles on opposite pages, some enter them all on the same page, and rule two sets of money columns, one for extending the sums of the Dr. articles, and another for the sums of the Cr. articles ; but this plan is not recommended.

Those who keep their books upon this plan, ought also to have a CASH BOOK, and an INVOICE BOOK ; which will make it unnecessary to enter the particulars of such articles in the day-book.

BOOKSELLERS' MARKS. An acquaintance with marks, on the title pages of books, is of some use; because many ancient books have no other designation either of printer, bookseller, or even city. The anchor is the mark of Raphelengius at Leyden; the same with a dolphin twisted round it, of the Manutii at Venice and Rome; the Arion of Oporinus at Basil; the caduceus, or Pegasus, of the Wecheliuses at Paris and Francfort; the cranes of Cramoisy; the compass of Blantin at Antwerp; the fountain of Vascosan at Paris; the sphere in a balance, of Janson and Blaew at Amsterdam; the lily of the Juntas at Venice, Florence, Lyons, and Rome; the mulberry-tree of Morel at Paris; the olive-tree of the Stephenses at Paris and Geneva, and the Elzevirs at Amsterdam and Leyden; the bird between two serpents, of the Frobeniuses at Basil; the Truth of the Comelins at Heidelberg and Paris; the Saturn of Colinaeus; and the printing-press of Badius, Ascensius, &c.

BOOK-WORM is an insect of the mite kind, which afterwards becomes a fly, bred from eggs deposited in the month of August in books, especially in the leaves nearest the covers. It is not unlike the mite or blatta found in corn. When the time of its transformation approaches, it seeks to get into the air, and eats through, till it gets to the extremity of the book. The mixture of juice of wormwood and other bitter ingredients in the paste (which is an expedient used by book-binders), is no security to books against book-worms. The best security is from mineral salts, which all insects hate. For this purpose book-binders ought to mix with the paste employed in binding, the salt called arcanum duplicatum, alum, and vitriol. With this precaution books may be preserved from all injury by this mischievous little creature. M. Prediger, in his Instructions to German Book-binders, (Leipsic, 1741,) recommends making paste of starch, instead of flour; and advises to powder slightly the books, their covers, and the shelves on which they stand, with a mixture of powder of alum, and fine pepper; and in the months of March, July, and September, to rub the books with a piece of woollen cloth steeped in powdered alum.

BOO'LY, n. s. An Irish term.

All the Tartarians, and the people about the Caspian Sea, which are naturally Scythians, live in hordes; being the very same that the Irish *boodies* are, driving their cattle with them, and feeding only on their milk and white meats. *Spenser.*

BOOM', n. s. From Dutch, *boom*, a tree. In sea language, a long pole used to spread out the clue of the studding sail; and sometimes the clues of the mainsail and foresail are boomed out. A poll with bushes or baskets, set up as a mark to show the sailors how to steer in the channel, when a country is overflown. A bar of wood laid across a harbour, to keep off the enemy.

The yards secure along the *booms* reclined,
While some the flying cords aloft confined.

Falconer's Shipwreck.

As his heroick worth struck envy dumb,
Who took the Dutchman, and who cut the boom.

Dryden.

To Boom, v. n. From the noun. A sea term. To rush with violence; as a ship is said to come booming, when she makes all the sail she can.

Dict. To swell and fall together.

Booming o'er his head,
The billows closed; he's numbered with the dead.

Young.

Forsook by thee, in vain I sought thy aid,
When *booming* billows closed above my head.

Pope.

BOOMITES, a kind of agate, of remarkable brightness and transparency, which represents the figures of shrubs, trees, mosses, &c. in the manner of the dendrachates, or mocho-stone.

BOON', n. From Sax. *bene*, a petition. A gift; a grant; a benefaction; a present.

Vouchsafe me for my meed but one fair look:
A smaller *boon* than this I cannot beg,
And less than this, I'm sure, you cannot give.

Shakspeare.

That courtier, who obtained a *boon* of the emperor,
that he might every morning whisper him in the ear,
and say nothing, asked no unprofitable suit for himself.

Bacon.

The blustering fool has satisfied his wil,
His *boon* is given; his knight has gained the day,
But lost the prize.

Dryden's Fables.

What rhetorick didst thou use

To gain this mighty *boon*? she pities me.

Addison. Cato.

Sated with Nature's *boons*, what thousands seek
With dishes tortured from their native taste,
And mad variety, to spur beyond
Its wiser will the jaded appetite.

Armstrong.

Boon', adj. Fr. *bon*. Gay, merry; as a boon companion.

Flowers, worthy of Paradise, which not nice art
In beds and curious knots, but Nature *boon*
Poured forth profuse on hill, and dale, and plain.

Milton.

Satiate at length,
And heightened as with wine, jocund and *boon*,
Thus to herself she pleasingly began.

Id. Paradise Lost.

I know the infirmity of our family; we play the
boon companion, and throw our money away in our
cups.

Arbutnot.

BOONDY, a town of Hindostan, the residence of a rajah, in the province of Ajmeer, and tributary to the Mahrattas. It is situated on the declivity of a long range of hills, which run nearly from east to west. The palace of the rajah is a large massy stone building, well fortified. In the retreat of the British troops under colonel Manson in 1804, the rajah rendered them considerable assistance.

BOONEN (Arnold), portrait painter, born at Dort in 1669, was at first a disciple of Arnold Verbuys, and afterwards of Godfrey Schalcken, with whom he continued six years. The sweetness of his coloring, and the neatness of his touch, with a striking likeness in his portraits, procured him many admirers. He painted subjects by candle light very naturally, and much more of his work was requested than it was possible for him to undertake. He painted Peter the Great of Muscovy; Frederic I. of Prussia; the duke of Marlborough, many of the princes of Germany, and most of the noblemen who attended the Czar; but his excessive application, to answer the multitude of his engage-

Y

ments, impaired his health, while it enriched him. He died in 1729, aged thirty-two.

BOONSBOROUGH, a small town of Kentucky, agreeably situated on the south side of the river Kentucky, about 160 miles above its confluence with the Ohio, and twenty south-east of Lexington.

BOOPS, in entomology, a species of sphex, inhabiting Germany. Color, black; three segments of the abdomen, and the tarsi of the legs, testaceous.

Boors, in zoology, the specific name of the pike-headed whale; *Balana boops* of Linnæus. It is distinguished by having double spiracles on the snout, and a horny protuberance at the extremity of the back. This is the Jupiter fish of Anderson; the French name it *la Jubarte*. See **BALÆNA**.

BOOPHTHALMUS, from *βοη*, an ox, and *οφθαλμος*, an eye; a kind of gray agate with large dark blue circles in it, resembling an ox's eye.

BOOR, } Dutch, *boer*; Germ. *bauer*.
BOORISH, } In Anglo-Saxon it is only found
BOORISHLY, } in composition, as *gebur*, a countryman; a ploughman, one who lives by works of husbandry; a tiller of the ground; therefore rustic, uneducated, clownish, coarse, barbarous; the savage of a civilized country.

Therefore, you clown, abandon, which is, in the vulgar, leave the society, which, in the *boorish*, is company of this female. *Shakspeare. As You Like It.*

The bare sense of a calamity is called grumbling; and if a man does but make a face upon the *boor*, he is presently a malecontent. *L'Estrange.*

BOHRHANPOOR, a city of Hindostan, in the Mahratta territories, and the province of Khandesh, of which it was formerly the capital. It stands on the north-west side of the river Tuptee, in lat. 21° 20' N., long. 76° 20' E. The town is the chief place of a singular sect of Mahomedans, named Bohrah, or Ismaeliah, deriving their origin from one of the early followers of the prophet. They spread over all the countries of the Deccan, and carry on an extensive commerce. In Surat there are 6000 families of Bohrahs, and in Oujain 1500. A younger brother of the moullah, or high-priest, resides at Oujain, and exercises both a temporal and spiritual authority over the Bohrahs resident there. This city was taken possession of by the British under Colonel Stevenson in 1803, but was restored at the conclusion of the peace in December. It is much fallen from its former grandeur. Travelling distance from Nagpoor 256, Poona 283, Bombay 340, and Calcutta, by Nagpoor, 978 miles.

BOOROOJIRD, a city of Persia, in the province of Irak, standing on the declivity of a mountain. It is a flourishing place, and belonging to it is a district peopled by an agricultural tribe called Lack. Population 12,000.

BOORO, an island in the eastern seas, between the third and fourth degrees of south latitude, and the 126th and 127th of east longitude. In length seventy-five miles, by thirty-eight miles the average breadth. The principal settlement is Cajelli, at the bottom of a gulf of the same name. The Dutch built a stone fort here, which was blown up in 1689; since which

they have only had an enclosure of pallisadoes. Buffaloes and rice abound here, also bananas, cocoa-nuts, lemons, citrons, and bitter oranges: it is on this island that the best cajeputa oil is procured.

The Chinese trade here for cabinet and different species of dye woods. Part of the inhabitants are Mahomedans, but the interior is inhabited by the aborigines or *horaforas*, who live dispersed among inaccessible mountains. The south is much infested by the Papuas from New Guinea.

Boors is a distinctive appellation of the peasants of Russia. In the ukases, and other public documents, they are divided into the free and vassal Boors; the former being the link between the burghers and the vassal peasantry. Free Boors must not be alienated or sold, and they possess property, provided they pay the taxes, and perform their tasks of labour to the state, or to their lords. To this class of the Russian people belong foreign colonists, who have settled as husbandmen, as well as the single house owners; as also the Cossacs, Kalmucs, Tartars, and other nomadic tribes, who inhabit the steppes. The vassal Boors are slaves; not only disqualified for possessing property, but entirely, with every branch of their families, at the disposal of their lords, by whom they may be exchanged or sold like any other property. In Little Russia is an intermediate class, attached as a sort of fixed property to the land, from which they can neither be alienated nor sold. The whole peasantry consists of three classes—Crown Boors, Mine Boors, and Private Boors. 'Dr. Clarke says, 'Traversing the provinces south of Moscow, the land appears as the garden of Eden, a fine soil, covered with corn, and apparently smiling in plenty. Enter the cottage of the poor laborer, surrounded by all these riches, and you find him dying of hunger, or pining from bad food, and in want of the common necessities of life. Extensive pastures, covered with cattle, afford no milk for him. In autumn the harvest yields no bread for his children. The lord claims all the produce. Can there be a more affecting sight than a Russian family having got in an abundant harvest, in want of the common stores to support them, through the rigor of their long and inclement winter!'

The late emperor Alexander, though he only gave absolute freedom to the Boors of Courland, will long be remembered for his rational plans of ameliorating the condition of this class generally, by encouraging the diffusion of useful and religious knowledge among them. He also removed the disqualification of a peasant to engage in any business, or carry on any manufacture on his own account, by an Imperial ukase, dated 28th December 1818 (old style); and encouragement is held out to them to avail themselves of this important concession. Estates in Russia are valued by the number of vassals they feed; this human stock being valued at from 200 to 300 rubles each.

BOOSHATTER, formerly the city of Utica, famous for the retreat and death of Cato, lies about seven miles inland from Porto Farino in the bay of Tunis. Nothing remains of its ancient grandeur, except part of a large aqueduct, some

cisterns, and other ruins, which cover a large extent of ground, and show it to have been a considerable place. The sea came up anciently to this city, though now seven miles distant.

BOOSNAIL, a town and district of Bengal, formerly the residence of a foudjdar. Abou Turab khan, who held this office about the year 1730, was murdered by Sittaram, a chief of banditti, who was soon after taken, and, with his male followers, impaled alive; the women and children were sold as slaves. The district is rich and well cultivated. The town stands in long. 89° 39' E., lat. 23° 32' N.

BOOT', *v. & n.* } Ang.-Sax. betan, or botan.
BOOT'LESS, } Bot, in Saxon, is recom-
BOOT'LESSLY, } pense, repentance, or fine,
BOOT'V. } paid by way of expiation.

Botan is to repent, or to compensate; the precise idea, according to Tooke, is to make up by one thing a deficiency in another. If another suffers injury or loss, we do not repair it in kind, but give an equivalent benefit. To boot, is also something superadded. It is the surplus of a bargain; the overflowing of an advantage; something thrown in over and above. Its general application is, to profit and advantage; to compensate or reward; to serve or be of service to. Boot and booty are the same, namely, acquisition, profit, and advantage; but the latter is applied to what is taken from an enemy; to what is acquired by the marauder and the bandit in their depredations. To play booty is to play dishonestly, with an intent to lose.

Suche evil is not alwaie *botelesse*;
 Why?—put not thus impossible thy cure,
 Sithe thing to come is often avanture.

Chaucer's Troilus and Cresside.

So forth he fared, as now befell, on foot,
 Sith his good steed is lately from him gone;
 Patience perforce: helpelesse what may it boot
 To fret for anger or for grieve to mone,
 His palmer now shall foot perforce alone. *Spenser.*

Whereas the damned ghosts in torments fry,
 And with sharp shrilling shriekes doe *botelesse* cry. *Id.*

God did not suffer him, being desirous of the light of wisdom, with *bootless* expence of travel, to wander in darkness. *Hooker.*

It shall not *boot* them, who derogate from reading, to excuse it, when they see no other remedy; as if their intent were only to deny that aliens and strangers from the family of God are won, or that belief doth use to be wrought at the first in them, without sermons. *Id.*

For what I have, I need not to repeat;
 And what I want, it *boots* not to complain. *Shakspeare.*

Thrice from the banks of Wye,
 And sandy-bottomed Severn, have I sent
 Him *bootless* home, and weather-beaten back. *Id.*

Bootless speed,
 When cowardice pursues, and valour flies. *Id.*

My gravity,
 Wherein, let no man hear me, I take pride,
 Could I, with *boot*, change for an idle plume,
 Which the air beats for vain. *Id.*

Canst thou, O partial sleep, give thy repose
 To the wet seaboy, in an hour so rude;
 And, in the calmest and the stillest night,
 With all appliances and means to *boot*,
 Deny it to a king? *Id.*

Others, like soldiers, armed in their stings,
 Make *boot* upon the summer's velvet buds. *Id.*
 And I will *boot* thee with what gift beside,
 That modesty can beg. *Id. Antony and Cleopatra.*
 One way a band select from forage drives
 A herd of beeves, fair oxen, and fair kine,
 Their *booty*. *Milton.*

His conscience is the hue and cry that pursues him;
 and when he reckons that he has gotten a *booty*, he
 has only caught a Tartar. *L'Ettranger.*

He might have his mind and manners formed, and
 be instructed to *boot* in several sciences. *Locke.*

What *boots* the regal circle on his head,
 That long behind he trails his pompous robe? *Pope.*

BOOT' N. & V. } Ang.-Sax. abutan, about;
BOOT'CATCHER, } because, says Skinner, boots
 go round, or about, the legs. 'It is more prob-
 ably,' says the Ency. Met. 'from the Ang.-Sax.
 botan; Dut. *boeten*, to boot; to superadd; to
 supply; to add something more to make up a
 deficiency in something else. The boot of a
 coach is something superadded to the coach;
 boots for the legs are an additional covering or
 protection for the legs.' Perhaps it is rather from
 the Welsh, *butias*; pronounced bootias (a pair of
 boots), derived from bot, any round body.

His *bootes* souple, his hors in gret estat,
 Now certainly he was a fayre prelat.

Chaucer's Canterbury Tales.

His lacquey with a linen stock on one leg, and a
boot-hose on the other, gartered with a red and blue
 list. *Id.*

That my leg is too long—

—No; that is too little.—

I'll wear a *boot*, to make it somewhat rounder. *Id.*

A *booted* judge shall sit to try his cause,

Not by the statute, but by martial laws. *Dryden.*
 The ostler and the *bootcatcher* ought to partake. *Swift.*

Bishop Wilkins says he does not question but it will
 be as usual for a man to call for his wings, when he
 is going a journey, as it is now to call for his boots.

Addison's Guardian.

Boot, among the ancient Romans, was called
 ochrea; and by middle age writers, greva, gam-
 beria, bainberga, bembarga, or benberga. The
 boot is said to have been the invention of the
 Carians. It was at first made of leather, after-
 wards of brass or iron; whence Homer calls the
 Greeks brazen-booted. The boot was used by the
 foot, as well as by the horsemen. It only covered
 half the leg; some say the right leg, which was
 more advanced than the left, it being advanced
 forwards in an attack with the sword; but in
 reality it appears to have been used on either leg,
 and sometimes on both. Those who fought with
 darts or other missile weapons, advanced the left
 leg foremost, so that this only was booted.

Boot, Bordekin, a mode of torture used to
 extort confession. A boot, stocking, or buskin
 of parchment, being put on the leg moist, and
 brought near the fire, in shrinking squeezes the
 leg violently, and occasions intolerable pain.
 There is also another kind of boot, consisting of
 four thick strong boards bound round with cords;
 two of these are put between the criminal's legs,
 and the two others placed one on the outside of
 one leg, and the other on the other; then, squeez-
 ing the legs against the boards by the cords, the

criminal's bones are severely pinched, and sometimes even broken.

BOOTAN, a considerable region of northern Hindostan, lying between Bengal and Thibet, and principally between the 26th and 28th degrees of north latitude. It is supposed to be 200 miles from east to west, and ninety miles from north to south. It is mountainous, and in many parts extremely cold, but highly cultivated and productive. Situated without the tropics, it is free from the periodical rains; and the climate is in general favorable to both European and Asiatic fruits. The forests also produce fine firs and other timber. The *deb or deu rajah*, who resides at Tassisudon, is tributary to the lama of Thibet. The principal towns are Tassisudon, Poonakha, Wandipore, Ghassa, and Murrichom. The inhabitants are robust and fair, of the Boodh religion. Most of the laborious duties of life are performed by the women. Their houses are in general of one story, but the palace of the rajah is a lofty pile. The glandular swelling of the throat, commonly found in mountainous districts, is very frequent here. Bootan produces a hardy breed of horses called tangans; they are in general pyebald, and about thirteen hands high. Numbers are brought annually to Rungpore, loaded with the produce of their own country, and of Thibet and China. The district is supplied with silk from Bengal, and with tea from China; of this herb they are excessively fond. The government is very jealous of a free intercourse with Bengal, requiring passports from all travellers; and boast that they were never invaded by the Mahommedans or Chinese. Their customs approach to those of the Birmans or inhabitants of Ava.

BOOTES, a constellation of the northern hemisphere, consisting of twenty-three stars according to Ptolemy's catalogue, of eighteen in Tycho's, of thirty-four in Bayer's, of fifty-two in Hevelius's, and of fifty-four in Flamstead's catalogue; one of which, in the skirt of his coat, is Arcturus, a star of the first magnitude. Bootes is represented as a man walking, and grasping a club in his right hand, and is fabled to have been Icarus, who was transported to heaven because he was a great cultivator of the vine; for when Bootes rises, the vine begins to shoot.

BOOTH, *n. s.* Dut. *boed*; Welsh, *bueth*. A house built of boards, or boughs, to be used for a short time.

The clothiers found means to have all the quest made of the northern men, such as had their *booths* in the fair. *Camden.*

Much mischief will be done at Bartholomew Fair by the fall of a *booth*. *Swift.*

Booths sudden hide the Thames, long streets appear,

And numerous games proclaim the crowded fair.

Gay.

BOOTH (Barton), a famous tragedian, born in Lancashire in 1681, and educated at Westminster, under the celebrated Dr. Busby. He was intended for the church, but his success in the Latin plays, commonly performed by the scholars, gave him an inclination for the stage; and, absconding from school, he went to Dublin, and commenced actor. His first appearance was

in the part of Oroonoko, in which he received great approbation. From this time he continued improving; and, after two successful campaigns, returned to his native country. Having, by letter, reconciled himself to his friends, he obtained a recommendation from Lord Fitzharding to Mr. Betterton, who gave him all the assistance in his power. The first part he appeared in at London was that of Maximus in Lord Rochester's *Valentinian*, wherein his reception exceeded his most sanguine expectations. His performance of Artaban, in Rowe's *Ambitious Stepmother*, established his reputation. In *Pyrrhus*, in the *Distressed Mother*, he shone without a rival. But he was indebted to a happy coincidence of merit and chance, for that height of fame which he at length attained in the character of Cato, as drawn by Addison in 1712. For this being considered as a party play, the Whigs, in favor of whose principles it was evidently written, thought it their duty strongly to support it, while the Tories, unwilling to have it considered as a reflection on their administration, were still more vehement in their approbation. They made a collection of fifty guineas in the boxes during the performance, and presented them to Mr. Booth. He also received an equal sum from the managers, in consideration of the great success of the play. Nor were these the only advantages he reaped from his success; for Lord Bolingbroke soon after procured a special licence from queen Anne, recalling all the former ones, and nominating Mr. Booth as joint manager at Drury-lane with Wilks, Cibber, and Dogget. In 1704 Mr. Booth had married a daughter of Sir William Barkham, Bart. who died in 1710, without issue. In 1719 he married the celebrated Miss Hester Santlow, a woman of a most amiable disposition, whose great merit as an actress, added to the utmost discretion and prudential economy, had enabled her to save a considerable fortune. During the twenty years in which Mr. Booth continued a manager, the theatre was in the greatest credit; and his death, which happened on the 10th of May 1733, contributed not a little to its decline. He wrote a dramatic work, entitled *Dido and Æneas*; and a superior Latin inscription to the memory of Mr. William Smith, an actor.

BOOTH (Henry), earl of Warrington, was born in 1651, and member for Chester in several parliaments during the reign of Charles II. Being a zealous Protestant, he was active in promoting the bill for excluding the duke of York from the throne. This, with his vigorous and constant opposition to the arbitrary measures then prevailing, rendered him so very obnoxious to the court, that in 1684 (soon after his becoming Lord Delamere, by the death of his father), he was committed close prisoner to the tower, and though liberated soon after, he was committed a second and third time in 1685; at last, in Jan. 1686, he was tried for high treason; but in spite of all the efforts of the court and the bloody Jefferies, was acquitted by his jury. After this, he lived retired till matters ripened for the Revolution, to which he contributed by raising forces, and every other means in his power. Upon its accomplishment, he was made a privy counsellor,

chancellor of exchequer, lord lieutenant of Chester, &c.; but though he held some of these offices for life, he was dismissed from others, as he opposed the court measures, and wished for further limitations of the royal prerogative. To avoid all appearance of ingratitude, his dismissal was accompanied with the creation of the new title of Earl of Warrington, in 1690, and a pension of £2000 a year. He died 2d January, 1694. He wrote several political tracts, and the Case of William Earl of Devonshire; which, with his speeches made in parliament, and some family prayers, were published in one volume, 8vo. in 1694.

BOOTH (Abraham), a dissenting clergyman of the Baptist persuasion, was born at Blackwell, in Derbyshire, in 1734, of poor parents. He had consequently but little education, and at an early age was placed with a stocking-weaver. He studied the Scriptures diligently, however, and became so well versed in them as to be called to the ministry among the Baptists, and he at the same time opened a school at Sutton-Ashfield. In 1769 he was ordained pastor of the church in Prescott-street, Goodman's-fields, where he exercised his charge in a great professional conduct and a spotless character till his death in 1806. He wrote, 1. *The Reign of Grace*, 8vo. 2. *Glad Tidings to Perishing Sinners*. 3. *The Death of Legal Hope, the Life of Evangelical Obedience*, 12mo. 4. *An Essay on the Kingdom of Christ*. 5. *Pastoral Cautions*. 6. *Pædobaptism Examined*, 3 vols. and some other works.

BOOTON, an island of the Eastern Seas, lying off the south-eastern extremity of Celebes, in about the fifth degree of south latitude. Its length may be estimated at eighty-five miles, and its width at twenty miles. It is separated from the island of Pangansane by a strait which is passable for square rigged vessels. This island is high and woody, but well cultivated, and produces rice, maize, yams, a variety of tropical fruits, and abundance of the wild bread fruit tree. Fowls, goats, buffaloes, and fish, are also to be procured here. The inhabitants are very tawny, of short stature, and ugly; their language on the sea coast is the Malay, and their religion Mahomedan. The Dutch had formerly a settlement in the bay of Booton, and held the chief of the island under a sort of subjection. On the east side is a bay, named by the Dutch Dwaal, or Mistake Bay, into which if a ship be drifted by the currents, she cannot get out until the west monsoon sets in, and even then it is difficult. A Dutch governor, going to Banda, was detained in this gulf a whole year.

BOOT-TOPPING, in sea language, the act of cleaning the upper part of the ship's bottom, or that part which lies immediately under the surface of the water, and daubing it over with tallow, or with a mixture of tallow, sulphur, resin, &c.

BOOTY,
BOOT'ING, v. } See **BOOT**.
BOOTY'ING.

If it be indeed an incendiary letter, what if you and I, sir, go there; and when the writer comes to be paid for his expected *booty*, seize him. *Goldsmith*

BOOTY, among the Greeks, was divided in common among the army, the general only claiming a larger share. By the military discipline of the Romans, spoils taken from the enemy belonged to the republic, particular persons having no right to them. Sometimes indeed they divided it among the soldiery, to animate them, and serve in lieu of a reward. But this distribution depended on the generals, who were to conduct themselves herein with great equity and moderation; otherwise it became a crime of speculation to lay hands on the pillage. The consuls Romulus and Vaturius were condemned for having sold the booty taken from the Æqui. During the Jewish republic, the booty was divided equally between the army and the people; but under the kings a different kind of distribution obtained. Among the Mahomedans, two-thirds of the spoils are allowed to the army; the other third to God, to Mahomet and his relations, and to the orphans, the poor, and the pilgrims. Among us, formerly, the booty was divided among the soldiers. If the general be in the field, every body takes what he can lay hold of: if the general be absent, the booty is distributed among the soldiers, two parts being allowed the cavalry, and one to the infantry. A captain is allowed ten shares, a lieutenant six, and a cornet four.

BO'PEEP. Bo and peep; childish play, not always confined to children. A kind of advancing and retiring; looking and hiding the face, for the mere purpose of drawing each other on to further amusement. It is sometimes played by parent and child; by knave and fool; by the gallant and his wanton.

The woman wantonnesse, shee comes with 'ticing traine;

Pride in her pocket plaies *bopeepe*, and bawdry in her braine. *Gascoigne's Flowers.*

Then they for sudden joy did weep,

And I for sorrow sung,

That such a king should play *bopeep*,

And go the fools among. *Shakespeare.*

Rivers,

That serve instead of peaceful barriers,
 To part the' engagements of their warriors,

Where both from side to side may skip,

And only encounter at *bopeep*. *Hudibras.*

There the devil plays at *bopeep*, puts out his horns to do mischief, then shrinks them back for safety.

Dryden.

Just so, in life he runs about,

Plays at *bopeep*, now in now out;

But hurts no mortal creature. *E. Moore.*

BOPYRUS, in entomology, a genus of the class arachnides, order tetracera, and family assellota, of Latreille: the monoculi of Linnæus. They live by suction on different marine crustacea.

BOQUINIANS, **BOQUINI**, a sect of Sacramentarians, who asserted that the body of Christ was present in the Eucharist only to those for whom he died; viz. the elect.

BOQUINUS, the founder of the sect of Boquinians, a Lutheran divine, who taught that Christ did not die for all mankind, but only for the faithful, and consequently was only a particular Saviour. In this opinion he was not singular.

BORA, in natural history, the name used for the bufonites, by some authors; these are supposed by many to be real stones, but are only the teeth of a fish.

BORACIC ACID. To procure this acid, dissolve borax in hot water, filter the solution, then add sulphuric acid by little and little, till the liquid has a sensibly acid taste, and when cool, a great number of small shining crystals will form. These are the boracic acid. They are to be washed with cold water, and drained upon brown paper. Homburg first obtained this acid separate in 1702, by distilling a mixture of borax and sulphate of iron.

Boracic acid appears in the form of thin irregular hexagonal scales, of a silvery whiteness, having a kind of greasy feel. It has at first a sourish taste, then a bitter cooling impression, leaving an agreeable sweetness. It is not brittle but ductile; it has no smell. Exposed to the fire it swells, losing its water of crystallisation, and in this state it is called calcined boracic acid. It melts a little before it is red-hot, but it does not flow freely till it is red. After fusion it is a hard glass, unaltered in its properties, for on being dissolved in boiling water it crystallises as before. This glass is much used in the composition of false gems.

Boiling water dissolves scarcely one-fiftieth part; cold water much less. It is more soluble in alcohol, and alcohol containing it burns with a green flame. If mixed with finely powdered charcoal, it is capable of vitrification; and with soot it melts into a black bitumen-like mass, soluble in water, and not easily burned to ashes; part sublimes. With the assistance of a distilling heat it dissolves in oils, especially mineral oils; and with these it imparts a green color to spirit of wine. When rubbed with phosphorus it does not prevent its inflammation, but an earthy yellow matter is left behind. It dissolves none of the metals except iron and zinc, and perhaps copper; but it combines with most of the metallic oxides, as it does with the alkalis. It is of great use in analysing stones that contain a fixed alkali.

Crystallised boracic acid is a compound of fifty-seven parts of acid and forty-three of water. The honor of discovering the radical of boracic acid, is divided between Sir H. Davy and M.M. Gay Lussac and Thenard. The first, on applying his powerful voltaic battery to it, obtained a chocolate-colored body in small quantity; but the two latter chemists, by acting on it with potassium in equal quantities, at a low red heat, formed boron and sub-borate of pot ash. See BORON.

The boracic acid has been found in a disengaged state in several lakes of hot mineral waters in Tuscany, in the proportion of nearly nine grains in a hundred of water; and also adhering to schistus, on the borders of lakes, of an obscure white, yellow, or greenish color, and crystallised in the form of needles.

BORACITE. Borate of magnesia. A crystallised mineral found in gypsum in the Kalberg in Brunswick, and at Segeberg in Holland. It is translucent, and of a shining lustre; color yellow, gray, or greenish-white. Vanquelin's

Analysis gives 83.4 boracic acid, and 16.6 magnesia. Its most remarkable property is, that like the tourmalin it becomes electric by heat; and it has four electric poles, the perfect angles always exhibiting negative electricity, and the truncated angles positive.

BORAGO, **BORAGE**, in botany, a genus of plants, of the class pentandria, order monogynia. The generic character is, cal. five cleft: cor. rotate, having at its orifice five obtuse emarginate teeth. It contains seven species, the most remarkable of which is the *B. officinalis*, or common borage, employed in medicine as a refrigerant. It grows wild in this country, but was brought from Aleppo.

BORAK, **AL**, in the Mahommedan theology, the animal, something between a mule and an ass, which carried the prophet on his journey from Jerusalem to heaven. The night on which he performed this excursion is called *Leilat al Me'raje*, the night of the ascension.

BORANA, in entomology, a species of tortrix, inhabiting Sweden. The head cinereous, and thorax fuscous.

BORASSUS, in botany, a genus of plants described by Linnaeus. The male and female flowers grow on separate plants, and are called by different names, in the Hortus Malabaricus; the male being called *ampana*, and the female *carimpana*: cal. a spathe; spadix amentaceous, imbricate: cor. three-parted. Fem. styles three: drupe three-celled, three-seeded. One species only, a native of India, a palm with leaves folded like a fan, and cut at the edges.

BORAX is a salt, in appearance similar to alum, brought originally from the East Indies in an impure state, and afterwards purified in Europe. It was long uncertain whether this salt was a natural or factitious substance; but it is now ascertained that it is naturally produced in the mountains of Thibet, from whence other parts of the eastern continent are supplied. Mr. Kirwan, in his mineralogy, informs us, that Mr. Grill Adamson sent some to Sweden in 1772, in a crystalline form, as dug out of the earth in Thibet, where it is called *pounxa*, *my-poun*, and *houi-poun*. It is said to have been found in Saxony in some coal-pits.

Borax is found, in commerce, in three different states. 1. Borax, Chinese, is somewhat pure, and is met with in the form of small plates or masses irregularly crystallised, and of a dirty white. It appears to consist of fragments of prisms and pyramids, confounded together without any symmetrical arrangement. A white powder appears on the surface, thought to be of an argillaceous nature. 2. Borax, crude, tincal, or chrysocola, comes from Persia in greenish masses, of a greasy feel, or in opaque crystals of an olive green, which are six-sided prisms terminated by irregular prisms. There are two varieties of these crystals, differing in magnitude. This salt is very impure by the addition of foreign matters. Mr. Kirwan tells us, that this kind is called *brute borax*, *tincal*, or *chrysocola*, and that it is in the form of large, flat, hexangular, or irregular crystals, of a dull white or greenish color, greasy to the touch, or in small crystals, as it were cemented together by a rancid yel-

lowish oily substance, intermixed with marl, gravel, and other impurities. 3. Borax, Dutch, or purified borax, is in the form of portions of transparent crystals of considerable purity. Pyramids with several facets may be observed among them, the crystallisation appearing to have been interrupted. Its taste is styptic; it converts syrup of violets to a green; and when exposed to heat, it swells up, boils, loses its water of crystallisation, and becomes converted into a porous, white, opaque mass, commonly called calcined borax. A stronger heat brings it into a state of quiet fusion; but the glassy substance thus afforded, which is transparent, and of a greenish-yellow color, is soluble in water, and effloresces in the air. It requires about eighteen times its weight of water to dissolve it at the temperature of sixty degrees of Fahrenheit; but water at the boiling heat dissolves three times this quantity. Its component parts, according to Kirwan, are, boracic acid thirty-four, soda seventeen, water forty-seven.

Borax serves as a flux to vitrifiable earths, with which it forms a good glass, and is employed in making artificial gems. It vitrifies clay, but much less completely than siliceous earths; and from this property it adheres to the inside of crucibles, and glazes them. The acid of borax, as well as the borax in substance, is made use of to fuse vitrifiable earths, with which it forms clear and nearly colorless glasses: by the assistance of heat it dissolves the earth precipitated from the liquor of flints. It unites with ponderous earth, magnesia, lime and alkalies, and forms, with different substances, salts distinguished by one general name of borax, though only that formed by the combination of sedative salt and mineral alkali is used in the arts. It is used in many other chemical operations as a flux, besides that of glass making; and the dyers also use it for giving a gloss to silks. In medicine it is occasionally given in cardialgia as an antacid. Its solution is in common use as a cooling gargle, and to detach mucus, &c. from the mouth in putrid fever; and mixed with an equal quantity of sugar, it is used in the form of powder to remove the aphthous crust from the tongue in children.

BORBETOMAGUS, in ancient geography, a city of the Vangiones on the Rhine; now called Worms.

BORBONIA, in botany, a genus of the decandria order, and diadelphica class of plants; natural order, thirty-second, caryophyllææ: *stigma*. emarginated: *cal.* spines pointed; the legumen is pointed. There are eight species, all natives of warm countries. They are a kind of broom; and rise to the height of ten or twelve feet, but in Europe seldom above four or five. They must be kept constantly in the stove, and may be propagated by shoots; but as these are generally two years before they put forth roots, the best method is by seeds, which must be procured from their native places.

BORBONICA, in ornithology, a species of motacilla; color grayish; a yellowish gray beneath; quill and tail-feathers brown, edged with gray. This is the ficedula borbonica of Brisson; and the Bourbon warbler of Latham. Inhabiting the islands of Bourbon and Madagascar.

BORBONICUS, a species of turdus, of a cinereous olive color; crown black; abdomen and vent yellow; tail fuscous, with two obsolete bands near the tip. Inhabits the isle of Bourbon. This is the Bourbon thrush of Latham.

BORBONIUS (Nicholas), a French Latin poet of the sixteenth century. He was highly esteemed by the most learned men of his time. His poems were printed in 1540.

BORBORIANI, BOREORITES, in church history, a sect of gnostics, in the second century, who, besides embracing the errors of these heretics, denied the last judgment. Their name comes from *Βορβορος*, filth; on account of a custom they had of daubing their faces and bodies with dirt.

BORBORYGMUS, *Βορβορυγμος*; Greek, a rumbling of the intestines.

BORD HALFPENNY, a small toll by custom paid to the lord of the town for setting up boards, tables, booths, &c. in fairs or markets.

BORD LANDS, the demesnes which lords anciently kept in their hands, for the maintenance of their board or table.

BORD LODGE, 1. a service required of tenants, to carry timber out of the woods of the lord to his house: 2. the quantity of provision which the Bordarii, or bordmen, paid for their bord lands.

BORD SERVICE, the tenure of bord lands, by which some lands in certain places are held of the bishop of London, and the tenants now pay sixpence per acre, in lieu of sending provision as formerly for their lords' table.

BORDA (John Charles), a French mathematician and natural philosopher; was born at Dax, in the department of the Landes, 1733. He studied under the Jesuits, who endeavoured to induce him to enter into their order, and was afterwards intended for a civil employment; but, in consequence of his passion for geometry, he was suffered to devote himself to the sciences. In 1756 he laid before the Academy a Memoir on the motion of Projectiles, which procured him admission into that body. The year following he was aide-de-camp to M. de Maillebois at the battle of Hastembeck, and on his return to Paris was employed as inspector of the dock-yards. In this situation he made numerous experiments on the resistance of fluids and the velocity of motion. In 1767 he published a valuable Dissertation on Hydraulic Wheels; and, in 1768, another on the Construction of Water-pumps. He was now appointed sub-lieutenant in the marine, and sent with Pingrè on a voyage of discovery to the South Seas, of which an account was published in 2 vols. 4to. 1778. He afterwards served under count d'Estaing in America, when he discovered many defects in the construction of vessels, which led to some important improvements in naval architecture. He also produced an invention called the Circle of Borda, the first idea of which was given by Meyer. Besides this he was the contriver of the mensuration-rod, for ascertaining new station-lines. He also projected a reform in weights and measures; for which purpose he published Tables of Lines, at his own expense. One of his last labors was the determination of the length of the pendulum

vibrating seconds at Paris; where he died, greatly lamented, in 1799.

BORDARII, often mentioned in the Domesday inquisition, were distinct from the servi and villani, and seem to be those of a less servile condition, who had a bord or cottage, with a small parcel of land allowed to them, on condition they should supply the lord with poultry and eggs, and other small provisions for his board and entertainment. Though, according to Spelman, the bordarii were inferior to the villani, as being limited to a small number of acres.

BORDAT, in commerce, a small narrow stuff, manufactured in some parts of Egypt, particularly in Cairo, Alexandria, and Damietta.

BORDE (Andrew), M. D. was born at Pevensey in Sussex, early in the sixteenth century. In his Introduction to Knowledge, he says, that he was a student of Oxford. He entered a brother of a Carthusian convent in or near London; but, not liking their discipline, he returned to Oxford, and applied to physic. Some time after, he embarked for the continent; and, as he expresses it, 'travell'd through and round about Christendom, and out of Christendom into some parts of Africa.' In 1541, and 1542, he resided at Montpellier, where he was made M. D. and after his return to England received the same degree at Oxford. From his preface it appears that he had also been in Scotland. Having satisfied his inclination for travelling, he settled first at Pevensey, afterwards at Winchester, and finally in London, where he became first physician to Henry VIII; notwithstanding which, he had the misfortune to end his life in the Fleet prison, in 1549. Wood says, 'he was esteemed a noted poet, a witty and ingenious person, and an excellent physician.' Pitts calls him a man of sufficient learning, but too volatile. His writings are, 1. A Book of the Introduction of Knowledge, the which doth teach a Man to speak part of all manner of Languages, &c. Lond. 1542, 4to; dedicated, from Montpellier, to the lady Mary, daughter of Henry VIII. It is written partly in verse, and partly in prose. 2. The Breviary of Health, Lond. 1547, 4to. 3. Dictary of Health, Lond. 1576, 8vo. 4. The Merry Tales of the Madmen of Gotham; printed, says Wood, in the time of Henry VIII., in whose reign, and after, it was accounted a book full of wit and mirth, by scholars and gentlemen. It is now sold only on the stalls of ballad-sellers. 5. A Right Pleasant and Merry History of the Mylner of Abingdon, with his Wife and his Fair Daughter, and of Two Poor Scholars of Cambridge; Lond. 4to. 6. A Book of every Region, Country, and Province, &c. published by Hearne at end of Benedictus abbas Peterb. de vita Henrici II., Oxf. 1735; 8vo. 7. The Principles of Astronomy, Lond. 12mo. The author says, that he wrote this little book in four days, with one old pen, without mending.

BORDELL, } A brothel. Menage thinks
BORDELLO, } the old French bordeau is
BORDELLIER, } compounded of board and
cau, because such places were heretofore by the
water side. Wachter contends that bordell is the
diminutive of the Ang-Sax. bord, a house; and
properly signifies domuncula, a small house.

— And the same shall the man tell plainly, with
all the circumstances, and whether he hath sinned
with common *bordel* women or non, or don his sin in
holy times or none. *Chaucer's Canterbury Tales.*

From the *bordello* it might come as well,
The spital, or pichatch. *Ben Jonson.*

Making even his own house a stew, a *bordel*, and a
school of lewdness, to instil vice into the unwary ears
of his poor children. *South.*

BORDENTOWN, a thriving town of the
United States in Burlington County, New Jersey;
seated on the east side of the Delaware, twenty-
six miles above Philadelphia, and four south-
east by south of Trenton. As it stands on a
rising ground, about seventy feet perpendicular
above the Delaware, between two creeks which
run into that river, it is extremely healthy.

BORDER, *v. & n.* } Fr. *border*; Dut.
BORDERER. } *boorden*, from board;
and also aboard, in its consequential usage. To
approach; to accost, or accoast; to be, or come
